Atlantic City (N. J.) & Suburban Traction Company.—The creditors' committee, composed of John L. Clawson of Philadelphia, H. von H. Stoerer of Chester, Pa., and A. C. Stamm of Harrisburg, Pa., prior to the meeting of shareholders on March 30, at which it was decided to issue \$30,000 preferred stock, issued a circular letter, an abstract of which follows: The company defaulted in the interest due February 1, 1907, upon its \$750,000 outstanding bonds. The company has a floating debt of about \$100,000; has issued \$27,000 car equipment bonds, and has entered into a contract to pave Florida avenue, Atlantic City, at a cost of about \$15,000. The plan of readjustment which it seems best to adopt to accomplish the desired end is to defer the payment of the interest due on February 1, and August 1, 1907, on the first mortgage bonds; negotiable scrip will be issued for this interest payable with interest at the rate of 5 per cent per annum from the date of each coupon, the principal to be paid at the option of the company without impairment of the lien. The refunding mortgage bondholders are asked to agree that the interest for two years upon their bonds shall be deferred upon the same conditions, and also to purchase at par 6 per cent non-cumulative preferred stock in amounts equal to 12 per cent of their holdings of the bonds. The unsecured creditors are asked to accept preferred stock as full payment of their claims, as of March 1, 1907, amounting to \$50 and upwards. The taxes, as well as debts of less than \$50, must be paid in cash; but if the plan is to succeed and the property be saved from a receivership, unsecured creditors for advances, supplies, machinery, etc., must accept preferred stock.

Birmingham (Ala.) Railway Light & Power Company.—Gross earnings for the year ended February 28, 1907, are reported as \$1,998,270. Net earnings, after the payment of operating expenses and taxes, were \$808,925. After the payment of bond interest, amounting to \$406,322, the surplus was \$402,603.

Chicago & Milwaukee Electric Railroad Company, Chicago.—Joseph E. Otis and George M. Seward have resigned as directors and are succeeded by P. G. Beach and G. L. Francis.

Chicago General Railway Company.—Amy Bonney has filed a bill in the circuit court at Chicago alleging that Edward F. Bryant is incompetent to administer the trust of 50 persons interested in this company. She asks to have returned to her \$2,000 bonds of the Chicago Midland Transit Company and 700 shares of the Chicago General Railway Company, the value of which, she declares, has been reduced to practically nothing by the transactions of Mr. Bryant and his associates. In 1904 Mr. Bryant, the bill says, agreed to act as trustee for the holders of stocks or bonds of the Chicago General Railway Company, the Chicago Midland Transit Company and the West & South Towns Street Railway Company, and to reorganize the properties. The bill charges the fraudulent issue of receivers' certificates and asks the appointment of a receiver to take charge of all the securities and interests involved in the trust, and also that Mr. Bryant be compelled to render an accounting.

Humboldt Transit Company, Eureka, Cal.—Control of this company, it is reported, has been purchased by George Heazleton of San Francisco. The company has 10 miles of track in Eureka.

Indianapolis Huntington Columbia City & Northwestern Traction Company, Indianapolis.—The appointment of a receiver for this road has been requested by Frank M. Dell in court proceedings at Indianapolis. It is reported that the McGowan interests may acquire the property.

Lincoln (Neb.) Traction Company.—A semi-annual dividend of 4 per cent has been declared on the common stock, placing it on an 8 per cent annual dividend basis. In 1906 the rate was 6 per cent.

Philadelphia Rapid Transit Company.—The directors on April 4 issued a call of \$5.00 a share on the 600,000 shares of stock of the company, par value \$50, of which \$30 has been paid in. The assessment is payable on or before May 6.

United Railways & Electric Company, Baltimore.—The report for the year 1906 compares as follows:

	1906.	1905.	1904.
Gross earnings	\$6,853,102	\$6,023,698	\$5,440,942
Operating expenses	3,220,942	3,765,292	2,876,538
Net earnings	\$3,632,160	\$2,258,406	\$2,564,404
Other income	4,725	2,725	10,238
Total income	\$3,636,885	\$2,261,131	\$2,574,642
Fixed charges	2,365,587	2,230,067	2,244,578
Surplus	\$1,271,298	\$ 31,064	\$ 330,064
Extraordinary expenditures	980,000		
Balance	\$ 291,298	\$ 31,064	\$ 330,064

Since the fire in 1904 the company has spent for betterments and improvements \$6,891,734.21.

West End Street Railway, Boston.—The Massachusetts railroad commission has authorized this company to issue \$420,000 additional common stock at \$85 a share, par value \$50, to meet the cost of additions and improvements.

Manufactures and Supplies

ROLLING STOCK.

New York & Queens County Railway, Long Island City, N. Y., is in the market for 40 cars.

Henderson City Railway, Henderson, Ky., is in the market for three car bodies of the closed type.

Chicago City Railway, Chicago, has just placed an order for 300 cars with The J. G. Brill Company.

Puget Sound Electric Railway, Tacoma, Wash., has ordered six cars from the American Car Company.

Chester Traction Company, Chester, Pa., has purchased seven 35-foot semi-convertible cars from The J. G. Brill Company.

Meadville Conneaut Lake & Linesville Electric Railway, Meadville, Pa., has placed an order with the St. Louis Car Company for five cars.

Erie Cambridge Union & Corry Railway, Erie, Pa., is preparing plans and specifications for new cars and equipment and will make purchases about July 1.

Union Street Railway, New Bedford, Mass., according to official advice has ordered one double-truck freight car and six box passenger cars from J. M. Jones' Sons. These will be equipped with Taylor trucks and Westinghouse 10113 motors.

Spokane & Inland Railway, Spokane, Wash., has ordered from the Westinghouse Electric & Manufacturing Company eight single-phase electric locomotives, to weigh 144,000 pounds each. They will be equipped with four motors of 250 horsepower each.

Rhode Island Company, Providence, R. I., has placed an order for 20 vestibule cars for delivery next fall. The company placed orders some time ago for 21 cars for delivery in April and for 14 cars which are now ready to be put into service. It is understood all the cars will be built by the Cincinnati Car Company.

Dallas Consolidated Street Railway, Dallas, Tex., recently ordered six double-truck closed cars from the American Car Company. These are for city service, will be 40 feet long over vestibule, 8 feet 4 inches wide and will be equipped with Brill 27-G trucks and two motors on each car, with a capacity of 50 horsepower each.

Oakland Traction Company, Oakland, Cal., as reported in the Electric Railway Review of January 19, has arranged for the building of considerable new equipment in its own shops during 1907. This will include 60 motor cars, 20 of which will be 50-foot, double-truck cars and 20 double-truck cars 55 feet in length; also 10 coaches and 10 standard-gauge flat cars.

Northwestern Elevated Railroad, Chicago, is preparing plans and specifications for 45 coaches and will place the order in about two weeks. They will be of the same dimensions as the 35 combination motor and trailer cars ordered last fall from the Jewett Car Company, which are now being delivered. All the new cars will be equipped with 45-inch sliding doors and it is the intention of the company to remodel the vestibules and doors of all its old equipment to conform with that now being put into service.

Morris County Traction Company, Morristown, N. J., as reported in the Electric Railway Review of April 6, placed an order on March 12 with the Jackson & Sharpe plant of the American Car & Foundry Company, Wilmington, Del., for six semi-convertible cars for November delivery. These will have a seating capacity of 36 passengers, length of body 30 feet 9 inches, length over vestibule, 40 feet 9 inches, width over sills 8 feet, will have underframe and body of wood and will be equipped with American Car & Foundry Company's type C trucks.

Beloit Traction Company, Beloit, Wis., as reported in the Electric Railway Review of February 23, has placed an order with the St. Louis Car Company for six closed cars for delivery on July 1. The company expects to place an order this fall for four open cars for 1908 delivery. The specifications on the closed cars call for the following details:

Seating capacity ..32 passengers	Width—
Wheel base9 ft.	Inside7 ft. 8 in.
Length—	Over all8 ft.
Body22 ft.	BodyWood
Over all30 ft.	UnderframeSteel
	BrakesHand power

Camden Interstate Railway, Huntington, W. Va., as reported in the Electric Railway Review of March 2, has placed an order with the Niles Car & Manufacturing Company for eight interurban cars, for delivery on June 16. The specifications call for the following details:

Width, over all.....8 ft. 4 in.	Height, track to trolley
Length, over vestibule.47 ft. 8 in.	base13 ft.
Weight.....27,000 lb.	Wheel base6 ft.
Seating capacity..52 passengers

Conneaut & Erie Traction Company, Erie, Pa., as reported in the Electric Railway Review of April 6, has placed an order with the Jackson & Sharpe plant of the American Car & Foundry Company, Wilmington, Del., for two combination passenger and express

cars. These cars were ordered about February 1 and are for delivery about May 1. The specifications call for the following details:

Seating capacity..48 passengers	Width, inside.....8 ft.
Wheel base, each truck.4 ft. 6 in.	Over all8 ft. 4 in.
Length of body.....35 ft.	Height, track to trolley base

SHOPS AND BUILDINGS.

Albany & Hudson Railroad.—This company has leased a five-story brick building at 24 State street, Albany, N. Y., and will remodel it and use a part of it as a station.

Cleveland & Southwestern Traction Company.—It is reported that the new car barns at Elyria will be ready for occupation about the latter part of April.

Dayton, O.—Representatives of the various interurban lines radiating from Dayton conferred recently with the city council, which met as a whole, to discuss the erection of a traction depot. A number of sites have been suggested, and, besides learning the wishes of the council on that point, a number of other matters were discussed.

Georgia Railway & Electric Company, Atlanta, Ga.—At a recent meeting of the directors it was decided to greatly enlarge and improve the car building and repair shops as soon as the plans can be prepared by the architects, Morgan & Dillon. All of the new construction is to be of brick and steel and will be fireproof. A new car barn is also to be built, 238 feet long by 102 and 22 feet wide. New additions are also to be made to the paint and carpenter shops, respectively, 50 by 110 feet and 68 by 98 feet. The carpenter shop will be enlarged and an entirely new blacksmith shop will be built.

Indiana Union Traction Company.—This company is making arrangements for the construction of a passenger station at the Marion Country Club, Marion, Ind.

Inter-Urban Railway, Des Moines, Ia.—It is reported that this company will erect a large interurban station on the northeast corner of West Second and Grand avenues this summer or fall.

San Diego (Cal.) Electric Railway.—This company has secured a building permit for the construction of an addition to its present car house at San Diego, which will cost about \$10,000.

San Jose (Cal.) Railway.—This company, it is reported, proposes to erect a new car house, shops and offices this year.

United Railways & Electric Company, Baltimore, Md.—William A. House, acting president, has awarded a contract to David E. Evans, Jr., & Co., Baltimore, for construction of a car barn at North avenue and Gay streets, Baltimore; one story, 124 by 356 feet; reinforced concrete construction throughout, steel rolling doors, slag roof, fire doors, metal frames and sashes, galvanized iron skylights, metal lockers, sprinkler system, electric wiring and fixtures, sanitary plumbing, steam heating system. Simonson & Pletsch, Baltimore, architects.

Worcester Consolidated Street Railway.—It is reported that this company will build a \$65,000 extension to its Market street car house in Worcester, Mass., to be constructed entirely of brick and steel.

TRADE NOTES.

Carbonite Wheel & Abrasive Tool Company, Townson, Md., has been incorporated with an authorized capital stock of \$25,000, for the purpose of manufacturing a patented device for improvement in compositions for polishing and grinding. The incorporators are:

Charles H. Snyder, John J. Dotterweich, Charles Schlaffer and others.

Pantasote Company has moved its Chicago offices from the Monadnock block to 707 Fisher building.

Browning Engineering Company, Cleveland, has removed its Chicago offices from the Monadnock block to Room 1006 Fisher building.

The J. G. Brill Company, Philadelphia, lost by fire on April 4 its new foundry at Sixtieth street and Woodland avenue, Philadelphia, estimated at \$20,000.

N. H. Emmons on April 1 assumed charge of the Boston office of the Heine Safety Boiler Company, St. Louis, Mo., succeeding W. E. Muse, who resigned a short time ago on account of ill health.

Baldwin & Rowland Switch & Signal Company, New Haven, Conn., has received an additional order from the Norfolk & Southern Railway of Norfolk, Va., for four recording block signals and one Acme traction switch.

Charles E. Irwin, recently in the sales department of the Hukill-Hunter Company, Pittsburg, has been appointed general sales agent for the Fort Pitt Spring & Manufacturing Company, with offices in the Farmers' Bank building, Pittsburg.

Continental Engineering Constructing Company (Inc.), 50 Broadway, New York, announces the election of Shirley E. Johnson, recently with Fisk & Robinson, bankers, as vice-president of the company. Charles M. Meeker is president and W. L. Wheeler secretary.

Theodore D. Buhl, president of the Buhl Malleable Iron Works of Detroit, Mich., died suddenly of apoplexy near the Waldorf-Astoria hotel in New York. He was also president of the Detroit National Bank and was connected with the firm of Parke, Davis & Co. of Detroit.

Scioto Construction Company, Columbus, O., has been incorporated with a capital stock of \$25,000, for the purpose of doing a general contracting business. The incorporators are: Barton Griffith, Fred H. Heywood, W. H. Agan, C. B. Howard and E. E. Bryan, all of Columbus.

Goldschmidt Thermit Company, New York, on April 1 removed its offices from 43-49 Exchange place to the new West Street building, 90 West street. At the same time a San Francisco office was opened at 432 Folsom street, under the management of L. Heynemann, for handling the business of California, Oregon, Washington and Nevada.

Drummond's Detective Agency, New York, is offering special inducements to electric railways having periodical inspections of their roads. The company believes better results can be obtained under this method, and has accordingly arranged a cheaper rate schedule. No charge is made by the company for consultations and all inquiries will be properly handled.

Dossert & Co., 242 West Forty-first street, New York, have received an order from the Chicago City Railway for 900 Dossert solderless cable taps; also from the New York Central & Hudson River Railroad for 150 of these tap joints in addition to 100 straight two-way connectors. The use of these taps for tapping off feed wires is becoming more general among traction companies.

Blake Signal Manufacturing Company, Boston, Mass., has recently completed the installation of the Blake electric block signal system on the line of the Chautauqua Traction Company of Westfield, N. Y., which operates between Jamestown and Chautauqua, N. Y. This system, which was described in the Street Railway Review of April, 1906, page 190, was installed on a part of the Jamestown & Chautauqua line several months ago.

Clinton Wire Cloth Company, Clinton, Mass., will on May 1 remove its New York office from 33 Park place to 261 Broadway. At the same time the Chicago office will be removed from 237 Lake street to 30-32 River street. For over half a century this concern has been manufacturing wire cloth of every description, embracing woven wire fence, electrically welded wire fabrics for concrete construction, wire lath, hexagonal netting, perforated metals, etc.

General Supply Company, Railway Exchange building, Milwaukee, Wis., has recently been incorporated to deal in building materials, the company making a specialty of selling to the dealer all kinds of building supplies direct from the manufacturer. The company has arranged for every facility for prompt delivery and purchasers of this class of equipment are invited to send inquiries to the company. Julius H. Kirl is interested in the new concern.

William S. Johnson, for the past twelve years assistant engineer of the Massachusetts state board of health, announces that he has opened an office at 101 Tremont street, Boston, for the practice of civil engineering. Special attention will be given to design and construction of systems of water supply and sewerage, valuation of water works and of water power, treatment of manufacturing wastes and other matters relating to sanitary and hydraulic engineering.

J. M. Gallagher has recently been appointed manager of the sales department of the Electric Railway Improvement Company of Cleveland, O. This company is manufacturing and installing rail bonds under the Wherry patents for copper welding and the Ellhu Thompson patents for electric brazing. Mr. Gallagher has for several years located at Chicago as the western representative of the Mayer & Englund Company of Philadelphia, Pa., and the Protected Rail Bond Company, and since the organization of the Elec-

tric Service Supplies Company has been associated with it until forming his present connection.

Invincible Rail Joint Company, mentioned in our issues of March 30 and April 6, has opened offices at 54, 55 Ziegler building, Spokane, Wash. As previously stated, the company is building a plant for the purpose of manufacturing and putting on the market the J. B. Climo rail joint and the Owen-Shaw nut and bolt lock and track bolts and nuts.

Lake Construction Company has filed articles of incorporation in the state of Ohio, capitalized at \$100,000. It is the purpose of the company to do a general engineering and construction business along lines identified with the building of electric railways and also to manufacture building material, supplies and accessories used upon electric roads. S. H. White, H. D. Watson and Frank G. Frink are interested. The offices of the company are at Hammond, Ind.

Crocker-Wheeler Company, Ampere, N. J., manufacturer and electrical engineer, has opened an office in the Woodward building, Birmingham, Ala., in charge of B. A. Schroder, formerly representative of the company in the New Orleans territory. For some time the company has found it difficult to handle from its New Orleans and Baltimore offices its rapidly increasing business in electric motors and generators at Birmingham and to meet this demand was obliged to establish headquarters at that point.

Western Electric Company, Chicago, has awarded contracts for the construction of a 2-story factory building, 120 by 160 feet, to be built on the property of the company at Hawthorne, Ill., to be used in the manufacture of black enameled wire. It will have a tile roof, metal skylight, and will cost \$50,000. The company has also contracted for a 1-story pump house, 16 by 16 feet, to be erected at Hawthorne. It will be of pressed brick construction, concrete foundation, tile roof, and to cost \$1,800.

Milloy Electric Manufacturing Company, manufacturer of the Milloy base, automatic trolley retriever and the Milloy automatic signal, has moved from Cleveland, where it was formerly located, to Bucyrus, O., and has taken offices in the American Clay Machinery Company's building in that city. An extension to the plant of the American Clay Machinery Company of Bucyrus will be made to handle the business of the Milloy Electric Manufacturing Company. These extensions include an addition to the pattern storage building, a 70-foot addition to the foundry and considerable new special machinery.

Allis-Chalmers Company, Milwaukee, Wis., has received an order from the Light Heat & Power Corporation of Northampton, Mass., for a 375-kilowatt Allis-Chalmers engine type alternating-current generator and a 17½-kilowatt excitor; also from the Gould Storage Battery Company of New York for an Allis-Chalmers 600-ampere, 140-volt induction motor-driven generator set for the Elmira Water Light & Railroad Company of Elmira, N. Y. The set will be composed of an interpole shunt-wound generator, designed for a normal rating of 600 amperes at 140 volts, mounted on a combination base with a 60-cycle, 3-phase standard Allis-Chalmers induction motor.

New Departure Manufacturing Company of Bristol, Conn., manufacturers of automobile and bicycle specialties, as mentioned in the Electric Railway Review of April 6, has purchased the business and factory of the Liberty Bell Company of Bristol, Conn., and will use the Liberty factory building as a branch of its factory, continuing the manufacture of the well-known Liberty bells. Among other things secured by this purchase was the Liberty cushion trolley harp, which for some time has been marketed by the Liberty Bell Company and has given good service on many important electric railway lines. This harp will be manufactured and sold by the new owners.

ADVERTISING LITERATURE.

Kinnear Manufacturing Company, Columbus, O.—Wood rolling doors constructed with special reference to the requirements of roundhouses and other buildings where sulphurous fumes prove deleterious to steel work are the subject of an illustrated pamphlet issued by this company.

Allis-Chalmers Company, Milwaukee, Wis.—A new index, corrected up to April 1, has been issued to show the catalogues, bulletins, instruction books, etc., at present obtainable. This shows a list of 135 publications, each treating of a separate product or group of products of the Allis-Chalmers Company.

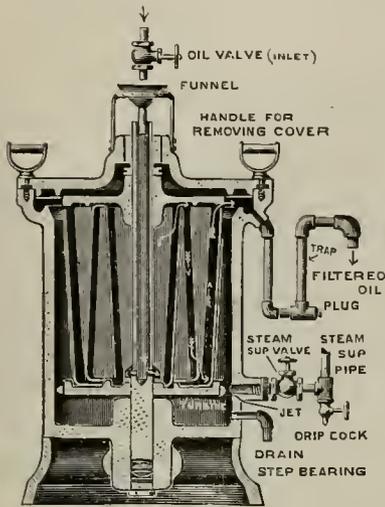

Paragon Concrete Fence Post Company, 417 Portsmouth Building, Kansas City, Kan.—A small booklet sets forth the merits of Paragon concrete posts as compared with those of wood posts, rough hewn stone posts and iron posts, and shows the form of the concrete post, together with the method of attaching woven wire to it.

B. F. Sturtevant Company, Hyde Park, Mass.—Bulletin 143 describes Sturtevant generating sets with horizontal engines. Generators of the horizontal sets are of the eight-pole type, direct-connected to the engines by flange couplings. Each generator has a capacity for a momentary 50 per cent overload without shifting of brushes or destructive sparking at the commutator.

Goldschmidt Thermit Company, 90 West Street, New York City, N. Y.—A handsome booklet, illustrating the various manners in which the Thermit process may be employed for effective welding purposes, has been published under the title of "Thermit Welding Process and What It Offers to Transportation Companies." The adaptability of Thermit to railway repairing provides the subject for a large portion of the book.

THE CENTRIFUGAL OIL FILTER.

One of the most frequent sources of waste in all industries in which machinery is required, and one which is generally the least thought about and considered, is the loss of oil through leakage and throwing away oil which has been used once and becomes dirty. The tendency of modern times, however, which forces the greatest economy to be practiced in even the smallest departments of an industry has extended so that it is no longer the custom to waste oil which has been once used, but to thoroughly filter the oil and carefully remove impurities so that the oil may be used over again.

Turbine Oil Filter.

Possibly one reason why oil filters were not generally introduced some time ago was that the older forms operated by gravity filtered so slowly and prohibited the use of a sufficient thickness and fineness of the filter bed to effectively remove all the foreign matter. To overcome this difficulty and provide a filter which will operate rapidly, occupy the minimum of space, and permit easy cleansing and cheap operation, the Oil & Waste Saving Machine Company, 1307 Real Estate Trust building, Philadelphia, has developed an interesting little turbine centrifugal oil filter, a vertical cross section of which is illustrated herewith.

As will be seen from the illustration, the filter consists essentially of a series of conical shaped bowls set one within the other and between which is placed the filtering material through which the oil is passed. The oil, it will be observed, passes into the hollow turbine shaft and enters the bottom of the innermost cone, from which it is thrown by centrifugal force outward through the filtering material, which because of the great pressure created at a high speed can be made sufficiently fine to remove even the microscopic particles of dirt which may be held in suspension in the oil. The filtering action is further assisted by the centrifugal force in that it increases the apparent difference in the specific gravity of the oil and the foreign matter which thus readily separates from the oil and is deposited on the inner surfaces of the cones.

The centrifugal machine is revolved at a high rate of speed by a small steam turbine, also shown in the section, which consists simply of a single row of impulse blades mounted on the circumference of the base of the centrifugal. Steam from a small nozzle forces these buckets around and causes the machine to revolve at a high rate of speed. As the entire rotating part is light and rests on oil films in the step bearing the amount of power required to revolve the machine is insignificant, so that an exhaust pipe is not necessary, the small amount of steam necessary to rotate the filter being easily condensed within the turbine and discharged through a small drain shown in the illustration.

The only care needed for the machine is simply to open the steam valve when using the filter and close it when finished. The step bearing is made of laminae, which reduces the relative surface velocity of the bearing surfaces which are also separated by an oil film, and thus the friction is reduced to a minimum and the wear of the step bearing is inappreciable for an indefinite period.

The filter itself is so arranged that it can be easily taken apart by lifting off the cover, which thus makes the filtering material easily accessible, so that it can be removed, cleaned and replaced. A feature which is of especial interest is that the filter is so arranged that should the first cone of the filtering material become clogged so that the oil cannot pass through it, the oil will go over the top of the partition and go through the second layer of material. The filter paper which is used in this filter is such an inexpensive item that when new paper is needed the old is simply thrown away instead of being cleaned and replaced.

The Page-Merritt bill in the New York legislature, the provisions of which and hearings thereupon considerable space was devoted in the issue of last week, has been under careful consideration for the past week, briefs and suggestions for amendments having been received up to April 10, when it was taken up for consideration by the committees of the two houses having it in charge. It seems probable that amendments providing a larger salary for the commissioners, a division of the cost of maintaining the metropolitan commission and some modification of the clause prohibiting railroads from investing in the stock of other railroad companies will be admitted by the supporters of the bill.

ECONOMIZERS FOR WATER-GAS PLANTS.

Theoretically 24 pounds of anthracite coal or coke is required for the manufacture of 1,000 cubic feet of water-gas, but owing to the great waste of heat which occurs during the "blowing up" period, both through the escape of CO formed during the process of blowing up and the loss of heat contained in the products of combustion, the actual amount of coal required for the manufacture of 1,000 cubic feet of gas is generally from 40 to 50 pounds. The efficiency of the system is, therefore, in general only approximately 50 per cent under normal conditions of operation. For many years since the introduction of the water-gas process, this heat contained in the products of combustion of the generator, and the heat formed at the base of the stack by the burning of the CO to CO₂, has been thoughtlessly allowed to escape, with the result that improvements which have been made in the retort process have again widened the field and caused many gas companies to return to the retort method because of its greater economy.

The Green Fuel Economizer Company of Matteawan, N. Y., realized these shortcomings of the water-gas process and started a series of experiments to determine what saving could be produced by utilizing a large part of the heat which was formerly allowed to go to waste. The method adopted in these experiments was the placing of a Green economizer and air heater in a brick setting, through which the products of combustion from the gas generator were caused to pass. This was accomplished by leading off a flue from the hood over the generator, which catches the gases that escape and leads them to the economizer, from which they are discharged into the atmosphere by an auxiliary stack.

The result obtained by the use of the economizer in tests which have been made clearly demonstrates that the saving of the heat not only reduces the coal consumption of the generator by 15 or more per cent, but reduces the coal consumption of the boiler and the amount of oil needed for enriching the gas as well. The reduction in the generator coal required is accomplished by forcing the air from the blower through the air heater, thus increasing the temperature of the air used for "blowing up" the generator. This results in a more complete union of the oxygen with the coal, thus reducing the amount of air which need be supplied and very materially increasing the temperature of the generator, which therefore requires a shorter "blowing up" period. Hence the loss of heat during the "blowing up" process is very much reduced.

The reduction in the amount of coal supplied to the boiler is the result of heating the feedwater up to the temperature of the steam in the boiler, with a consequent higher evaporation, per pound of coal. The increased temperature of the generator, owing

Economizer for Water Gas Plants.

to the hot blast, so greatly increases the temperature of the vaporizer that the oil is more thoroughly vaporized and "fixed," which accounts for the reduced amount of oil needed for the enriching process.

The economizer is of the usual Green type, made of high quality cast iron throughout. The cast-iron tubes of the economizer and air heater have slightly tapered ground ends, which are forced into correspondingly ground holes in the cast-iron headers. The pressed fit is made by a hydraulic press, which insures a tight

joint, which will not cause trouble from leakage. Each section when complete is tested under a hydrostatic pressure of 350 pounds to the square inch, and is therefore amply strong to resist the highest pressures. The effectiveness of an economizer or air heater depends solely upon the condition of the surfaces, as the average temperature existing between the water or air in the tubes, and the flue gases surrounding them, is so small that even a very thin coating of soot would prevent the transfer of heat. In order therefore to keep the surfaces of the economizer or air heater always in a perfectly clean condition they are equipped with the Green automatic scrapers, which constantly work up and down the tubes. The scraper may be operated by a small engine or motor, or from a line shaft conveniently situated. An important point which is worthy of careful attention is the use of metal to metal joints throughout, which avoids the difficulty experienced from leakage in the usual "made" joints. Although these air heaters have been especially designed for water-gas plants, they may be advantageously employed in power plants in general, as the more perfect combustion and resultant gain in economy from the use of preheated air in the furnace is a well established fact.

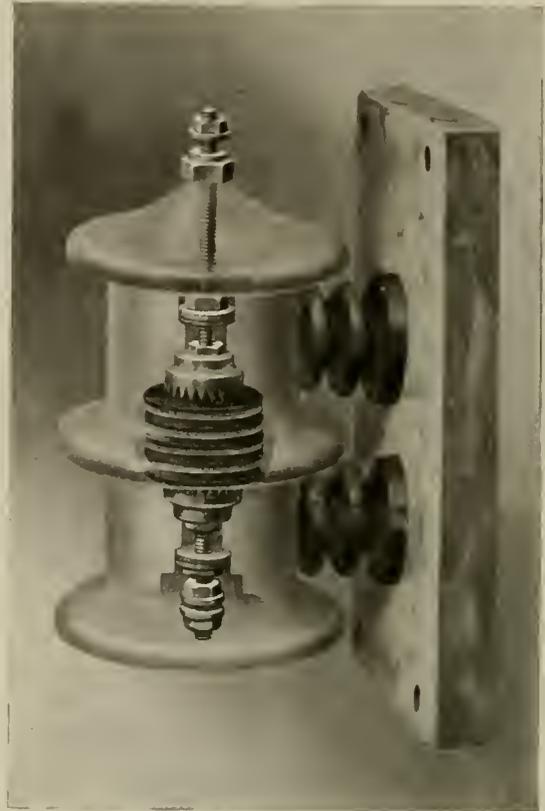

THE SHAW LIGHTNING ARRESTER.

The principles underlying the present design of the Shaw non-arcing lightning arrester are based upon results obtained from the various models heretofore placed on the market by the Lord Electric Company, 213 West Fortieth street, New York. A careful study has been made by representatives and engineers of the company of a great number of plants where this arrester has been installed. The data thus obtained have been utilized in the present construction to meet the latest requirements of central station and railway protection. Obviously the purpose of a lightning arrester is to offer a path of large capacity and relatively low static resistance from the transmission line to the earth. This has been found to be most easily accomplished by the use of conducting or semi-conducting parts separated by a series of spark gaps of higher electrical resistance. The Shaw patents are claimed to cover the basic principle of this construction. The low resistance conductors consist of rings, made in accordance with a special formula and having the outward appearance of carbon. These are treated by various processes. Each ring is so formed as to maintain an equal spacing between its periphery and that of the next succeeding ring. The cross section has the form of an ellipse and thus provides an internal as well as an external discharge path. Mica washers separate these rings from each other and these are constructed according to the service for which the particular arrester is intended. The ability of mica to carry static current, its high insulating qualities and non-absorbative nature, indicate this material as superior for forming spark gaps. The rings and mica discs are mounted upon porcelain arbors especially vitrified and so constructed as to give great mechanical strength. These arbors are inserted into the bore of the rings and discs, leaving the periphery exposed for the transmission of static discharges over large surfaces. For railway, electric light and power work the arresters are mounted in porcelain housings which have been subjected to high insulation test. For voltages of 1,000 and under, the housings are mounted on a supporting base made of seasoned hard wood, while instruments for over 1,000 volts are furnished with bases of white Italian marble.

The arresters are claimed to be absolutely water-tight and dust-proof and will not be affected by changes in temperature or any outside influence. For protection from accident they are furnished with wooden cases constructed of seasoned lumber so treated as not to be affected by moisture. The arrester is made in various models, designed for voltages from 60 to 66,000.

In connection with the mounting of these arresters the company offers a number of suggestions. Emphasis is placed upon the

be placed in such a position that the path from the line to the ground through the arrester is a straight one. In these connections bends, curves and sharp angles should be avoided if possible, but when impossible the bend should be made in the form of a curve of long radius. The ground connection is recommended to be of a bronze, brass or copper casting or plate of at least four square feet in area and weighing not less than 20 pounds. This should be packed well with powdered charcoal or coke. In case wires are run in iron pipe or conduit the wires should be soldered to the pipe,

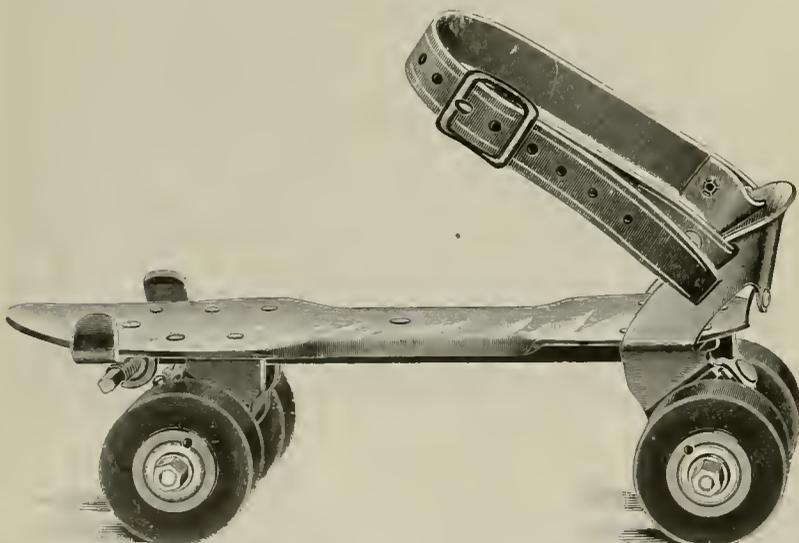

The Shaw Lightning Arrester.

otherwise soft wood molding treated with creosote is preferable. The accompanying illustration will show both the exterior and interior construction of this device.

BALL BEARING ROLLER SKATES FOR RINKS.

During the past three or four years there has been developed a steadily increasing interest in indoor roller skating, which was so popular about 20 years ago, and from the interest which pleasure-seekers throughout the country have exhibited in this healthful and enjoying pastime, there is every evidence that it will become more popular during the coming summer and succeeding years than it has been at any previous time. It is expected that this will be especially true of roller skating in the open rinks, which are operated in the parks of electric companies because they are situated out in the open, where all the enjoyment of skating can be associated with an abundance of fresh air. The introduction of high-class skates fitted with metal or composition wheels mounted on ball bearings no doubt has had much to do with the increasing interest in roller skating, and it is certain that the pleasure which is derived from this exercise depends greatly upon the quality of skates which are furnished by the rink management. In order to supply the demand of rink managers for skates of high quality which are light yet strong in construction, the Union Hardware Company of Torrington, Conn., has designed and is manufacturing a complete line of skates of superior merit. An illustration of the half clamp rink skates for men is presented, showing one of the latest designs, fitted with ball bearing "Hemacite rolls." A peculiar point in the construction of this skate, which is worthy of especial attention, is the bracing of the foot plate by means of a miniature angle iron riveted to the under side of the plate, which thus stiffens it very materially. The trucks, which are of pressed steel, are mounted on pivots so that they can oscillate and permit turning in a 3-foot circle, a point much appreciated by fancy skaters. The high heel band and strap attached will also be an attraction to most skaters, as the average individual has pretty weak ankles. The material used throughout is of the highest quality and the clamps which are so constructed that they take a firm grip on the soles of the shoe are easily adjusted and are very durable. These skates and a large variety of other designs are manufactured by this company.

Ball Bearing Roller Skate for Rinks.

difficulty liable to arise from cutting down the initial expense of making proper ground connections, as a large percentage of lightning arrester troubles have been traced to this source. The connection from the line to the arrester and from the arrester to the ground should be as direct as possible and the arrester should

Gross earnings of 181 electric and street railways in 1906, as compiled by the Commercial and Financial Chronicle, reached the total of \$215,153,525, an increase of 11.67 per cent over the figures for 1905, while net earnings amounted to \$92,442,309, a gain over the previous year of 11.54 per cent. The compilation also gives the gross

and net earnings of 85 roads for the fiscal year ended on September 30 last, \$23,708,187 and \$6,798,100, respectively, and of 202 roads for the fiscal year ended on June 30, 1906, amounting to \$61,705,741 and \$27,339,786, respectively. The total gross earnings of the 468 roads in the different periods increased 11.49 per cent, and the increase in net earnings was 11.01 per cent, or only a slight variation from the record of the 181 roads in the last calendar year. The combined experience of these roads, which are located in all sections of the country and include both street and interurban lines, shows a striking increase of corresponding size in gross and net earnings.

The Illinois supreme court rendered a decision on April 18 that the city of Chicago cannot issue \$75,000,000 of Mueller certificates for the purpose of acquiring street railways without creating an indebtedness which would carry it beyond the constitutional limit. The effect of this decision is that, unless some other means of raising

money are devised, the city will be effectually barred, under the new ordinances approved on April 2, from purchasing the property of the Chicago City Railway Company and the Chicago Railways Company (Union Traction lines). The franchises, except in the event of purchase by the city, are for 20 years. The contention of the immediate municipal ownership advocates was that the city could issue the certificates against the street railway property alone and without regard to the existing outstanding city debt, which is limited by law to 5 per cent of the assessed valuation of property in the city. In discussing the plan to give holders of these certificates, if foreclosure took place, a franchise for 20 years,

the court recognizes the right of the city to purchase property and to bond it for the payment of the indebtedness; but under the plan contemplated in the Mueller certificates the city would extend the mortgage, not only over the tangible property which was purchased, but also over an entirely new franchise. The municipal ownership furor has died out in Chicago, and the new city administration, elected for four years, is opposed to the purchase of the street railway properties. In the recent election and the present decision the designs of those who would have plunged the city into a costly experiment have received an effective quietus.

The most important development in the Cleveland street railway controversy during the last week is the announcement of the Cleveland Electric Railway Company that its test of 3-cent fare operation on the Central avenue and Quincy street lines for the last three months proved unprofitable.

Since January 7, when the supreme court declared that the franchises for those lines had expired, the company has been operating the lines at a 3-cent fare under a temporary agreement to pay the city any surplus after operating expenses, depreciation and taxes had been deducted from gross earnings. In a communication to the council on April 15, which will be found on another page of this issue of the Electric Railway Review, the company states that not only has there been no surplus but that operation of the lines has actually resulted in a loss. This announcement is of especial interest in view of the fact that the entire issue in the Cleveland controversy is between a 3-cent fare, as advocated by Mayor Johnson and the Municipal Traction Company, and a 3½-cent fare as offered by the Cleveland Electric in return for a new franchise. Since November 1 the Municipal Traction Company has been operating the lines of the Forest City Railway on a 3-cent fare basis, but, although the company claims to have earned a small surplus over the 6 per cent rental on the property, the accuracy of its accounting methods has been questioned. The Cleveland Electric Company is evidently ready and willing to have the accuracy

of its results proved, for it has announced its intention of discontinuing the operation of the Central avenue and Quincy street lines on April 23. This action will give the Forest City company an opportunity to exercise its franchises on those streets. In case no purchaser is found for the tangible property of the Cleveland Electric Company in those two streets, the company states that it will proceed at once to remove its tracks. If that is done the Forest City company will have an opportunity to demonstrate whether it can finance the construction of new lines on the basis of 3-cent fare revenue.

THE CORRUGATION OF RAILS.

There are few questions connected with electric railways which have been the subject of more unsatisfactory discussion, or upon which more contradictory evidence has been presented than the cause of rail corrugation. This objectionable feature results in uncomfortable riding, the frequent renewal of rails, and the more rapid wear of rolling stock, and it is therefore one which justly deserves the continued attention of railroad engineers. A vexed and complicated problem of this kind is perhaps best approached by the collection of all possible facts bearing on the subject in the effort to find the cause, and the best remedy can then be more easily worked out.

The street railways of England appear to have experienced more trouble from corrugated rails than those in the United States; at least, they have given more attention to the subject and have developed machines for grinding off the high spots from rails in the track. The cause of corrugated rails may be found in some peculiar defect in the trucks, the rails or the track, and it is quite probable that it is due in some instances to a combination of these causes. In a paper on "Rail Corrugations," read at a meeting of the Institution of Electrical Engineers (London) on March 21, 1907, J. A. Panton has attempted to prove that the trouble lies entirely in the car trucks. His explanation is that the corrugations are caused by the lateral play of the wheels and axles in weak trucks and by the unsymmetrical thrust of the gear motor on the axle. This causes the wheels to skew in the track, the flanges to bind in the narrow grooves, especially at guard rails on curves, and the wheels are constantly tending to climb the rail and fall back, all this causing the irregular surface wear of the rail. While the trucks may be in some instances the cause of corrugations, it is too much to claim that they are the sole or principal cause, as there are many tramways with ordinary trucks which are not troubled with this defect.

It was pointed out in the discussion of Mr. Panton's paper that the axles could not be deflected from their natural radial position by the gear wheels, as their shafts are held rigidly in the motor frame, which takes the reaction. The general opinion of tramway managers in England is that the action of trucks of different types is much alike in its effect on the rail and that none has any marked effect. The Tramway and Railway World (London) has collected the opinions of over 50 tramway engineers and managers, who are practically unanimous upon this point.

The testimony in regard to the rail itself is equally confusing and unsatisfactory to one seeking the cause of corrugations. On solid track and with slow speeds the corrugations may have a pitch as small as 2 to 3 inches. On elevated lines over bridges, where a speed of 30 miles per hour is attained, the pitch is often 10 to 12 inches, while under other forms of track the pitch may be as long as 24 or 30 inches. The corrugations have also a different wave length in the same rail, being shorter at the joints than at the middle of the rail. The wave length also varies with the speed and track elasticity. For these reasons it is not reasonable to conclude, as some engineers have, that rail corrugations are due to periodic chatter of the rolling mill. Others believe that girder rails are rolled at too high a temperature and the web cools first and is distorted by the subsequent

contraction of the top and bottom flanges. It is difficult to understand how a rail should wear uniformly for several years and then develop corrugations as the result of an irregular web. It is a strange fact, and one which has not received satisfactory explanation, that when a rail has once begun to show corrugations the state is incurable and the fault will reappear even if the rail head is ground off level. It is often found also that if a corrugated rail is relaid in another part of the track which is free from the trouble, the surface will become smooth again. The opposite result will obtain if a rail from smooth track is transferred to an infected location, for then the corrugations will appear. This testimony appears to be the best that could be offered to prove that the methods of manufacture, composition or hardness are not to blame for corrugation, but it points rather strongly to the track as the cause.

The standard specification for tram rails used in England calls for a rather soft rail, and although soft rails wear most rapidly under heavy rolling stock, they do not necessarily wear irregularly, and rails from different makers, of various degrees of hardness, have shown corrugations in one place or another. It is found also that corrugations occur on steam lines when the rails are quite hard. From this showing it would appear that the rail itself has little to do with the strange phenomenon we are considering and the prospect for a valid explanation will be more encouraging if that be eliminated in the further search.

The managers of English tramways are generally agreed on the fact that corrugations usually make their first appearance on the outer rails of curves, particularly those of large radius, and the explanation offered to account for this is that the wheel flange is continually commencing to climb and then falling back, and, while falling, the wheel might jump forward and allow the axle to assume its position radial to the curve. It is this slipping which is supposed to be the cause of the corrugation, and as it is common to all trucks, no particular type of truck can be regarded as defective in this respect. The fact that the corrugations develop soonest on easy curves is due to the practice of running faster on such portions of the track and slower on sharp curves. But corrugated rails are not confined to curves and some lines are entirely free from them on curves and straight track. On the Leicester tramways the irregular wear is confined to straight track, more especially in the down-grade rails. On the London surface lines the corrugations are found on both straight and curved track, but the up-grade rails are most affected. At Portsmouth, England, the grades are free from corrugation, but they are found on the level curves of that system. At Sheffield the grades are comparatively free, but the few corrugations are about equally divided on up and down grades. With different kinds of track and rolling stock on these lines it is difficult to draw any conclusions from these reports. It might be thought that the quality of track has much to do with this irregular rail wear, but an English engineer who made a study of the tramway question in the United States reported to the London county council that neither the trucks nor the roadbed is responsible for corrugated rails and that increased elasticity of the roadbed has no effect on the trouble.

Other engineers are equally positive that the rigidity of the track is the main cause of corrugations. At Liverpool experiments have been made with rails laid on concrete, wood, and tar asphalt, and the corrugations are found with each kind of track. Some American engineers have thought that rail corrugations are due to the vibration or lateral bending of the web of the rail, and frequent cross braces have been suggested. Others think that corrugations may be due to the rails being loose on their support, or the ties loose in their foundation, or that there is a movement of the track foundation or substructure.

These various experiences and opinions relating to corrugated rails are here presented as a preliminary study of the subject for the benefit of future investigators, and to

show the difficulties which the problem involves. It will probably be found that there are a number of causes, some of them peculiar to certain lines, and that the best remedy will be found by a careful investigation of local conditions, rather than the development of a general theory applicable to all lines where the trouble exists. The improvements which are being made in roadway and rolling stock should lessen the evil, and the most substantial track should be found the most economical when the expense for rail renewals is considered.

MAINTENANCE AND DEPRECIATION.

The proceedings of the American Street and Interurban Railway Accountants' Association, just published, include a report of the executive session held at Columbus, O., on October 18, 1906, and elsewhere in this issue will be found the paper of Mr. R. N. Wallis on the subject of depreciation and an abstract of the discussion which followed. The remarks of a number of the speakers were interesting and instructive, but the discussion was to some extent hampered because of the narrowness of the text and because of the failure properly to define the terms used before proceeding to the discussion.

The question was: "Does the maintenance of an electric

for depreciation sufficient for all practical purposes. Mr. Neal, however, showed that if a property is replaced gradually and all renewals charged to maintenance, the value at any given time would be but little more than half of the original cost, and therefore to keep the value of a property intact it is necessary to provide a depreciation reserve in addition to charging all renewals to the maintenance accounts.

The conclusion of the Accountants' association was that in order to obviate the need of a charge for depreciation, "maintenance" must include "a sufficient charge set aside for future replacements of depreciated property." On reflection this will be found to be a much broader interpretation of maintenance than that of the standard classification which merely includes the expenditures for renewals as they occur. The unexpended balance of the "charge set aside" would cover the deficit referred to by Mr. Neal, or, as stated by Mr. Davies, the balance of the renewal reserve, together with the value of the property, would at any time be equal to the capital expenditure, which is the ideal condition.

In connection with this review of the ideas expressed by electric railway accountants as to the proper course to be followed in regard to repairs and renewals, it will be interesting to compare the theory and practice of the electric and the steam railways. It has already been said that the

Charges for Maintenance and Depreciation in Per Cent of "Operating Expenses."

	Fiscal year.	Maintenance of way and structures.	Maintenance of equipment.	Total maintenance.	Depreciation or renewals reserves.	Total maintenance and depreciation.

railway at a high standard of efficiency eliminate the necessity of a charge for depreciation?"

The answer finally given to this question was: "The maintenance of an electric railway at a high standard of efficiency does not eliminate the necessity for depreciation unless the word 'maintenance' is construed to cover a sufficient charge set aside for future replacements of depreciated property." The association is to be congratulated upon thus officially recognizing the fact of depreciation and the need of making suitable provision for it.

The Street Railway Accountants' Association at its first regular meeting, at Niagara Falls in 1897, discussed the "Standard Classification of Operating Expense Accounts," submitted to the convention, wherein it was provided that each item under the heads, "A—Maintenance of Way and Structures" and "B—Maintenance of Equipment," should embrace the cost of repairs and renewals. At the next meeting of the Accountants' association, at Boston in 1898, the standing committee on "Classification of Accounts" submitted a revised report, in which some minor changes were made, but each paragraph under maintenance began: "Charge to this account all expenditures for repairs and renewals of," etc. This revised report was adopted by the association.

This direction that renewals be included in maintenance is today the recommendation of the American Street and Interurban Railway Accountants' Association, as it has been ever since the adoption of the report on classification of operating expenses by the association in 1898, and may be accepted as the theoretical standard of the association. In the case of a company having a perpetual franchise a strict conforming to this standard might be regarded as a provision

"Standard Classification of Operating Expense Accounts" recommended for the electric lines provides that renewals shall be charged to the maintenance accounts. This is also the standard prescribed for the steam railways by the interstate commerce commission in accordance with the federal statute known as the act to regulate commerce. The theory being the same for both classes of roads, the figures in the accompanying table are cited to show the practice.

Comparisons of this kind are most generally made in terms of gross earnings or of gross receipts, but it is believed that a comparison on that basis is too much affected by traffic conditions to bring out the point it is desired to make. For instance one of the reports cited shows two companies with ratios of operating expenses to total income of 51 per cent and 89 per cent, respectively. The total charges to the maintenance accounts are 4.4 per cent and 10.5 per cent, respectively, of the total income. When expressed as percentages of operating expenses the figures for maintenance are 8.5 and 11.7, instead of 4.4 and 10.5, which gives a better idea of what these lines are doing toward keeping up the property. The table herewith has been compiled to show, in terms of the money spent, how much has been spent for maintenance and how much has been spent (or reserved) for depreciation.

The statistics of the interstate commerce commission show that the steam railways of the United States in 1905 charged 40.52 per cent of "Operating Expenses" on account of "Maintenance," in which are included renewals. Inasmuch as the steam railways include renewals as part of operating expenses, the charge for maintenance is a smaller proportion of operating expenses than it would be were only current repairs so charged. Analysis of the maintenance and depre-

ciation charges of the Chicago Union Traction Company and the Glasgow Corporation Tramways, both of which are admitted to be attempting to make adequate reserves for renewals, shows that renewals amount to about one-third more than current repairs. Applying this correction to the maintenance charges reported by steam railways for 1905 the amount would be 52.73 per cent of "Operating Expenses" on the electric railway basis of computation. In a paper read before the American Institute of Electrical Engineers on January 25, 1907, Messrs. Lewis B. Stillwell and Henry St. Clair Putnam estimated that were the steam railways operated by electricity maintenance charges would be nearly 15 per cent less than at present. Admitting all these claims and making the correction, the maintenance charges of steam railways in the United States for 1905 would have been 45.08 per cent of "Operating Expenses," if the lines were operated by electricity. The electric railways in Connecticut, in Massachusetts and in New York are expending from 22 to 25 per cent of total operating expenses for maintenance, and the reports show no reserves for renewals.

While it is probable that the maintenance charges of the steam railways, which are twice as great as those of the electric railways, are to some extent swelled by expenditures for betterments, all of the difference is not due to this. When the figures for Connecticut, Massachusetts and New York electric roads are compared with those for the few American electric railways that are making partial or complete provision for depreciation in the way of reserves for renewals, the conclusion to be drawn is that electric railways in general are diverting an amount equal to 10 or 12 per cent of their gross earnings from operating expenses, and making it available for dividends, that is, provided it is not required for bond interest.

It is recognized that there is a depreciation of railway property not made good by current repairs. The extent of this depreciation, the best method of providing for it, and the most convenient way of handling the accounts relating to it are debatable matters which should receive the earnest attention of the Accountants' association. There are some points which seem clear: (1) If the difference between the theory and practice of the electric railways is to continue, the "Standard Classification of Operating Expense Accounts" should be revised. (2) To avoid excessive fluctuations in expenses, renewal reserve funds should be created by charges made at regular intervals. (3) It is desirable to have the total of the repair or up-keep accounts and the total of the renewal or depreciation reserves shown together, so that it may be seen whether the repair account is being favored at the expense of the renewal reserve.

These various questions are of especial interest now because the interstate commerce commission has been examining into the practice of the steam railways in accounting for repairs, renewals, replacements, betterments, improvements, additions and construction, and has invited from the railways a full statement of views on the methods of accounting for depreciation, and we understand the matter is to be discussed at the meeting of the Association of American Railway Accounting Officers at Atlantic City on April 24 next. The interstate commerce commission in its "Accounting Circular No. 8," just issued, submits a tentative plan for the consideration of the railway accountants. It is the purpose of the commission for the first year, beginning on July 1, 1907, to have the accounting department of each road determine what charge should be made for depreciation, and submit the reasons leading to the determination adopted. It is planned to make later a careful investigation to determine the useful life of various classes of material and equipment.

The Peoria-Bloomington line of the Illinois Traction System was opened on April 15, when a car carrying a party of officials made the trip from Bloomington to East Peoria, at a speed of about 40 miles per hour. It is expected to begin regular service about April 20.

ANNUAL MEETING OF THE IOWA STREET AND INTER-URBAN RAILWAY ASSOCIATION.

The fourth annual convention of the Iowa Street and Interurban Railway Association was held at the Lafayette Inn, Clinton, Ia., on Friday and Saturday, April 19 and 20, 1907. Thanks to the untiring efforts of the secretary, L. D. Mathes, and of the entertainment committee, of which P. P. Crafts is chairman, all was in readiness for the meeting and exhibits before the delegates from the railway companies arrived. The business meetings were held in the parlors of the headquarters hotel.

The first session was called to order by the president, F. J. Hanlon of Mason City, vice-president, secretary and auditor Mason City & Clear Lake Railway, at 10:10 on the morning of April 19.

Hon. H. U. Crockett, mayor of Clinton, made a short address of welcome, the response to which was made by C. D. Cass of Waterloo, general manager of the Waterloo Cedar Falls & Northern Railway Company. The president then read his annual address, as follows:

President's Annual Address.

It gives me great pleasure to open the fourth annual meeting of this association. It is not often that one meets as strong a body of men as the electric railway men of Iowa, a body of which I am proud to be a part. It seems but a few months since the first call was made for organization and at that time no one knew but that the infant would "die a bornin'," but we have prospered because there was a real need and a broad field for such a body as ours, and this year I think the owners of all electric railway properties have seen the association justified, and the wisdom of the founders has been commended on every side.

To our friends, the supply men, we owe a generous amount of praise for our success, and I speak for every member of this body when I say they are doubly welcome. Very little is sold at our convention, but when a man calls on me in my office, I like to think I saw him at the last meeting.

We are living in a record-making epoch and in fact will be looked upon in a few short years as pioneers in the electric railway business, when operating men will be joking in their meetings about the times when it was hard for an electric line to get a joint freight tariff, and we old-timers will be relating real experiences and swapping real stories about the hardships of the first 10 years of the twentieth century.

The most important work this year has been concerning legislation, which at one time threatened to overwhelm us, and I am proud to say that at every call a goodly number of our members were quick to respond and exert their influence in opposition to proposed legislation that would have been injurious to electric railway interests. I cannot commend too highly both branches of the legislature for their very evident desire not to embarrass the electric railways with hostile legislation, when the harmful effects of proposed acts were explained. Among the most important work was the defeat of the running board, Sunday closing and wire regulation bills and the securing of a 10-cent minimum on the 2-cent fare bill.

In these days of anti-corporation agitation, amounting almost to fanaticism, it seems to me that we have emerged almost unscathed and already we see signs that the movement has reached the crest and has begun to recede. These periods have come and gone in the past, and we may only expect a repetition of history.

The work of your secretary in this connection is worthy of the highest praise and to his watchful diligence and energy may be ascribed a goodly portion of our success. Not only in this matter but in all others he has been faithful, and I trust the members will in all instances show their appreciation of his efforts to protect your interests by prompt replies to all correspondence. He gets no salary and renders valuable service and needs encouragement instead of having to wait for "the letter that never came."

The value of the papers to be read in this meeting will be greatly enhanced by a free discussion and the programme has been so arranged that ample time is allowed for everybody to ask questions and give his experience. The officers of the association ask and urge every member to express his views on all the topics and I am confident you will be benefited if you bring your knotty problems before the association. Very likely your neighbor has had to unravel the same tangles.

In conclusion, gentlemen, let us consider that the field of electric railways is just commencing to broaden. Let us take care of our association, nurture it and not only keep it the lusty infant it now is, but make it the full-grown man.

All we need is the enthusiasm and the support heretofore given to maintain our fame, which has gone far beyond the borders of Iowa, as being the best, if not the largest, state association in the field.

L. D. Mathes, manager and purchasing agent Union Electric Company, Dubuque, read his annual report as secretary and treasurer. The report recited the work of the executive committee, and gave a financial statement showing the prosperous condition of the association.

Mr. Mathes, the secretary, read the paper by H. W. Garner on "Amusements: How Should This Feature be Handled by Operating Companies?" This paper and an abstract of the discussion which followed it will be found on page 516 of this issue.

Afternoon Meeting.

The afternoon session was called to order at 2:10 o'clock.

J. M. S. Waring, of the Electric Storage Battery Company, gave an informal talk on the application of the storage battery, in the course of which he described interesting examples of storage battery installations to equalize fluctuating loads on alternating current systems through the medium of suitable transforming apparatus. Replying to an inquiry, Mr. Waring said that the maintenance on storage batteries was not above 5 per cent per annum, and this included renewals and provided for depreciation, as the only depreciation was in the plates.

Mr. Mathes announced that there would be a discussion on depreciation at an executive session on Saturday.

H. H. Polk read a paper on "Modern Train Dispatching Methods on Electric Railways." This paper will be found on page 521 of this issue.

A paper on "Freight Handling by Electric Lines," read by P. P. Crafts, concluded the afternoon session. This paper will be found on page 518 of this issue.

Entertainments.

All arrangements of the convention details and for the entertainment of delegates at the Clinton meetings of the Iowa Electrical Association and the Iowa Street and Interurban Railway Association were in charge of a committee comprising P. P. Crafts, general manager Iowa & Illinois Railway, chairman; Thomas S. Crawford, general manager Clinton Gas Light & Coke Company; and R. M. Howard, general manager Clinton Street Railway. Associated with this committee and constituting a local committee to assist in the entertainment of guests were a number of the leading business men of Clinton, including G. E. Lamb, president Iowa & Illinois Railway; C. H. Young, president Clinton Street Railway; F. W. Ellis, C. C. Coan, W. F. Coan, C. B. Mills, Dr. L. M. Ellis, R. C. Langan, Dr. J. C. Langan, E. T. Boyle, H. E. Oates, W. J. Young, E. A. Young, C. C. Ewing, H. W. Seaman, W. S. Gardner, F. Iten, Val Bonney, F. A. Perkins, B. Bahnser.

The programme arranged included the following:

An excursion on the Mississippi river on the afternoon of Friday, G. E. Lamb, president of the Iowa & Illinois Railway, placing his houseboat, "The Chaperone," at the disposal of the convention for this purpose.

A Dutch lunch and smoker at the Lafayette Inn on the evening of Friday, features of which were music and an amateur vaudeville entertainment.

An excursion to Davenport, Rock Island and Moline, the party leaving Clinton on the afternoon of Saturday in a special car of the Iowa & Illinois Railway, and transferring to a special car of the Tri-City Railway at Davenport. After inspection of the government power house on Rock Island and the plant of the Tri-City Railway at Moline and a supper at the Commercial Club, Davenport, the party to return to Clinton.

The Clinton Street Railway, the Iowa & Illinois and the Tri-City companies all extended the courtesy of free transportation to the delegates and representatives of manufacturers in attendance.

List of Delegates.

The street railway men who had registered on Thursday night and the companies they represented were:

R. M. Howard, Clinton Street Railway Company, Clinton.
 P. P. Crafts, Iowa & Illinois Railway Company, Clinton.
 F. A. Perkins, Iowa & Illinois Railway Company.
 B. Johnson, Clinton Street Railway Company.
 C. F. Hillman, Iowa & Illinois Railway Company.
 W. C. Waters, Tama & Toledo Electric Railway & Light Company, Toledo.
 A. E. Park, Des Moines Winterset & Western Railway Company.
 L. D. Mathes, Union Electric Company, Dubuque.
 C. O. Elbert, Ft. Dodge Des Moines & Southern Railway Company, Boone.
 F. J. Hanlon, Mason City & Clear Lake Railway Company, Mason City.
 John A. Highbee, Howell N. Highbee and Charles E. Caster, Peoples Gas & Electric Company, Burlington.
 C. E. Fahrney, Ottumwa Railway & Light Company, Ottumwa.
 W. A. Stockfield, Citizens' Railway & Light Company, Muscatine.
 E. Moore, J. C. Federsen and J. Widerman, Iowa & Illinois Railway Company.
 John Reynolds, Boone Electric Company, Boone.
 H. W. Garner, Oskaloosa Traction Company, Oskaloosa.
 Mr. G. W. Bissell, Ames College, Ames.
 L. Sincere, Toledo.
 H. H. Polk, G. B. Hippee, Des Moines City Railway.
 R. A. Leussler, Omaha and Council Bluffs Street Railway Company, Omaha.
 H. B. Noyes, Omaha & Council Bluffs Street Railway Company, Omaha.
 L. Charles Nash, Omaha & Council Bluffs Street Railway Company, Omaha.
 E. L. Kirk, Sioux City Traction Company, Sioux City.
 C. M. Cheney, W. C. Breckenridge, L. E. Knowles, C. D. Cass, L. H. Breckenridge, Waterloo Cedar Rapids & Northern Railway Company, Waterloo.
 T. L. Cole, Davenport.
 F. Marron, Rock Island.
 J. E. Hayde, Boone, Ia.
 T. B. Terry, Cedar Rapids.
 C. D. Cass, Waterloo Cedar Falls & Northern Railway, Waterloo.
 H. R. Longanecker, Centerville Light & Traction Company, Centerville.
 L. E. Knowles, Waterloo Cedar Falls & Northern.
 H. G. Laurence, Chippewa Valley Electric Railroad, Eau Claire, Wis.

MANUFACTURERS' EXHIBIT AT CLINTON, IA.

At the annual conventions of the Iowa Street and Interurban Railway Association and the Iowa Electrical Association, held at Clinton, Ia., on Thursday, Friday and Saturday, April 18, 19 and 20, the basement of the Lafayette Inn was set aside for the manufacturers' display of electric lighting and railway supplies. The space available was about 2,000 square feet. The booths, which were 8 by 10 and 7 by 10 feet in size, were arranged so as to show to the best advantage the working models and other exhibits on display. The room was wired for both alternating and direct-current circuits, and current for power and lighting was furnished with the compliments of the local railway and lighting companies.

Among the manufacturers and dealers in electrical apparatus and supplies represented at the conventions were:

Allis-Chalmers Company, Milwaukee, Wis.—Represented by E. Dryer and D. K. Chadbourne.

American Steel & Wire Company, Chicago, Ill.—Double twin spindle track drills, rail bonds, trolley wire and insulated cables. Represented by George Long, George Quigley and Frank Conklin.

Atlas Railway Supply Company, Chicago, Ill.—Rail joints, braces and tieplates. Represented by G. M. Huber.

Benjamin Electric Manufacturing Company, Chicago, Ill.—Electric lighting supplies and car lighting specialties. Represented by H. E. Watson and W. L. Rogers.

Brilliant Electric Company, Cleveland, O.—E. Y. Hennecke.

Viscosity Oil Company, Chicago, Ill.—Represented by E. R. Stubbs and S. J. Ross.

Buckeye Electric Company, Cleveland, O.—Represented by A. J. Schram.

Buda Foundry & Manufacturing Company and Paige Iron

Works, Chicago, Ill.—Buda track specialties, consisting of track jacks and drills, spring switches and tool grinders. Represented by V. A. Swett and E. S. Nethercut.

Central Electric Company, Chicago, Ill.—Electrical supplies. Represented by F. R. Bryant.

Electric Appliance Company, Chicago, Ill.—Sangamo meters, electric laundry irons. Represented by P. R. Boole and J. K. Alline.

Electric Service Supplies Company, Philadelphia, Chicago and Keokuk.—Electric railway supplies. Represented by Thomas H. Henkle and E. R. Mason, of the Porter & Berg department.

Electric Storage Battery Company, Philadelphia, Pa.—Represented by G. W. Aktin and J. M. S. Waring.

Evans, Almirall & Co., New York, N. Y.—Central station heating. Represented by Benjamin Kauffman.

Everstick Anchor Company, St. Louis, Mo.—Everstick guy anchor and auger handle. Represented by Jasper Blackburn.

Federal Electric Company, Chicago, Ill.—Electric signs. Represented by G. T. Otis.

Ft. Wayne Electric Works, Ft. Wayne, Ind.—Single and multiphase meters, arc lights, motors, wattmeters, calibrators and transformers. Represented by F. S. Wiemeyer and A. L. Pond.

Fostoria Incandescent Lamp Company, Fostoria, O.—Represented by J. Rice.

Fox-Callahan Company, Milwaukee, Wis.—Terminal hood. Represented by E. M. Clark.

W. R. Garton Company, Chicago, Ill.—Porcelain insulators, lighting arresters, solder hands, Heaney fireproof wire, Wapax anchors, trolley cords and overhead railway materials. Represented by W. R. Garton and C. C. Ewing.

General Electric Company, Schenectady, N. Y.—Electric kitchen utensils, luminous radiators, railway supplies and electric lamps. Represented by E. L. Callahan, R. E. Keller, F. M. Vogel, Darwin Ulke, G. A. Seabury and J. D. A. Cross.

Gould Storage Battery Company, New York, N. Y.—Represented by E. M. Hervey.

Illinois Electric Company, Chicago, Ill.—Electrical supplies. Represented by C. C. Dawson.

H. W. Johns-Manville Company, New York, N. Y.—“No-ark” inclosed fuses, overhead line materials, insulators, meters and friction tape. Represented by J. W. Hardy and W. B. Roberts.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Root railway spring scrapers and fenders. Represented by Fred N. Root.

McClintock Manufacturing Company, St. Paul, Minn.—Railway signals. Represented by Charles H. Decker.

Monarch Electric & Wire Company, Chicago, Ill.—Monarch wire and flaming arc lamps. Represented by H. E. Mason.

National Brass & Metal Company, Minneapolis, Minn.—Represented by A. M. Nelson.

National Carbon Company, Cleveland, O.—Represented by C. W. Wilkins.

National Conduit & Cable Company, New York, N. Y.—Represented by F. B. Snitzer.

National Lead Company, New York, N. Y.—Represented by C. T. Clark.

Ohio Brass Company, Mansfield, O.—Railway supplies.

Ohmer Fare Register Company, Dayton, O.—Fare and recording registers. Represented by C. W. Ketteman.

John A. Roebing's Sons Company, Trenton, N. J.—Represented by H. N. Black.

St. Louis Car Wheel Company, St. Louis, Mo.—Represented by F. O. Grayson.

Shelby Electric Company, Shelby, O.—Represented by R. P. Bricker.

Standard Electric Manufacturing Company, Naperville, Ill.—Represented by R. W. Loose.

Standard Underground Cable Company, Pittsburg, Pa.—Weatherproof, trolley and magnet wires. Represented by J. E. O'Neill.

Tri-City Electric Company, Davenport, Ia.—Represented by Edward Kunkel and I. N. Butterworth.

W. T. Van Dorn Company, Chicago, Ill.—Drawbar and automatic couplers. Represented by N. P. Moerdyke.

Wagner Electric Manufacturing Company, St. Louis, Mo.—Electrical instruments. Represented by Frank N. Jewett and C. C. Warner.

Westinghouse Electric & Manufacturing Company, Pittsburg, Pa.—Alternating-current electric fans, electric meters. Represented by A. M. Miller, H. H. Caughlan and W. R. Pinckard.

Western Electric Company, Chicago, Ill.—Insulators, motors, arc lights, fans and electric railway supplies. Represented by D. C. Guest, W. E. Myers, O. B. Duncan, H. E. Griffin and M. R. Last.

AMUSEMENTS: HOW SHOULD THIS FEATURE BE HANDLED BY OPERATING COMPANIES?*

BY H. W. GARNER, GENERAL MANAGER OSKALOOSA TRACTION & LIGHT COMPANY, OSKALOOSA, IA.

It is not to be within the bounds of this article to bring before you in review the opinions and observations of any great number of persons who are engaged in devising, constructing and operating amusement parks and resorts, and catering to the amusement whims of the public. Every railway manager has only to read the excellent articles appearing regularly in railway publications and reviews, descriptive of amusement parks and their operation, to keep advised of the extent, development and constant progress along the lines of fostering and building up outdoor amusements.

It has been reliably stated that this country presents the greatest industry and the greatest prosperity in the way of outdoor amusements in the world; and in this connection it is safe to assume that without electricity the summer park, as we know it, would never have been evolved or brought to its present state of development. This article will endeavor to present to you:

1. What the electric railway companies of this state have accomplished in the way of furnishing or promoting amusements as a feature of their operation and for the purpose of inducing traffic.

2. To determine as nearly as possible to what extent the companies can invest conservatively and profitably in maintaining amusement resorts or in assisting in enterprises intended to provide pleasure for the public.

3. To point out in a general way the best methods to pursue, as shown by experience and observation.

The actual management and various features of amusement parks and resorts certainly present as varied and diverse sides as those of the transportation business itself, and today we find millions of dollars invested in this generally profitable business.

I feel safe in saying that the railroads in this state, as well as in other states, find themselves, in a way, the originator or sponsor for amusement resorts now in operation or contemplated. Evidently in only a very few of the larger cities of this state has the amusement park taken its place in the business world and passed from the hands of the street railway company into those of private investors and managers. However, in every instance the street railways are absolutely essential to the development of amusement parks; their interest and that of the park operators are mutual.

The electric railway interests of this state are now represented by 23 separate companies, operating a total of over 500 miles of electric street and interurban track, and serving an approximate population of 500,000. For convenience the companies are divided as follows:

Companies serving population of 40,000 to 100,000 = 6.
Companies serving population of 20,000 to 40,000 = 6.
Companies serving population of 10,000 to 20,000 = 7.
Companies serving less than 10,000 = 4.

To a certain extent every company appears to have engaged in the amusement business and every man apparently retains some distinct, if not comforting, memories. The writer remembers when it was one of his duties several years ago to preside over the ticket office of a summer vaudeville theater, and, after each performance of a colored minstrel troop, to lock up the band instruments for safe-keeping, these instruments being referred to in a certain chattel mortgage given to secure railroad fare advanced. At the end of a rainy week the minstrel troop had faded away, but the instruments adorned the company's office for some time afterward.

Reports from the various cities show that the railway companies of this state are well advanced in the provision of amusement parks for the patrons of their lines, and in several of the cities the companies have established and are now maintaining creditable and valuable amusement facilities.

To what extent the various cities have engaged in this departure it is not the purpose of this article to disclose. I find, however, that three companies own outright their parks and operate them under their direct control. Eight companies derive benefits from amusement parks operated either privately by the cities or leased by the companies. The remaining 11 companies derive no benefits from and do not have amusements or pleasure parks on their lines. The three companies first referred to guarantee the expenses of the parks, and none of these companies reports a profit on the actual operation of the park, from which it might be inferred that as a separate financial undertaking, apart from the profit derived from increased railway traffic, the summer park in this state has not proved to be a paying investment.

With very few exceptions the entrance to all parks is free, and it is a question whether the possible benefit that

*Read before the Iowa Street and Interurban Railway Association, Clinton, Ia., on April 19, 1907.

might be secured in making an admission charge and enabling the management to provide a better grade of attractions might not be offset by a decrease in patronage due to the admission charge.

Every manager reports music and band concerts as the feature most attractive and best enjoyed by the park patrons, when furnished in congenial surroundings, with forest trees, flowers, greensward and plenty of shade. Every manager who sets out to furnish summer amusements must hold ever before him the fact that mankind never ceases to love and to take pleasure in the open air, the beauties of nature and the restfulness of music.

He was a clever man who named a park "sans souci," which means "without care." The railway manager whose duty and interest it has become to provide for this side of man's nature, knows well from observation that his park or his amusements are successful and lasting only when they cater to this desire to be merry and care-free.

Other attractive features which have been provided by the companies of this state for their patrons include vaudeville and summer theatrical and operatic performances, moving pictures, merry-go-rounds, balloon ascensions, and aerial acts, boating and bathing facilities, figure eights and various other amusement devices.

Sunday is universally the best day for parks and, as near as the writer can ascertain, the amusements furnished and intended to be provided at every park operated in the state, directly or indirectly under the control or patronage of street railway companies, are absolutely clean and moral in nature, and free from objectionable features. The only parks or amusement resorts that have stood the test of time and are recognized today as legitimate and permanent investments are the respectable parks.

Certain members of this association will remember distinctly a bill which was introduced in the last legislature, governing Sunday amusements. It was a significant fact that in the debate on this bill, which took place before the committee, the attractions and music furnished at parks operated by street railway companies were not specifically designated by the supporters of this measure as the objectionable amusements which were considered a desecration and obnoxious. Nevertheless, every man who was present at this hearing knows, and developments proved later, that if this measure had become a law practically every park now being operated by street railway companies would have closed its gates, and this measure, which was aimed to strike at a supposed existing evil, would have embraced in its jurisdiction every park and pleasure resort; and the great public, the people who ride, would have been deprived of what is perhaps the greatest free blessing that comes to the weary, the restfulness of beautiful shady parks, the diversion of pleasing innocent amusement, the refreshing stimulus of music. What railroad company could operate its park without the traffic on Sunday, the one day in the week for which the park is made? This bill did not become a law because the street railway men of the state convinced their representatives that the parks were created for the people and that no man had yet openly presented any convincing arguments why the parks should close. The laws for two years are made, but it behooves every street railway company operating or interested in any park or amusement resort which is patronized by the public on Sunday, so to operate that park that no man can support a measure which may close the park because it is a nuisance or because it is objectionable to any great class of men and permits a desecration of the Sabbath.

The majority of the railway companies of this state encourage financially, in nearly every instance, baseball games; and, in fact, if the truth were told, the national games could hardly flourish without the boosting hand of the street railway company. Circuses are welcomed and in many instances furnished free grounds adjacent to car facilities. Chautauqua meetings have generally proved to be good traffic producers. Street fairs and carnivals are somewhat out of date and railway companies have apparently not suffered any great loss. County fairs, race meets, conventions and football games are all worthy of encouragement.

Harvest days for the street car companies are not without their burdensome conditions. Chief among these in the handling of summer traffic are: The restriction of single-track roads; regular schedules which are not maintained on account of increased traffic; increased liability to accident because of extra traffic; inability to secure competent and trained men for short periods of summer traffic; and last, but not least, sufficient reserve capacity in cars, and the peak load problems. These so-called "necessary evils" must be encountered, carefully considered, and then provided for by every manager; and to attempt to standardize the remedies for these conditions would be as impracticable as to attempt to reduce to an exact science the design and operation of amusement parks. Local conditions must be recognized in

each particular case, but to these can be added the known experience of the past.

To many of the street railway companies of this state, the extent to which they are warranted in establishing or investing in amusement resorts is a perplexing question. On one hand you are told by the experienced successful park manager: "If you go in, get in strong." The writer knows of several instances when we "got in strong." On the other hand a too conservative policy may be depriving your company on every bright summer day of traffic that is waiting to be invited. With at least one-half of the companies operating in this state the writer believes, from his observations, that it is financially impossible to maintain regularly during the summer season a park theater, presenting attractive and entertaining features. In the remaining cities it may be possible, although reports received from the companies do not indicate flattering returns on the venture itself.

In nearly every city, however, in which a street railway line is in operation, it appears to be practicable and eminently desirable, according to the size of that city and the resources of the company, to secure either directly or indirectly by lease or purchase, park grounds, distant from the center of the city and provided with good car facilities. In the smaller cities the assistance of the city council and the people is almost necessary to the establishment of a public park.

The writer, in presenting this article, assumes that the majority of the managers at this meeting are not vitally interested or affected in a consideration of this subject by the practices and conditions existing with street railway companies in cities of over 100,000 population.

In preparing this article the writer is indebted for several excellent letters received in response to requests for suggestions. Among these is a letter from Paul D. Howse, general manager of White City, Chicago, modestly designated as the "finest amusement park in the world." It may be of interest to learn from Mr. Howse that the fire show was the greatest single attraction ever placed in White City. The scenic railway has had the longest life and drawing power. Free attractions are maintained at all times when White City is open. In Mr. Howse's opinion, street railway parks have been unsuccessful most frequently because no money was spent for free attractions.

I believe that no better advice can be given to the members of this association on the question of how amusement features are to be handled and considered than that which has come to me through the courtesy of E. C. Boyce, vice-president of what is really one of America's most beautiful scenic resorts, Dreamland, Coney Island. Although Mr. Boyce has been interested in building many of the largest amusement resorts of this country, his suggestions are equally valuable for the guidance of managers who are interested in smaller enterprises. Mr. Boyce writes:

"In cities of from 5,000 to 65,000 population, I would advise street railway companies to keep clearly in mind the fact that an amusement resort should be considered solely as an indirect means of creating traffic for the railway. In this connection I append the following list of things that may be profitably undertaken: 1. The erection of a band stand and maintenance of free music during the summer season, the cost of the music to be governed entirely by the income from traffic. 2. Free fireworks weekly or bi-weekly. An excellent exhibition can be had for an expense of \$50. 3. The building of a roller coaster or so-called figure eight. This is one of the two amusement devices that can be profitably operated for an indefinite period and whose first cost is comparatively low. The other device is the merry-go-round or carousel. 4. Free outdoor attractions, aerial acts, animal shows, etc., are particularly attractive where prizes are given to children.

"Aside from the things above enumerated, I would not advise street railway companies to invest in any other form of amusement or entertainment. The most practical method is for the company to lease or purchase a suitable tract of ground, located preferably between 20 and 60 minutes' ride from the city; to make the ground reasonably attractive by means of bunting, electric lights, etc., and plan to sublet concessions either on a percentage or for a flat rental, preferably to local people, for any and all wholesome forms of amusement. The rental thus obtained always returns a large percentage of profit to the owners of the land.

"It is always possible to find sufficient concessionaries to make a resort as attractive as the business will warrant. In this way a railway company cannot possibly lose money on the venture, and it is always enabled to control generally the conduct of the resort, this being a very desirable feature. Under no circumstances is it wise to charge an admission fee to such a resort, and the policy of the railroad company should be liberal in the matter of supplying and charging for electric light, power concessions, space, etc."

Mr. Boyce's suggestions, in my mind, are conservative and are well worth following, either by the company already

engaged in the amusement business or by one about to venture in the field.

Discussion on Amusements.

Mr. Garner's paper was discussed at considerable length. G. B. Hippee (Des Moines City Railway) believed that local conditions should govern railway amusement enterprises and that it is important for companies to proceed cautiously. At Des Moines, he said, the attractions of the present park, with its large theater, had been increased gradually. Admission to the park is free, but charges are made for theater seats. Visitors may reserve seats for the park theater at the Des Moines office of the company. The park itself lost money. Mr. Hippee stated, but traffic on the park line had increased 50 per cent.

P. P. Crafts (Iowa & Illinois Railway, Clinton) said that he had found their park successful in increasing traffic. Special features at the park are a refreshment pavilion and swings and tables in the woods. The profits of the restaurant paid all the expenses of the park except those for music. Round-trip rates of 40 cents, and for children of 25 cents, are made to the park, which is located 18 miles from Davenport and Clinton.

L. D. Mathes (Union Electric Company, Dubuque) had found that the park at Dubuque is an aid in creating favorable public sentiment because the park has a good moral influence. The park was open three months and increased railway receipts over \$20,000, with expenses of \$12,000. Mr. Mathes believed that a mistake had been made in having the park free.

Mr. Hippee believed that every electric railway could make money by having a park on its line, but thought that the best results were generally obtained by leasing concessions. One of the greatest attractions had been the bathing of the Hagenback circus elephants in the park lake.

C. D. Cass (Waterloo Cedar Rapids & Northern Railway) stated that his road was taxed to its capacity in handling the traffic at the Chautauqua meetings, which now last four weeks. Last summer the national conventions of various societies had been held at Chautauqua park during the months preceding and following Chautauqua meetings. The Chautauqua association had the Thomas orchestra at Waterloo last summer for a week; and although the association suffered a loss, it is to have a similar feature this year.

All speakers agreed that the roller coaster was the most profitable attraction, with the merry-go-round second.

FREIGHT HANDLING BY ELECTRIC LINES.*

BY P. P. CRAFTS, GENERAL MANAGER IOWA & ILLINOIS RAILWAY COMPANY, CLINTON, IA.

It was not so many years ago that projectors of an interurban railway were shown the exit if they approached capitalists with a proposition in which the earnings from freight handling were to be considered as a part of the road's income. Now the situation has reversed and the investor gives very careful consideration to that part of the business which he formerly scorned.

What has brought about this change of front? Simply the faith, locked in the breasts of interurban managers, that freight haulage would sooner or later become profitable and a strong influence in the earning power of properties under their charge. These managers have continued to hammer away until, in the western section of the central west, particularly, the results have been generally satisfactory and in some cases astonishing.

You may ask, why should not eastern roads have developed their freight business in the same proportions? A number of roads have met with considerable success, but, owing principally to physical and franchise conditions, due to lack of experience and foresight of the earlier builders, the freight business has been greatly restricted. Interurban roads which have been constructed recently, however, have drawn a lesson from the earlier roads and now build with proper regard to that traffic.

It is now customary, wherever possible, to organize in-

terurban roads under the general railway laws, to build on ample right of way and, when building through small towns under franchise rights, to obtain the right to transact a general railway business, including freight, and to locate the line in such towns at some other point than on the main street. When conditions warrant, steam rights are obtained. The character of roadway construction also is changing, not only for the maintaining of high-speed passenger service, but also for the operation of heavy freight trains, with steam locomotives if necessary.

It is impossible to give here an estimate of the proportion of freight to total gross earnings which might be expected of a new road, for that is governed purely by local conditions, some of which I shall enumerate: 1. The population served outside of the main terminal and its dependence upon that terminal as a trading center. 2. The proximity of other trading centers to the population served outside of the main terminal, and the railway facilities tending to attract business away from the main terminal. 3. Steam trunk line connections leading to the main arteries of commerce and the ability of interurban roads to establish joint rates with them.

The Inter-Urban Railway of Des Moines and the Iowa & Illinois Railway of Clinton, respectively, provide examples of the first and second conditions. Des Moines, being located at a great distance from a city of superior class, is the normal trading center for the towns reached by the Inter-Urban Railway; consequently the current of freight traffic to the smaller towns is principally from Des Moines.

In the case of the Iowa & Illinois, however, although the tri-cities—Davenport, Rock Island and Moline—would seem to be the normal trading centers for Clinton, owing to the difference in population, yet Clinton is only 138 miles from Chicago, and as a consequence divides its business. The trading of Clinton with the tri-cities is constantly increasing, but it will continue to be divided to a greater or less degree, depending largely on the business-getting methods of the tri-city merchants, jobbers, etc. The examples just illustrated bear more particularly on the package, or less than carload, traffic.

A full exposition of the third condition cannot be given without consuming too much time. In general, however, an interurban road with proper freight handling and terminal facilities, which offers quick and efficient service, together with joint rates with some trunk line, in competition with other trunk lines operating between competitive points, may reasonably expect a fair division, or a greater portion, of the freight traffic. Shippers desire the best service with lowest rates, but, assuming rates to be even, shippers are generally favorable to the roads which provide good passenger accommodations; consequently the interurban roads reap the reward of frequent passenger service.

The proportion of freight to total gross earnings varies in this state from 5 per cent to an amount in excess of passenger earnings, depending upon the foregoing conditions. Interurban freight traffic may be properly divided into the following classes:

1. Strictly light packages, transported only in baggage rooms of passenger coaches, at express rates or at a fixed charge per package or per hundred pounds, regardless of class, and generally termed express business.
2. Less than carload freight transported on fast baggage cars at regular freight or special tariffs under regular or special classifications, generally the former.
3. A combination of class 2 and the haulage of a few local carload shipments daily at regular tariffs and classification.
4. Regular carload traffic hauled by steam or heavy electric freight locomotives at regular tariffs and classification. Or any combination of the above-mentioned classes.

A freight business of class 1 may be conducted at small expense and is of material assistance in the earnings of a road. The freight carried consists generally of packages that are easily transported in the baggage compartments of passenger cars, which are usually empty except for a very few trips per day. Usually no extra office force is required the only expense being for stationery, books and possibly a small storage space at the main terminal. In some cases, when the charges are a certain rate per package, regardless of weight within reasonable limitations, a proper system of tickets dispenses with waybills, expense bills, etc.

Inasmuch as the majority of freight-handling interurban roads of the middle west come under the head of class 2, and that part of the paper will probably be of interest to the greater number of electric railway managers, I shall enter into greater detail in handling the subject. Interurban roads which conduct their freight business under the head of class 2 more nearly approach operating conditions parallel

*Read before the Iowa Street and Interurban Railway Association, Clinton, Ia., April 19, 1907.

to the time freight business of steam railways. The ability of the interurban roads to make fast time and to deliver at highways, farm crossings and warehouse or store doors is an inducement to either the shipper or the receiver, which assists in obtaining the business. Being usually restricted, however, to a narrow car similar in appearance to a passenger car, due to operating over city streets, an interurban road has limitations on its freight-earning capacity.

The profits of such a business depend largely upon the opportunity of the management to secure combined freight and passenger depots at the termini and in the larger local towns, so that extra labor in billing and handling at stations may be avoided, upon the charges of terminal city railways for the right to haul freight over their tracks, and upon the hour of day when freight may be delivered to receivers.

Generally speaking, the margin of profit in this class is close and only careful management will produce a profit, particularly during the first few months after the business is started. Expenses must be carefully watched and attractive freight houses and convenient handling facilities at terminals sacrificed for something which costs less to maintain.

Damage claims must be very carefully handled, and to that end it is advisable to adopt some system of billing and accounting which permits a shipment to be easily traced from its origin to the final destination. Some interurban roads have adopted simple billing systems, requiring only one writing to make the receipt, waybill, expense bill and office copy. Such a system, however, does not permit of proper checking, particularly if merchandise is transported over more than one road.

After an interurban road enters class 2, a good local commercial agent is a necessity. The business, consisting of a great number of small shipments, requires constant development and care, particularly if competition exists. A live commercial agent, who is a good street man, and not a desk man, earns his salary many times over, particularly if he understands how to deal with shippers. The business obtained depends considerably on the personality of the commercial agent.

A few interurban roads make team deliveries, either adding to the tariff to cover the expense of optional deliveries, or maintaining an express tariff covering team delivery. In all cases that I have personally investigated I discovered that the cost of operating teams consumed a large portion of the profits derived from the car service. As an illustration, the rates of one 50-mile interurban road were based on express tariffs and its freight earnings amounted to nearly \$13,000 per year, but its net earnings were only \$2,600. I believe the advantages of frequent service compensate for any advantage gained by making team deliveries.

I fear that many managers, in charging expenses to the freight business, do not give proper consideration to such items as additional clerks, printing and stationery, insurance on goods in freight houses, a proper percentage of the receipts to cover loss and damage, power for freight cars, proportion of track and line maintenance, telephone service, interest on the freight-handling investment, etc. Neglect of these items deceives the manager as well as his stockholders, and unless receipts grow beyond the safe point the awakening will be painful and embarrassing.

An average interurban road operating 30 to 50 miles of track, serving a total population of 130,000 to 200,000, should not enter the freight field unless its receipts from freight will exceed \$10,000 a year, beginning with the second year. If the receipts are below that figure, the margin of profit will be too small for consideration or the expenses will exceed the receipts.

Perhaps a brief description of the freight business conducted by the Iowa & Illinois may be of interest as illustrating the point brought out in the foregoing. We went into the freight business in a very tentative manner. In fact, it took considerable time for us to decide whether or not there was sufficient business in less than carload lots to warrant the purchase of a freight car and the expense of operating a freight business.

The next grave question was that of rates, and, after considering for some time a reduction of the rate below that permitted by the Iowa state laws for class "A" roads, we finally concluded to adopt the maximum tariff and to consider the business as freight and not express.

At first our old passenger depot in Davenport served also as a freight depot, but within a very few months we outgrew the capacity of the space allowed to freight and were forced to take our passenger business to a new location. In Clinton we still have sufficient space to handle the business, but within a very few months we will be compelled to seek additional storage room.

Immediately upon starting the business we engaged a commercial agent, and the quick growth of the receipts to the point where we were paying expenses showed our wisdom. Within one year, with one freight car engaged in the business and the use of passenger coaches to carry some freight, the business grew to a gross figure exceeding \$10,000 a year. During the summer and fall of 1906 we were compelled to operate our freight car two round trips per day for nearly 75 per cent of the time, and after the contract with the American Express Company was put into effect we purchased and placed in service a trailer freight car with the same capacity as the motor. The improved facilities which we have been able to offer shippers since purchasing the second car have increased the business at a very rapid rate, and we are now considering the purchase of a third car.

We make a specialty, on less than carload business, of beating the time of the steam railroads 24 hours between Davenport and points on the Chicago & Northwestern Railway in the western part of the state. For this reason we obtain considerable business which is transferred to that road.

The schedule of our freight cars is as follows: The trailer express car, attached to one of the passenger motors, leaves Clinton at 5:15 a. m., arriving in Davenport about 6:30 a. m. This trip accommodates the southbound American Express and such freight business as is offered for early delivery. The motor express car leaves Clinton at 8:45 a. m., doing all of the local work and arriving in Davenport about 11 o'clock. Returning in the afternoon the trailer car leaves Davenport at 3 p. m., attached to a regular passenger motor, and carries nothing but goods for transfer to the Chicago & Northwestern, local goods to Clinton, and American Express, no intermediate local freight being accepted for this trip. The motor car leaves Davenport about 3:45 p. m., carrying local freight and such Clinton local freight as cannot be handled by the trailer car. Besides this, rush shipments in small quantities, milk, cream, butter, eggs, etc., from certain stations are handled in the baggage rooms of the passenger coaches. Our passenger schedule, however, is extremely close and permits of very little freight handling. The northbound American Express is handled on three successive passenger cars, leaving Davenport at 6, 7 and 8 p. m., respectively. We anticipate having in a very short time a third car to handle the northbound American Express and such freight as is offered to us after 3:45 p. m. This car will leave Davenport at 7 p. m. We find that a trailer freight car is much cheaper to operate than a motor, but of course it can handle only through business. It does not seriously delay the passenger motor to which it is attached.

When the freight business was started we adopted what we considered to be a very simple set of forms for billing and accounting, but we soon ascertained that the tracing of damaged and stray shipments was very difficult, and after carefully looking over the field we finally adopted the forms that are used by the Chicago & Northwestern Railway. These forms appeared at first to be very complicated, but a short acquaintance with them indicated their simplicity and the ease of tracing damaged and stray shipments.

We make a specialty of rush orders by telephone via our private line. Often a merchant in Clinton who finds himself short of some particular article telephones to our Clinton office, and, through our Davenport office and our private line, we transmit the fact to the shipper in Davenport. Shipments so ordered are frequently in Clinton within two hours from the time we were called up at the Clinton office.

Wherever possible we deliver from the cars to the store doors, which saves drayage and naturally brings business to us. A number of small platforms at which we stop our local express cars have been built by the shippers between towns.

We constantly endeavor to please our shippers and to show a spirit of co-operation, which has a great influence on the growth of our business. We endeavor to be conservative in charging off expenses against the freight business and work into it anything which rightfully belongs to it. We go so far as to charge off monthly 3 per cent of the gross freight receipts. This is piling up a tidy fund, but we propose to allow the account to grow, for at any time we may have to meet heavy freight damages due to fire, water or wreckage.

At the present time the gross earnings from this business amount to practically 15 per cent of the total gross earnings, and we hope to see it reach 20 on the same basis, i. e., while our freight business comes under the head of class 2.

Referring again to the main subject in hand, very little can be said about interurban roads coming under classes 3 and 4. Their business is merely a further development from class 1. The earnings from freight then become a large per-

centage of the total, and in class 4 may equal or exceed the passenger earnings.

Joint tariffs are desirable either with steam trunk lines or a system of interurban roads, particularly the former, in order that the carload business may prove profitable. Owing to the antagonistic attitude of the steam railways, however, joint tariffs are difficult to establish, except where competitive conditions are such as will induce one of the steam roads to join with the interurban road. Let us hope that before long, under rulings of the national and state railway commissions, interurban roads, irrespective of the fact that electricity is used as motive power, will be given the same rights to establish joint rates with the steam railways as are enjoyed among the steam railways.

Interurban roads coming generally under classes 3 and 4 must of necessity have steam railway terminals and yards, and the experience of our steam friends should teach us how far we can go in the development of such yards and terminals. It is a very easy matter to become seriously overloaded with yard and terminal maintenance and fixed charges, which are not warranted by the traffic handled. Such matters should therefore be very carefully watched.

Another point which has been discussed by interurban roads for several years is as to the best and cheapest motive power, steam or electricity, for hauling heavy trains. It is my opinion that unless a road is equipped for very heavy traffic in its power house, substations, overhead wiring, etc., the operation of heavy trains by electricity involves too great an investment and that it is, therefore, much cheaper to operate by steam locomotives. Taking, as an example, the ordinary interurban road of 30 to 50 miles in length, its power generating equipment, substations and overhead lines, particularly the latter two, have not sufficient capacity to successfully operate heavy locomotives. Consideration of the investment necessary for the increased capacity against the higher operating expense of a steam locomotive as compared with an electric locomotive will favor steam operation.

The development of the freight business upon electric railways in Iowa has been very healthful for the past few years and promises to continue its growth in reasonably high percentages from year to year. We have all gained considerable experience in this part of our business and, looking into the future, can readily see the benefits which our properties will derive. The development of the freight business also has been particularly strong in the states of Ohio, Indiana, Michigan, Wisconsin, Illinois and Missouri, that is, in that section of the country generally termed the "middle west."

As an example of the growth of freight business on interurban roads in Iowa, I will enumerate the present and guaranteed prospective roads which will make freight haulage a feature of their business:

The Inter-Urban Railway, operating from Des Moines to Colfax on one division, and to Perry and Woodward on a recently constructed second division, is an excellent example of the development and growth of freight traffic on interurban roads. It conducts both a fast less than carload and a carload business upon Iowa distance tariff and classification. An operating and joint rate agreement with some of the steam trunk lines is of assistance to the road and to the territory served by it. Both electric and steam locomotives are employed as motive power.

The Waterloo Cedar Falls & Northern, one of the first roads in Iowa to enter the freight field, conducts practically the same class of business and under like conditions relating to joint rates and motive power as the Inter-Urban Railway.

The Mason City & Clear Lake Railway conducts considerable carload business between Mason City and the Chicago & Northwestern at Clear Lake, operating under an agreement with the latter road. All freight is hauled by electricity. Its carload business is of considerable magnitude on that account.

The roads above mentioned may be included under classes 3 and 4. Beginning on a comparatively small scale, the growth of traffic has been steady and substantial until their receipts from freight haulage now constitute a large proportion of the total gross earnings.

The Cedar Rapids & Iowa City Railway & Light Company commenced operating in 1904 and immediately entered the freight field, conducting both a less than carload business in a baggage car and hauling carload business by an electric locomotive.

The Iowa & Illinois Railway commenced operating in 1904, carrying at first packages on passenger coaches and starting a baggage car in 1905. A very small local carload business is conducted, an electric locomotive or the baggage car being used as motive power.

Neither of the two roads last mentioned has joint tariff agreements with any of the trunk lines, but the Iowa & Illinois Railway does considerable less than carload business.

The Cedar Rapids & Marion City Railway, the Tama & Toledo Electric Railway and the Oskaloosa Traction & Light Company conduct a local business partly in baggage rooms of passenger coaches and partly in baggage cars. These roads are examples of classes 1 and 2.

The Ft. Dodge Des Moines & Southern Electric Railway, now under construction, connecting Ft. Dodge, Boone, Ames and several smaller towns with Des Moines, will be the greatest example within this state of combined electric and steam operation and the development of this road will undoubtedly be watched with great interest by the electric railway men. This road is really a combination, physically at least, with the present Newton & Northwestern steam line, inasmuch as approximately 40 miles of the latter road will be electrified to complete the connections between the branches touching the towns above mentioned. It is proposed to operate electric passenger and fast freight service combined, with steam locomotives for heavy freight service. The combined mileage of the roads involved will be nearly 160 miles.

Backed by our experience in the past and the present, I believe we can feel assured that any average interurban road, the investment in which is warranted by the prospective passenger business, has a successful freight business practically assured, which within a very few years will become an important factor in its earnings.

STEAM MOTOR: ITS VALUE IN INTERURBAN SERVICE.*

BY W. G. WAGENHALS, OF THE KOBUSCH-WAGENHALS STEAM MOTOR CAR COMPANY, ST. LOUIS, MO.

While considerable advancement has been made in steam motor cars by English, Austrian and French inventors, the field has practically been neglected in this country. The only real effort to develop a steam motor car of any size was made in 1898 by the Baldwin Locomotive Works, which built a car on the order of the Cincinnati Hamilton & Dayton Railway Company for use between the cities of Middletown and Hamilton, O., which was to be run in competition with the interurban electric line of which I was general manager. I paid very little attention to the details of this machine, but after repeated trials, it was placed out of commission, and the Baldwin people made no effort to revive the steam motor car business. Since that time I know of no effort to design a steam motor car for railroad service.

About three years ago I built a steam railroad, 24 miles in length, from Ripley to Sardinia, O., and, finding that the passenger receipts did not justify the operation of a train service, I endeavored to find some form of a self-propelled car which would reduce the expense of operation, as our franchise obligated us to run three trains each way per day. I took the matter up with Mr. Kobusch, president of the St. Louis Car Company, and he advised me that there was nothing in the market which would fill these conditions. At that time I had under contract the 24 miles of steam road and 50 miles of electric road and, after talking the matter over with Mr. Kobusch, we formed a partnership for the construction of a motor car for this service. I agreeing to give up the construction business, and to devote my entire time to the perfection of a motor car along the lines which I presented to him at that time. After nine months of work in this direction, we have produced the largest self-propelled motor car which has ever been built.

This car has a total length of 82½ feet with a seating capacity of 64 people; the weight on the driving wheels is 115,600 pounds, with 62,960 pounds on rear trucks, or a total weight of 178,560 pounds. This car has a greater tractional weight than the largest 6-wheel locomotive. This car under repeated tests has handled 22 loaded freight cars on level track at a speed of 5 miles per hour, which gives its maximum pulling capacity. It has developed a speed of 45 miles per hour on 0.5 to 1 per cent grades, at which speed it would easily be able to handle one or two trailers. The car has a water carrying capacity of 2,000 gallons, sufficient for a 45-mile run, and an oil tank capacity of 1,000 gallons, sufficient for a 500-mile run.

This car has been operated over the Chicago Burlington & Quincy Railroad out of St. Louis in the presence of mechanical men and general superintendents of the largest steam railroads in the country, and no criticism has been offered by them as to its design or performance. No alterations have been made in the original design of the car, as every detail of the operating mechanism has worked out as originally designed.

The engine is built entirely of steel castings, with the

*Read before the Iowa Street and Interurban Railway Association, Clinton, Ia., April 19, 1907.

exception of cylinders and valve chambers, which are of cast iron. The frames of the engine are so designed that they form at the same time an oil tight case for the cranks and cross head; the forward end of the case is extended to form an axle bearing to hold the engines in line with the driven or truck axle. The arrangement is identical with the present method of mounting motors in an electrically propelled car. All bearings are provided with removable brass shells which make the repairs of the wearing parts practically the same as in an electric motor car.

The success of the car can be attributed to the combination of both steam and electric railroad practice, as far as the general mechanical design is concerned, the duplex steam engine displacing the motor, and the power house (or boiler) being carried in the car itself, avoiding the transmission of electrical energy over a trolley line, as is the practice today.

The engine on the forward truck is connected to the body of the car through a flexible steam connection, consisting of two ball and one expansion joints, which have been demonstrated to be perfectly tight under 300 pounds pressure. The boiler is of a marine water tube type, tested to 500 pounds cold water pressure with an allowed running pressure of 250 pounds per square inch. This type of boiler is in service on a number of United States government torpedo planting boats, and after five years of continued service has shown that a minimum of repairs is required; and, owing to the rapidity of the circulation, very little scale is formed.

The boiler has demonstrated its rapid steaming qualities, and has a greater number of square feet of heating surface for its size than any other boiler in the market today.

In a space of 3 feet square and 8 feet high, we have over 1,215 square feet of heating surface with a total grate area of 43½ square feet. This compares favorably with the largest 6-wheel locomotive of today.

Steam is generated by crude oil, atomized through a steam jet burner of special design, which sprays or atomizes the oil in the fire box and, although we have five of these burners, it has never been necessary to use more than two of them with the car exerting the maximum effort in speed or pulling capacity.

In one of the tests over the Burlington railroad, on a 1½ per cent grade, 8 miles long, at a speed of 35 miles per hour, the car started the grade with 180 pounds pressure and mounted the top with 250 pounds, with the engine running at ¼ cut off. This performance, in the presence of a number of Burlington officials, was declared by them superior to any performance of their locomotives.

The engines used on this car are specially designed, with cylinders 11 by 12 inch stroke. The valves are of the piston type, and were furnished by the American Balance Valve Company, which has recently furnished to the Pennsylvania Railroad over 1,200 pairs of valves of the same type. The valves have shown perfectly tight under pressure of 300 pounds per square inch and, owing to their design, there is very little friction, and they can be moved by hand under this pressure.

The valve gear is a standard type of Stephenson link, as is used in the ordinary locomotive. All bearings are amply large to withstand the different strains, and as noted heretofore, the engines are so designed that they are self-lubricating, the frames forming the crank case. The cylinders, while small in comparison with locomotive practice under the pressure used, develop 275 horsepower at the rail.

The connection between the car body and truck for the control of the link is made through an arc of a circle with an arrangement similar to that used with the brake system for an ordinary double-truck interurban car. This allows of curvature of the truck without affecting the position of the links or the throw of the valves.

The exhaust of the engine passes through the center plate, through a metallic packed joint, which also allows for curvature, the exhaust ending in the stack of the boiler. The car is heated by both exhaust and live steam.

Now, as to its practicability and uses: The car was originally designed to displace train service on branch lines of steam railroads where the ordinary train service would not pay. With a locomotive and one or two cars, four or five men are necessary for the operation of the train—an engineer, fireman, brakeman, conductor and flagman—without taking into account hostlers and repair men at the terminals. This type of car is operated by two men, an engineer and conductor. The same service can be obtained with the engineer doing his own repair work and also supplying the car with fuel oil, when necessary, as the only labor involved is the connection of a hose from the storage tank to the tank under the car, and the opening of a valve. Compare this with the unloading of coal from a car in the holsting bucket,

the operation of a crane, and the removal of cinders necessary where coal is used for fuel. We claim a saving in labor which will pay the interest on the investment.

I do not claim that the car can be operated in competition with electric power where the service is hourly or less, in which case operation by electricity is superior to any other power, but for interurban service, where a service of one or two hours is all that is necessary, the steam car can be operated for less money than the power house. Take as examples, short lines from 10 to 20 miles, extending from county seats to small distant towns which have no railroad connections. This car opens a field where it can have no competition. The expense of construction lies only in the road bed and the equipment of one or more cars.

All freight and express matters can be handled with the same equipment, as the car is able to pull several trailers at its maximum speed. Repeated tests have shown a consumption of oil of about 2 gallons per mile run. Figuring oil at 3 cents per gallon gives running expenses per mile which compare very favorably with the gasoline type of motor car or steam generated with coal.

MODERN TRAIN DISPATCHING METHODS ON ELECTRIC RAILWAYS.*

BY H. H. POLK, PRESIDENT AND GENERAL MANAGER INTERURBAN RAILWAY COMPANY, DES MOINES, IA.

Until recently the managers of electric railways have given but very little attention to that most important part of train operation, the dispatching of trains. However, they have at last come to realize that it is just as important to safely dispatch electric trains as steam trains. Both should be dispatched in much the same manner. Even today the dispatching systems on most electric railways are crude, go-as-you-please propositions.

There are three important factors in train operation to be taken into consideration:

1. First and above all others is safety both to passengers and property. This must be obtained regardless of cost.
2. The speedy operation of trains over the road, giving all possible dispatch commensurate with safety.
3. The economical operation of trains, keeping them on the "go" all of the time and not lying "dead" on some side track waiting to be passed by something.

In order to obtain these very important results it is absolutely necessary that trains be operated on train orders issued from a central office, directing train movements in addition to the movements provided for in the rules and timetables. If the printed timetables showing the meeting places and time of all regular trains, and the rules directing how these trains are to proceed with relation to each other, are studied by all trainmen, thoroughly understood by all alike, and faithfully carried out, collisions will be prevented. If, however, it becomes necessary to issue special orders for trains not on the timecard, then the train order is absolutely necessary. These orders must be clearly expressed and the form, and even the paper on which they are written, must be such that they may be easily and quickly understood by all those whose duty it is to read them. Conductors and motormen must know that the orders are given by competent authority and that all concerned have corresponding orders. Only one dispatcher must issue orders on a division at a time. "This is one of the few cases where one head is better than two." For two dispatchers to issue train orders on the same division involves very serious risks, and also contributes largely to the lack of confidence on the part of all trainmen. Never let two men dispatch a train.

When a timecard is issued a receipt should be taken therefor from all persons concerned, thereby making certain that it has been received. In issuing train orders it is more difficult to be assured that they have been received and understood by all concerned. After the order has been prepared by the dispatcher it is then transmitted to the desired persons either by the telegraph or telephone.

The telephone is used almost universally by interurban roads for train dispatching, while the telegraph is used by steam railways; however, in my opinion the telephone is far superior for transmitting train orders on interurban lines. All stations and sidings can be equipped with telephones, where a train crew may communicate with the train dispatcher at any time, thus avoiding serious delays.

The system now in use on the line I represent follows the standard dispatching systems of steam railroads, some modifications being necessary to adapt it to our use. All

*Read before the Iowa Street and Interurban Railway Association, Clinton, Ia., April 19, 1907.

trains leaving the central waiting station of the Des Moines City Railway Company are under its jurisdiction while running on its tracks, and receive their first order from the Inter-Urban Railway Company dispatcher at Beaver Valley Junction on the Beaver Valley division and at Grand View Park on the Colfax division. At these points are located telephones, a pad of standard No. 31 train order blanks, and a locked box in which to deposit a third copy, of which I will say more. One of these booths is also located at each siding on the line.

The conductor of an out-bound train, on arrival at one of these points, steps into the booth and calls up the dispatcher, saying, "Jones train No. 96 at Beaver Valley Junction." The dispatcher reads to him the order which he wishes to issue, the conductor writing it himself verbatim as given and making three copies by the use of carbon sheets, one copy to be given to his motorman, one to be retained by himself and the third to be deposited in the box, to be used in case of any misunderstanding of orders, as a means of placing the blame upon the proper person. After the order is written by the conductor, he reads it back to the dispatcher, who checks it with his copy and, if correct, says "Complete;" the conductor then writes "Complete," together with the time the order is made, and signs his name. He then goes to the motorman's cab, giving him a copy, which the motorman in turn repeats to him. The conductor is then permitted to board his train. He gives two bells and the train starts.

We are very particular to have the conductor deliver the order to his motorman before boarding his train in order to absolutely avoid any start without a thorough understanding on the part of the motorman. With us it is a very serious offense to violate this rule. A few years ago we had a very serious accident because the crew disobeyed this rule. The conductor, after receiving his order, stepped on the rear platform, signaled his motorman to go ahead, and was walking through the car to give the motorman his copy when the collision occurred. The order in this case was a "hold order."

A conductor is required to report at all stations where agents are located, and should his train become delayed between stations, he must call the dispatcher from the nearest telephone booth, thus giving the dispatcher the opportunity to change the order if desirable. Our sidings are about two miles apart, but trains must report at only such sidings as are designated on the timecard, and must never leave those sidings without a clearance or train order.

In-bound trains must report their arrival at Beaver Valley Junction and Grand View Park, and also at the central waiting station in Des Moines.

Our dispatcher issues daily an average of 120 train orders. On the Beaver Valley division we operate 36 passenger trains, two package express cars and two freight trains between 5 a. m. and 12:40 p. m., making a total of 1,303 miles per day. On the Colfax division we run 34 passenger trains, four package express cars, and freight trains when necessary, making 1,065 miles per day.

The telephone line as installed consists of two No. 9 galvanized iron wires carried on cross arms in the usual manner on the same poles and underneath the high-tension transmission lines, and transposed every ten poles to prevent interference from parallel power and feeder line. The dispatcher's switchboard was made by the Stromberg-Carlson Telephone Manufacturing Company. The telephone instruments are of standard make and of the bridging type.

By reason of the almost constant use of the telephone line by the dispatchers, it became impossible to transact any company business without seriously interfering with the safe dispatching of trains. It therefore became necessary either to build a second telephone line or to install what is known as a composite system. We chose to do the latter; it is much the cheaper, involving only the cost of installing telegraph instruments. By this change we have doubled the capacity.

In the installation of the telegraph we had the choice of two general methods, one being what is known as the European or open-circuit method, the other being the American or closed-circuit method. The former of these two systems was adopted upon the advice of Mr. Cunningham, our electrical superintendent, as it has many advantages over the latter, especially for the composite system. The European or open-circuit system is essentially a multiple system, while the American, or closed circuit, is a series system. With the European open circuit no power is used except when the instruments are actually in use. Another advantage is that in case the line should break instruments could be used on each side of the break. As no switches are used on the keys it is impossible for the operator to go away and leave the line open by leaving his key open.

Both sides of the telephone line are used as one side of

the telegraph line. The telegraph instrument is connected between both sides of the telephone line and the ground by means of a suitably balanced super-wound impedance coil, wound and connected in such a manner as to offer impedance to the alternating telephone current and signaling current passing from one side of the line to the other, but offering little impedance to the direct-current telegraph current passing from both sides of the telephone line through the telephone instruments to the ground.

The success of the composite system depends upon both sides of the telephone line having the same resistance, impedance, capacity and inductance. In other words, the telephone line must be perfectly balanced, preventing the double-current intermittent telegraph current impulses from passing from one side of the telephone line to the other through the receivers. In a perfectly balanced line there is no disturbance or interference between the telegraph and telephone instruments.

The use of the telegraph on the telephone line does not necessitate any more care than would be necessary for a satisfactorily operating telephone circuit paralleling high-tension lines. The energy used to operate the telegraph instruments is obtained at each station direct from the 600-volt, double-current feeder by shunting one 16-candlepower lamp in a series of five.

A composite system not only doubles the amount of business that can be handled over a single line, but is much more reliable and convenient than either a telephone or telegraph line alone. The telephone and telegraph are not affected by the same cause; that which would knock out or disable one might not affect the other.

IOWA ELECTRICAL ASSOCIATION.

The seventh annual meeting of the Iowa Electrical Association was held at Clinton, Ia., on April 18 and 19, the headquarters being at the Lafayette Inn. On the first day the papers presented were as follows:

"Cost of Operation per Dollar of Income," by Prof. L. B. Spinney, Iowa State College. This paper was based on somewhat incomplete returns from the electric lighting plants of Iowa and brought out the fact that there is great need of adopting a uniform system of accounting. In discussing this paper L. D. Mathes (Dubuque) urged the importance of sound accounting methods, and especially the recognition of and provision for depreciation; he believed that it would be only a short time until electric lighting companies would be subject to regulation by state commissions, and pointed out the importance of having complete and accurate accounts when opposing requests for reductions of rates.

"Central Station Economies," by Gus Lundgren, Cherokee, Ia. This paper dealt with practical points of the business and emphasized the need of weighing and measuring devices in the station in order that the management might have accurate knowledge of what the plant is really doing.

"Increasing the Central Station Day Load," by E. S. Callahan, General Electric Company. The paper considered various applications of electricity for domestic and especially kitchen use.

"Manufacture of Ice," by Rufus Lee, Clarinda, Ia.

"Co-operation," by J. R. Crouse, Cleveland, O. Mr. Crouse was unable to attend the meeting and sent copies of a paper on "Profitable Commercial Co-operation," read before the National Electric Light Association, together with a letter inviting the Iowa association to appoint a committee of two to act with the Co-operative Electrical Development Association, which is intended to secure the co-operation of all electrical interests in a campaign of education to encourage greater use of electricity.

The programme for Friday's meeting included the following papers:

"Central Station Advertising," by Curtis Advertising Company.

"Central Station Lighting—Steam and Hot Water," by W. H. Schott, Chicago.

"Selection of Steam Engines," by H. E. Chase, Des Moines, Ia.

"Producer Gas Engines," by Prof. G. W. Bissell, Iowa State College, Ames, Ia.

"Electric Distribution Systems," by Prof. A. H. Ford, Iowa State University, Iowa City, Ia.

ELECTRIC FREIGHT HANDLING AT NEW BEDFORD.

About three and a half years ago an electric express service was inaugurated with New Bedford, Mass., as a center by the interests controlling the Union Street Railway Company of New Bedford. The business then begun in a small way has now been extended to through service between New Bedford and Providence, R. I., a distance of 34 miles, and between New Bedford and Monument Beach, Mass., 26.75 miles. In New Bedford the cars are operated on the tracks of the Union Street Railway Company; while the Dartmouth & Westport Street Railway and the Providence & Fall River Street Railway companies handle the service between New Bedford and Providence. In the streets of the latter city the traffic is under the auspices of the Rhode Island Company. Eastward from New Bedford the Union Street Railway Company operates the cars as far as the Fairhaven and Mattapoisett line; the New Bedford & Onset continues the service to Onset, and the Taunton & Buzzards Bay completes the run to Monument Beach.

We present herewith a view of the original freight station in New Bedford, which was established in the basement of an old house. A spur track of the local system served one side of a platform, which extended at right angles around a corner of the building. Express wagons and trucks received and delivered freight at the further end of the platform from the spur track. The capacity of the terminal was limited, and the company secured half the basement of an old cracker factory at the corner of William and Bethel streets, and equipped it for a general express business. This terminal is located within three minutes' walk of the most crowded part of the business district in New Bedford and is thus easily accessible from all the important stores, hotels and mercantile houses.

The present freight terminal in New Bedford receives express matter and freight at five doors on the west side of the building from trucks and wagons. From the wagons it is trucked across a platform in the interior of the building to the express cars which stand on a spur track in the middle of the station. The track has a capacity of two cars, and it is surrounded on both sides by the platform, so that both sides of the cars can be loaded or unloaded at once. An

department of the Dartmouth & Westport Street Railway, under the management of Mr. Edward F. Nicholson. E. E. Potter, general superintendent of all the electric lines centering in New Bedford, has oversight of the freight business in addition to his other duties, but the operating details are handled by Mr. Nicholson, who gives his whole time to the express traffic. The classification of express matter and freight is based largely upon the standard classification of

Electric Freight Handling at New Bedford, Mass.—Original Freight Station in New Bedford.

steam railroad freight as used by the Pennsylvania and other companies, although in cases where the merchandise cannot be handled profitably at the regular steam rates or thereabouts, a special charge is made for the prompt service of the trolley express. In general the company handles all merchandise which can be brought to its terminal by wagon, and the variety of articles transported is very great, ranging from prescriptions to furniture and beef. Explosives are not handled by the company.

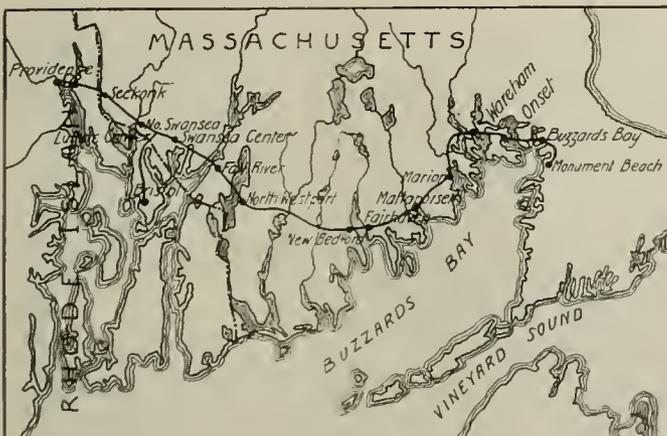

Daily service is maintained as follows in the freight department: Cars leave the Rhode Island Company's freight station in Providence for Fall River at 10 a. m., 3 p. m. and 5 p. m., and for New Bedford at 12 noon and 5 p. m. Cars leave Fall River for Providence at 8:30 a. m. and 12:30, 3 and 5:30 p. m., and for New Bedford at 8:30 and 10:15 a. m., 1:15, 3 and 4:45 p. m. Cars leave New Bedford for Providence at 6:10 a. m. and 1 p. m., and for Fall River at 8 and 10:15 a. m., and 3:15 p. m. In Providence connections are made for all points reached by the freight service of the Rhode Island Company. Cars leave New Bedford for Onset at 8:30 a. m. and 2:30 p. m. In the summer season afternoon trips are made to Buzzards Bay, Bourne and Monument Beach. Between New Bedford and Fall River the line is double-tracked.

Table I gives the rates charged on the different classes of merchandise handled by the service between New Bedford and Providence.

Table I.—Rates in Cents per Hundred Pounds.

	Class					Miles.
	1.	2.	3.	4.	5.

2 1/4 hours. In the summer season the population of the Buzzards and Narragansett Bay territories is very much enlarged, and the electric express service has proved to be a great convenience. Even in the winter season persons living in the districts served can telephone orders to New Bedford in the morning and receive their goods the same afternoon by 3:30 or 4:30. A sketch map of the lines traversed by the through express cars is shown. Warehouses for the temporary storage of goods are located at Westport, Fall River, Mattapoissett, Marion, Wareham, Onset and Bourne. Agents of the company

brakes and double trolleys are installed. The motors are mainly General Electric 67 or Westinghouse 51, and the freight capacity of each car is from 12 to 14 tons. The crew consists of a motorman and a conductor, who handle the freight together with the assistance of local agents when it is necessary. The use of four motors greatly increases the reliability of the service and enables the cars to make a good schedule speed. Although the maximum speed is not as high as that of the passenger cars, the absence of as frequent stops and the greater ability of the express cars to coast enables the

are located at all the important centers and at Marion the agent gives practically his whole time to the electric freight business. Orders are handed to agents by the public in special heavy manila envelopes, 3 1/2 by 6 inches. Accounts of freight received and shipped, cash and charges are kept in much the same general way as on a steam road. Each car carries a waybill of its contents showing the car number, way-

freight traffic to be handled at speeds which keep the equipment well out of the way of the passenger cars. The company handles mail regularly between Fall River and New Bedford in a special mail car, which has greatly facilitated the arrival of postal matter, especially in the first morning delivery.

The general offices of the Union Street Railway Company are located in an attractive building at the corner of Purchase

and William streets, New Bedford. The waiting room is about 50 feet long by 18 feet wide, and it is provided with comfortable seats throughout the length of one side and in the large bay window which faces the intersecting streets. At one side of the room is a large soda fountain, which is operated under a concession. The waiting room is admirably lighted by 10 inclosed arc lamps, and it is provided with standard time service, a telephone pay station, cigar and souvenir postcard stand, photographs of scenery along the company's lines, United States mail service, and steam radiators mounted high enough on the walls to be well out of the reach of patrons. The room is finished in light oak with an ornamental tile flooring, and the company maintains an office at one end where tickets are sold, timetables given out and parcels checked. The general superintendent's office is also readily accessible on the street floor, and the other general offices are located at the head of a flight of stairs leading to the second story. The modern design of the waiting room is a pleasing contrast to the trolley stations found in many cities, in which the conditions are far from attractive. Passengers who desire to wait out of doors for their cars are protected from the weather by a large glass awning in the front of the bay. The company's private branch exchange is located at this station, which is the operating center of the system.

All the express cars as well as the passenger cars are maintained at the principal shops of the company, which are located about a mile and a half from the center of the city. In the shops the practice in hoisting facilities and motor driving is of particular interest. All the tools in the machine department are driven by a single motor on the group plan, the motor being a shunt machine of modern design. The company turns down its worn-out axles into armature shafts, makes its own journal bearings, armature and field coils. A new mail car is now being built in the carpenter shop, which is fitted up with electrically driven tools. Special care has been taken to protect the workmen by inclosing any low-running belts in wooden housings. Worn-out pinions having 22 teeth are milled down to 17-tooth pinions, the holes, stock and key ways remaining unchanged. The equipment includes a large wheel press, a boring mill and a wheel grinder for the removal of flat spots as well as lathes, shapers, coil winders, drying oven and a number of traveling air hoists. The tracks in the paint shop are provided with a crossover to facilitate the movement of cars in and out, and heavy fire doors are installed between all departments. A valuable feature of the electric express cars is a special box in the vestibule which has a hinged cover held in place horizontally by chains when the box is unlocked. This serves as a desk for the conductor, who would otherwise be somewhat at a loss to handle his papers.

A special contrivance in use in the paint shop is an

arrangement for securing light at any point where it is needed in concentrated form. Two 5-lamp circuits of incandescent lamps are mounted at the bottom of a rod about 15 feet long, which can be hung by two hooks across the trolley wire and across a special overhead ground wire, run through the paint shop. The two circuits are controlled by a special snap switch on the pole, and the device can be taken anywhere without the least trouble from dangling wires or the annoyance of disconnecting and connecting circuits.

ELECTRICITY AT JAMESTOWN EXPOSITION.

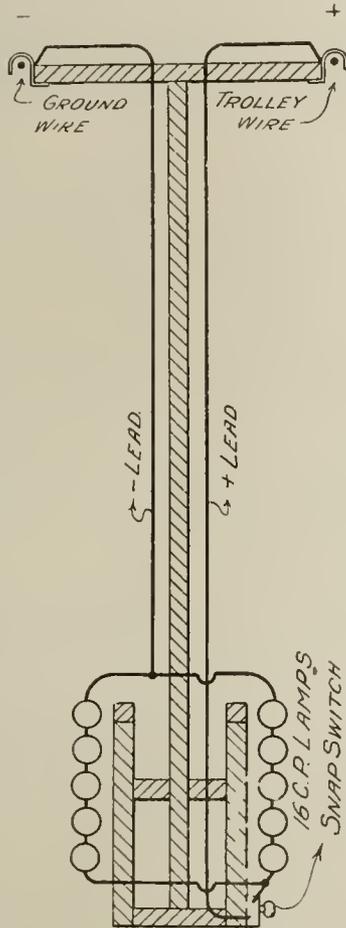

Electric illuminating effects have now become one of the most important attractions at large expositions, and this will be still further exemplified in the illuminating effects which are being planned for the Jamestown exposition. The principal lighting, as in the case of the Pan-American exposition, will be by incandescent lamps, and the illumination for the police will be by constant-current series arc lamps. A feature which will probably attract a great deal of attention will be the illumination furnished by a large number of searchlights on land and searchlights on the large fleet which will be assembled in Hampton Roads. No doubt this will be a great attraction.

All the current necessary for operating the motors which will be distributed throughout the grounds for running exhibits, and current for the lighting, will be furnished by Curtis steam turbines located in the power house of the Norfolk Railway & Light Company, which is about seven miles from the exposition grounds. The current will be transmitted from there by the high tension over a model transmission line from the power house to the transformer station, which will form one of the exhibits in Machinery Hall. This substation will be arranged on the same general plans as the high-class substations found in practice. Here will be located large air-cooled transformers and a number of small type H transformers for the general illumination, and there will also be supplied a number of constant-current transformers for the series arc lighting system. The direct-current service for the grounds will be furnished by motor-generator sets of ample capacity. The switchboard for controlling the various circuits throughout the exposition grounds is located in a gallery and is representative of a modern switchboard in large central stations. The switchboard and electrical equipment of the substation throughout will be furnished by the General Electric Company, which will also supply the lamps.

SALE OF CONTROLLING INTEREST IN THE CHICAGO & SOUTHERN TRACTION COMPANY.

W. S. Reed of Chicago, president of the Chicago & Southern Traction Company, has announced that he has sold a controlling interest in the property to a Detroit syndicate, composed of C. J. Reilly, C. A. Black, Matthew Slush and J. M. Mulkey, and that the company has increased its capital stock from \$2,000,000 to \$5,000,000 and the bonded debt from \$2,000,000 to \$5,000,000.

The company operates the Chicago Electric Traction Company, now in the hands of a receiver, Charles Henrotin, which has a line from Sixty-third street and South Park avenue, Chicago, to Morgan Park, Blue Island, West Harvey and Harvey. The Chicago & Southern also has a line from Harvey south to Kankakee, Ill., which is now in operation as far as Crete. Between Crete and Kankakee the track is laid and the overhead work is completed, and it is expected to begin operation in about six weeks. With the increased capital stock and bonds it is the intention to extend from the present main line to several points outside the southern limits of Chicago and also to extend the line to Lafayette, Ind., connecting there with the Indiana and Ohio systems. Two subsidiary companies were incorporated last year to build these extensions, the Chicago Blue Island & Joliet Traction Company to build to Joliet, Ill., and the Chicago Kankakee Lafayette & Southeastern Railway to build the line to Kankakee.

DISCUSSION ON "DEPRECIATION" BEFORE THE ACCOUNTANTS' ASSOCIATION.*

The president, W. B. Brockway, announced that the purpose of the concluding session of the American Street and Interurban Railway Accountants' Association at Columbus was to give the accountants of American street railways a better idea of the meaning of "Depreciation." He said the executive committee believed the peculiar opinion held regarding "Depreciation" was that depreciation was right in principle, but the longer its consideration could be postponed the better. This had raised a feeling in the minds of street railway men that they were criminally neglecting the subject, and has also raised a spirit of antagonism in the mind and action of the public because it had assumed the railways to be in very much better condition and making far more money than they really were. The companies seemed to have gone upon the principle that so long as they deferred the question of "Depreciation" just so long could the companies pay 10 per cent in dividends instead of perhaps 5, or 5 per cent instead of nothing at all. The chair then introduced Mr. R. N. Wallis, treasurer Fitchburg & Leominster Street Railway, Fitchburg, Mass., who read the following paper:

Depreciation as Applicable to Electric Railways.

BY R. N. WALLIS.

Accounting recognizes three methods of treating depreciation. The first provides, by an annually increasing fund or account or a periodical charge, an amount to represent the decrease in value which cannot be met by ordinary maintenance. The second assumes that, by including betterment charges as expense, values will be kept in correct proportion. The third ignores the presence or possibility of a deterioration which the ordinary maintenance expense does not cover. Factories and similar undertakings most commonly adopt the first; American railroads the second; while street and electric railways—particularly in America—have been quite prone to follow the third. This is not strange, since the history of accounting shows that in the development period of an industry, when all is new, when the life of apparatus is unknown, when funds are enthusiastically tossed into the property without investigation, little attention is ever given to depreciation. As the industry settles on a firm basis, however, the need for a proper settlement of the problem appears.

Roughly, 15 years of electric railroading have passed, during which time—in this country—there has obtained very little practice of accounting for depreciation as such. Some few roads have established funds or accounts to provide for it. Some are charging betterments against income to a greater or less extent. Some have "charged off for depreciation" through the profit and loss account. Undoubtedly a considerable proportion of the older undertakings have already, consciously or unconsciously, looked to the future in this matter and have so ordered their finances as to be on a safe basis when they come face to face with the problem; many of more recent beginnings will do so as they grow older. Not to have established a fund or a bookkeeping account for depreciation does not necessarily mean that no provision has been made.

Whether or not the industry needs—as manufacturers do—to establish some practice, within reasonably elastic limits, of allowing in its accounting for this ultra wear and tear is a question for debate. Our brethren across the water almost universally consider a fund or account providing for renewals a necessity. This subject was discussed in 1904 at the International Tramways Union, comprising many European companies. The replies to questions indicate that practically all anticipate depreciation by annual payments to a fund (the most common method) or charges to an account. Of 41 companies replying only 2 expressed the slightest doubt of the necessity of providing renewal funds. Of the 39 M. Haselmann found that 22 gave sufficiently complete replies to admit of classification as to their methods of maintaining a fund. Twelve turned annually into a renewal account or fund certain percentages of the cost of installation, varying as follows:

For tracks, etc.....from 1 to 10 per cent
For line constructionfrom 1 to 8 per cent
For rolling stockfrom 1.25 to 10 per cent
For power station equipment.....from 2.5 to 10 per cent

Six companies based the percentage upon the capital invested, varying from 1.5 per cent to 3.5 per cent, while four

companies took as a basis the gross receipts, varying from 5 per cent to 10 per cent. After a careful study of practices, M. Haselmann, quite tentatively, suggested that the following percentages of first cost value be set aside annually as a renewal fund:

Rails, ties, switches, crossings, etc.....	1.9 per cent
Poles (presumably iron)	1.0 per cent
Wires, feeders, etc.	4.0 per cent
Cars	1.7 per cent
Engines, generators, batteries, etc.....	4.0 per cent

After some discussion, during which it appeared that the German association was studying the question of standard percentages, it was decided to await action until another convention and secure the benefit of the studies of that association. Since then the latter body has abandoned the attempt to fix any uniform percentage, holding that dissimilarity of the undertakings precludes any definite action. The English association has reached much the same conclusion.

At the last meeting of the Municipal Tramways Association of Great Britain in 1902 Mr. James Dalrymple, in his report on a standard classification of accounts, suggested depreciation credits to asset accounts, aggregating 18 per cent of the gross expense or 13 per cent of the gross receipts. The details were as follows:

	Per car-mile (in pence).	Percentage of cost value.
Permanent way
Electrical equipment of line.....	.30	4
Ground
Buildings and fixtures.....	.17	3
Power station and substation plant.....	.35	6
Workshop tools and sundry plant.....	.035	2
Cars23	8
Electrical equipment of cars.....	.23	8
Miscellaneous equipment02	5
Office furniture008	16

The latest schedule from Mr. Dalrymple does not materially differ, although he has added \$2,182 per mile of track for its renewals. Against the amounts so credited to asset accounts all large renewals would be charged.

In the discussion which followed the report the question of depreciation rates was declared out of order and it is impossible to determine the sentiment of the others present. There was some disposition shown, however, to criticize the rates, though there was no dissension from his view of the need of depreciation accounts, discussion on that subject being in order.

The fixing of exact rates must be regarded as impossible. What holds in one climate or in one class of construction, or under one frequency of service, or under one management, or under one policy regarding repairs, does not in another. Each company must settle that problem for itself after careful study of its circumstances.

That the foreign practice is to establish a renewal fund or account does not prove that it is necessary for American companies. This method contemplates the growth of a fund or account large enough to care for any heavy renewals, such renewals to be paid from the fund or charges to the account, the amount received for worn-out materials being credited. The amount or percentage to be set aside annually should, strictly speaking, be large enough to provide for supplanting patented devices on account of new inventions and other such contingencies.

Now if all the track or line or cars are to be replaced at one time, obviously it becomes necessary to provide through a series of years for the payment. If, however, an equal proportion of the renewals is made each year, then depreciation is provided for automatically. Somewhere between these two limits lie the actual facts of our industry. Depreciation of power plant in many roads or other forms of investment concentrated in one or two parcels may well be considered separately, since the ultimate determination of life means wiping out the whole of that part of the investment. Part cannot be replaced each year.

A balance sheet should be a statement of fact. Theoretically it should show the exact state of the investment at the time it is issued. Any method that contributes to this condition may rightfully be adopted; anything which causes misrepresentation should be rejected. The ideal balance sheet puts in figures the actual value, at the time of its casting, of each item it contains. Tracks, line construction, cars installed today and in constant use are not as valuable after a year's wear. Theoretically their actual value at the end of the year should be set down. Hence a reduction should be made either by reducing the amount of the asset accounts, by offsetting on the liabilities side an account or accounts which shall provide for this reduction in value or by payment from the earnings to a fund to keep pace with this depreciation. In the last two cases this account or fund should care for the amount spent for replacing when the old shall have worn out and this replacing should be charged to such account or fund and not to expense.

*Abstract of the proceedings of the executive session of the American Street and Interurban Railway Accountants' Association, Columbus, O., October 18, 1906.

A reserve account has this superiority over a reserve fund in providing for depreciation—that stockholders may consider the fund which exists in cash or securities as an actual profit or asset, whereas it merely represents a loss or something which is gone. As a liability the reserve account represents exactly what it should. Whatever, if any, accounting for deterioration is adopted, the rate should be subject to frequent revision as to its accuracy, the most accurate way being by revaluation of assets.

In fact, however, the method in the electric railway has been more often to charge down such asset accounts as are subject to depreciation according to the profit—if good, a large charge; if little, a small charge; if the profits are none, no charge. This is a haphazard way and yields far from a truthful balance sheet, the accounts representing neither cost, actual value, nor a reasonable depreciation charge. The only way this may be considered fair is to make the charge smaller in one exceptionally hard year to be offset by an extra charge in the next year. If, however, a fair percentage of receipts to “charge off” be determined upon, the method of charging to various asset accounts is questioned, as tending to confuse and misrepresent, inasmuch as it does not show the cost value of the various assets. Putting this to the credit of a general reserve account is considered better. The method suggested by Mr. James Dalrymple of Glasgow may overcome the objection to crediting to asset accounts, namely, to show on the report or statement the amount of the actual capital investment, deducting what has been allowed for depreciation, showing the net in a separate column.

Again, in the railway business there are indications that the surplus account is built up or kept at a high level in many cases through the failure to write off sufficiently from the capital value, or failure to keep the capital value at a proper figure by charging betterments to expense or against net income. This, of course, cannot last without introduction of new capital with resulting fictitious balance sheets. That this tendency is fast decreasing is evidenced by the discussion which the general question is evoking from our managers and accountants.

Experience in other industries suggests that, except small roads, railways may properly charge renewals to expense—with proper allowance for value of the replaced—in such departments as need a steady replacement from year to year (such as tracks, poles, wires, cars); while in departments which require replacement only occasionally (such as engines, generators, boilers, buildings), a depreciation charge should be made. On very small roads obviously the renewal of two or three cars in one year would cause a serious drain on net income, and should not be provided for in any one year. There is more need, therefore, for depreciation reserve or fund with the small road than the large.

The practice of having big power station units requires more attention to depreciation of machinery on all roads than would be necessary if the units were small. It is undoubtedly the first department to receive consideration in deciding where to begin with depreciation.

A new corporation has more need of meeting depreciation than one well established. In its first years the wear and tear is going on with very little or no expense for repairs or renewals. As it becomes well established, the expenditures for repairs and renewals become more nearly equal from year to year, and, by applying proper amounts, both repairs and deterioration may be provided for by the actual expenditures.

In case depreciation has been ignored until expenditures must be made for some large renewal, there may be established a suspense account which should then be reduced as rapidly as possible. This method, while legitimate, should not be used unless necessary, since manifestly it treats unfairly owners or stockholders before and after the establishment of the account, to the advantage of those before and to the disadvantage of those after.

If any other individual or corporation is financially interested in the cost of anything produced by the electric railway, for example, a concern buying power, the price determined should certainly allow a reasonable amount for deterioration.

The public should allow sufficient rates for a fair return upon the investment and enough over to maintain an ample surplus after keeping the asset accounts, by depreciation or otherwise, at a figure equal to the value of the assets they represent. Any corporation selling groceries, or one manufacturing clothing, for example, may do this without question, but through some peculiarity of the public mind a public service corporation which succeeds in doing it is regarded as luxuriously rich. The public attitude only too common toward electric railways is to demand more than it is willing to pay for. Clearly this leads to poor service as well as loss for the many investors, owners of the corporation. Electric railway officials have been too prone to bend to this attitude of the public without attempt to show it the unreasonableness of its

position. We should use more care to give the people the exact facts to enable them to see the truth. The public is reasonable if it understands. Any audit or appraisal to be just must allow a fully reasonable amount for depreciation of property as shown by its actual value. This should be done regardless of what policy the company may have pursued with reference to depreciation.

A fund to meet the loss resulting from a suspension of privileges of a short time franchise should be independent of any depreciation fund or account. For this purpose a sinking fund of actual cash or securities should be established, sufficient payments being made to it to secure the return of their investment to the stock and bond holders at the termination of the franchise.

The question of appreciation must also be considered. The authorities on accounting regard it as inadvisable to appreciate because of increase in the value of assets. “Marking up” assets is sufficiently rare as to be almost disreputable. The failure to consider depreciation in the electric railway business would have caused worse results had not the value of nearly all the materials it uses increased in value. For instance a modern car fully equipped, built five or six years ago, is worth as much today, despite wear and tear, as when it was bought. And so with other items. The reason accounting authorities discourage taking advantage of appreciation is that fluctuation of prices may wipe out the appreciation. If it has been allowed for, when prices fall the resulting loss must be charged off; if it is not allowed for, it stands as an actual surplus—a “hidden profit.”

Discussion.

The chair then announced as the subject for discussion: “Does the maintenance of an electric railway at a high standard of efficiency eliminate the necessity of a charge for depreciation?”

C. N. Duffy (Milwaukee Electric Railway & Light) inquired whether “maintenance” as used in this question included “replacement” or “renewal.”

Mr. Wallis said that in his opinion it did not.

Mr. Neal (Boston Elevated) said he construed the question to include the matter of keeping up the property, whether it had been depreciating seven or eight years or not, and perhaps exclude an item like the replacement of a large engine by one of a different character, etc. He would construe “maintenance” very much more broadly and say that unless there is a difference in the value and character of the equipment everything is maintenance. He considered that to keep a high standard of efficiency it was necessary to renew the materials and different parts, and believed that “maintenance” should be considered in a broad sense, although excluding actual betterments.

F. R. Henry (United Railways of St. Louis) said he believed that if maintenance charges covered all renewals there would be no need for a depreciation fund, but maintenance as generally understood did not include a charge for replacement and that no matter how efficiently the property was maintained it would be necessary to provide a reserve for depreciation. His company had such a fund to provide for renewals and replacement and to enable it to proportion the cost properly. He considered that a replacement or depreciation fund was necessary in order that the books should show the actual statement of the business and that it was not fair to the stockholders or to the public to make two statements, one for stockholders which showed no depreciation and a second one for the taxing bodies wherein depreciation was shown. Mr. Henry cited the practice that generally obtained among street railways of capitalizing the cost of reconstruction and said he believed that there must be an end to this continuous capitalization of expenditures to take care of the depreciation of the property, and that the conservative management of the future would require that a reasonable charge for depreciation be made. In his opinion the depreciation charge should be set up monthly and based on a percentage of the gross earnings, as thereby each month and year would be charged with the proportion of this reserve which it could best stand.

W. F. Ham (Washington Electric Railway & Light Company) said he could argue the question from only one stand-

point. He considered that maintaining the property at its highest efficiency meant to spend upon the property all that could be spent in keeping it up to the best standard known to the art. At the end of 10 years there would not have been spent upon the property, assuming it to have been new to begin with, an amount representing the actual deterioration. Such an amount could not be spent because the property was not worn out. At any period there would exist as a liability the value of the wear or reduced life which had resulted from the use of the property and which could not be replaced by maintenance, and for the purpose of meeting this liability a depreciation fund should be provided. Mr. Ham distinguished between the physical property and the value of the franchise and believed it would be desirable to keep these two assets separate on the books.

John I. Beggs (Milwaukee Electric Railway & Light Company and United Railways of St. Louis) addressed the convention and gave some account of the policy which had been followed by him since his connection with the street railways of Milwaukee and St. Louis. He indorsed the position taken by Mr. Ham. Mr. Beggs said that the method followed by him in creating a reserve fund charged against earnings was not popular with the financiers or managers because it did not permit a good showing of earnings to be made, at least in the first few years. Many persons were in the electric railway business not with the intention of keeping the properties as permanent investments, but for the purpose of making a good showing from operation and then unloading. To do this to advantage it is necessary to show earning capacity, as the larger the earning capacity the more profit the promoter could make. He agreed with Mr. Ham as to the need of providing for the wear that commences with the first turn of the wheel over the rail and which was imperceptible at first and might continue to be imperceptible for several years. Mr. Beggs said further that in making replacements he had not added anything to the capital accounts and consequently had succeeded in getting rid of some of the water, which had been injected into these properties in their early days, by a process of gradual evaporation. He cited as an example the replacing of single-truck cars by double-truck cars in Milwaukee. The modern cars he considered worth three times as much for transportation purposes as the old cars, but the cost of the large car was very little more than the original cost of the old single-truck car. In answer to a question by Mr. Duffy Mr. Beggs said that if "replacements" or "renewals" were construed as "maintenance" or "up-keep" of the property there was no need of a further allowance for depreciation, and that he did not consider that the up-keep of the property required an independent open account on the books, such as appeared on the books of his companies. Continuing, Mr. Beggs mentioned the need of an amortization fund which he said should not be confused with the up-keep of the property.

Mr. Ham asked what Mr. Duffy meant by "providing" for maintenance, to which Mr. Duffy replied that if track and equipment were maintained by the replacing or supplanting of worn-out portions the mere physical performance of having replaced, or restored, or substituted, kept the property good and there was no necessity for any further provision for the depreciation of the tangible property.

Mr. Ham stated that he believed Mr. Beggs had misunderstood Mr. Duffy's question because Mr. Beggs had said first that in the case of a new property it was absolutely impossible to make sufficient expenditures on account of maintenance to equal the deterioration that accrued, and that upon Mr. Duffy's putting the question in a different form Mr. Beggs had said that if the property is maintained it is not necessary to provide for depreciation.

Mr. Duffy replied that if property was replaced or restored at the end of a given period when worn out then that kind of maintenance of it had removed the necessity for depreciation.

Mr. Neal read a letter from H. L. Wilson, auditor of the Boston Elevated Railway Company, as follows:

No matter how well property is kept up there must be a certain lessening of value going on all the time. Of course the better the property is maintained the less rapidly does this loss occur. The equipment that is well taken care of may be used for a much longer period and if disposed of will realize a much better price.

Some roads need a depreciation account more than others. Those that need it most are those that have taken the poorest care of their equipment.

I have in mind two large cities, in one of which the equipment is kept up to a high degree of efficiency; in the other some of the equipment has been abused by both the public and the company's employees. The first one has not only kept its property in excellent condition, but has laid by something for depreciation; the second one has done neither. Both pay dividends; the first earns them and a little more; the second is running up a nice deficit, as the rate of dividend is guaranteed. One is honestly capitalized and has charged its expenses conservatively, the other is well irrigated and has treated expenses in a very liberal manner. It will be very hard to make both managements look at this question of depreciation in the same light.

Take a new company that starts out with everything new; for the first year the maintenance expenses are very light, everything is in excellent condition, but there is certainly a depreciation going on, and it is during this time that a certain sum should be set aside. This is desirable for several reasons. An important one is that the owners may get an inflated idea of what a success the road is from the showing of net earnings, and later on when the expenses begin to run up may be disappointed. Naturally, a new road should increase its business as time goes along, and the management might say that in this way the maintenance charges can be provided for. This may be partially true, but, if the business increases, the amount of equipment must increase, and the wear and tear on the property will be greater.

Suppose during the first 10 years a substantial sum is set aside for depreciation, the road prospers and all its property is kept up to a high degree of perfection, and after the 10 years it is able to pay for all renewals and substitutions out of earnings; in a case of this kind the depreciation charges might stop and the sum already provided be allowed to remain as it stands.

Unfortunately we cannot always start with a new proposition, and the question is what can we do with the older companies who have never provided for the day of reckoning. The larger part of such companies have made no provisions for the rainy day, and too many of them have suddenly realized that they were in a precarious condition and did not know which way to turn for assistance. Several have reorganized or scaled down their stock, and others ought to have done so, but they hope they may weather the gale and are struggling along.

The impression that was prevalent a short time ago that an electric railway could not help but be a paying investment anywhere, has proved in many instances to be a mistaken idea, and in practically all instances the business must be handled in the same way that any manufacturing plant must be treated. Years of practice have shown that organizations of this latter kind that have not charged off a depreciation, but have been satisfied to keep their equipment in good repair, have finally got into difficulties, and there is no reason to think that electric railways can escape a similar fate.

There is another way that a certain amount of depreciation may be provided for other than to take out a sum from earnings from time to time and transfer to an account with this title, and that is by charging out direct to expenses the total cost of new equipment purchased to take the place of that disposed of or the cost of reconstruction where the cost of new property exceeds the cost of that which it replaces. I think in most cases where new property costs more than that which it replaces cost when it was new, it has been the practice to capitalize the excess cost.

In fact, there are many instances where betterments are charged that exist only for the reason that it is desired to make a good showing. I know of one instance where cars were rebuilt and 90 per cent of the amount expended was charged to equipment and 10 per cent to operation. If these charges had been reversed it would have been only a fair division, and it would have been perfectly proper to have charged the entire expense to operation.

There is another company (not a railway company) that makes a very fine showing each year by charging

replacements at cost and crediting what is removed at second-hand value. Thus they show a small operating expense, and then they turn about and charge out a fairly liberal sum to a depreciation account. This makes a very handsome report, and they point with pride to the liberal fund they have created.

Mr. Neal said that this letter showed that Mr. Wilson believed in the establishment of a depreciation fund no matter how great the state of efficiency secured by maintenance. As an example he took a case where it is assumed that the entire equipment of a road is eliminated in 10 years and that the policy is adopted of renewing one-tenth of that road every year. There would be one piece of road that was brand new, another that was nine years old, another eight, etc. If at any time the actual condition be computed the road would be found to have but 55 per cent of its new value. He considered that without question something more than a high degree of maintenance was necessary to provide for the other 45 per cent of the physical property. Each item of equipment or construction had a different life in service and it required good judgment in making estimates of life for different kinds of equipment.

A. H. Ford (Ford, Bacon & Davis) said that he wished to congratulate the Accountants' association in taking up the question of depreciation, which was one that had been begged from the beginning. Financiers would not discuss it because a reserve for depreciation might and in many cases would interfere with dividends. He considered that the statements such as those made by Mr. Beggs were of the kind needed to secure proper action by those who had to decide concerning depreciation. The statements of the properties with which he was connected showed maintenance charges equal to about 10 per cent of the gross earnings. This charge was not sufficient to provide for renewals and the properties were wearing out, and the time would come when the present physical equipment would have to be replaced.

Mr. Edwards (New York Edison Company) at the request of the chair gave a summary of the method followed by his company in providing for depreciation. He said that when the subject was first taken up it soon grew beyond any preconceived ideas. After the management had had some years' experience and had made comparative records, it was found that the electric lighting properties were disappearing. The ordinary wear and tear incident to the electric lighting business was but a portion of the decrease in value. The important thing in the electric lighting business Mr. Edwards designated as "supersessional depreciation;" that is, the depreciation in value which comes from the necessity of superseding unexhausted machinery by new and improved types. Mr. Edwards stated that since he had been connected with electric lighting work he had seen six different systems thrown on the scrap heap. He believed that when renewals exceed in value the things renewed the excess should be charged to capital account, because the capital account should show the facts, and an increase in value was as much a fact as a decrease in value would be. He indorsed the policy of providing reserve funds to care for damages, fire losses, etc. Mr. Edwards said that his company did not use the word "maintenance," as it was believed that the term "repair and renewal" was more expressive. He urged the need of including depreciation in the statements of corporations. A statement in which depreciation is neglected invites agitation to secure a reduction in rates charged for the service rendered, because state legislatures and other rate regulating bodies take the position that the company is earning too much money; and in some instances it had been found that they object to admitting the propriety of a charge for depreciation that has not been shown in the regular statements of the business.

Mr. Edwards stated that his company charged to operating expenses one cent per kilowatt-hour for a reserve fund.

The debit was made to "Contingent Expense" account and the credit to "Contingency and Renewal" account. This one cent per kilowatt-hour was the result of experience and was intended to include damages such as might be incident to an earthquake or a great conflagration, ordinary wear and tear, and supersessional depreciation; therefore, the term "contingency and renewal" was used as being broader than maintenance or depreciation.

H. J. Davies (Cleveland Electric Railway) stated that his company had had to confront two propositions at the same time. The first was a suggestion from Mayor Johnson that the company name a price at which the Cleveland Electric Railway would lease or sell its property to a holding company until the time came when the laws of Ohio should authorize municipalities to own and operate street railways: the price to be the present value of the physical property and the estimated worth of its future net earnings during the life of its franchises. The second was an investigation of the property by a committee of the Cleveland chamber of commerce to ascertain what it had cost in the past to carry passengers, and at what rate the present company could afford to carry passengers in consideration of a 20 or 25 year franchise grant. Mr. Davies said that conditions as to street and interurban railway investments in Ohio were very serious. A number of interurban companies had been placed in the hands of receivers—some of them more than once—and others would follow the same course to the disappointment of investors. These financial troubles were because of the failure to provide for renewal of the property as it wore out, making it necessary to assess stockholders or sell bonds when the time for renewal came. In cities where the fare had been five cents or thereabouts, managers and directors of companies, with a view rather to the effect of their reports upon the stock market than to the preservation of their properties, had put out statements showing operating expenses to be about 50 per cent of gross earnings, from which the public could easily and logically argue that since a company was making 2½ cents profit per passenger it could afford to carry passengers for 3 cents. Mr. Davies quoted extracts from his last report to the president of his company as follows:

DEPRECIATION OR RENEWAL RESERVES.

Track Depreciation.—Following the suggestion made in my last annual report, a charge has been made each month to expense, and a corresponding credit to a number of reserve accounts, which we have called "Depreciation Reserves," for wear and tear of track, equipment, etc., in addition to the ordinary repair charges. The rule of the Street Railway Accountants' Association, as expressed in the Standard Classification of Operating Expense Accounts, provides that all expenditures for repairs and renewals shall be charged to maintenance (expense) accounts. This rule, if not incorrectly expressed, is likely to be misinterpreted and misapplied. The rule should provide that there be charged to expense all expenditures for repairs as distinguished from renewals, and, in addition, each month, by way of reserve, a sum large enough to take care of or provide for the wear of the month, this sum to be such a proportion or percentage of the cost of renewal as the month bears to the probable life of the property; so that when a piece of track or equipment is entirely worn out and replacement must be made, a reserve sufficient to pay for the replacement will appear on the books. The reserve and the value of the property ought to equal at any time the cost of replacement. It would be still more accurate and scientific to charge to maintenance expense a certain sum per car-mile run in each month, large enough to cover both ordinary maintenance charges and the month's proportion of the probable cost of renewals, crediting this sum to a "Renewal Reserve" account.

To follow strictly the rule of the association would require that the cost of renewals be charged to expense in the year or month in which the renewals are made, throwing an abnormal burden on the summer months, when track-laying is done, whereas the wear on the track is as great per car-mile run in the winter months as in summer. If, instead of charging the cost of renewal to expense at the time the expenditures are made, the cost be spread over several future months or years, as was our custom until recently,

the subsequent periods will show a much larger maintenance expense than the period immediately following construction. The first few years after construction, if no charge is made for renewal, will show very low maintenance cost; the first few years after renewal, if the cost of renewals is made and spread over a term of years, will show very high cost of maintenance. This method of accounting has deceived stockholders and the public as to the earnings of street railway companies, and as to the cost of carrying passengers. No provision having been made in the early years of operation for renewal reserves or funds, the owners of street railway properties have had to provide additional capital for renewals; and this had led in many cases to over-capitalization. And this process of renewing from new capital has been repeated by some companies several times.

Provisions should be made from the current earnings of the company for depreciation of its property by reason of wear for depreciation by reason of progress and improvements in the arts of manufacture and in methods of operation, and for decrease in the value of franchises due to lapse of time. There is less excuse for neglecting this provision on the part of companies possessing short-time franchises than on the part of those, like the New York and Pennsylvania companies, that have franchises running for 99 or 999 years. But I know of no railway company in the country that is making adequate provisions for this deterioration and depreciation.

Depreciation of Cars.—We own 876 passenger cars. If they were all of our new convertible type, we might be able to do the present business with 800. Eight hundred convertible cars, with trucks, motors, air brakes and other accessories, would cost us now, new, nearly four million dollars. Their life would probably not exceed 10 years. To provide funds for 800 new cars when these wear out, we should, therefore, charge to expense, in addition to expenditures for ordinary maintenance, or, at least, should deduct from income in some way and put in a renewal reserve for cars and motors, nearly \$400,000 per year. As before stated, we charged off \$20,000 for this purpose last year.

Our total depreciation charges amounted to 1.24 per cent of our capitalization of \$31,426,000; to 2.6 per cent of \$15,000,000, Mayor Johnson's estimate of the cost of reproducing the entire property.

Mr. Davies said that 2.6 per cent on this valuation would indicate a life of between 30 and 40 years, which was a ridiculously long estimate.

Mr. Davies discussed two methods in the accounting of depreciation for wear and tear and for renewal of machinery or other property that had been worn out by use or had become obsolete. One of these was to set aside from earnings a fund for renewal or replacement, and the other was to put aside nothing for this purpose, but to divide all surplus earnings among stockholders and then put up new capital for the reconstruction of the plant. If in the case of a street railway with a short-term franchise the latter method had been followed and within the life of its franchise the company had earned good dividends and had also returned to the stockholders the entire amount of their investments less the value of the physical property, at the end of the term the company ought not to expect the public to be eager to make a new contract under which the company might earn good dividends not only upon the cost of a new plant but also upon the cost of the worn-out plant, in addition to getting back the cost of the new plant from year to year as it depreciated. He considered that it was not fair to the public to renew the plant by the investment of new capital and to expect to earn dividends upon double capital, unless there has been a failure to earn upon the original investment. Also, it was not fair to one management to charge to maintenance the cost of renewing a plant which had been worn out or partially worn out by another management which had not provided for renewals.

Mr. Davies considered the better plan to be to provide from current earnings for renewals that must be made within the life of the company's franchise. While renewal charges probably should be less in the earlier years than in the later years, because the business was less, a renewal charge proportional to the work done by the plant should be made. He considered that the charging of depreciation to expense was in accordance with the standard classification of expense accounts recommended by the association,

and drew an analogy between the method followed by most companies in creating accident reserves by charges to expense account No. 33 (Damages). He believed that a charge to provide for repairs and renewals based on a unit of service or output—the car-mile, the car-hour or the kilowatt-hour, for instance—was better than a charge based on the inventory of value and the estimated life. According to the classification of accounts recommended by the association there should be charged to maintenance each month the cost per unit, not alone of keeping the track and cars in running order, but also the cost of renewing track and equipment, the amount so charged to maintenance accounts to be credited to a depreciation reserve. All expense of ordinary repair and renewals should be charged to the depreciation or reserve account, the balance to the credit of the account representing all that portion of the property that had disappeared by wear or rust or otherwise. That balance of the depreciation reserve account and the value of the property at any time should equal the original capital cost. Mr. Davies suggested, in lieu of this, that ordinary repairs might be charged to the appropriate expense accounts and then enough additional charged to these accounts to bring them up to the several sums per unit which had been determined to be the cost of repairs and renewals, depreciation being then one of the subdivisions of each maintenance account.

Mr. Wallis spoke of the effect of the Massachusetts law which required that the railroad commissioners fix a price, in their opinion the market value of the stock, at which new stock might be issued, and suggested that in case a company in this way sold stock at a premium of \$40 or \$50 a share, this premium could be used to provide for depreciation.

Mr. Davies called attention to two recent publications on depreciation, references to which he desired to have included in the record. These were a paper by G. W. Bissell, professor of mechanical engineering, Iowa State College, on "The Depreciation of Electrical Properties," read before the Iowa Electrical Association and published in the *Electrical Age* for June, 1906, and an editorial in the *Electric Railway Review* for August, 1906.

C. L. S. Tingley (American Railways Company) said that the necessity for a depreciation account or reserve—that is, some provision other than the current charge for maintenance—is more apparent with a small property than with one in a large city, because on the smaller road a larger proportion of track and of equipment would reach the limit of usefulness at the same time. He considered it imperative that small companies provide month by month and year by year for taking care of the contingency of renewal when it should arrive.

After considerable discussion as to the language in which the sense of the meeting should be recorded, the following resolution was adopted:

"That the maintenance of an electric railway at a high standard of efficiency does not eliminate the necessity of a charge for depreciation unless the word 'maintenance' is construed to cover a sufficient charge set aside for future replacements of depreciated property."

An especially handsome private car is now being turned out by the Cincinnati Car Company for W. Kesley Schoepf, president of the Indiana Columbus & Eastern Traction Company. The car will be finished in solid mahogany and will have a combination parlor and dining-room, library, kitchen, lavatory and observation platform, the latter to be inclosed in glass. The car will be 60 feet long over all, 8 feet 8 inches wide and 13 feet 4 inches high, and will weigh 40 tons.

It is estimated that 100,000 people visited Coney Island last Sunday, April 14, most of them traveling over the lines of the Brooklyn Rapid Transit Company. The regular season at the resort will not begin until May 11, when Dreamland and Luna Park will open.

ARTISTIC TROLLEY POLES IN DENVER.

The trolley poles which are used on Sixteenth street, Denver, were designed in accordance with the ideas of the Art Commission of the City and County of Denver. The plan to use combination ornamental trolley and light poles was first suggested by Robert W. Speer, mayor of Denver. His idea was to have ornamental poles support both arc lights and trolley wires. Mr. Speer requested the art commission

Artistic Trolley Poles in Denver—Effect of New Poles.

to select the most graceful and artistic design available which would fill the desired purpose.

The Denver City Tramway Company removed the old trolley poles and furnished the steel tubular poles which are set in concrete on the curb lines. The city furnished and placed the outside ornamental cases and the Denver Gas & Electric Company furnished the electric lights and wires for the lights. The poles are attractive and the effect is pleasing, both by night and day.

For the following description and the accompanying illus-

trations, we are indebted to Henry Read, the chairman of the art commission.

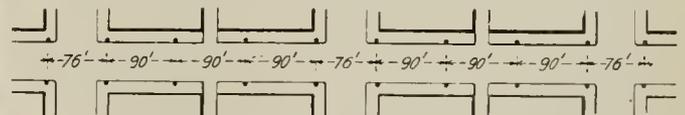

The standard trolley pole consists of an inner wrought-iron pole with an outer cast-iron casing. This construction was necessary because, on account of the strain of the span wire, the Tramway company was unwilling to be responsible for a complete cast-iron standard. The strain and the resulting curvature were carefully measured on existing poles. The Tramway company was obliged to have the poles set at a slight angle and these conditions compelled the use of a more cumbersome casing than was at first contemplated. All inner poles were of the same height, but heavier poles were used at street intersections to provide for the additional strain at the curves. The following are the specifications for the two styles of poles:

Street intersection poles—One piece 8-inch extra heavy, 21 feet long; one piece 7-inch extra heavy, 12 feet long, swedged 24 inches at joint; one piece 6-inch standard, 5 feet long, swedged 36 inches at joint.

Inner poles—One piece 7-inch extra heavy, 21 feet long; one piece 6-inch extra heavy, 11 feet long, swedged 24 inches at joint; one-piece 5-inch standard, 5 feet long, swedged 36 inches at joint.

The third section in each case is designed for the double purpose of providing a receptacle over which the casting that supports the wire can slip, and for reinforcing the pole down far enough to permit the insertion of eye-bolts through the double thickness at a point 21 feet from the sidewalk for a straight line span wire. The other point of attachment for wires on curves, etc., is 24 feet from the sidewalk and this attachment passes through the double thickness.

The inside poles are set in the ground 7 feet below the sidewalk and the others are set 6 feet below the sidewalk.

Artistic Trolley Poles in Denver—Showing Location of Poles on Street.

The manner in which the standards were set is shown in the accompanying plan. Eight standards in each block are set on the curb, and those which are placed at street intersections are 2 feet outside of the lot line of the transverse streets. The blocks are 286 feet in length, including 16-foot alleys. The streets, including the sidewalks, are 80 feet in width. Multiple alternating-current enclosed arc lights are used. Only the outer light is used, so that a single line of lights is presented. No other poles are used now on Sixteenth street in Denver. The installation has been entirely successful.

ELECTRIFICATION ON THE LONG ISLAND RAILROAD.

In the annual report of the Long Island Railroad Company for 1906, the president, Ralph Peters, refers as follows to the progress of improvements and electrification:

The section of your line between Springfield Junction and Valley Stream was electrified, thus completing a loop service from the Far Rockaway branch to the Old Southern road, which is the short line between Jamaica and Springfield Junction. This makes a total of about 100 miles of single track now operated by electric third rail. Its workings during the year have been very successful and the service has been reliable and efficient in every respect; and, while it has not yet been economical, owing to the fact that your power is not fully employed, it has materially increased your passenger traffic.

Plans are being prepared for the electrification of your lines from Long Island City to Port Washington and to Whitestone Landing; and as soon as the tunnels under the East river are completed, your lines will be electrified to Jamaica and to Woodhaven Junction, via the Glendale cutoff, a connection between the main line of your company, the Montauk division and the Rockaway Beach division. Plans are also being made for an enlarged terminal at Jamaica, where the change from steam to electric locomotives will be made.

The Long Island Consolidated Electrical Company has

completed the acquisition of a one-half interest in the New York & Long Island Traction Company and in the Long Island Electric Railway Company, and has also purchased during the year the Babylon Railroad, a small line in the village of Babylon. The company has also planned the construction of a cross-island line from Huntington to Babylon via Farmingdale and Amityville, and the necessary franchises for this extension have been secured. It is proposed to obtain the funds for this purpose through the sale of the electrical companies' bonds, guaranteed by your company.

DEDICATION OF THE ENGINEERING SOCIETIES BUILDING.

The building of the Engineering Societies, the gift of Andrew Carnegie, at 29 West Twenty-ninth street, New York, was dedicated during the present week. The exercises began on Tuesday, April 16. The proceedings were opened by a prayer by the Rev. Dr. Edward Everett Hale, chaplain of the United States senate. Communications were read from the president of the United States, the president of the republic of Mexico and the governor-general of Canada. Charles F. Scott, president of the American Institution of Electric Engineers and chairman of the conference and building committee, gave a historical address, in which he related how the gift had been made by Mr. Carnegie and the steps which had been taken leading to the construction of the building, which was now for the first time turned over to the three societies—the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Institute of Mining Engineers. On behalf of the United Engineering Societies, which is the holding organization, E. E. Olcott, president, accepted the building. He was followed in an address by Mr. Carnegie, in which he referred to the good results which were brought about by the co-operation of societies devoted to associated lines of work. He said that whenever men unite and try to do good, unification takes place, but wherever they conspire against the public good they find themselves unable to trust each other and they therefore fail. In this he saw great hope for the future.

An oration was delivered by Dr. Arthur T. Hadley, president of Yale University, who had chosen for his subject "The Professional Ideals of the Twentieth Century." In the course of this he said:

A serviceable public opinion can only be formed when intelligent people, technically trained for different lines of life, seriously try to find out how their work can be made to meet the public needs. They are the only ones who can do this well. If it is done by anybody else it will be done badly. If the lawyers as a class try to keep the law in line with the demands of intelligent public opinion we can get good law. But if lawyers are content to see the law perverted to private ends and judges take refuge in technical construction of precedents without full regard to the needs of the existing situation legislatures will step in to create a chaos of conflicting laws which are worse than no law at all.

If our engineers get their own minds clear and get the public mind clear as to the political economy of the properties intrusted to their charge and the ethics of their management they can forestall those conflicts which now threaten to break out at every moment. There are three professions today which do not regard themselves as servants, but as masters—the financier, the journalist and the politician. If the engineer and the lawyer accept positions as servants it is not simply a confession of inferiority, it is a dereliction of public duty.

In the evening a joint reception was held, the receiving parties consisting of the presidents of the three societies and later each society held a reception in the rooms which had been assigned to them. The entire building was open for inspection.

On April 17 the exercises were continued, consisting of addresses by Dr. Samuel Sheldon, president of the American Institute of Electrical Engineers; Dr. F. R. Hutton, president of the American Society of Mechanical Engineers; and Dr. J. Hays Hammond, president of the American Institute of Mining Engineers. Medals for distinguished services were presented to Ralph W. Pope, Frederick R. Hutton and Rossiter W. Raymond, secretaries and past secretary of

the several societies. Presentation of the John Fritz gold medal to Alexander Graham Bell was made by Charles S. Scott, chairman of the John Fritz medal board of award. Dr. James Douglas, past president of the American Institute of Mining Engineers, delivered an oration upon the subject of "Ethics of Secret Processes in the Arts."

PLAN FOR SETTLEMENT OF INTERLINE ACCOUNTS.

The Central Accounting Conference has adopted a plan for the settlement of interline freight and ticket accounts. It is provided that settlement for all interline way-bills shall be made by the receiving road.

In a report of the initial meeting which was held in Dayton, O., on March 2, received from Mr. C. B. Baker, freight auditor of the Western Ohio Railway Company, Lima, O., who is secretary of the conference, it is stated that it was thought best to use the word conference in the title, rather than association, as the latter might be misunderstood and the purpose of the gatherings misconstrued. The secretary was directed to request auditors and other accounting officers of all electric lines in the territory which were not represented at the meeting, to become members of the conference and to attend the next meeting in Indianapolis on June 1. It is not expected that the meetings will last longer than one day and as they are to be held in centrally located points the time spent in attending them will not be great.

The conferences are intended to be informal gatherings for the purpose of interchanging thoughts on accounting matters and to discuss the best methods of handling the accounts of electric lines in the hope that a uniform method may prevail. It is believed that many of the differences between the various lines can be adjusted to advantage through the meetings of the conference.

The plan for settlement of interline freight accounts and ticket accounts, which, it is expected, will be followed by all lines wherever practicable, is as follows:

Interline Freight Accounts.

Interline billing shall cover the movement of freight and express shipments between such points and over such lines as may be agreed upon between the accounting departments of the respective lines.

It is understood that when shipments covered by interline billing move over more than two lines the forwarding line shall furnish to the intermediate line or lines, daily, copies of all way-bills moving over such lines or line.

Settlement for all interline way-bills shall be made by the receiving line.

A report of all interline way-bills received shall be rendered by the receiving line on or before the fifteenth day of the succeeding month and shall include all way-bills received during the month for which the report is rendered; the original report, accompanied by a division statement showing the apportionment of earnings between all lines interested, shall be mailed to the forwarding line, and legible copies of such reports and division statements shall be mailed to all intermediate lines interested. The report and division statement as rendered by the receiving line shall be accepted as a basis for settlement and all errors or omissions shall be taken up by correspondence with the receiving line and adjustment shall be made in the succeeding month's report.

The receiving line is responsible for the collection of proper revenue on all way-bills received and shall correct the freight earnings on all way-bills to the basis of current rates and divisions and should issue correction sheets to all lines at interest, reporting the way-bill on monthly abstract at corrected figures; but no changes may be made in the advanced charges or total prepay of any way-bill received, until authority for the change is obtained from the forwarding line.

If errors occur in the advanced charges or total prepayment shown on way-bills, the receiving line should make a request to the forwarding line for authority to correct and, as soon as authority is received, issue correction sheets to all lines at interest accordingly.

As soon as interline abstracts have been exchanged between lines for each month, and not later than the twenty-fifth day of the succeeding month, the debtor line shall for-

ward a voucher in favor of the creditor line for the balance due on interline billing for the previous month.

It is understood that the debtor line shall not wait for any bill or notice from the creditor line before making the voucher.

It is desirable to settle interline billing each month and the voucher should show the month for which settlement is made. If more than one month's interline billing is settled by one voucher, the balance for each month should be shown separately on voucher, so that the creditor line may properly handle the amount in its accounts.

It is expected that all lines will promptly reply to all communications relating to differences in interline abstracts, so that adjustment of all errors may be made whenever possible in the following month's account.

Interline Ticket Accounts.

Ticket reports shall be rendered monthly covering all ticket sales over foreign lines and the line selling tickets shall apportion earnings to all lines at interest.

Ticket reports shall be rendered as soon after the close of each month as possible, not later than the fifteenth day of the succeeding month, and the reports as rendered shall be accepted and all differences handled by correspondence and included in the subsequent report.

As soon as ticket reports for any month have been exchanged, and not later than the twenty-fifth day of the succeeding month, the debtor line shall forward a voucher in favor of the creditor line for the balance due on interline tickets for the month for which the report is rendered, without waiting for a bill or notice from the creditor line.

It is desirable to settle interline ticket accounts monthly, but if more than one month is included in the voucher, the amount for each month should be specified to enable the creditor line to properly handle the payment.

It is understood that interline excess baggage will be included in ticket reports and settlements.

CLEVELAND RAILWAY DELIVERS ULTIMATUM.

The Cleveland Electric Railway Company has formally thrown down the gantlet to Mayor Johnson and the 3-cent fare promoters. At the meeting of the city council on Monday night, April 15, the company presented a communication signed by President H. E. Andrews by order of the board of directors, in which it is declared that the company will cease operating over the Central avenue and Quincy street lines at midnight on April 23 and unless a purchaser approved by the council takes over the fixed property on those lines before that date it will proceed forthwith to tear up its tracks. Since January 7, when the decision of the supreme court declared that the franchises on those lines had expired on March 22, 1905, the company has been operating under a temporary agreement by which the city was to receive any surplus over cost of operation at 3-cent fares. The company now states that operation at 3-cent fares has resulted in a loss. The communication to the council follows:

The operation of these lines under the temporary arrangement made with the city, under which a fare of three cents has been charged and transfers given, has not returned to the company the cost of operation, taxes and depreciation, but has subjected, and is now subjecting, the company to an actual loss in operation. This being the situation, the company cannot longer consent to operate upon these terms.

In this connection, we remind your honorable body that the decision of the supreme court determining that the franchises of this company had expired upon Central avenue and Quincy street was rendered January 7, 1907—more than three months ago. The object of the temporary arrangement, which was made to operate at three cents, was for the accommodation of the public, to the end that you might have a reasonable time to determine what the public interests required as to a permanent arrangement with reference to the operation of these lines. Up to this time, we are not advised of any disposition on your part to make a grant to this company upon these lines, but, as we understand your attitude, you propose turning over these routes to some other company, not giving to us even an opportunity to bid upon the same. We beg to advise you that this company cannot longer afford to operate the lines at the present rate of fare thereon charged, and that it will, at midnight of April 23, 1907, discontinue such operation.

We beg also further to advise you that this company is

willing to turn over its fixed investment in these lines to a purchaser approved by the council, at a reasonable valuation, provided such purchaser accepts this offer and makes payment for such property on or before said April 23, 1907. Unless the property can be so transferred by that date, we ask permission of the city to remove the property of the company from these streets.

The council will please understand that this action is taken only because, in the judgment of the board of directors of the company, it seems the only course of conduct proper for the company in the circumstances; but it is not intended as in any way modifying the offer which this company has heretofore made to accept a renewal of its franchises on these streets with a rate of fare of seven tickets for a quarter, including liberal transfer privileges to cross-town and other lines. This offer, which has heretofore related to the entire system, we now renew as to the Central avenue and Quincy street lines in question.

This action of the company was entirely unexpected. The mayor immediately urged the passage of a resolution requesting the company to name at once a valuation of the property so that the council could proceed to find a purchaser. He insinuated that the Cleveland Electric had purposely made the operating expenses on the lines in question as high as possible, by putting on too many cars to permit the showing of an earning.

The council then adopted a resolution taking a recess until 10 a. m. on Tuesday and requesting the Cleveland Electric to attend the meeting by an accredited representative, prepared to inform the council what the property consists of that it desires to sell and what it deems the fair value of such property. Another resolution was passed calling upon the Forest City Railway Company "to proceed at once to prepare to operate its street railroad in Central and Quincy avenues in accordance with its grant, and to operate at once upon the suspension of operation by the Cleveland Electric Railway Company."

At the council meeting on Tuesday morning the Cleveland Electric presented a communication signed by President Andrews, refusing to deal with the city council in regard to the price of the property. The communication was as follows:

After passing a resolution designating the Forest City as the proper company to negotiate with the Cleveland Electric, and giving the Cleveland Electric permission to remove its tracks, in case no agreement is reached, under the direction of the board of public service, the council adjourned until Thursday morning.

In the afternoon Mr. du Pont conferred with Mr. Andrews and endeavored to make the latter name a price and specify just what property the company would sell. Mr. Andrews, however, refused to open negotiations until the Forest City Railway Company furnished the directors with a satisfactory guarantee of its financial ability to pay for the property. Mr. du Pont then sent to the Cleveland Electric directors a communication protesting against the action of Mr. Andrews and offering in behalf of the Forest City Railway Company to buy the tracks, poles, trolley, span and feed wires in place on Quincy avenue, Central avenue, east of East Ninth street, and East Ninth street from Central avenue to Prospect avenue for the sum of \$149,993.19 cash, to be paid on April 23 at 12 o'clock at the Citizens' Savings & Trust Company on delivery of a good marketable title to the property and an agreement of the Cleveland Electric not to harass or interfere with the enjoyment of it for street railway purposes directly or indirectly. He also offered to buy a car house and cars if a price could be agreed upon and requested an answer by noon on Friday, April 19.

The Cleveland Electric directors on Wednesday refused the offer of the Forest City company of approximately \$150,000 for the property on Central and Quincy avenues, promising to designate later a price at which it would sell.

President du Pont on the same day issued orders to make preparations for the operation of the lines by the Municipal Traction Company. The Low Fare Railway also began laying tracks on Sumner avenue in accordance with a notification sent to both of the other companies on April 11.

MUELLER CERTIFICATES WOULD EXCEED CHICAGO'S CONSTITUTIONAL DEBT LIMIT.

A decision against the Mueller law, which provided for an issue of \$75,000,000 certificates for the purchase of the property of the Chicago street railways, was rendered by the Illinois supreme court at Springfield on April 18. The court holds that the issue of these certificates would make the indebtedness of the city exceed the constitutional limitation. Unless a new plan for raising money is devised, the city will therefore be unable to purchase the Chicago City Railway and Chicago Railways (Union Traction) properties, as proposed in the new ordinances.

The decision has raised the question whether the new Chicago charter, which is under consideration by the Illinois legislature, should contain the provision giving the city the right to issue public utility certificates to "be payable solely out of the revenues or income to be derived from the public utility property for the acquisition of which they were issued."

The decision, which was rendered by Justice John P. Hand, states in part:

Without the right to those who purchase at foreclosure sale to operate the street railways for 20 years from the date of purchase the certificate holder would have only a lien on the rails in the street and other equipment of the street railway, which would be of little value without the right to operate said street railways in the streets of the city. By the trust deed or mortgage proposed to be executed by the city to secure the payment of said street railway certificates, in case of its foreclosure and a sale under the foreclosure decree, the city would lose the right itself or through its grantees or licensees to use its streets for the period of 20 years from the date of the foreclosure sale for street railway purposes, and also the compensation which it receives, as license fees or otherwise, from their tracks, the surrender of which rights would entail upon the city not only the loss of the control of its streets for street railway purposes for 20 years, but would deprive it of many hundred thousands of dollars which would be paid into the treasury during that period by street railways as compensation for the use of its streets upon its streets upon which they operate their street car lines.

The supreme court therefore reverses the decree of the circuit court and remands the case to that court with directions to overrule the demurrer to the bill of complaint.

Progress of Reorganization.

George W. Wickersham and Lewis C. Krauthoff, attorneys for the New York stockholders in the Chicago Union Traction Company, have been in Chicago in consultation with the local interests. The plan for reorganization which they have drafted has been submitted to P. S. Grosscup, judge of the United States Court at Chicago. When the plan has been approved by the various interests concerned its details will be made public. It is announced that as the reorganization of the company is so near, Judge Grosscup will not appoint a successor to James H. Eckels, one of the receivers of the Union Traction Company, who died on April 15.

The New York stockholders of the company have been requested to deposit their shares with the Central Trust Company of that city. The committee is composed of J. N. Wallace, president of the Central Trust Company, Alfred Skitt, John W. Castles, James Jourdain, Robert M. Galloway and H. B. Hollins. The call states that the benefits of the new ordinance are available through a deposit of stock, both common and preferred, to an amount specified in the ordinance; and that a plan of reorganization is to be formulated, and prompt action is essential to secure proper representation and consideration of the rights of stockholders in the preparation and adoption of the plan. Deposits will be received up to and including May 15, 1907.

Beginning on April 18 transfers were exchanged between the Chicago City Railway Company and the Chicago General Railway Company. The latter company operates a line in Twenty-second street from Cottage Grove avenue west to Crawford avenue, with feeder lines in Kedzie and Ashland avenues, Throop street and in Lawndale. The new ordinance

requires the use of part of the Chicago General lines for through routes and the Chicago City Railway Company conceded the transfer privilege. The Chicago General company is making plans for new equipment with the idea that its traffic will be largely increased by the new arrangement.

Bion J. Arnold has been in New York City this week and no announcement as to the two other members of the board of supervising engineers has been made. The new cars which are to be used on the Chicago City Railway and the Chicago Railways (Union Traction) lines, are so much wider and larger than the cars which were in use when the present tracks were constructed that in the plan for the new track the space between the tracks will be increased.

Formal acceptance of the ordinance, together with a bond for \$100,000, was filed with the city clerk by the Chicago City Railway Company and the Chicago City Railroad Company on April 15.

AMERICAN STREET AND INTERURBAN RAILWAY ASSOCIATION COMMITTEES.

In addition to the committees of the American Street and Interurban Railway Association for carrying on the work during the present year, which have already been published in previous numbers of the Electric Railway Review, the following have been appointed:

Promotion of Traffic.

W. E. Harrington, president Pottsville Union Traction Company, Pottsville, Pa., chairman.

Howard F. Grant, manager Seattle Electric Company, Seattle, Wash.

H. E. Reynolds, assistant general manager Boston & Northern Street Railway Company, Lynn, Mass.

H. J. Crowley, general manager American Railways Company, Philadelphia, Pa.

G. W. Parker, general express and passenger agent Detroit United Railway, Detroit, Mich.

Subjects.

Richard McCulloch, assistant general manager United Railways of St. Louis, St. Louis, Mo., chairman.

Ernest Gonzenbach, general manager, Sheboygan Light Power & Railway Company, Sheboygan, Wis.

R. E. Danforth, general manager Public Service Corporation, Newark, N. J.

C. L. S. Tingley, second vice-president American Railways Company, Philadelphia, Pa.

H. H. Adams, superintendent shops United Railways & Electric Company, Baltimore, Md.

B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

Car Wiring.

John W. Corning, electrical engineer Boston Elevated Railway Company, Boston, Mass., chairman.

C. B. King, general manager London Street Railway Company, London, Can.

L. P. Crecelius, superintendent Public Service Corporation, Newark, N. J.

Hugh Hazelton, electrical engineer, 32 Park place, New York.

I. D. Shipper, The J. G. Brill Company, Philadelphia, Pa.

Insurance.

H. J. Davies, secretary Cleveland Electric Railway Company, Cleveland, O., chairman.

A. H. Ford, vice-president Birmingham Railway Light & Power Company, New York, N. Y.

R. B. Stearns, general manager Chicago & Milwaukee Electric Railroad, Highwood, Ill.

Charles O. Kruger, second vice-president Philadelphia Rapid Transit Company, Philadelphia, Pa.

G. L. Estabrook, secretary and treasurer East St. Louis & Suburban Railway, Philadelphia, Pa.

Public Relations.

John B. Parsons, president Philadelphia Rapid Transit Company, Philadelphia, Pa.

W. Cary Ely, president Ohio Valley Finance Company, Buffalo, N. Y.

Jere C. Hutchins, president Detroit United Railway, Detroit, Mich.

Henry A. Robinson, general solicitor New York City Railway Company, New York.

E. C. Foster, president New Orleans Railway & Light Company, New Orleans, La.

News of the Week

Philadelphia Enabling Act Approved.

Governor Stuart of Pennsylvania has approved the Fahey bill, an act enabling the city of Philadelphia to enter into contracts with the Philadelphia Rapid Transit Company, which was passed by the legislature at the instance of the retail merchants' association of Philadelphia. Before Governor Stuart signed the bill he heard members of the Trades League of Philadelphia in opposition to the measure. The league representatives charged that the provisions of the enabling act were in direct conflict "with the vital and fundamental principles of modern municipal progress" and would place the city of Philadelphia at a serious disadvantage with other American cities for 999 years. The Trades League is in danger of disruption because of its attitude on the traction situation. In the last month 13 influential organizations, including bankers, business houses and manufacturers, have withdrawn from its membership.

Seeks Interchange of Freight with Steam Roads.

The Grand Rapids Grand Haven & Muskegon Railway of Grand Rapids, Mich., an electric line operating between the towns named in its title, and handling through freight for Chicago, under an arrangement with the Goodrich Transportation Company, which operates in the great lakes, is seeking to make prorating agreements with the steam roads. Mr. S. L. Vaughan, traffic manager, advises us that he has written to the several trunk lines west of Chicago asking them to concur in tariffs he was about to publish, naming the all-rail rates and all-rail percentages as a basis. Several lines notified him that they had general concurrences filed with the interstate commerce commission covering the issuance of such tariffs. Later on, evidently discovering that the Grand Rapids line was an electric line, some of the roads wished to be eliminated from such tariffs, but the concurrence in a tariff is effective for 40 days before a non-concurrence takes effect. Mr. Vaughan was advised that at a recent meeting of the Western Trunk Line Association it was agreed not to participate in such through rates. The company then filed an informal complaint with the interstate commerce commission. The Grand Rapids shippers are anxious for through service and at a recent meeting of the transportation committee of the board of trade a resolution was passed asking the interstate commerce commission to give the company's complaint careful attention.

Chicago Employees Refuse Wage Increase.

The motormen and conductors of the Chicago City Railway Company, which operates the south side lines of the city, have refused to accept the increase of wages promised by the company before the election in case the settlement ordinances should pass and which the company on April 12 announced that it was willing to make effective as of April 1. Division 260 of the Amalgamated Association of Street Railway Employees of America held a mass meeting on Saturday night, April 13, and decided not to make a new contract with the company, in place of the present contract, expiring on June 31, unless the employees of the elevated roads of the city and of the Chicago Union Traction and Consolidated Traction companies, operating on the north and west sides of the city, are assured a similar increase. The rate of wages under the present contract, which was made after the strike of 1903, is 19 cents per hour for the first six months' service, 24 cents per hour for the following six months, and 25 cents per hour thereafter. On March 29 the company offered an increase, conditional on the passage of the ordinances, to 23 cents for the first three months, 25 cents for the following nine months, and 27 cents thereafter, and on April 12, after the election, President Mitten announced that the company stood ready to grant the increase, effective as of April 1, with an extension of the contract to July 31, 1908. Increases were also offered to men employed on cinder, supply and sprinkler cars, who were not included in the original promise.

The conference board of the Union Traction employees met on April 17 and decided to demand a scale of 33-1-3 cents an hour and a nine-hour day. The Union Traction and the City Railway companies have both paid the same scale since the men organized six years ago.

Rapid Transit Affairs in New York.

The rapid transit commission on April 11 received two bids for the construction of the first section of the subway loop to connect the Brooklyn and Williamsburg bridges, the section between Canal and Pearl streets, about one-half mile long. The Degnon Contracting Company submitted a bid of \$2,952,000 for the subway construction and \$83,000 for the pipe galleries. The bid of the Cranford Contracting Company of Brooklyn was \$3,775,000 for the subway and \$50,000 for the pipe galleries. This section will take two years to build and work is to begin within 60 days from the awarding of the contract. The contract would have been awarded to the Degnon company, but for the fact that there were only four members of the commission present at the meeting, while six votes, or a majority of the board, were needed. Action was therefore postponed until Thursday, April 18.

A flow of water in the subway at One Hundred and Fifteenth street and Lenox avenue, although combated energetically by the Interborough Rapid Transit Company for weeks, has assumed more dangerous proportions than ever and on April 15 it became necessary to shift the northbound trains to the southbound tracks between One Hundred and Tenth and One Hundred and Twenty-fifth streets, which resulted in a serious congestion. In the construction of the subway under Lenox avenue, trouble was met in the form of an underground stream, which ran out of the Harlem Mere in a westerly direction. Eight feet of concrete, heavily covered with

waterproofing and tarred paper, were laid to protect the tracks, but they kept the subway dry only for a time. Water began to seep in several months ago. Serious trouble has been avoided by the use of pumps, but no method of restraining the flow has yet been ascertained.

Legislation Affecting Electric Railways.

Missouri.—Bills substantially alike have been introduced in both houses to provide for the regulation of public service corporations by the state railroad and warehouse commission. The principal provision is as follows: "That all cities, towns and villages in this state shall have power and authority, by ordinance, to regulate and fix, within the city limits, the rates and charges for their respective service, commodity or other thing of value of all telephone companies, telegraph companies, street railway companies, electric light companies, gas companies, water companies, refrigerating companies, heating companies, subway or conduit companies, tunnel and viaduct companies and all other companies, corporations and persons owning or operating any public utility or utilities under franchise granted by the state or any municipality thereof, and to provide and enforce penalties and fines for the violation thereof. Provided, however, that any such rate or charge so fixed must be a reasonable one and shall not be changed oftener than once in every 12 months."

New York.—A bill introduced by Assemblyman Sheridan provides that any street surface railroad company may remove its tracks from a street provided the board of railroad commissioners certify that the tracks to be removed are not required for the convenience of the public. The bill further provides that such a company may also, with the consent of the mayor, discontinue the operation of cars over any portion of its road whenever the railroad commissioners shall certify that the operation of cars thereon is unnecessary for the convenience of the public by reason of the operations of other lines. It is also provided that such removal of tracks shall not impair the validity of the company's franchise. The bill is intended to enable the New York City Railway to remove some of its unused tracks, which have been a subject for complaint.

Pennsylvania.—The house on April 10 voted to reconsider the Fahey bill, which it had defeated the day before. The bill makes it necessary, before a charter can be granted for a new line or an extension, for the company to first obtain the right of way from the municipalities through which it proposes to build. The bill is in the hands of the committee on electric railways.—The Homsher bill, granting the right of eminent domain to electric railways, was passed by the house on April 11. As amended on second reading the bill provides that all companies taking advantage of the law shall be common carriers of express matter and light freight.—Governor Stuart on April 15 signed the McNicol-Fahey bill, which is intended to make possible the retail merchants' plan for reorganizing the Philadelphia Rapid Transit Company, by enabling municipalities to make contracts with electric railway companies operating within their limits for the purchase of the lines at an agreed price, and to secure representation on the directorates of such companies.—The committee on municipal corporations has reported a bill which empowers common pleas courts to declare the forfeiture of the rights and privileges of public service companies for failure to keep agreements with the city or to perform any of their corporate functions or obligations.—The Homsher trolley freight bill was passed by the senate on April 16 by a vote of 40 to 0 and sent to the governor. The bill provides: "That the right and privilege to do an express business, and to transport and carry farm produce, garden truck, milk, merchandise and other light freight and property upon, along and over all street railways, and to charge and collect a reasonable compensation therefor, is hereby extended to, and conferred upon, all street railway companies, including every kind of street railway, suburban street railway, or interurban street railway, whether their lines of railway are to be and are maintained either at the surface or above or below the surface of the earth, and by whatever power their vehicles are to be and are transported, and upon all companies, duly authorized to become the lessees or operators of such railways, heretofore or hereafter incorporated, under the laws of this commonwealth, even though the said street railway companies may have been heretofore restricted as to the kind of power to be employed, or in such transportation or may have been forbidden to transport freight or other property." In conclusion the bill provides that the transportation of express matter by trolley companies shall be subject to reasonable regulations of the local authorities, and that these regulations shall be subject to the supervision of the courts.

Electric Freight Rights Granted.—The Massachusetts railroad commission has granted certificates of public necessity and convenience for the carrying of freight to the Blue Hill Street Railway, the Newton & Boston Street Railway and the Newton Street Railway.

Wage Increases.—The Chicago South Bend & Northern Indiana Railway of South Bend, Ind., has announced an increase in wages for conductors and motormen from 17½ to 19 cents per hour.—The Grand Rapids (Mich.) Street Railway has increased the wages of its conductors and motormen from 18, 19 and 20 cents per hour to 20, 21 and 22 cents per hour, according to length of service.—The Columbus Railway & Light Company has increased the wages of its conductors and motormen ½ cent per hour.—The Louisville & Northern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company have announced an increase of wages for conductors and motormen, effective on May 1. The men on the interurban and suburban lines will receive 20 cents per hour for the first two years and 22 cents per hour thereafter. The men employed on the city lines will receive 17½ cents per hour for the first two years and 19½ cents thereafter.

Construction News

RECENT INCORPORATIONS.

Blue Valley Railway Company.—Incorporated in Missouri to build and operate an electric railway. Capital stock, \$100,000. Incorporators: Alexander Massey, John Georgen, Edwin L. Browne, Joseph S. Chick, Jr., and Willard E. Winner.

Carlyle & St. Louis Railway.—Incorporated in Illinois to extend the East St. Louis & Suburban Railway system from Lebanon, Ill., eastward to Carlyle, Clinton county, 25 miles. The road will parallel the Baltimore & Ohio Southwestern from East St. Louis to Carlyle, with principle office at Carlyle. Capital stock, \$5,000. Incorporators: Thomas E. Ford, Carlyle; J. C. Eisenmayer, Trenton; B. H. Helmann, Aviston; August J. Kluthe and Henry Hu-mert, Breese, Ill.

Greenfield Bernardston & Northfield Street Railway.—Incorporated in Massachusetts to build an electric railway from Greenfield to Northfield. Capital stock, \$75,000. Incorporators: John Wilson, Lester A. Luey and Archibald D. Flower of Greenfield; John W. Chapin and Everett E. Benjamin of Bernardston; and Charles H. Webster of Northfield.

Tampa & West Coast Railway.—Incorporated in Florida to build a railway, probably an electric one, from Tampa to Clearwater and St. Petersburg, Fla., about 40 miles. A franchise has been secured from the county commissioners. Capital stock, \$300,000. Incorporators: J. N. Holmes, C. B. Ware and J. Craig Phillips of Tampa, Fla.

Waterbury & Milldale Tramway Company.—Incorporated in Connecticut with \$300,000 capital stock to build an electric railway through Waterbury, Wolcott, Cheshire and Southington.

Windsor Locks & Western Street Railway.—Incorporated in Connecticut with \$100,000 capital stock to build an electric railway from Windsor Locks to East Granby.

FRANCHISES.

Cheyenne, Wyo.—Parks Bros., bankers, of Kansas City, Mo., have applied for a franchise to build an electric street railway system through the business section of Cheyenne. They agree to have the line in operation inside of 90 days and have deposited a certified check of \$10,000 as a guarantee to carry out the agreement.

Decorah, Ia.—The Minneapolis Rochester & Dubuque Traction Company, at a special election on April 12, was granted a franchise for the use of several streets in Decorah. The line must be in operation within two years. William P. Mason, secretary, Minneapolis, Minn.

Elkins, W. Va.—The city council has granted a franchise to the Elkins Electric Railway, which proposes to build a street railway in Elkins. The company has deposited a bond of \$5,000 to insure the completion of the line in 12 months. C. W. Maxwell of Elkins is interested.

Galena, Kan.—The Southwest Missouri Railroad of Webb City, Mo., through A. H. Rogers, president, has applied for a franchise for an outlet from Galena for a line to Baxter Springs, Kan.

Hamilton, O.—The Cincinnati Northern Traction Company has secured a franchise from the county commissioners to take up its old tracks between Hamilton and Middletown and lay a new double-track line between the two cities.

Kansas City Springfield & Southern Traction Company.—This company, which proposes to build an interurban line from Nevada to Springfield and other points, is seeking right of way from Carthage to the county line, about 20 miles.

Lima, O.—A franchise has been granted by the county commissioners to the Indiana Columbus & Eastern Traction Company for the operation of its Lima-Bellefontaine extension in Allen county.

Milwaukee, Wis.—A franchise has been granted to the Chicago & Milwaukee Electric Railroad for the use of Wells street as far east as Second street for the operation of its cars. This is an amended franchise to one granted to the company about a year ago and some opposition was raised on the ground that the "exclusive right" clause in the franchise would bar other companies from entering Milwaukee over the viaduct. As the railroad company will pay \$80,000 for the construction of the viaduct it refused to accede to the demand that a competing company be allowed to use the same tracks. The franchise finally was passed with two amendments regarding the opening of two streets to other lines, provided these lines give the Chicago & Milwaukee company reciprocal rights or pay a reasonable sum for the use of the tracks.

Mt. Vernon, O.—The 25-year extension to the franchise of the Mt. Vernon Electric Railway, which recently was granted by the city council, has been vetoed by the mayor on the ground that provision regarding payment by the company to the city for this privilege has been omitted in the instrument.

Sapulpa, I. T.—Schmidt & Reynolds have been granted a franchise for an electric line from Sapulpa to the oil fields, eight miles.

Silvis, Ill.—A 50-year franchise has been granted to the Moline Rock Island & Eastern Traction Company for a single or double track line in Silvis. Four months' time is allowed in which to

finish laying the tracks after acceptance of the franchise. The rails already have arrived in readiness to begin construction work.

TRACK AND ROADWAY.

Ardmore Street Railway.—Work has begun on the construction of the street railway in Ardmore, I. T.

Asheville & Hendersonville Railroad.—C. F. White, Skyland, N. C., writes that this company proposes to build an electric railway from Asheville to Hendersonville, N. C., 22 miles. Surveys are being made. C. E. Van Bibber, 60 Wall street, New York, chief engineer.

Atlanta Buford & Gainesville Railway.—H. D. Jaquish of Gainesville, Ga., president, states that work will begin this summer, probably in June, on the proposed line to connect Atlanta, Norcross, Buford, Cumming and Gainesville, Ga., which will be about 80 miles long.

Augusta & Columbia Railway.—James U. Jackson, vice-president, states that the surveys for this line from Aiken, Ga., to Columbia, S. C., 59 miles, have been completed and it is proposed to begin construction at once. J. A. Wills of Augusta is chief engineer.

Barberton Doylestown & Orrville Railway.—It is reported that Cleveland capitalists have signed a contract to finance and build this proposed line from Barberton to Orrville, O. The cost is estimated at \$400,000 and the work is to be completed in 18 months.

Bath Branchport & Hornell Electric Railroad.—A hearing on the application for a certificate of necessity to build this road from Bath to Branchport, N. Y., was held on April 9 before the New York railroad commission. Among the witnesses were John F. Tuerk, president, and Fred Hastings of Bath, secretary. Several business men of towns on the proposed route testified as to the necessity of the road. The hearing was adjourned until April 23.

Baton Rouge Electric & Gas Company.—Work on the reconstruction of this property has been started by Stone & Webster of Boston, Mass. The entire line of about four miles is to be rebuilt with 90-pound rails and several extensions will be built.

Bayou Teche Railway & Light Company, New Orleans, La.—Surveys have begun for the street railway in New Iberia, La., and the interurban line to Jeanerette. H. R. Fine of New Orleans, who will have charge of the construction work, has announced that all of the construction material has been ordered and that work will begin at once. P. M. Schneidau, New Orleans, is president.

Beaumont, Tex.—An engineer named Sanders, representing Ft. Worth interests, is reported to have completed surveys for an electric line from Beaumont to Port Arthur, Tex., 19½ miles.

Belmont Electric Railway.—The Riggs & Sherman Company of Toledo has been engaged to make surveys and estimates for this proposed line from St. Clairville, O., to Wheeling, W. Va.

Buffalo & Rochester Traction Company.—The application of this company for a certificate of public necessity for its line from Buffalo to Batavia and Rochester, N. Y., has been denied by the state railroad commission, on the ground that the territory is now adequately provided with transportation facilities. The company has already secured much of the right of way for the line and, it is stated, will probably appeal to the appellate division of the supreme court.

Buffalo Lockport & Rochester Railway.—Paul Iglehart, division superintendent for J. G. White & Co., who has a contract for building this road between Rochester and Lockport, N. Y., 54 miles, writes that two-thirds of the roadbed has been completed and 10 miles of track laid. The route includes South Greece, Spencerport, Brockport, Holley, Albion, Knowlesville, Medina and Middleport. The overhead construction will be of the span type in towns and of the center pole type outside of towns. Five substations and one car barn are now under construction. The power house will be of 3,200 kilowatts capacity, generating 60,000-volt, 3-phase, 25-cycle current. Maximum grade, 1½ per cent; maximum curvature, 7 degrees; weight of rails, 70 pounds. All contracts have been let. C. B. Hill, Buffalo, N. Y., president; Edmund Wragge, Toronto, Can., chief engineer. The headquarters are at Toronto, Can.

Charleston & Summerville Electric Railway.—The first 15 miles of the grading on this line from Charleston to Summerville, S. C., has been graded ready for tracklaying. The site for the power house has been selected and work on the foundations is to begin in a few days.

Chicago & Milwaukee Electric Railroad.—The MacArthur Brothers Company of Chicago has been awarded a contract for some very heavy steam shovel work near Milwaukee, Wis. The work is being commenced and is expected to last all season. Thomas Dixon, Lake, Wis., is superintendent for the contractors.

Chicago South Bend & Northern Indiana Railway.—It is reported that Henry Schaal, right of way agent, has secured about three-fourths of the right of way for the line between South Bend and Michigan City, Ind. The route as finally selected runs about five miles north of Laporte.

Cincinnati Northern Traction Company.—Judge Murphy of Hamilton, O., has handed down two decisions in suits brought to determine the manner in which the company shall cross the tracks of the Pennsylvania and the Cincinnati Hamilton & Dayton at Coke Otto and north of Trenton on its new route between Hamilton and Middletown, O. The court decided that overhead crossings should be built and ordered that the expense, amounting to \$40,000,

be divided equally between the companies affected, but assessed the cost of maintenance on the traction company.

Citizens' Railway, Lincoln, Neb.—This company expects to build about seven miles of extensions within the city limits of Lincoln, Neb., besides an interurban line to Havelock, about 4½ miles. Work on the city lines has already been started.

Columbus & Northern Traction Company.—This company, which has purchased the Columbus Urbana & Western Electric Railway, which has a line about eight miles long, running north out of Columbus, O., will soon begin making surveys for an extension north to Lima or Bellefontaine. W. H. Ogan of Indianapolis is interested.

Columbus, O.—Work has been started on the electric road which S. B. Hartman is building from South Columbus to his stock farm, south of the city. A large force of men has been put to work and it is expected that construction will proceed rapidly.

Corbin & Nashville Railroad, Somerset, Ky.—It is reported that this company has let contracts for building the line from Tateville to Monticello, 25 miles, and that work will start in the near future.

Denver, Colo.—It is reported that St. Louis, Mo., capitalists are interested in a proposed road to connect Denver and Colorado Springs, Colo., and that as soon as arrangements can be made for a connection with the Denver City Tramway a franchise will be applied for.

Des Moines Winterset & Creston Electric Railway.—It is now stated that 90 per cent of the right of way has been secured for this line from Des Moines to Creston, Ia., and that financial arrangements are being made with the expectation of beginning construction by June 1. B. Schreiner, Des Moines, chief engineer.

Duluth, Minn.—It is reported that an electric railway is being promoted to connect Duluth with Ft. Frances, New Ontario, on the Rainy river.

East Shore & Suburban Electric Railway, Martinez, Cal.—This company has commenced the extension of its line along the Bay shore to Point Orient. It is stated that the road will be in operation within 90 days.

Ellwood City & Hazel Dell Railway.—C. J. D. Strohecker, president, Zellenople, Pa., writes that this company, recently incorporated, proposes to build an electric line from Beaver Falls to Ellwood City and New Castle, Pa., 20 miles. The preliminary arrangements are now being made. George B. Nye of Zellenople, secretary.

Elmira Corning & Waverly Railroad.—G. Tracy Rogers of Binghamton, N. Y., president, is quoted as saying that the line will be completed between Elmira and Waverly by June 1 provided the company is successful in securing the remainder of the right of way. Work on the line between Elmira and Corning has been discontinued, for the reason, it is stated, that the status of public service corporations under the proposed "public utilities" bill is too uncertain to permit of further expenditures of capital.

Enumclaw, Wash.—Surveys are being made for an electric line from Enumclaw to Auburn, Wash. S. Knickerbocker and J. J. Smith are interested.

Evansville, Ind.—Tillman Bethell of Henderson, Ky., is said to be interested in two proposed lines from Evansville, one to Uniontown, Ky., and one to Owensboro, Ky.

Ft. Smith (Ark.) Light & Traction Company.—This company has recently completed an extension on Catholic avenue to Hawthorne place.

Fresno Traction Company.—This company is reported as planning to build five or six miles of extensions in different parts of Fresno, Cal.

Helena Light & Railway Company.—A carload of steel rails has arrived from the Carnegie Steel Company, which will be used in extensions on State and Lawrence streets, Helena, Mont. This is the first shipment of a large order of rails.

Henderson Traction Company.—This company, recently incorporated to build street railways in Henderson, Ky., has organized by electing the following officers: President, Henry P. Barret; vice-president, J. Henry Lyne, and secretary and treasurer, Charles E. Dallam, all of Henderson. The directors are: Henry P. Barret, J. Henry Lyne, C. E. Dallam and B. G. Witt of Henderson; C. C. Tennis, Pittsburg; C. A. Hinch and W. F. Boyd, Cincinnati.

Honesdale & Hawley Electric Railway.—Surveys are being made for this line from Honesdale to Hawley, Pa., via White Mills.

Illinois Traction Company.—Tuttle Brothers of Decatur, Ill., who recently were awarded the contract for the Springfield-Jacksonville line, have also been awarded a contract for the grading on the Decatur belt line, which is to be built this summer. The first of the material for the new bridge over the Sangamon river east of Decatur, on the Champaign-Decatur line, has been delivered by the Decatur Bridge Company. The bridge will have four spans, each 45 feet in length, and two spans, each 20 feet in length. A deep cut will be made between the bridge and Decatur.—General Manager L. E. Fischer of Danville has announced that the line between Lincoln and Mackinaw will be built next and will be completed by fall.—It is expected that a meeting of the directors will be held at an early date to determine upon plans for the bridge across the Mississippi to St. Louis. The plans for the location have not yet been approved by the secretary of war. It has been persistently reported during the past few days throughout the state that the company was planning a line from St. Louis to Kansas City. We are officially advised that the company has taken no action in regard to such a line.

Indiana Columbus & Eastern Traction Company.—Vice-president Norman McCl. Crawford and General Manager J. L. Adams recently inspected the route of the Bellefontaine-Lima extension and Mr. Crawford stated that construction would begin on May 1. All of the right of way has been secured and surveys have been completed. J. C. Carland of Toledo has the contract.

Indianapolis Newcastle & Toledo Electric Railway.—E. E. Stevens, secretary, announces that the exceptionally fine weather has advanced the completion of the line between Indianapolis and Newcastle at least one month. The roadbed is now ready for the ties and rails and the power house is almost completed. If equal progress is made during the next month the line will be in operation between Indianapolis and Newcastle by June 1. This line is being very carefully and substantially built and it is the purpose of the company to handle a heavy freight traffic.

Lewiston Augusta & Waterville Street Railway.—This company has let a contract to Gore Brothers of Boston, Mass., for the construction of nine miles of electric road from Sabattus to Mechanic Falls, Me., of 21 miles from Sabattus to Gardiner, and 21 miles from Augusta to Waterville, the construction of the last line to be conditional on the success of the company in securing right of way. The entire contract calls for the expenditure of about \$800,000.

Milwaukee Northern Railway, Port Washington, Wis.—W. A. Comstock of Detroit, president, states that the company expects to open its line between Milwaukee, Port Washington, Cedarburg and Grafton, Wis., on July 4.

Minster Loramie & Southern Railway.—The Riggs & Sherman Company of Toledo has been engaged to make surveys and estimates for this proposed line from Minster to Versailles, O., 16 miles. R. B. Anderson of Wapakoneta, O., is interested.

Mississippi Southern Railway, New Albany, Miss.—This company has employed a corps of engineers to make a survey of the proposed road from Gulfport to West Point.

Missouri Interurban Railway, Sedalia, Mo.—A contract has been awarded to the Bell Construction Company of Indianapolis, Ind., for building this line from Sedalia to Jefferson City, Mo., about 80 miles. Work is to begin on May 15 at Ottaville and will be pushed in both directions. J. D. Starke of Saleville, Mo., is president, and B. W. Colby, St. Louis, chief engineer.

Mountain Copper Company.—This company has just completed the construction of an electric railway line from Boulder, Colo., to the Hornet mine for the transportation of ore.

Niagara St. Catharines & Toronto Railway.—This company's extension from St. Catharines to Fonthill, Ont., 12 miles, was opened for traffic on April 15. The line will probably be extended to Welland and Ridgeville during the summer. E. F. Seixas, general manager, St. Catharines.

Northern Ohio Traction & Light Company.—The Barberton-Wadsworth line was formally opened on April 13.

Northwestern Ohio Electric Railway.—It is reported that preliminary agreements for the financing and construction of this line from Defiance to Montpelier, O., via Bryan, have been made and that contracts will be signed in a few days. The line will be 34 miles long and it is estimated will cost \$30,000 per mile. Construction is to begin on May 1. It is proposed to issue \$1,000,000 of bonds. The road is being promoted by E. C. Bell and J. W. Weadcock of Toledo; Mayor John Crowe, Dr. R. A. Rigrish and J. H. Hockman of Defiance. The home offices of the company will be at Defiance.

Omaha Lincoln & Beatrice Electric Railway.—Fifty carloads of rails are now being delivered for the tracklaying between South Omaha and Sarpy City, Neb. The grading on this section has already been completed.

Parkersburg Marietta & Interurban Railway.—It is reported that this company, which now connects Parkersburg, W. Va., and Marietta, O., proposes to extend its line this summer up the Muskingum river, from Rainbow to Beverly. Surveys are being made. J. P. Horstman, chief engineer, Parkersburg.

Petersburg, Va.—A movement is on foot and a committee has been appointed to secure funds for building an electric railway connecting the Norfolk & Portsmouth Traction Company's lines with the Richmond & Petersburg Electric Railway.

Philadelphia & Western Railroad.—It is stated that arrangements are being made to turn over this road to the operating department about May 1. The road extends from a connection with the Philadelphia Rapid Transit Company's elevated line at Sixty-third and Market streets, Philadelphia, to Wayne, Pa.

Pittsburg & Butler Street Railway.—This line was completed from Butler as far as Etna, Pa., on April 12. The road will soon be in operation between Pittsburg and Butler.

Puyallup Valley Northern Transit Company.—The Continental Engineering-Constructing Company, 50 Broadway, New York, has been awarded the contract for building this line from Tacoma to Seattle, Wash. The officers of the company are: President, Fred J. Chamberlain; secretary, John Mills, both of Puyallup, Wash., where the offices of the company are located.

Rochester Corning & Elmira Traction Company.—President Meders has announced that work on this line from Rochester to Elmira, N. Y. will begin in 60 days. It is now planned to build a branch from Dansville to Hornell.

Salem Street Railway.—Judge Harter of Salem, O., has denied an injunction applied for by property owners on Broadway to

restrain the Salem Street Railway from operating cars on Broadway under a franchise owned by the Youngstown & Ohio River Railroad. It is stated that the case will be appealed to the circuit court. If the decision is sustained the Salem Street Railway will form a link in the Youngstown & Ohio River line from Youngstown to East Liverpool.

Schoenectady (N. Y.) Railway.—This company expects to open its line between Saratoga and Ballston, N. Y., on June 1.

Silver Belt Electric Railway.—This company has been organized at Montreal, Que., and proposes to build an electric line from Latchford to Cobalt, Halleybury and New Liskeard. Branches will also be run into various mining camps. Harvey Graham is president and Mr. A. J. Young one of the directors.

South Bethlehem & Saucon Street Railway.—This company, which, it is stated, will soon begin work on its line from South Bethlehem to Center Valley, Pa., has elected officers as follows: President, Charles P. Hoffman of South Bethlehem; and directors, William H. Lauer of South Bethlehem, O. H. Wieand, Thomas Mulligan, P. F. Cannon of Allentown, and C. P. Hoffman of South Bethlehem.

Southern Illinois Traction Company.—This company, which has located an electric railway from Murphysboro, Ill., through the coal belt, touching Carbondale, Herrin and Johnson City, has awarded a contract for building the line between Herrin and Johnson City to McCann Brothers. Work is to begin May 1.

Springfield (Mass.) Street Railway.—It is reported that this company will spend \$60,000 in laying double tracks and making other improvements in Long Meadow, Mass.

Toledo & Indiana Railway.—The circuit court at Auburn, Ind., on April 9 decided a suit involving a dispute between this company and the Toledo & Chicago Interurban Railway Company, in regard to the ownership of a right of way between Waterloo and Butler, Ind., in favor of the Toledo & Chicago. Following this decision it is reported that the company has made arrangements with the St. Joe Valley Railway, a projected road which has secured a right of way from Butler to Robinson Park, about 10 miles north of Ft. Wayne, whereby the latter company will build the road and make a traffic agreement with the Toledo & Indiana Railway.

Union Traction Company of Kansas.—Work has been commenced on the stringing of the trolley wire between Independence and Coffeyville, Kan., and only about six miles of rails remain to be laid. The line is expected to be in operation by June 1. D. H. Siggins, president, Independence, Kan.

United Railways of St. Louis.—This company has started work on 20 miles of proposed reconstruction work in St. Louis.

Washington Railway & Power Company.—This company has ordered five miles of 60-pound rails for the first part of the street railway in Vancouver, Wash. The company also proposes to build an extensive system in the vicinity of Vancouver, including lines to Washougal and to Proebstel, which are to be built as soon as the city line is complete. W. H. Moore of Portland, president.

West Chester (Pa.) Street Railway.—This company will rebuild all of the overhead work on its line through Coatesville, Pa., and work is to begin at once. The material is on hand.

Winona Interurban Railway.—The Whitley (Ind.) county commissioners have authorized an election for May 7 for the purpose of voting on a subsidy of \$30,000 for the projected line from Winona to Ft. Wayne.

York County Traction Company.—Plans have been completed for the construction of the proposed extension from York to Hanover, Pa., about 20 miles. The contract for building the line from Bear's Station to Hanover, 15 miles, has been let to Dodge & Day of Philadelphia, and for the section from Bear's Station to York, five miles, to John L. Dobbins of York. W. F. Bay Stewart of York is president; L. C. Mayer of York, chief engineer.

POWER HOUSES AND SUBSTATIONS.

Bay City (Mich.) Traction & Electric Company.—It is announced that this company will spend about \$125,000 to build a new power house, which will be fitted with steam turbines, boilers and all necessary auxiliary machinery.

Denver City Tramway.—This company has placed an order with the Westinghouse Electric & Manufacturing Company for a 2,000-kilowatt turbine unit, to be erected about July 1.

Grays Harbor Railway & Light Company.—It is announced that this company began the work of clearing the site for its new power house at Hoquiam, Wash., on April 10. The cost of the power house will be about \$200,000. Details of the equipment have been given in a previous issue.

Indiana Columbus & Eastern Traction Company.—It is reported that this company is preparing to build two new substations, one at Etna, Ind., and the other on Licking switch.

Montreal Street Railway Company.—This company, it is announced, has placed an order with the Canadian General Electric Company for three storage battery units, to be installed at the St. Henri, St. Denis and Maisonneuve substations. These batteries are at present being installed and it is believed that they will have a marked influence on improving the street railway facilities, as well as reducing the cost of operation of the plants.

Personal Mention

Mr. W. K. Ball has resigned as superintendent of shops of the Tacoma Railway & Power Company, Tacoma, Wash., to engage in other business.

Mr. A. J. Connelley has been appointed chief inspector of the Louisville (Ky.) Railway Company, succeeding Mr. Frank M. Tucker, resigned on account of ill health.

Mr. J. F. Heyward has resigned as manager of the Cincinnati Traction Company to become president and general manager of the Citizens' Traction Company, Oil City, Pa.

Mr. J. W. Parker, who has been connected with the Springfield Troy & Piqua Railway, Springfield, O., since its organization, has resigned his position as superintendent to engage in other business.

Mr. William H. Brown, secretary and treasurer of the Springfield Consolidated Railway, Springfield, Ill., has been appointed secretary of the Peoria (Ill.) Gas & Electric Company, succeeding Mr. J. M. Robb, resigned.

Mr. Samuel Cross has resigned as superintendent of repairs and tests of the Interborough Rapid Transit Company, New York, to devote his time to the Cross-Lachance Electric Company, of which he is president and general manager.

Mr. S. L. Vaughan, whose photograph is presented herewith, has been appointed traffic manager of the Grand Rapids Grand Haven & Muskegon Railway, with headquarters at Grand Rapids,

S. L. Vaughan.

Mich., as reported in the Electric Railway Review of April 6, 1907. Mr. Vaughan, who is now 42 years of age, is a graduate of the Plattsburg, N. Y., high school. In 1881 he removed to Michigan, and after learning telegraphy, became an employe of the Chicago & West Michigan Railway, with which company he remained in various capacities for 20 years. In 1901 he was appointed Michigan agent for the Barry Transportation Company, operating a line of steamers on Lake Michigan, between Muskegon, Grand Haven and Chicago, with office at Grand Rapids, Mich. In the spring of 1902 he was appointed general freight and passenger agent of that company, with office in Chicago. In April, 1906, he was appointed auditor and general accountant of the Grand Rapids Grand Haven & Muskegon Railway, which operates a system of about 50 miles, connecting the cities named in the title, and handles through freight to Chicago in connection with the Goodrich Transportation Company. His appointment as traffic manager becomes effective on April 15.

Miss R. Boydland has been appointed general accountant for the Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich., succeeding Mr. S. L. Vaughan, recently appointed traffic manager. Miss Boydland entered the service of the company about three years ago as stenographer.

Mr. E. V. McGrath has resigned as assistant general passenger and freight agent of the Toledo Urban & Interurban Railway, with headquarters at Bowling Green, O. Until October, 1906, Mr. McGrath was soliciting freight and passenger agent of the Indiana Columbus & Eastern Traction Company at Springfield, O.

Mr. Blaine Gavett of Saginaw, Mich., effective on April 15, was appointed superintendent of the Kalamazoo Lake Shore & Chicago Railway of Kalamazoo, Mich. Mr. Gavett formerly was connected with the passenger department of the Pere Marquette at Detroit and more recently with the Saginaw division of that road as trainmaster.

Mr. Frank M. Tucker has resigned his position as chief inspector of the Louisville (Ky.) Railway on account of ill health, effective on April 1. Mr. Tucker has been connected with the company for more than 30 years, 20 of which have been spent as inspector and chief inspector. Mr. Charles C. Ostrander, formerly assistant to Mr. Tucker, will be his successor.

Obituary.

James H. Eckels, one of the receivers of the Chicago Union Traction Company, died in Chicago on April 14. At the time of his death Mr. Eckels was president of the Commercial National Bank of Chicago, a director of the Chicago Union Traction Company and of the Allis-Chalmers Company, besides being prominently connected with various financial institutions. In 1893 he was appointed comptroller of the currency of the United States under President Cleveland.

Financial News

Boston Elevated Railway.—This company has filed a petition with the Massachusetts railroad commissioners for approval of an issue of \$5,800,000 bonds. The proceeds of the bonds will provide funds for construction, equipment and the purchase of real estate. The company has also asked for authority to issue \$8,000,000 additional capital stock to meet the cost of construction and equipment of the new Cambridge subway.

Central California Traction Company, San Francisco.—The California Safe Deposit & Trust Company of San Francisco offers the first mortgage 5 per cent bonds of this company at 97½ and interest. The bonds are due on April 1, 1936. Of the total issue of \$1,500,000 there have been issued \$500,000, and the balance are reserved for further extensions and improvements. A sinking fund is provided of \$15,000 annually for the first 10 years, \$30,000 a year for the ensuing 10 years and \$45,000 a year for the remaining four years. The company was organized, the circular says, to construct and operate an interurban system for passenger and freight traffic in the central valleys of California, having as its initial point the city of Stockton, thence extending north about 50 miles to Sacramento, forming the first division of the system. Franchises in the cities of the system run for 50 years. All rights of way, other than those obtained in the cities, are the company's private property. The company's line in Stockton is finished and in operation, and consists of 10 miles of track, with 65-pound steel rails, power houses and car barns. About a mile of track has been graded in a northerly direction toward Lodi, outside of the city limits. This has been installed at an approximate cost of \$200,000, paid for by stockholders. The company now proposes to construct the road to Lodi, 14 miles from Stockton. The cost of this work and equipment will be about \$350,000. The electric power is furnished by the American River Electric Company, which is installed in Stockton and in Sacramento. It is expected by the company that freight and passenger traffic connections will be made with the Western Pacific Railway and the Atchison Topeka & Santa Fe.

Cincinnati Northern Traction Company, Cincinnati.—The annual report for 1906 compares as follows:

	1906.	1905.	1904.
Gross earnings	\$1,027,728	\$847,229	\$703,796
Expenses, construction, etc.....	799,603	764,819	655,864
Net earnings	\$ 228,125	\$ 82,410	\$ 47,932
Other income	463	122	93
Total	\$ 228,588	\$ 82,532	\$ 48,025
Charges	95,892	77,860	79,926
Surplus	\$ 132,696	\$ 4,672	*\$31,901

*Deficit.

Cleveland (O.) Electric Railway.—The directors have declared a quarterly dividend of three-fourths of 1 per cent on the \$23,400,000 capital stock. In 1906 quarterly dividends of 1¼ per cent were paid. From 1901 to 1905 the rate was 4 per cent per annum. The reduction is attributed to the decrease in earnings resulting from the company's experiment in selling seven tickets for 25 cents, which has now been abandoned.

Columbus Delaware & Marion Railway, Columbus.—At the annual meeting of stockholders at Columbus on April 16 the following directors were elected: John G. Webb of Springfield, O.; George H. Holzbog of Jeffersonville, Ind.; O. M. Gottschall of Dayton, O.; N. J. Catrow of Miamisburg, O., and H. B. Hanc of Marion, O.

Coney Island & Brooklyn Railroad.—The New York railroad commission, in granting authority to this company to increase its capital stock from \$2,000,000 to \$3,500,000, stipulated that only \$1,000,000 of the new stock may be issued without further action of the commission. The proceeds of the new issue will be applied to improvements.

Galveston (Tex.) Electric Company.—The annual report of this company, which has been filed with the secretary of the city of Galveston, shows that the gross receipts in 1906 from fares and sale of tickets were \$274,459. From light there was received \$36,107; from power, \$3,568, and from other income, \$900. The agreement between the company and the city of Galveston provides that whenever the gross income of the company from passenger fares and tickets shall amount to \$300,000 per annum or over, the city shall have the right to pass appropriate ordinances requiring the railway company to furnish transfers to passengers who may be compelled to use two lines of the company in order to reach their destinations.

Hudson (N. H.) Pelham & Salem Electric Railway.—A decree of foreclosure and sale against this company under a suit started by the New York Trust Company, as trustee of the first mortgage bonds, was entered at Concord, N. H., on April 8 by Edgar Aldrich, judge of the United States circuit court. The company is controlled by the New Hampshire Electric Railways Company.

Kalamazoo Lake Shore & Chicago Railway, Kalamazoo, Mich.—This company has leased from the Pere Marquette Railroad for 25 years from April 15 the South Haven & Eastern branch, extending from South Haven to Lawton, Mich., a distance of 37 miles. The rental is \$1,500 a month for the first five years and increases for the balance of the term. The lessee pays all taxes and maintenance charges. The Kalamazoo Lake Shore & Chicago was completed in 1906 from Kalamazoo to Paw Paw, Mich.

Lewiston (N. Y.) & Youngstown Frontier Railway.—A majority

of the \$134,000 capital stock of this road has been acquired by the Niagara Gorge Railroad Company of Niagara Falls, which has operated the road under a short-term lease.

Louisville (Ky.) Traction Company.—At the meeting of stockholders of this company in Jersey City on April 13 an increase in the common capital stock from \$12,000,000 to \$15,000,000 was authorized.

Pittsfield (Mass.) Electric Street Railway.—This company has been given authority by the Massachusetts railroad commission to issue \$100,000 first mortgage 4 per cent bonds, due on July 1, 1923. The proceeds will be used to retire floating debt and for new construction.

Puget Sound Electric Railway, Tacoma, Wash.—A new issue of \$1,000,000 convertible 5 per cent notes, dated on February 1, 1907, and due February 1, 1912, has been authorized, and \$500,000 of the notes are offered by Boston bankers at 94¾ and interest, yielding about 6¼ per cent. The notes are convertible at par from February 1, 1909, at the option of the holder into 6 per cent preferred stock.

Rutland (Vt.) Railway, Light & Power Company.—The following report is made of operations for the year ended on March 31, 1907, of the Rutland Street Railway, which is controlled by this company:

	March 31, 1907.	March 31, 1906.	Increase.
Gross earnings	\$105,154	\$93,726	\$11,428
Operating expenses	56,003	55,370	633
Net earnings	\$ 49,151	\$38,356	\$10,795

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis.—This company has given a trust deed to the Fidelity Trust Company of Philadelphia, trustee, to secure an issue of \$10,000,000 bonds, maturing on April 1, 1932. The company has formally acquired the property of several of the constituent companies, as contemplated in the plan outlined in the Electric Railway Review of March 30, 1907, page 440. The property of the Indianapolis Coal Traction Company, the Indianapolis & Western Railway and the Indianapolis & Eastern Railway was purchased. The property of the Indianapolis & Northwestern Traction Company and the Indianapolis & Martinsville Rapid Transit Company was leased for 999 years. The Indianapolis & Northwestern Traction Company has outstanding \$2,470,000 bonds out of \$3,000,000 authorized, and \$450,000 preferred stock out of \$1,000,000 authorized. The new company assumes the payment of 5 per cent interest on bonds, and also 6 per cent dividends on the preferred stock, payable quarterly, beginning in June, 1908. On the \$750,000 outstanding bonds of the Indianapolis & Martinsville Rapid Transit Company the new company guarantees 5 per cent interest.

United Railroads of San Francisco.—The Wall Street Journal publishes the following statement concerning the cost of betterments and improvements: "Telegraphic advices from the United Railroads of San Francisco state that the company has had to face an expenditure due to the earthquake and strike and for betterments and improvements from March 1, 1906, to March 1, 1907, amounting to \$4,294,271. This had all been provided for, so that the company on March 1, 1907, had current liabilities amounting to \$2,310,209, against which it had current assets of \$2,177,410. In addition to this it had sold securities which were delivered in March that netted it an amount in excess of \$900,000, and still left in its treasury over \$2,500,000 of its 4 per cent consolidated bonds. It is claimed that by the sale of securities the \$4,294,271 above mentioned has been provided at a cost not exceeding 5 per cent interest."

West Shore Traction Company.—The New York state railroad commission has given authority to this company to increase its capital stock from \$2,500,000 to \$5,000,000 and to issue \$900,000 first mortgage bonds. The company will build an electric road from Carteret, N. J., to Tompkin's Cove, N. Y.

Winnipeg (Man.) Electric Railway.—The earnings for the year 1906, with a comparison, are as follows:

	1906.	1905.
Gross earnings	\$1,416,305	\$1,119,768
Net earnings	714,341	544,021
Fixed charges	251,038	119,570
Dividends	248,668	200,000
Balance	214,635	194,451
Total surplus	761,538	546,052
Passengers carried	17,229,554	13,081,249
Capital stock outstanding on December 31	\$4,575,200	\$4,000,000
Bonds outstanding	5,400,000	3,500,000
Due Bank of Montreal	331,912	918,904

Dividends Declared.

- Cleveland (O.) Electric Railway, quarterly, three-fourths of 1 per cent.
- Columbus (O.) Railway, preferred, quarterly, 1¼ per cent.
- East St. Louis (Ill.) & Suburban, preferred, quarterly, 1¼ per cent.
- Grand Rapids (Mich.) Railway, preferred, quarterly, 1¼ per cent.
- Milwaukee Electric Railway & Light Company, preferred, quarterly, 1½ per cent.
- Twin City Rapid Transit Company (Minneapolis), common, quarterly, 1¼ per cent.
- West Penn Railways (Pittsburg), preferred, quarterly, 1¼ per cent.

Manufactures and Supplies

ROLLING STOCK.

Southern Street Railway, Chicago, is figuring on a number of new cars.

Iowa & Illinois Railway, Clinton, Ia., is considering the purchase of one additional freight car.

Schenectady Railway, Schenectady, N. Y., is reported as contemplating the purchase of 16 large cars.

Sacramento Electric Gas & Railway Company, Sacramento, Cal., is building 14 cars at its Sacramento shops.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia., is asking prices on six new open cars for early delivery.

El Paso Electric Railway, El Paso, Tex., has placed an order for four interurban cars and four open cars for delivery about June 1.

Douglas Street Railway, Douglas, Ariz., recently placed an order with the American Car Company for two 38-foot semi-convertible cars.

Southeastern Ohio Railway Light & Power Company, Zanesville, O., has ordered one work car from the Jewett Car Company. This will have a 4-motor equipment.

Oregon Water Power & Railway Company, Portland, Ore., has under construction at its Portland shops 10 box cars, to be 40 feet in length and with a capacity of 50,000 pounds.

Sioux City Traction Company, Sioux City, Ia., as reported in the Electric Railway Review of February 9, is erecting six summer cars at its shops. They are to have 20-foot bodies, 5-foot 9-inch vestibules and are to be 8 feet wide. The cars will be mounted on Taylor trucks.

Gulfport & Mississippi Coast Traction Company, Gulfport, Miss., has ordered three 25-foot vestibule semi-convertible cars and two 40-foot trailers from the American Car Company, for delivery about June 15. The trailers will contain 15 seats and all cars will be mounted on Brill 27-GI trucks.

San Antonio Traction Company, San Antonio, Tex., has placed an order with the G. C. Kuhlman Car Company for 10 semi-convertible cars, 40 feet long over vestibule, with a seating capacity of 40 passengers, to be equipped with 4 GE-54 motors, to be used for city service and for delivery on August 1.

Erie Cambridge Union & Cory Railway, Erie, Pa., as reported in the Electric Railway Review of April 13, is preparing plans and specifications for new cars and equipment, and will make purchases about July 1. The building and equipping of this road is being handled by the Van Bibber Company, 60 Wall street, New York.

Omaha & Council Bluffs Street Railway is building at its Omaha shops eight summer cars for use on its lines. These cars, which have already been framed, are 46 feet 6 inches over bumpers and 7 feet 10½ inches wide over sills. The body of the cars are 34 feet 6 inches long. The cars will replace the open cars having side steps formerly used by the company. They are to be inclosed by 18-inch sides, above which wire screens 3 feet high will be fastened. Entrance to the car will be made at the ends. This is the first effort the company has made at manufacturing its own cars.

Trans-St. Mary's Traction Company, Sault Ste. Marie, Ont., as reported in the Electric Railway Review of April 6, has ordered from The J. G. Brill Company two semi-convertible type cars, to have bodies 38 feet 8 inches long and 41 feet 9 inches over all. These will be equipped with type GE-67 motors and with the General Electric Company's type K-28 controllers. The trucks will be of the Brill type 27-G, Providence fenders, and will be heated with the Consolidated Car Company's system of electric heating. The cars are designed for city service and will be equipped with double trolleys.

Chicago Lake Shore & South Bend Railway, South Bend, Ind., has just placed an order with the Niles Car & Manufacturing Company for 24 heavy interurban coaches, to be 57 feet long over all and 10 feet wide. Fifteen of the cars are the exclusive passenger type, with passenger and smoking compartments, and nine cars are combination passenger, smoking and baggage cars. These cars will be equipped with Baldwin class 90-35 heavy trucks, with 38-inch M. C. B. section steel-tired wheels and Westinghouse No. 148 A. C. motors, geared to 75 miles per hour. The passenger cars are for delivery in the spring of 1908 and the combination cars for delivery this fall. An interesting feature of the cars is their dimensions, which fit them for operation over steam roads.

SHOPS AND BUILDINGS.

Coal Belt Electric Railway, Marion, Ill.—The city council of Herrin, Ill., has passed an ordinance vacating some property on East Walnut street so that the company may erect thereon an interurban passenger station.

Fresno Traction Company.—It is reported that this company will erect a car house with a capacity for about 30 cars, also a paint and machine shop, at Fresno, Cal.

Shreveport Traction Company.—This company is now building

a fireproof brick and concrete car house to cost \$25,000. The dimensions of the building are to be 120 by 160 feet.

TRADE NOTES.

Lackawanna Steel Company occupied its new offices on the eighteenth floor of the United States Express building, 2 Rector street, New York, on Saturday, April 13.

Browning Engineering Company, Cleveland, has removed its Chicago offices from the Monadnock block to room 1506 Fisher building, instead of room 1006, as previously reported.

Green Engineering Company will on May 1 move its Chicago office from the Western Union building to the Commercial National Bank building. The Pittsburg office has been moved from the Lewis building to the Farmers' Bank building.

L. F. Purtil, who has for many years represented the Westinghouse Air Brake Company at Buffalo, N. Y., has been appointed representative of the New York Belting & Packing Company, with headquarters at 61-63 Chambers street, New York.

Ohmer Fare Register Company of Dayton, O., which recently enlarged the output capacity of its plant, reports a very large and rapidly growing increase in its business, and wishes to announce that every effort is being made to fill orders promptly.

Lord & Burnham Company, 1133 Broadway, New York City, has received an order from the Norfolk & Western Railway for the installation of its sash operating device in the Roanoke (Va.) shops of the company. The order calls for 7,000 feet and is for operating monitor and clear story sashes.

Brig.-Gen. Eugene Griffin, first vice-president and general sales manager of the General Electric Company, died very suddenly on the evening of April 10 at Schenectady, N. Y., of apoplexy. With his wife and daughter he had gone to Schenectady to witness

Brigadier-General Eugene Griffin.

an amateur play given by a local club, of which his son, Hancock Griffin, was a leading member. General Griffin was born at Ellsworth, Me., on October, 13, 1855, and was a little over 51 years of age. After receiving a preparatory school education he entered West Point and graduated in 1875 with high honors. Following his graduation he entered the engineer corps and obtained the rank of captain. From 1883 to 1885 he was professor of civil and military engineering and the art of war at West Point. He was then aide-de-camp on the staff of Maj.-Gen. Winfield Scott Hancock and later until the close of the year 1888 was chief of the engineering division of the Atlantic and the department of the East.

In 1889 he resigned from the army to take up electric engineering with the Thomson-Houston Electric Company as second vice-president. In 1881, when the Thomson-Houston Company was consolidated with the General Electric Company, he was elected first vice-president of the General Electric Company. In 1893 he was elected president of the Thomson-Houston International Electric Company, and was also director of that company. At the outbreak of the Spanish-American war, General Griffin offered his services to the United States and organized the First regiment, United States volunteer engineers, of which he became colonel. In January, 1899, he was promoted to brigadier-general, which rank he held to the end of the war. He was a prominent member of several clubs in New York City and was also a member of the Metropolitan Club of Washington, the Somerset of Boston, and the City Liberal Club of London. He held a membership in the more prominent of the engineering and army clubs.

Union Hardware Company, Torrington, Conn., has awarded the contract to Tracy Brothers Company, 52 Benedict street, Waterbury, Conn., for the erection of a new factory building. The main building will be 100 by 150 feet, two stories high and will have a three-story ell, 40 by 75 feet. The building was designed by Richard P. Jenks, Providence, R. I.

W. J. McBride, for the past seven years first vice-president and general manager of the American Car & Foundry Company, has resigned to accept the active management of the Haskell & Barker Car Company of Michigan City, Ind. Mr. McBride will assume his new duties on June 1. Edward F. Carry, second vice-president and manager of the Chicago office of the company, has been appointed first vice-president and general manager to succeed Mr. McBride, effective about May 1.

Green Fuel Economizer Company has removed its New York offices from 74 Cortlandt street to the new West Street building, 90 West street. The new offices of the company will be considerably larger and will enable the company to handle promptly its increasing business in economizers, fans, blowers and exhausters. Since entering the fan business this company has built many large fans

for mechanical draft, including several with over-hung wheels. The New York office will be represented as heretofore by William Downs.

National Brake & Electric Company of Milwaukee, Wis., reports that as a result of the passing of the recent traction ordinance in Chicago, the Chicago City Railway has given instructions to proceed at once with the filling of an order for 300 of the new National air brake equipments, which had been placed some time ago. This is one of the largest recent orders for air brake equipments for electric cars, and brings the total number of National equipments in service on the Chicago City Railway to the imposing total of nearly 1,000.

Blake Signal & Manufacturing Company, 246 Summer street, Boston, Mass., is in receipt of an unsolicited testimonial from Mr. Arthur Bessey Smith of the department of telephone engineering at Purdue University with regard to the soldering tube flux manufactured by the Blake Signal & Manufacturing Company. Inasmuch as this testimonial comes from a man of recognized standing in telephone engineering and one who has a practical knowledge of telephone work as well, having filled every position from telephone lineman and repair man to manager, the testimonial is considered effective evidence of the practical usefulness of the tube flux.

ADVERTISING LITERATURE.

Columbia Foundry Company, Cincinnati, O.—Columbia brake-shoes of various types to meet the needs of railways, both steam and electric, are illustrated and briefly described in a 20-page pamphlet.

Trussed Concrete Steel Company, Detroit, Mich.—An elaborate brochure, entitled "The Typical Factory," describes in detail the new plant of the George N. Pierce Company, manufacturers of automobiles at Buffalo, N. Y. The plant is a large one, with several buildings which exemplify reinforced concrete construction under the Kahn system.

Weston Electrical Instrument Company, Waverly Park, Newark, N. J.—Bulletin No. 6 is a four-page leaflet devoted to the Weston multimeter, model 58, which is designed to quite accurately serve the purposes of a direct-current voltmeter, milli-voltmeter, ammeter, mil-ammeter, ohmmeter, ground detector and wheatstone bridge.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1423 describes Gates rock and ore breaker with a short head and concaves, for fine crushing and designed particularly to meet the demand for a crusher which will utilize screenings and other fine material to advantage. Bulletin No. 1057 is devoted to the Allis-Chalmers type K direct-current motors and generators and provides a number of illustrations of motor driving as applied to heavy shop machinery.

THE TOMLINSON AUTOMATIC RADIAL CAR COUPLER.

With the advent of the electric railway, where train operation of cars is of frequent occurrence, and in connection with the operation of two or more cars, the necessity soon became apparent for an automatic coupler to fulfill the new requirements, which are different from those of steam road practice.

The latest development in the line of automatic couplers for electric railway operation is the Tomlinson automatic radial coupler,

Tomlinson Automatic Car Coupler—Figure 1.

recently placed on the market by the Ohio Brass Company, and which is the only coupler absolutely automatic in action.

In operating the Tomlinson coupler no adjustment whatever is required, except the alignment of drawbars, and it is never necessary to enter between the cars when coupling. It is only necessary to back the cars together, which engages and firmly locks the couplers. Moreover, there are no loose parts to be inserted in the coupler to put it in readiness for action; therefore a car cannot be left, through negligence or otherwise, with the coupler in an inoperative condition. After uncoupling, which is accomplished by simply pulling a chain, the parts return automatically to the normal position, ready for instant coupling. Its construction is such as to give maximum strength for minimum weight.

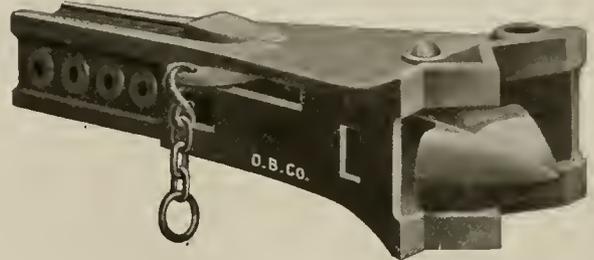

Mr. C. H. Tomlinson originated the idea of this coupler and patents were issued to him fully covering this invention. The following description will be of interest, for the Tomlinson system is thoroughly practical in every particular.

The Tomlinson coupler is made in two sizes, known as numbers 2 and 3. Size number 2 is designed to meet the requirements of all classes of city and light interurban service, and size number 3

is adapted to elevated and subway service, also heavy interurban service and for all places where it is desired to intercouple with steam road cars.

Besides the variation in size, the couplers also differ as to draft-gear connection. They are made in four forms—for rectangular-bar draft gears, for channel-bar gears, for 80-pound rail-section gears and for drop gears—the principle of the coupler action being the same in all.

The coupler consists essentially of a strong malleable iron head-piece, which is hollow and contains an arrow-pointed, drop-forged coupler hook, with sufficient play in a horizontal direction to allow

Tomlinson Automatic Car Coupler—Figure 2.

the coupler hooks of two engaging couplers to slide past each other and become locked. This hook is shown plainly in Figures 1 and 2.

The hook in each coupler is prevented from moving past the center of the coupler. It may, however, move toward the side of the coupler in opposition to the action of a spring. Thus, when the opposing coupler hooks meet, they are forced apart against the action of the springs sufficiently to allow the hooks to slide past each other, the shoulders interlocking. The arrangement is such, however, that should the spring in one of the couplers break and allow the hook to move to one side, there still would not be sufficient clearance to allow the couplers to unlock. The spring is under tension only at the instant of coupling or uncoupling and gets no strain of the train load, either push-in or pulling.

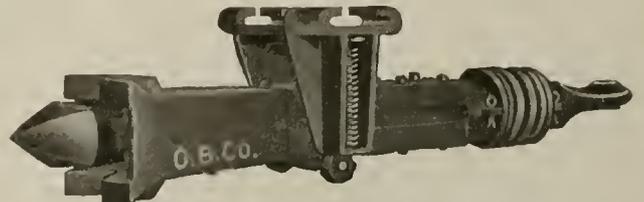

In uncoupling the hooks are forced apart by a lever cam. To this lever cam is connected a chain, a slight pull on the chain of either coupler being sufficient to disengage the hooks.

An important feature of the Tomlinson coupler, and one which effectually prevents lateral movement of the coupler heads, is the form of the coupler face used. The faces of the couplers are serrated, as shown in Figures 1 and 2, and fit together accurately. The faces have large bearing surfaces and the serrations prevent any movement in a lateral direction. When once coupled, therefore, the connection between the cars is practically rigid, and surging of the cars is prevented. This feature greatly facilitates the control of the train and does away with the necessity of buffing platforms, now used to take the slack out of other couplers, and which cannot be used successfully on cars which travel short-radius curves. It is also impossible for the cars to become uncoupled when rounding curves.

The Tomlinson coupler will intercouple with all standard radial car couplers now in use, without removing or even deranging any of its parts. By the addition of an emergency knuckle (Figure 1) it will couple automatically with all M. C. B. couplers, as used on

Tomlinson Automatic Car Coupler—Figure 3.

Tomlinson Automatic Car Coupler—Figure 4.

steam roads. A wedge-shaped extension of the knuckle is made of the right dimensions to fit into the space in the Tomlinson coupler, which ordinarily receives the coupler hook of the opposing coupler. This knuckle is made only for the number 3 couplers.

Figure 3 illustrates the spring hanger attachment, which is used where unduly sharp variations in the grade line make necessary some allowance for vertical play of the coupler and draft gear. The hanger consists of a rectangular casting through which the draft gear passes, being supported by a yoke which rests on springs, allowing vertical movement, either up or down. These springs carry the weight of the coupler and draft gear and normally hold the former in a position parallel to the car sills. The spring,

however, allows vertical movement through a considerable range, so that the coupled car can conform to any sudden breaks of grade, as caused by viaducts, subways, etc. The carrier is supported by a radial slide bar under the car sills, the slide bar being formed in the arc of the circle, around which the hanger is free to slide when going around curves.

The fact that these couplers are absolutely automatic makes it only necessary to align the drawbars and bring the cars together to effect instant coupling. This is of particular advantage in case of emergency, as, for instance, a car barn fire. One man could, in such an emergency, back a motor car into a line of cars standing in the barn and bring out the whole train without assistance.

It is apparent that this coupler is not only strictly automatic in coupling with itself, but also will intercouple with all other types of radial couplers and automatically couple with M. C. B. couplers; even a push-bar can be used with it successfully. Heretofore, in making couplers, no such provision has been made for intercoupling with foreign cars.

FOUNTAIN WASH BRUSHES.

One of the departments of electric and steam railways which receives too little attention, considering the saving in time and money which could be produced if properly managed, is that controlling the cleaning of cars. The old custom of cleaning car windows and exteriors, floors, etc., with sponges, mops and buckets of water is not only an expensive method of having the work done and keeps the cars off the road longer than necessary, but it is also not sanitary and is a very unsatisfactory method of performing this service, as the cleaners do not renew the water often enough, and therefore the work, when finished, is really only half done.

Realizing the advantages of having an ample supply of clean water supplied to the brush or sponge while the work is being done, the Baumruk's Fountain Brush Company of Chicago, Ill., has devised a fountain cleaning brush and fountain sponges, a

Fountain Cleaning Brush.

typical illustration of which is presented herewith. The advantages of these cleaning brushes will be self-evident, as a fresh supply of water is constantly being discharged through the bristles of the brush while it is being used.

A hose, which is attached to the handle, may be supplied with hot, cold or warm water, depending upon the service for which it is required. It is hardly necessary to say that one man can do the work of several men if furnished with one of these brushes, as it is unnecessary for him to stop to refill his pail or to wash out his sponge or mop while at work, consequently the exterior and interior of a car can be washed as rapidly by one man with one of these brushes as by several using the old method. Consequently, not only is the cost of labor reduced, but the time required for the cars to be out of service is likewise reduced, which is a feature of great importance in railway work, and represents an important saving.

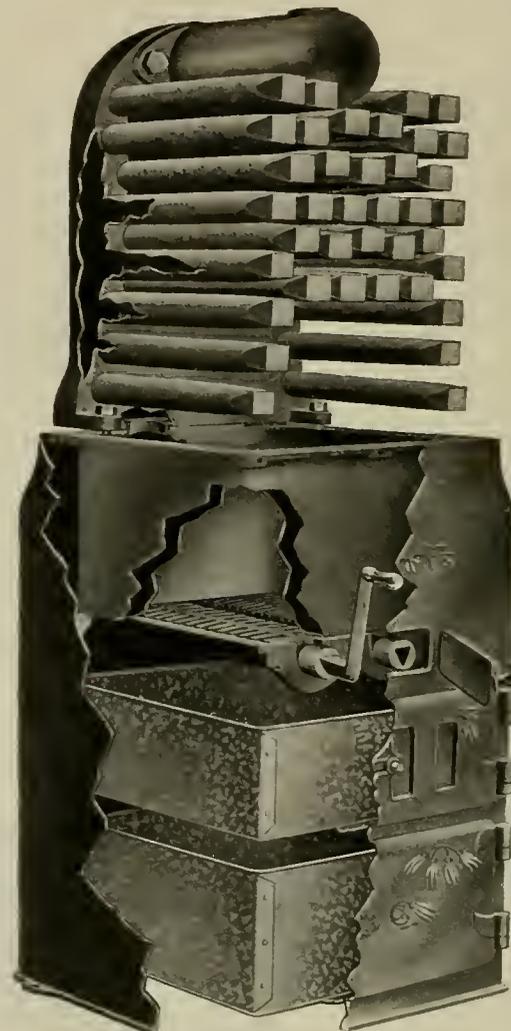

THE COOPER CAR HEATER.

Probably the earliest attempt at heating public conveyances was the placing of hot stones in the early stage coaches, on which passengers could place their feet and thus make the trip a little more comfortable than would otherwise have been the case. This insignificant attempt at heating was necessarily supplemented by frequent stops at taverns along the road, where warmth could be, both externally and internally, applied. With the introduction of steam railways and longer trips it soon became evident that some more effective way of heating must be devised, and soon stoves, generally using wood for fuel, were installed in the cars. This was also inadequate and was soon abandoned and steam heating coils, furnished with steam from the locomotive, were installed in the car, which furnished a uniform heat throughout the car and was a heating system considerably less expensive to operate. This was perfectly satisfactory on trains operated by steam locomotives, but with the introduction of electric cars it was necessary, when heating was desired, to return to the stoves, which, owing to their inadequate local heating, were soon to be replaced by electric heaters. These, however, were expensive to operate and required increased size of feeders, generators and boilers to supply the extra current demanded by them, and furthermore, with the old types of electric heaters much difficulty was experienced because of the intense local heat, which caused the passengers no end of discomfort and occasionally injury because of their clothing having taken fire. These conditions soon led to the introduction of hot water heaters, which could be placed in the car, and the heat from them distributed evenly throughout the car by means of coils of pipe placed along the seat, giving a more even distribution of heat at a lower cost.

From the primitive attempt of heating by means of stones the demand for comforts furnished by adequate heating has increased until now the problem of car heating has become one of the most important and serious which faces the manager of a transportation

line. A heater which it is believed is highly efficient, simple, durable and safe, has been devised by the Cooper Heater Company. An illustration and description of the heater is herewith presented. One of the most important features in the design of this heater is the remarkably small floor space which it occupies, varying from 12 $\frac{3}{4}$ by 12 $\frac{3}{4}$ inches in the smallest size, adapted for city cars, to 17 by 18 inches in the largest size, adapted to the heating of the largest interurban cars. The height of these heaters is from 42 to 46 inches, which also includes the space occupied by the ash pan and coal bunker of sufficient size to provide fully for 24 hours in the coldest winter weather.

Referring to the illustration, it will be seen that the heater consists essentially of a firebox formed of a cast-iron water wall, which is connected to a vertical water wall placed above it. As seen from the illustration, the vertical water wall contains numerous tubes of large diameter, giving a good circulation and a very large heating surface, compared to the grate area. A drum is also connected at right angles to the water wall at the top and from this the hot water connection is taken. The grates are of the rocking type, very substantially built to withstand the abuse which such parts naturally get in the hands of careless conductors. They

Cooper Hot-Water Heater.

are easily shaken and will not burn out easily, as the fire required for keeping the water at its maximum temperature is not hot enough to even damage the grates, which obviates one of the great difficulties which has been experienced with hot water, steam and stove heaters. The lower portion of the stove is enclosed in a neatly decorated cast-iron case and the upper portion is constructed of double walls with asbestos insulating material between them, thus preventing great radiation of heat and a consequent overheating of the vestibule. It is stated that the fire when started in the fall can be maintained throughout the entire heating season without relighting the fire. The construction of the ash pan and coal bunker is of sufficient size for 24 hours' fuel, a point of great importance, as it avoids stopping at car barns to replenish coal and empty the ashes, which always causes great annoyance to passengers and provokes unfavorable comment on the management. Throughout the design of this heater compactness, durability and efficiency have been sought, and it should be a great satisfaction to the designer to note the degree of success attained.

It is stated from actual test that it has been found that during weather ranging from 10 to 20 degrees above zero, and coal at \$6.00 per ton, the cost of fuel for heating a 21 by 8 by 8 foot car (inside dimensions) was found to be only 10 cents, and only 12 $\frac{1}{2}$ cents per 24 hours when the weather was below zero.

The Homsher freight bill, giving street and interurban railways the right to carry light freight and to do a general express business, which was passed unanimously by both houses of the Pennsylvania legislature and was signed by Governor Stuart on April 22, will undoubtedly prove an important factor in the development of the electric railway industry in that state. This law, which goes into effect at once, opens for the companies a field that, in states with more favorable laws, has been a profitable source of income, producing in many instances a large percentage of the entire gross earnings. In Iowa, where freight handling by electric lines is of great importance, the proportion of freight receipts, as stated in the paper read by P. P. Crafts before the Iowa Street and Interurban Railway Association, which was published in last week's issue of the *Electric Railway Review*, varies from 5 per cent of the earnings from all sources to an amount in excess of passenger earnings. Besides conferring a great benefit on the rural population by providing increased facilities and cheap and speedy transportation of farm products to the cities, this law should give a strong impetus to the construction of additional lines in a state in which the building of short connecting lines has already attained remarkable development.

In the design of stations for rapid transit service it is frequently a difficult matter to show various schemes clearly on plans and elevation drawings. If the situation is complicated by the need of showing tracks and platforms at different levels, it is a help even to the eye of the engineer to have a perspective view of the proposed design at hand for reference. The fact that one is accustomed to reading drawings does not lessen the value of the picture or isometric sketch of the completed layout. The perspective method of analysis has been worked out very nicely by the Boston Elevated Railway Company in connection with recent tunnel and terminal station studies made by its chief engineer of elevated and subway construc-

tion, George A. Kimball. In this work the usual drawings were prepared, but in addition a number of complete pasteboard models of the stations were made to a scale of one-eighth of an inch to the foot. All the physical features of the stations were shown clearly, including stairways, platforms, depressed tracks, entrances, exits, news-stands, windows and ticket offices. The relations of various foot passages to the platforms and sidewalks were especially well indicated in studies for the modification of the Old State House station of the East Boston tunnel, in the proposed terminal changes at Dudley street and in the new Washington street tunnel. In the studies made of land takings and building removals at the incline entrance of the Washington street tunnel the dimensions on the reduced scale were worked out with great care, so that the precise changes proposed could be understood readily even by the layman.

Some of the models of stations have been used in connection with the submission of plans to commissions, at directors' meetings and wherever it has been thought advisable to avoid the long and difficult study of detailed plans. Their construction was naturally a painstaking piece of work, but by using stiff pasteboard, glue and small tacks the models when completed were found to be strong enough to withstand pretty severe handling. In the study of station designs it is usually desirable to consider various locations of ticket offices, and this was provided for in a flexible manner by building separate models of these booths about an inch high, which could be moved about at will or fastened in place. As far as possible drawings were made in the interior of the models to show tracks and the individual risers of stairways. It was not considered necessary to construct the separate risers, but stairways were represented by an inclined plane of cardboard of the proper width, with parallel lines ruled thereon to represent the risers. In connection with these studies small meshed wire netting was used to represent fencing, and in some cases celluloid templates of the cars in plan were con-

Usefulness of Station Models.

structed on a small scale to facilitate the study of terminal arrangements. All these graphic methods of bringing complicated conditions into comprehensive focus were found to be valuable aids to a broad study of the station problems at issue.

As a means of preventing accidents and facilitating traffic an automatically controlled electric buzzer is being tested on some cars of the Denver City Tramway Company. On the lower car step contacts are placed between the step proper and a safety tread. Springs are also interposed here so that normally the contacts are separated. However, if a passenger steps on the safety tread his weight compresses the springs, closes the contacts and causes a buzzer to ring either in the motorman's vestibule or near the center of the car. At present buzzers are being tried in both locations, so that the most serviceable place may be determined. There are several reasons why such a system for signaling the presence of a passenger on the lower step should be of value: If a passenger steps off the car while it is in motion and an accident occurs, the motorman, who in the meantime has heard the buzzer and tried to stop the car, will be an excellent witness for the company. The same reasons hold in the event of a prospective passenger being hurt by trying to board a moving car and falling off. The presence of a passenger on the step will signal the motorman that he should stop at the next crossing, even though the conductor may have forgotten to ring the bell. In a crowded car, where the conductor is unable to see the step, he is notified by the buzzer whether or not a passenger is getting on or off the car and thus some little time, ordinarily lost, may be saved. At railroad crossings or other places where the conductor must leave the car the motorman is notified by the buzzer when the conductor again boards the car. These few reasons would seem to justify a careful test of this ingenious scheme for lessening the work of the claim department and assisting in maintaining better schedules.

GRAPHITE TROLLEY WHEEL BUSHINGS.

Periodically since the introduction of graphite trolley wheel bushings, the question of whether or not oil should be used on them has been the subject of heated discussions among the master mechanics of different systems. Most of these discussions have been more confusing than beneficial, for the testimony presented seemed about equally balanced, and the arguments equally reasonable and convincing. The result has been that those seeking information were compelled to experiment and settle the question for themselves.

As a matter of fact, the graphite bushing was originally intended to be run without oil and thus do away with the possibility of the wheels being ruined by lack of lubrication. Graphite is itself one of the best lubricants known when it is used under the proper circumstances. For the conditions for which the graphite bushed trolley wheel was originated it was perfectly satisfactory. Immediately after its introduction, however, the speed of electric cars was greatly increased, and likewise the capacity of the motors, consequently necessitating a much greater current to be collected, which greatly increased the arcing between the bearing and the axle on which the wheel turns. This and the high speed naturally cause the bearings to wear more rapidly and become rough and pitted from the constant high current arcing. The natural result is that in the roughened state of the wearing surfaces graphite alone is not a sufficient lubricant.

Furthermore, if even the least play exists between the wheel and the axle, the vibratory blows on the graphite and metal of the wheel, due to the centrifugal force of slightly unbalanced masses in the wheel when running at speeds of

from 3,000 to even 10,000 revolutions per minute, will cause the graphite to crumble. The bearing will therefore wear rapidly if not lubricated with oil or grease.

These considerations as well as practical experience suggest the advisability of using oil for lubricating trolley wheels, as the oil dampens the vibrations, and acting as an insulator reduces the arcing between the bearing and the axle. Hence practically all of the current is taken from the wheel by the springs on the sides of the wheel, and thus also prolongs the life of the bearings by preventing the roughening and scoring of the surfaces, which is the inevitable result of undampened vibrations in journals.

The question may be asked why graphite bushings are any better than ordinary bearing if oil must be used. The answer to this is, that, while it is necessary to use oil on graphite bushings to obtain the best results and greatest mileage, the life of the wheel is not so seriously impaired if the oil supply fails or if the barn men neglect to oil them, as would be the case with ordinary bushings, as graphite bushings can be operated without oil. If the oil supply fails on ordinary trolley wheel bushings, the general result is a hot box and a sliding of the wheel, which soon wears through and catches in the overhead work with disastrous results.

To sum up, it may be said that the graphite bushing was designed for far less severe conditions than are met in modern practice. They served the conditions for which they were designed well without the use of oil. The changed conditions of today are far more severe. In the case of city service the difficulty arises through dragging the wheels through a mass of special work, and on interurban lines the more severe conditions arise through high speed, and these conditions can only be properly met by an unfailing oil supply.

THE ECONOMY OF POOLING REPAIRS ON SMALL ROADS.

When scattered groups of electric railways are consolidated into a single operating organization the concentration of power plant capacity into a few stations or perhaps a single modern installation follows as a matter of course. It would seem feasible for the same general idea to be carried out with reference to repair shop practice in some instances where the adjacent roads are friendly, but where no actual consolidation of property has taken place. The cost of repairs per car on a small system is seldom as low as that on a large road, because the small company cannot as a rule afford the refinements of the large company in the way of specialized machinery and processes. We find in recent practice that a road owning 3,325 cars paid \$247 per car for repairs in one year; a road with 1,130 cars paid \$283; a line having 719 cars paid \$257; one with 310 cars, \$300; one with 26 cars, \$358; one owning 16 cars, \$294; and one with 7 cars, \$414. Allowing for differences in conditions, there is a definite tendency toward a higher cost of maintenance per car on the smaller lines.

By the erection of a central and thoroughly modern shop in a territory occupied by a number of small roads, it is probable that great economies could be enjoyed. The shops, in the first place, could be of fireproof construction. The shops could be equipped with a thoroughly up-to-date system of keeping stock and cost records; the tools could be direct driven by individual motors, and a brass foundry could be a prominent feature. Practically all the advantages of the large city shop could be afforded, and the work could pass through in a far more regular volume than obtains on a single road with a few cars, tending to lower the cost of production. Emergency and light repairs could, of course, be handled at local car houses. By the consolidation of interests there would be no necessity for the small roads, individually, to purchase expensive machine tools, which stand idle perhaps 80 per cent of the time; and the union of financial strength applicable to repairs would permit the payment of higher wages in some

cases than a struggling road can possibly afford in its shops under the other method.

It is true that there would be disadvantages in pooling repairs. The lack of standardization of equipment on different roads would make the spare parts rather extensive, and there is no doubt that lack of harmony among the different managements would make the work of the centralized shop very difficult. Dead mileage in some cases would be large. But after these points are weighed, it is hard to see why some scheme of this kind, if entered into in a broad spirit of co-operation, might not be feasible. A large amount of capital is at present tied up in duplicated supplies and tools in small street railway shops in the same territory; the "load factors" of the employes are irregular and the equipment stands idle a good part of the time. The master mechanic of the centralized shop would have to be a man of first-class caliber, worth certainly from two to four times the salary which a single road of small means could pay. There is certainly need of rolling stock standardization, when a single road operates from six to ten different styles of cars on its tracks. Co-operation and centralization of industrial functions are the spirit of the times, and the policy of annually spending large sums of money for the sake of maintaining a limited number of cars in an inferior shop that is one's own is open to question in the face of what has been done by legally consolidated companies to decrease their operating costs per unit of rolling stock.

LESSONS FROM A CAR HOUSE FIRE.

Every disaster has its lessons, and the destruction of the One Hundred and Forty-fifth street car house of the Metropolitan Street Railway Company of New York, a brief account of which was given in the *Electric Railway Review* of April 13, 1907, raises several points which it may be of benefit to mention.

It seems hardly necessary to state that the construction of a car house of above one story in height, which, on account of the high price of property, was apparently necessary in this instance, is deplorable unless conditions are such that the floors may be entered independently from different street levels or from the street level and an elevated structure, as otherwise an elevator is required to lift the cars to the floors above; and an elevator shaft becomes a dangerous fire hazard.

The car house of the Metropolitan Street Railway Company was a 4-story structure and cars were hoisted through an open elevator shaft. The pits were on the first floor. The second floor was used as a general storage and repair room for service cars, and the third and fourth floors contained the paint shop, where inflammable paints, oils, etc., were necessarily kept. With conditions of this kind it is plain that only extraordinary precautions in preventing dust and oily waste from collecting in and about the elevator shaft and among the first floor pits, and great care to avoid sparks or flame of any origin, could forestall the possibility of a sudden fire, which, having once gained headway, would sweep up the elevator shaft and spread to all floors.

The exact origin of the fire which occurred may never be known. One theory is that it was caused by defective insulation of an electric light wire; another, that a short circuit in a conduit carrying a conductor rail caused sparks to fly from the plow of a car, and to set fire to oily waste. Whatever the origin may have been the elevator shaft served as a flue which carried the flames to the explosive and inflammable oils on the upper two floors.

The car house of the Metropolitan Street Railway Company was built a good many years ago before it was generally thought necessary to provide concrete fire protection for steel construction. An examination of the tangled wreckage of steel work in the ruins indicates that the members buckled under the intense heat, dropping large areas of floor. What the damage would have been had the all-steel work

been incased in concrete is, of course, a matter of conjecture. Those who have had charge of the disposition of old car bodies know that they burn so furiously as to destroy all wood, even the heavy timbers, in about half an hour. The burning of a large number of cars between floors would furnish a severe test even for steel carefully incased in concrete, and the material burned would be greater in proportion to floor area than has probably been burned in any concrete building which, after passing through a fire, has been cited up to this time as an argument recommending the use of concrete. Where cars are stored on several floors, of which one or more contain a paint shop, it might be found to be impossible to provide a structure sufficiently fireproof to present a good insurance risk, but the subject should certainly receive the most exhaustive attention of engineers whenever it is found impracticable to store cars and provide shop facilities on one floor.

The appearance of the ruins of the Metropolitan Street Railway Company building also makes plain the fact that a fire wall between the power house and any other structure which is subject, as this car house was, to possible sudden destruction by fire, is not to be regarded as a sufficient safeguard for the power plant. Although the dividing wall between the power house and the car house ruins in New York still stands, one or two large apertures were caused by the falling steel work, and the wall was cracked so badly that the company found it necessary to close the power house, fearing that the vibration of the engines and generators would cause the wall to collapse.

It will be of interest to see how the Metropolitan Street Railway Company will solve the problem of fire risk in reconstructing its building.

ANNUAL REPORTS OF RAILWAYS.

United Railways & Electric Company of Baltimore.

The annual report of the United Railways & Electric Company of Baltimore says that the most important event of the year 1906 was the adoption of the new financial plan. This plan comprised the funding of coupons on the income bonds and the formation of the Maryland Electric Railways Company. The funding of these coupons made available the income, above interest requirements on the first mortgage bonds, for track reconstruction and repair, improvement of power houses and general improvements and betterments. In addition to this surplus an amount will be realized from the sale of property which is no longer needed.

At the end of the year the holders of \$13,584,000 income bonds, out of a total of \$13,940,000 outstanding, had accepted the plan which provides for the issue of 5 per cent 30-year coupon bonds dated June 1, 1906, at par, for the income coupons from June 1, 1904, to June 1, 1906, inclusive. Upon these coupons and upon those dated December 1, 1906, to December 1, 1910, inclusive, and also upon the income bonds, there was stamped a reference to an agreement whereby the company is bound to issue on the dates of these coupons to holders thereof its 5 per cent funding bonds or scrip at par. As under this funding agreement money is available for improvements only as earned, it was deemed expedient to anticipate the company's income and facilitate improvements by increasing the floating debt and retiring it at convenient periods.

In addition to the betterment of the existing property the company needed new stations, car houses, equipment, extensions, excursion resorts and other improvements. Associated interests therefore secured the charter of the Maryland Electric Railway Company. The property of this company and of the Baltimore & Annapolis Short Line were acquired by the Maryland Electric Railways Company, which authorized an issue of \$8,000,000 5 per cent first mortgage bonds, the proceeds of which are to be used only for acquiring new additions and new facilities. The entire property

is leased to the United company at an annual rental equal to 6 per cent upon the actual cost, and, beginning in 1910, an additional 1½ per cent per annum. The United company also agreed to purchase the property at maturity of the bonds by paying an amount sufficient to retire them. The money paid as a sinking fund, including increment, is to be applied toward the purchase price. A special sinking fund is provided for purchases of rolling stock, the lease of which is limited to 10 years.

The report discusses many other matters. On the advice of expert accountants an account for extraordinary expenditures was opened, and there was expended during the year for rehabilitation purposes \$1,436,692. The total amount paid for taxes increased 16 per cent.

The report gives in detail the work of improvement. During the year over 31.6 miles of single track were reconstructed. A total of 8.6 miles of new track was constructed. The conversion of the remaining portion of the old cable system to electricity was completed. The company now operates 394 miles of main track, of which 172 miles of suburban lines are laid with T-rails, and 172 miles are laid with 9-inch girder rails. The reconstruction of the car house on Light street, near Heath, and the extension which was begun in 1905 were completed during the year.

The Maryland Electric Railways has awarded contracts for the erection of one new car house which will be leased to the United company. It will also erect four other car houses, one of which will contain an office and a passenger station. The Maryland Electric Railways acquired Bay Shore park in October. This park had previously been leased to the United company.

The main figures of the report, with comparisons with two preceding years, were as follows:

	1906.	1905.	1904.
Gross earnings	\$6,583,102	\$6,023,698	\$5,440,942
Operating expenses and maintenance	*4,200,942	3,765,292	2,876,539
Net earnings	\$2,382,160	\$2,258,406	\$2,564,403
Fixed charges, taxes, etc.....	2,365,587	2,230,066	2,244,579
Surplus for year.....	\$ 16,573	\$ 28,340	\$ 319,824
Other income	4,725	2,725	10,238
Balance	\$ 21,298	\$ 31,065	\$ 330,062
Car-mile runs	26,035,327	25,431,376	23,397,515
Revenue passengers	133,785,601	122,318,433	109,526,908
Transfers	53,413,492	49,292,821	43,932,219

*Includes \$980,000 credited to extraordinary expenditures.

Operating expenses amounted to 48.93 per cent of gross earnings, as compared with 47.05 per cent in the previous year. The increase in gross earnings was 9.29 per cent, and the increase in operating expenses, after allowing for extraordinary expenditures of \$929,761 in 1905, was 13.59 per cent. This large advance was due to increased car service, to the payment of higher wages in every department, and to the increased cost of materials and supplies. The frequent and heavy rains in 1906 greatly interfered with excursion travel. The report states: "It should be borne in mind that Baltimore has a comparatively small floating population. Street railways in New York, Philadelphia, Washington, New Orleans and some other cities have an advantage in this respect; hence the increase in gross earnings of the system may be regarded as permanent."

It is announced that the Indiana Union Traction Company and the Ft. Wayne & Wabash Valley Traction Company have made arrangements with, and will undertake to transport the visitors to the annual G. A. R. encampment at Ft. Wayne on May 21-23 at a rate of \$3.00 for the round trip from Indianapolis. A rate of one cent a mile has heretofore been granted the old soldiers by the steam lines, but they declined to do so this year because of the 2-cent law recently passed by the legislature.

The new anti-pass law passed by the Iowa legislature goes into effect on July 4 and applies to electric as well as steam railroads.

REPORT OF BION J. ARNOLD ON STREET RAILWAY PROBLEMS IN TORONTO.

Bion J. Arnold of Chicago has submitted a report to C. H. Rust, city engineer of Toronto, based on a study of street railway conditions which was made for the city authorities. An abstract of Mr. Arnold's report follows:

I have made a study of the street railway transportation problem of the city of Toronto, giving particular attention to the following subjects:

The center of population referred to a north and south line.

The future growth of the population by general observation only.

The possible direction of such future growth with reference to the present north and south center line of population.

The operation of the cars of the Toronto Railway Company with special reference to traffic during the "rush-hour" period.

Immediate remedies to apply to relieve congestion.

Immediate track extensions.

From statistics furnished me by the assessment department of the city of Toronto, I find the north and south center line of population to be west of Yonge street, coinciding approximately with McCaul street.

It seems evident that the population of Toronto should grow by a steady annual substantial rate of increase. While, owing to the unusual activity that seems to prevail in your country at present, the rate of increase may remain about uniform for several years, or might possibly increase, statistics show that the average rate of annual increase of population of all cities is a decreasing one, and the rate of population increase of your city will, therefore, probably be a decreasing rate of increase, particularly after the passing of abnormal conditions.

In making an examination of the evident growth of your city in the immediate past, and the building activity to be observed at present, it would seem that the future building in the city will probably be more to the north and west than otherwise, thus tending to move the north and south center line of population in a westerly direction, rather than easterly.

Exhaustive observations have been made of the traffic conditions, with particular attention to headway of cars and the congestion of cars upon the streets.

From these observations it was learned that car congestion in your city is confined to Yonge street, and this congestion obtains to that part of Yonge street between Front street and Queen street, and in a measure affects the cars on Front street, King street and Queen street, in the vicinity of Yonge street, but, outside of this Yonge street congestion, objectionable congestion is not yet apparent.

In my judgment immediate relief should be furnished to Yonge street by the construction of additional tracks upon some north and south street adjacent to Yonge street. From the fact that the present north and south center line of population is west of Yonge street, and from the fact that the future growth of the city seems to favor a westward movement of this center line, the relief of Yonge street should be by a street west of Yonge street, and this without further argument suggests Bay street as being the logical street upon which to build additional tracks, and this construction is recommended. This new track should extend north of Queen street and should reach as far north as Bloor street in order to distribute the cars to the west upon the east and west lines.

In my judgment, in order to develop the entire system in such a manner as to at all times have the greatest capacity, I recommend that tracks be now constructed as follows: On Bay street from Front to Queen street; on Terauley street from Queen to College street, and then through Queen's park from College to Bloor street.

It would seem to me, after a study of population by wards, and an examination of the existing lines, that ward five may require in the immediate future an additional north and south line, possibly in the vicinity of Claremont, Clinton and Christie streets.

I understand that the Toronto Railway Company is requesting the right to construct connecting tracks at several points in the downtown district. These tracks are asked for by the company to facilitate the handling of cars during the rush hours and to make the system more flexible. I do not see any serious objection to the granting of these requests. In my judgment the people should be willing to grant any reasonable concessions to the company the acquirement of which will tend to facilitate the handling of the cars in a manner to benefit the public. The necessity for and the objections against these last named extensions should be apparent to those in daily contact with the actual conditions upon the ground, but were the decision left to me I should authorize their construction.

THE PITTSBURG & BUTLER STREET RAILWAY.

BY H. C. REAGAN, ELECTRICAL ENGINEER.

The Pittsburg & Butler Street Railway, as its name implies, connects the cities of Pittsburg and Butler. It traverses a territory which contains valuable oil and mineral resources and is well populated. Between Pittsburg, one terminal, and Butler, the county seat of Butler county, in the oil district of western Pennsylvania, the road passes through attractive suburbs of Pittsburg and important oil and coal centers. The line was designed to provide safe and speedy service between the two terminal cities.

The Pittsburg & Butler railway will connect at Etna, a suburb of Allegheny, with the Pittsburg Railways Company lines. The route is shown on the accompanying map. The road extends northward from Etna, going through Glenshaw, Gibsonia, Bakerstown, Valencia, Mars, Renfrew, McCalmont and Lyndora on the way to Butler. The Butler terminal is at

stone ballast the entire length of the line. The gauge of the tracks, 5 feet 2½ inches, was adopted to conform with that of the Pittsburg Railways Company, as the cars of the Pittsburg & Butler will use the Pittsburg Railways Company tracks in entering Pittsburg. Thirty-three-foot A. S. C. E. section steel rails, weighing 75 pounds per yard, are used. They are joined together mechanically by 4-bolt fishplates, and electrically by M. E. concealed bonds. The cross bonds which are used at intervals between the tracks and the special bonds at switches are of No. 0000 copper. Guard rails are used on all curves greater than 9 degrees. These guard rails are raised seven-eighths inch above the running rails by means of rail blocks which are inserted under the rail on every third tie. Between the guard rail and the main rail is an irregular shaped casting three inches long. This was designed by Mr. Layton.

Bridges.

In the bridge construction concrete and steel were used

Pittsburg & Butler Street Railway—Bridge over Thorn Creek.

Main street and connection is made with the Butler Passenger Railway.

In planning the route for the road it was the desire of Charles Gibson, the general manager, and Hudson F. Layton, the chief engineer, to follow the most direct line possible between the two terminal cities, and yet to keep close to the centers of population. In carrying out this plan many obstacles were met, as the country through which the road passes is generally mountainous and presents varied and costly engineering problems. On the line as constructed the grades are reduced to the minimum, permitting high speed and economical operation, and the curves are of long radius.

The roadway was constructed in accordance with standard steam road practice. All dirt fills are made around trestle bents, insuring a solid foundation and a minimum amount of shrinkage in the roadway. The ties, 7 by 8 inches by 8 feet, are spaced 24 inches on centers and are laid on

throughout. The principal steel bridge was built over the Baltimore & Ohio Railroad at Bryant. A feature of this bridge which is of interest is the economical abutment construction. Another important bridge, which is shown in one of the accompanying illustrations, was constructed over Thorn creek, near Renfrew. This bridge is 800 feet long and the highest point above the water is 85 feet, while the main span between towers is 118 feet long. The piers and abutments are of concrete construction. Sawed oak ties are used and guard rails are provided on the sides and in the middle of the track. On the viaduct which was constructed where the road enters Butler concrete was used for the piers and abutments. Straight through girders were used over the streets. This viaduct contains one girder 115 feet long with a depth of 9 feet. Another girder is 60 feet long with a depth of 5 feet. The towers are well braced with lateral and diagonal braces. All of the bridges on the line were designed

to support a standard steam railway train. The bridges were designed by J. H. Barrett, bridge engineer, under the direction of Mr. Layton.

Power Plant.

The power plant is located in Renfrew, about seven miles from Butler, and at the junction of Conoquennessing and Thorn creeks. This point was selected on account of the volume

and of the turbine room 51 feet 5 inches. The foundations of the building are concrete with an average thickness of 24 inches, and with the footing course varying from 3 to 6 feet at the pilasters. A point which was carefully considered in designing the boiler room was the provision of sufficient room over the boilers to facilitate the repairing of valves and the repacking of valve glands, pipe joints, etc., which occa-

Pittsburg & Butler Street Railway—Showing Concrete Abutment of Thorn Creek Bridge.

Pittsburg & Butler Street Railway—Showing Bridge at Bryant Under Construction.

of water available for condensing purposes. The plant is on the line of the Baltimore & Ohio Railroad and on a siding of the Bessemer & Lake Erie Railroad, providing good transportation facilities for coal. The power house is 105 feet 10 inches by 98 feet 7 inches.

The building is divided into boiler and turbine rooms.

sionally becomes necessary and is many times neglected because of the difficulty of working in the cramped space above the boilers, where the heat may be intense. The ashes are removed from under the boilers by means of an ash car, which is run on a track in a concrete tunnel built under the firing floor from a point immediately in front of the fireboxes

Pittsburg & Butler Street Railway—Private Car and Standard Equipment.

A monitor ventilator, extending over each section of the building, provides ample ventilation. The building is well lighted. The doors of the power house are of the Wilson roller steel pattern. The frame of the roof is of steel and the roof is shingled with Bangor slate.

The interior width of the boiler room is 48 feet 5 inches

to a hydraulic lift, which raises the loaded car to the boiler room level, whence it can easily be run to the ash dump. The boiler room equipment consists of four Babcock & Wilcox boilers, which are arranged into two batteries. The boilers are rated at 350 horsepower each. They are of the double-deck type and have 4-inch tubes and superheaters

capable of superheating the steam to 125 degrees F. A Ford damper regulator and water regulator is fitted for each boiler, and, while the boilers are fired by hand at present, they have been arranged so that stokers can be installed in the future. The blow-off valves are arranged with one plug cock and a standard B. & W. valve, the plug cock being next to the boiler, so that the blowing is always done by the

and for superheated steam. The superheated steam lines connect the boilers with the turbines. The saturated steam lines connect the auxiliaries and condensing engine pumps and dry vacuum pump to the steam drums of the boilers.

The superheated steam lines are of heavy steel piping and are fitted with screw flanges. At the rear of the boilers and suspended on brackets are two header lines, one 10 inches in diameter, which is used for superheated steam, and the other 6 inches in diameter, which is used for saturated steam.

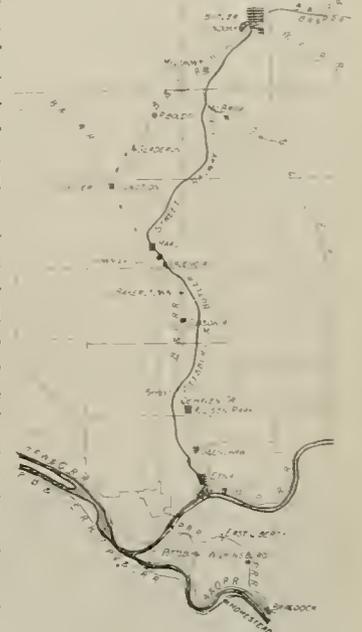

The superheated steam passes from the boilers to the header through a 6-inch line, which rises vertically from the superheated pipes to an automatic stop and check valve, thence runs by easy curves to the header. There are four of these pipes. Expansion and contraction of the steam piping is taken up by long radius bends and the pipe lines are carried on lower bearings to permit free expansion without causing undue strains on the piping. The exhaust pipes to the atmosphere from the turbine

are connected with a 30-inch exhaust line and the branches from each turbine are 18 inches in diameter and are fitted with check valves. The main exhaust pipe is fitted with a 30-inch atmospheric relief valve. The piping is extra heavy. The valves used are of Chapman manufacture.

One 2,000-horsepower Bonar vertical open heater has been installed in the boiler room near the pumps. The exhaust steam from the auxiliaries passes into this heater, as does also the steam from the turbines when operated non-

Pittsburg & Butler Street Railway—Viaduct on Line Entering Butler.

Pittsburg & Butler Street Railway—Map of Route.

first valve. This insures a tight valve in the plug cock, as it is not subjected to wear. The boilers are connected to the feed pumps by duplicate feed water pipes in such a way that if one of the pipes should break the other can supply the water to the boilers. In one of the lines there has been installed a Worthington duplex piston type hot water meter.

The stack is of brick, 125 feet high and stands on a solid concrete base 16 feet in diameter and 16 feet deep. The diameter of the stack base above ground is 14 feet with an

Pittsburg & Butler Street Railway—Power House at Renfrew, Pa.

Pittsburg & Butler Street Railway—Turbine Room.

inside diameter of 10 feet 6 inches and a flue opening 9 feet 6 inches. The wall at the top of the base is 24 inches thick, and the stack has a thickness of 8 inches at the point where it corbells out for the top. The top is surmounted by a cast-iron cap and a two-piece lightning rod, which is connected by a copper rod to a large ground plate.

The piping system consists of separate lines for saturated

condensing. The piping is so arranged that the steam can be by-passed around the heater when it is necessary to clean or repair the heater.

There are two Carpenter service pumps, 7½ and 8½ by 10 inches, installed in the condenser room. These supply water to the heater or to the storage tank and take their supply either from the discharge tunnel of the condenser or

from the intake tunnel. These pumps also furnish the gland water for the turbines and the jacket water for the dry vacuum pumps. The boilers are fed by two Epping-Carpenter duplex outside packed plunger pumps, 12 and 7 by 12 inches. Each of the feed pumps is of sufficient capacity to supply the boilers and discharge into a duplicate feed system, which eliminates the possibility of a shut-down in case of accident to the piping or pumps. The pumps are all equipped with Ford regulators.

The water for condensing and for boiler feed purposes is taken from the two creeks that join at the power house. A concrete dam was erected below the junction of the two streams, having a weir and sluice valve in the breast. The water enters an intake above the breast, which is designed as a settling basin. This intake is square and the stream side is constructed with 3-inch tile placed in the concrete walls, a movable screen being over the face of the tile. This basin is filled with coke, which thoroughly filters all the water before it enters the mouth of the tunnel leading to the condenser. The tunnel is made of concrete and extends from the well to the power house, thence under the condenser room floor to the pumps. There is also a discharge tunnel running the length of the building, and extending down to the lower

Pittsburg & Butler Street Railway—Interior View of Rotary Substation.

side of the dam, where two 30-inch gate valves control the discharge.

The condensers, which are of the jet suction type, were made by the Alberger Condenser Company. The condensers are served by a volute centrifugal pump, driven by a 6½ by 8 inch Westinghouse junior engine, direct connected by means of a flexible coupling. The use of the pump makes it possible to place the condenser below the turbine and thus avoid extending the exhaust pipes above the engine room floor. The exhaust pipe connection from the turbine to the condenser is by means of a 30-inch ell. The condensers are served by two stage rotative dry vacuum pumps, one for each unit, and with condensing water at a temperature of 70 degrees F. They are capable of maintaining a vacuum of 28 inches of mercury. The dry vacuum pumps are fitted with rotary valves with flash ports, and the cylinder heads and barrels are water cooled. The pumps are 8 by 16 by 16 by 12 inches. The condensers have each a capacity of 15,000 pounds of steam per hour. All piping except the steam and air discharge line is located below the turbine room floor.

Turbines, Generators and Transformers.

The generating units consist of two Westinghouse Parsons 750-kilowatt turbo-generators, designed to operate at 1,500 revolutions per minute, with steam at 160 pounds pressure and 100 degrees superheat. The turbines are connected

to a 750-kilowatt 3-phase generator of the standard Westinghouse turbo type, with a 35-kilowatt exciter mounted on the same shaft.

The foundations for the turbines are built up in the form of piers with intervening arches. These piers form a double row for each side of the bed plate, the center being open around the foundations. Resting on the foundations is the

Pittsburg & Butler Street Railway—Boiler Room.

frame of the turbine, which extends to the floor level. The construction of the foundations in this manner enables employes to pass from one end of the condenser room to the other without going around the end of the foundations, and also permits the condensing apparatus to be seen from any point in the condenser room and from the engine room floor. The main steam pipe to the turbines is provided with a thermometer so that the exact degree of superheat can be ascertained instantly, and thermometers are also fitted to the bearings and oil pipes so that the operator can tell at a glance whether the bearings are running warm or if the oil is not being cooled.

The generators are wound so that either 3,300 or 6,600 volt current, single or 3-phase, can be generated. The revolving field of the generators is of the two-pole type, and the field winding is laid in slots and retained by non-magnetic wedges. The generators are entirely inclosed and are venti-

Pittsburg & Butler Street Railway—View of Rotary Substation.

lated by ducts suspended under the turbine room floor. The intakes to the air ducts are provided with screens to prevent foreign material from entering the generators. The windings of the generators can be easily inspected by removing the end bells.

The Bonar continuous oiling system has been installed in

connection with the turbine oiling system. The apparatus is located in the condenser room and is composed of two filters and one oil tank and a steam pump for raising the oil to the storage reservoir on the gallery in the turbine room. The storage tank is also connected to the oil tanks of the turbines. When it is desired to change the oil of the turbines the valve is opened to the filters and the oil flows into them by gravity.

Pittsburg & Butler Street Railway—Transmission Lines.

When the oil is all out the valve is closed and the valve to the storage tank is opened.

The gauge board has mounted on it one pressure gauge, one pyrometer, two vacuum gauges and one recording steam pressure gauge, draft gauge and mercury column for checking the vacuum gauge.

The transformers are located in a room provided at the north end of the building. This room, which is 40 feet 6 inches long by 16 feet wide and 12 feet 6 inches high, is sufficiently large for six 500-kilowatt oil cooled transformers, of which four are now installed. A feature worthy of attention is the mounting of all the transformers on wheels. This arrangement permits the ready removal of any transformer in case of accident and the substitution of a new one in its place. The roof of this room forms the gallery upon which are mounted the stick type circuit-breakers, barriers, choke coils and lightning arresters. The transformers as at present

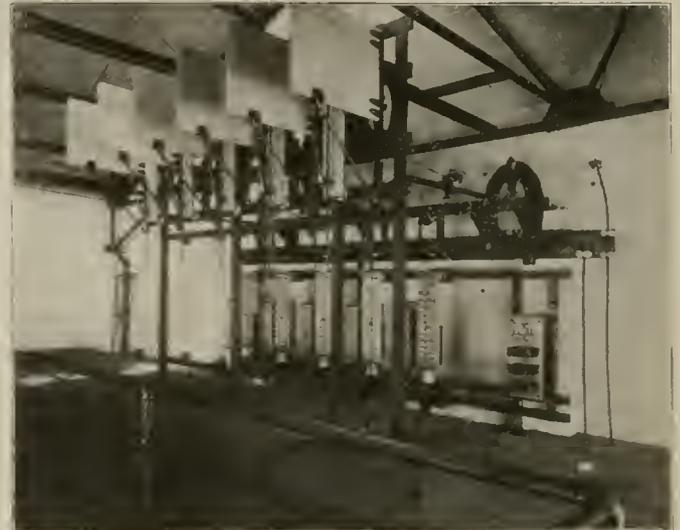

3,300 volts and step it up to 22,000 volts. The outgoing lines pass upward and through the concrete roof through the transformer room to the rack and circuit-breakers, and from there through 10-inch tile to the exterior lines.

Transmission Lines.

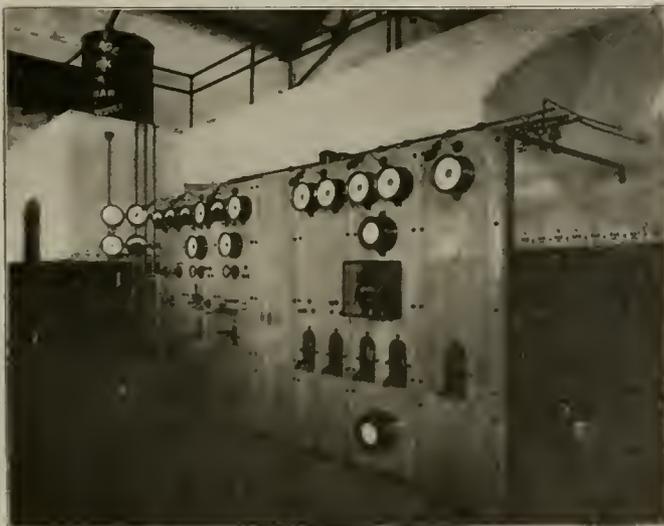

Outside of the terminal cities the road is to be operated by single-phase alternating current, with a line pressure of either 3,300 or 6,600 volts. Within the corporate limits of Pittsburg and Butler direct current will be used.

There are two transmission lines leading from the power house at Renfrew. One of these is composed of No. 4 wire and is to be used in transmitting single-phase current to Bryant at 22,000 volts pressure. The other line extends 3-phase from the power house to the substation at Butler, which supplies current for operating cars within the city limits.

The trolley line is of the Westinghouse type of catenary cable construction. No. 000 grooved trolley wire is used, and is suspended on a 7-16 inch steel messenger cable by clip hangers, spaced 10 feet apart. The catenary cable is supported by insulators on the bracket arms. On curves the trolley wire is held in line by strain arms, which are carried on large corrugated insulators. The cross-arms used are of

Pittsburg & Butler Street Railway—Circuit-Breakers and Lightning Arresters.

Pittsburg & Butler Street Railway—Switchboard in Power House.

installed are connected two in delta for the 3-phase line to Butler, which operates the rotary converter. Two transformers are connected in multiple for the single-phase transmission between Butler and Pittsburg. The low tension windings take current from the bus bars at a pressure of

oak and are 3 feet 10 inches long. The pole line is of rigid construction. The poles, which are of native grown chestnut, are 35 feet in height, and have minimum 8-inch tops. The poles are spaced generally 100 feet apart except on curves, where the spacing is 50 feet. Each pole is guy anchored.

The trolley is divided into three sections by line breakers, which break the catenary cable as well as the trolley circuit. One of these section breakers is placed at the power house and one at each of the two static substations. The ends of the trolley wire are connected to disconnecting switches in the power plant and substations, so that either section may be cut out if trouble occurs, or the substations may be cut out and the current passed directly from one section of the trolley wire to the other. The trolley wire is carried over bridges on span wire construction, the span wires being supported by steel poles. These poles are fitted with cross-arms, which carry the high tension lines. The insulator used for the high tension lines is of the Knowles No. 9373 porcelain triple petticoat type, and is carried on an iron pin set in cement. The diameter of the insulator is 8½ inches, and the height above the cross-arm is 15 inches. The insulators are spaced on the arm 36 inches, center to center, and are tested to withstand 75,000 volts. Where the 2-phase line is used, the top insulator is carried on a galvanized iron

saddle, which spans the top of the pole and is fastened to it by lag screws.

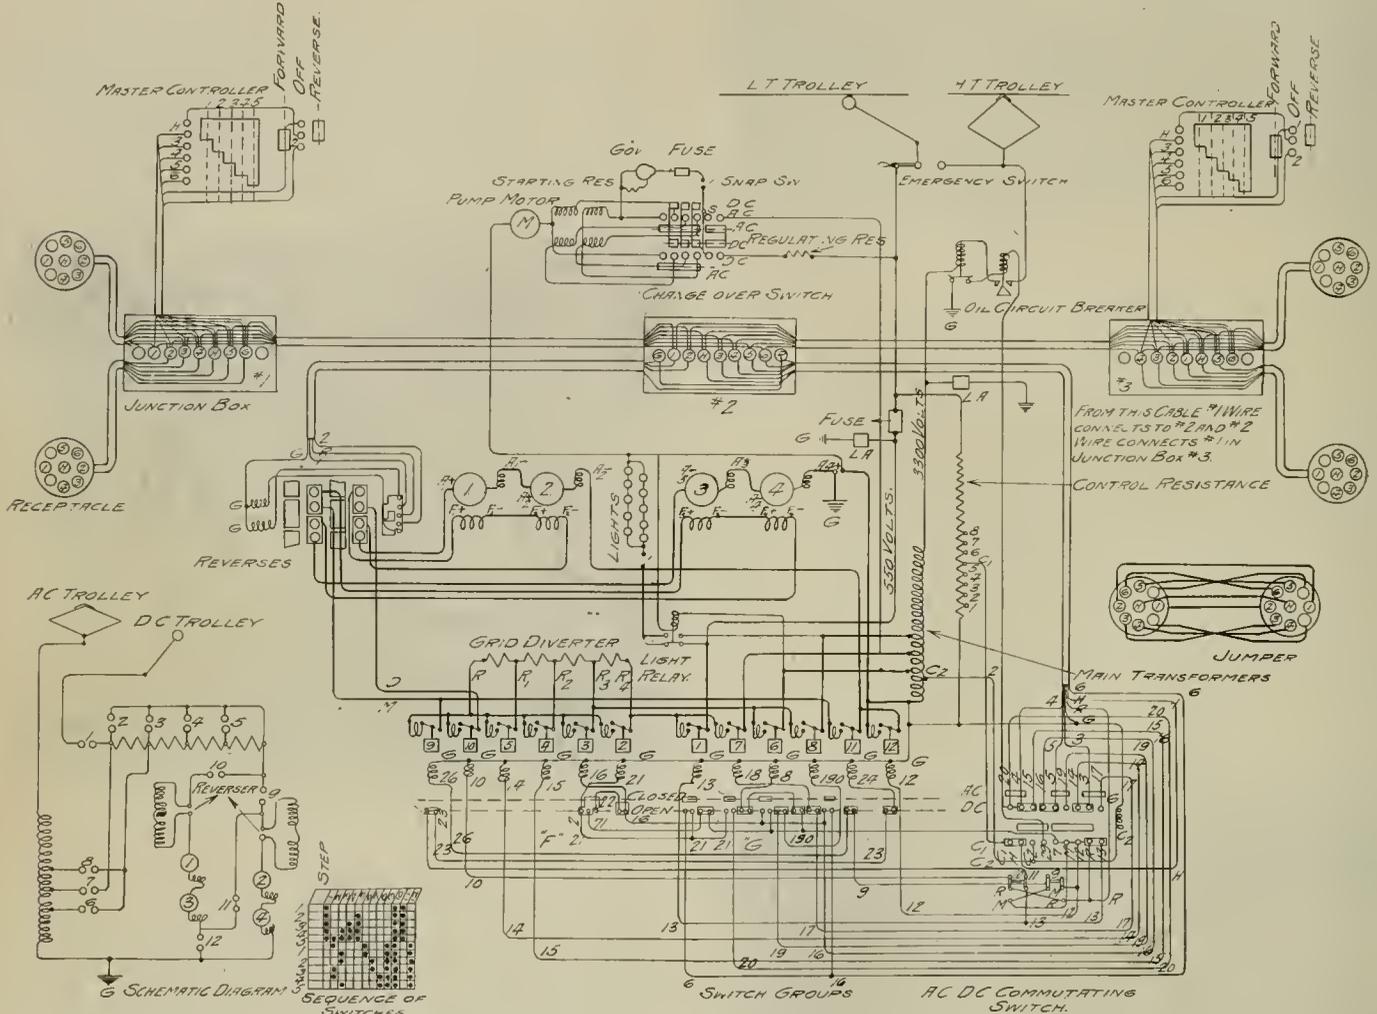

Switchboard and Wiring.

The switchboard is composed of seven panels of blue Vermont marble, six panels being mounted and one being left blank for the future generator installation. All panels have the instrument lights at the top of the board. All instruments are finished in black. The swing bracket at the top has mounted on it two 4,500-volt meters, one for each generator, and one synchroscope.

The wiring from the generators to the switchboard is suspended from the under side of the turbine floor on racks and insulators and passes up through the floor at a point back of the switchboard. The cables are lead covered and

breakers. The bus lines and choke coils and lightning arresters are located back of the framing.

The two static stations, used to furnish current to the single-phase trolley line between Butler and Etna, are located at Mars and at Bryant, about 11 miles apart. A line from the power plant supplies current directly from the generators to the trolley at 3,300 volts. In each station is installed one 500-kilowatt oil-cooled static transformer of the shell type. These transformers receive current at 22,000 volts and step it down to 3,300 volts, at which it passes out to the trolley line. Each station is provided with the usual stick type circuit-breakers and barriers with choke coils and lightning arresters. The line from the low-tension side of the transformer to the trolley is provided with a type "F" double-pole oil circuit-

Pittsburg & Butler Street Railway.—Diagram of Car Wiring.

pass through camp tile under the transformer room to the outlet in front of the transformers. The high-tension bus lines are located above the transformers in the transformer room. The single-phase transformers can be disconnected from each other at the bus by disconnecting switches. The single-phase current is taken from the middle and outside phase at the bus bars on the back of the board.

Substations.

There are one rotary substation and two static substations. The rotary substation is used to supply current to the Butler City Passenger Railway Company, and contains at present one 500-kilowatt, 550-volt rotary converter and three 200-kilowatt oil-cooled transformers, which supply current to the rotary. These receive current at 22,000 volts from the power station. The high-tension circuit-breakers are mounted on the framing directly over the transformers. Upon this framing are also mounted the barriers between the circuit-

breaker switch. There is a choke coil and lightning arrester on the outgoing trolley circuit. The ground return from the rail to the switch enters the station through a tile. The Mars station, which is half way between the power plant and the station at Bryant, is provided with circuit-breakers in the high-tension transmission line which passes through the station, so that the section beyond Mars can be cut out in case of trouble. The general style of these stations, which are built of brick, is shown herewith.

Car Equipment.

The cars for the road were manufactured by the Niles Car & Manufacturing Company, Niles, O. The cars are 51 feet 3 inches long, over all, 8 feet 1½ inches wide, and 9 feet 5 inches high. The lumber used in the construction of the car bodies was well seasoned. The sills and bottom framing were made strong, so as to carry safely the heavy equipment. The outside sills are composed of yellow pine timbers, 4½ by

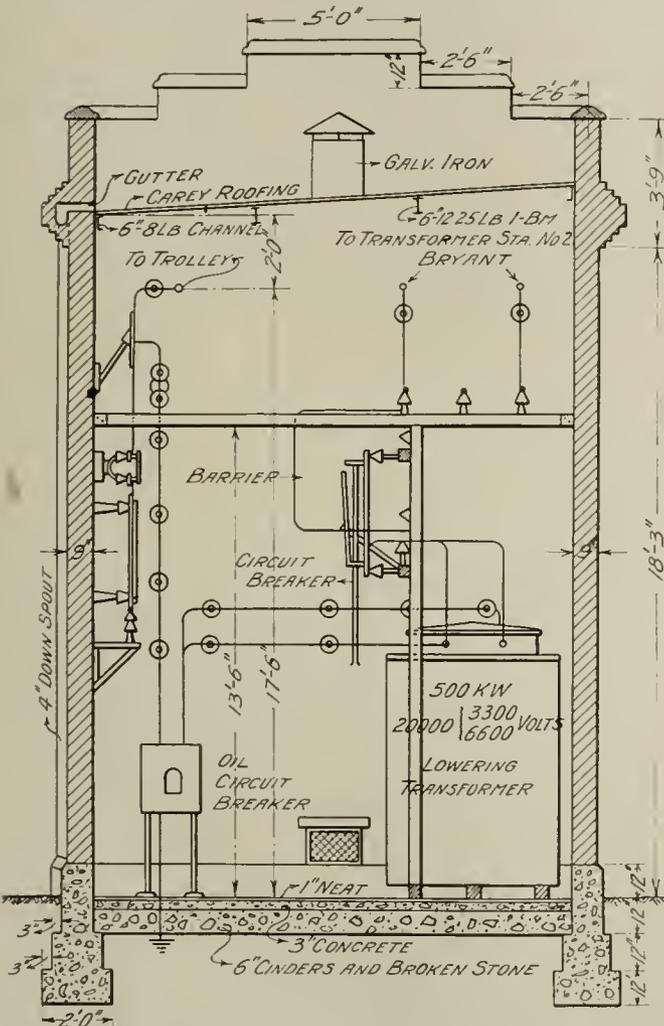

7 $\frac{3}{4}$ inches. The two center sills are composed of 6-inch I-beams and yellow pine fillers. The end sills are oak.

The windows of the cars are of the Pullman style, with the upper sash made stationary. The main compartments of the cars are provided with 15 reversible seats and four end seats, all of which are upholstered in mohair plush. The smoking compartments contain four reversible and four end seats. These are upholstered in leather.

The interiors of the passenger cars are finished in mahogany. The ceilings are of the full empire type and are painted a light green. The cars are heated by the Peter Smith hot-water heating system. Each car is equipped with two trolley poles and a pantograph current collector, the latter being used for alternating-current operation.

The trucks were built by the Standard Motor Truck

switches, one for the alternating-current and one for the direct-current control, the grid resistance, one combined alternating-current circuit-breaker and limit switch with pneumatic reset, which is operated from the platform, one reciprocating-type reverser switch, one commutating switch, for changing over from direct current to alternating current, one emergency change switch by which current can be taken for the alternating-current operation by trolley wheel to operate the car in case the pantograph becomes disabled. When in the normal position the switch is set to use current in the direct-current operation. There is one relay-light switch, which changes the

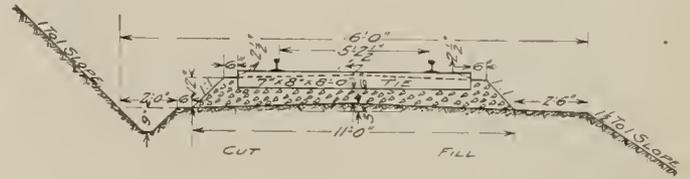

Pittsburg & Butler Street Railway—Section of Rotary Substation.

Company. They are solid forged from low-carbon, open-hearth steel and are designed to carry a load of 64,000 pounds at the king pin. They weigh 17,200 pounds and have a wheel base of 6 feet 8 inches. Rolled steel wheels, 36 inches in diameter, and forged steel axles, 6 inches in diameter, are used. The brake rigging is suspended from the equalizing bars. Peacock hand brakes and Westinghouse air brakes are used on the cars.

The cars are equipped with the Westinghouse alternating-current and direct-current multiple-unit electro-pneumatic control. Each truck has mounted on it two No. 132 100-horsepower alternating-current and direct-current motors. The general scheme of wiring of the cars is shown in the accompanying diagram.

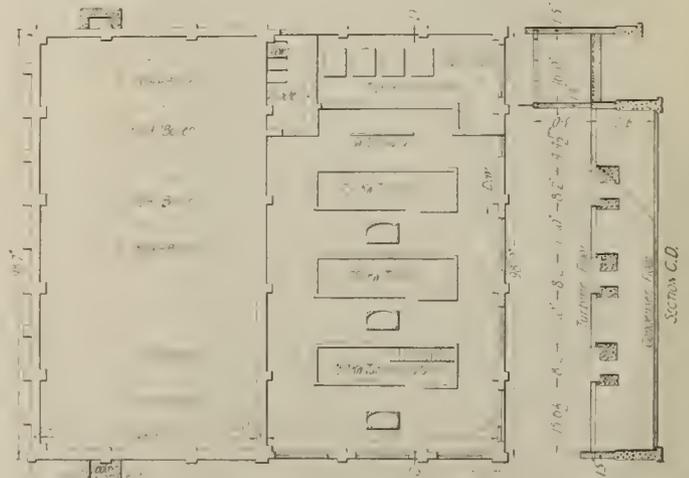

The electrical mechanism installed under the car body is one 200-kilowatt air-cooled auto-transformer, two sets of unit

Pittsburg & Butler Street Railway—Track and Roadbed Construction.

lights from direct current to alternating current when the car passes from one to the other. The auto-transformer is kept cool by a small motor-driven fan placed in one end of the transformer casing. The air is taken from openings in the cable duct and driven through the transformer coils and out at the other end. This motor is constantly in circuit.

The wiring for the pneumatic control is all in loricated conduit with junction boxes for distribution to the various points of connection. The main cables are also carried in a cable duct provided in the center of the car floor by the car builders. All cables to and from the reverser to the motors are carried in cable ducts. There are two trolley leads from the emergency switch, one alternating-current and one direct-current. The alternating-current lead passes from the pantograph in the center of the car in loricated pipe and is connected to an oil circuit-breaker. The two trolley circuits for direct-current operation merge into one lead, which passes down at the corner post of the car to the emergency switch, a fuse being provided in this circuit to take care of the over-

Pittsburg & Butler Street Railway—Plan of Power House.

load or short circuits. The air pump change-over switch is placed on the platform, so that the change from one system to the other can be made without getting off the car. The air pump motor is of the alternating-current and direct-current compensated type. When operating by direct current the fields are all in series and when operating by alternating current the fields are in multiple.

Motor Operation.

When using direct current the motors 1, 2, 3, 4 are in series, with all resistance in on the first point of the con-

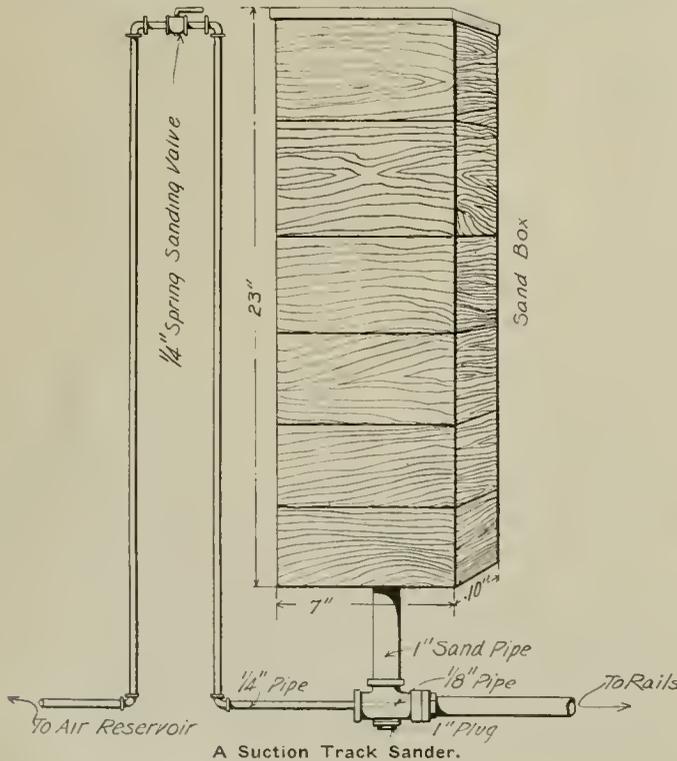

troller. The resistance is gradually cut out on points 2, 3 and 4, and on point 5 all resistance is cut out. The current passes through the entire winding of motors 1 and 2 to the reverser, then through the armatures and the compensated field winding of motors 1 and 2, then through the reverser to the ground. The current takes a similar course in passing through motors numbers 3 and 4.

When operating on alternating current the motors are operated two in series, forming a unit, and the two units are operated in parallel. Motors 2 and 4 have ground connections. The auto-transformer has three taps brought out to the unit switches. When starting, the lowest voltage tap is put in circuit by the unit switch, and each successive point in the master control increases the voltage. Before passing from one tap to the other a reactive resistance is put in series with the circuit, the resistance being a part of the grid resistance used in the direct-current control. The number of steps on the master controller is the same for both currents, the fifth point being the maximum speed position. It will be seen that with these motors the reversing is done in the field winding instead of in the armature, as is usual in direct-current practice.

The Pittsburg & Butler Street Railway Company was promoted by Charles Gibson, Jr., of Pittsburg, and was financed by the Pittsburg Trust Company, which is now operating the property. The road was designed, located and constructed by Hudson F. Layton of Pittsburg as chief engineer, who, since turning the finished road over to the operating department, has been retained as consulting engineer. Mr. Gibson acted as general manager during the construction period and since has been retained as vice-president and a director. Mr. Gibson and Mr. Layton are well known in railroad circles as designers and constructors. The future extensions of this road will give one of the longest electric lines in the country, forming, according to plans, the shortest line between Pittsburg, Erie, Lake Chautauqua and Buffalo.

A SUCTION TRACK-SANDER.

A suction track-sander designed along original lines by Mr. H. H. Buchanan, master mechanic of the Louisville & South-

A Suction Track Sander.

ern Indiana Traction Company, New Albany, Ind., is presented in the accompanying illustration.

As shown, the sand-box is connected to one of the vertical

branches of a cross by a 1-inch pipe. A 1/4-inch pipe connected to the compressed air reservoir is reduced to 1/8-inch at the cross and enters one of the horizontal openings and extends a little beyond the center line of the sand-pipe. This prevents the sand from being blown out of the sand-box when pressure is applied. From the opening opposite the air pit a 3/4-inch pipe leads the sand directly on the rails under the wheels. The branch of the cross below the sand-pipe is plugged to facilitate cleaning. A valve on the air line located near the airbrake serves to control the sanding.

TRAINMEN WITHDRAWING WAGES FROM DAILY COLLECTIONS.

The novel practice of allowing conductors to withdraw each night from money collected during the day sufficient amounts for their own and their motorman's wages has been in successful use by the Denver City Tramway for the past 18 years. The accompanying reproductions of some of the blank forms used by this company's auditing department will serve to illustrate the simplicity of this method of payment.

The daily trip-sheet, as shown, exhibits blank spaces for the usual information and also, at the lower right-hand corner, bears a blank receipt for the day's wages of the car crew. At the end of his day's service the conductor, having properly filled out the main portion of the trip sheet, withdraws from his fares the proper amount of money with which to pay his motorman and himself. He indicates the rates per hour, amounts of wages withdrawn, punch mark and the badge numbers in the proper spaces and then signs the formal receipt on the blank. This receipt is also signed by the motorman.

It is stated that by this method of paying there are practically no misunderstandings regarding wages and that

Denver City Tramway—Correction Notice Given Conductor.

Denver City Tramway—Trip Sheet with Blank Receipt.

the errors are remarkably few. Whenever the auditing department does find errors a correction notice, as illustrated, is handed the conductor who is responsible. Thus the error is adjusted at once and friction avoided.

CONCLUDING SESSION OF THE IOWA STREET AND INTERURBAN RAILWAY ASSOCIATION.

Before adjourning the fourth annual convention at Clinton, Ia. on Saturday, April 20, the Iowa Street and Interurban Railway Association re-elected officers for the ensuing year. An account of the proceedings at the opening session on Friday, April 19, with four papers which were read before the association, and other information relating to the meeting, was published in the Electric Railway Review of last week. The following officers were elected:

President—F. J. Hanlon of Mason City, vice-president, secretary and auditor Mason City & Clear Lake Railway.

Vice-President—P. P. Crafts of Clinton, general manager Iowa & Illinois Railway.

Secretary and Treasurer—L. D. Mathes of Dubuque, manager and purchasing agent Union Electric Company.

At the invitation of the Des Moines City Railway and the Inter-Urban Railway, Des Moines was selected as the meeting place for the next annual convention. It was decided that the papers and discussion during one-half day of the 1908 convention shall be devoted to the consideration of operating problems.

The association passed a vote of thanks to the railways and citizens of Clinton for the entertainment afforded the delegates during the convention. At the session on Saturday morning Isaac B. Smith read a paper on the "Joint Operation of City and Interurban Cars over City Tracks." This paper and an abstract of the discussion which followed it will be found on page 556 of this issue.

Handling Peak Load Traffic.

E. L. Kirk (Sioux City Traction Company) gave an informal talk on effective methods of handling peak or rush-hour traffic on city lines. He said he believed that the easiest and the most logical way to handle peak load traffic is through the use of trailers. His company had gone to extremes in using trailers and had developed trailer cars that will seat 90 people. These are handled by motor cars having a seating capacity of 68 people and are usually used on the long-haul park runs. In handling the night peak load some cars are sent out between scheduled cars as trippers. During the three years that trailers have been used at Sioux City not a person has been injured through their use and not a derailment has been reported. The cars are equipped with hand brakes.

J. G. Huntton (Tri-City Railway & Light Company) said that his company operates trailers on the arsenal division, but had not been so fortunate in avoiding accidents as the Sioux City Traction Company.

G. E. Miller (Union Electric Company, Dubuque) approved of the use of trailers. His company has used trailers on the park line for four years without an accident. In caring for peak loads he had developed the bellows schedule, which closes up as the travel increases. After the peak of traffic has been reached an inspector sees that all cars resume their regular schedule. He believed that the successful operation of trailers depends almost entirely on the care of motormen and conductors.

A short discussion followed the reading of the paper on the "Steam Motor: Its Value in Interurban Service," which was published in the Electric Railway Review of last week, page 520. As the author of the paper, W. G. Wagenhals, was not present to explain the questions that came up no satisfactory conclusions were reached. H. H. Polk (Inter-Urban Railway, Des Moines) said he believed that many small lines would eventually be built and would adopt as a standard a car similar to the one described.

On Saturday afternoon the delegates, accepting the invitation of the Iowa & Illinois Railway and the Tri-City Railway, inspected the government power house at Rock Island and the Tri-City Railway & Light Company's power station at Moline. Eighty of the members of the association and

representatives of manufacturers attended a dinner at the Commercial Club, Davenport, on Saturday evening.

Discussion on Train Dispatching.

Following the reading by H. H. Polk of the paper on "Modern Train Dispatching Methods on Electric Railways," which was published in the Electric Railway Review of last week, page 521, a discussion of the relative merits of the various systems of dispatching took place. Mr. Polk said that running cars on train orders as well as on the timecard schedules gives a double check on all trains, thereby reducing the dangers of collisions.

Mr. Crafts favored the issuing of orders only when unusual conditions prevail and advised the regular operation of cars on timecard schedules. He had made this the practice on the Iowa & Illinois Railway and had obtained excellent results. When cars are more than three minutes late conductors must obtain orders from the dispatcher before proceeding. Such cars are held at sidings so that all other cars may run on their regular schedule. By this system only the late car loses its schedule time. When all cars are running late some confusion results, but it is offset by the elimination of the dangers incident to the issuing of orders at each station. Mr. Crafts believed the frequency with which electric cars are run makes electric railway operation different from steam railway operation.

Mr. Hanlon said he favored the issuing of orders at given points, but believed that no railroad maintaining a fast schedule of cars can successfully have orders issued at all stations.

The discussion turned upon the merits of oil versus electric lamps for markers, switch lamps and crossing signals. Mr. Polk said that his company pays \$75 a month for maintenance of oil lamps on its line. He is now experimenting with electric lights, which, he believes, can be kept lighted day and night at a lower expense. He thought that lights which are worked automatically by a trip on the trolley wire would never be a success, as the danger that the trolley wheel would leave the wire at the critical point would make the system unreliable.

C. D. Cass (Waterloo Cedar Falls & Northern) stated that his company, which owns both a steam and an electric railway, follows steam railway practices in the operation of cars. He believed that if companies would make their sidings of the stub-end type they would have no trouble at those points.

Mr. Crafts said he thought stub-end switches were too slow for use on a railway operating on a fast schedule.

Discussion on Freight Handling.

In discussing the paper of Mr. Crafts on "Freight Handling by Electric Lines," which was published in the Electric Railway Review of last week, page 518, Mr. Polk said the Inter-Urban company derives 30 per cent of its gross receipts from freight traffic.

G. B. Hippee (Des Moines City Railway) believed the Iowa electric railways are far in advance of the railways of the east in the handling of freight. He said the eastern companies do not realize that the freight business can be developed as it has been developed in the west.

Mr. Crafts said he believed an interurban railway which was built for the operation of cars at high speed was necessarily of substantial construction, and he knew of no reason why it should not be safe for freight carrying in carload lots.

In answer to a question by A. E. Park (Des Moines Winterset & Creston) Mr. Polk said that the question of handling freight should be considered in building a new line. He had never obtained data on the comparative cost of handling freight in large and small quantities by steam and electric railways. However, he was positive that up to 8 or 10 cars in a train the cost of handling freight on electric railways was less than on steam railways.

Mr. Hanlon said that his company's track was built with 60-pound steel rails and there had been no difficulty in handling coal in carload lots. He said that electric railways

should adhere to steam railway practices and by maintaining the rates on freight work in harmony with the steam railways.

THE JOINT OPERATION OF CITY AND INTERURBAN CARS OVER CITY TRACKS.*

BY ISAAC B. SMITH, TRAFFIC MANAGER CEDAR RAPIDS & IOWA CITY RAILWAY & LIGHT COMPANY, CEDAR RAPIDS, IA.

Since the assignment by the association of this subject, an Iowa law has been passed fixing the rights and duties of electric railway companies with respect to the joint use of city facilities. The law is now in full force and effect and a treatment of the subject is, therefore, practically limited to the law and its application. I assume that only electric railways were intended to be considered and that the term "city tracks" means the tracks within the corporate limits of a city that belong to a street railway company or an interurban railway company or to a company performing both classes of service.

Section 1 of the statute provides, in substance, that any person, firm or corporation owning or operating an electric street railway in any city in Iowa is authorized and required: (1) To permit the use of its terminals (except car houses and approaches thereto), tracks, poles and wires located within such city, by the passenger and combination baggage cars of interurban railway companies when used for interurban business only and not for local street railway business. (2) To furnish electric power for interurban cars over city tracks so used; but only during the hours when street cars are operated, and provided the capacity of the power house is ample. In the use of tracks and power the grantor company is to have the preference, in order to avoid delays in service. Interurban companies shall pay reasonable compensation for all facilities and power furnished; and, in case of disagreement, questions involving compensation and conditions under which facilities shall be furnished, used and operated, shall, on petition, be heard and determined by the board of railroad commissioners of Iowa. An order of the commissioners, or court of appeal, shall be subject to judicial modification and review.

Section 2 provides: (1) The manner of perfecting an appeal from an order of the board of railroad commissioners. (2) That an order of the commissioners from which an appeal has been made shall not be suspended during review, provided the interurban railway company gives an indemnity bond satisfactory to the court or judge appealed to, and provided the compensation as awarded is made or secured to the grantor company.

The law gives no rights to a street railway company as against an interurban railway company already occupying city streets. But such a condition is unusual. The street railway is almost always the forerunner of the interurban railway, and it seems inadvisable to take up the consideration of the details of a contract that would be used so little, even though it should logically be included in the discussion. The passage of the law removes the necessity of securing a special grant from a city to authorize and permit the use of city tracks for interurban cars, which might be necessary in many cases. This is a most important feature of the law.

No single instrumentality brings constantly more orders to a city or more passengers for street railways than interurban lines, which are undoubtedly a great benefit to the city they enter; and, if local competition is eliminated, are an equal benefit to any system of city railway operating in such city. Interurban railways deserved encouragement, but street railways owning grants to important city streets were in a position legally to impose burdensome conditions upon them. Such anomalous conditions were no doubt the cause of the enactment of the statute in question.

It would seem that the question of compensation will be met by requiring a payment to the grantor company of a reasonable sum based upon the cost of terminals, their maintenance and operations, such compensation to be proportioned on car mileage, wheelage or some other equitable and established custom.

Looking at the proposition as a whole it would seem that the passage of our recent statute has very much simplified the matter of arranging for the joint use of city tracks by city and interurban cars. The rights and duties of contracting parties are well recognized and established, and it would seem that fair, reasonable and uniform regulations governing the joint use of city tracks by city and interurban cars are bound to result.

With regard to the actual details of operation, it would seem that current should be furnished by the company owning

the tracks, otherwise legal and electrical difficulties might be encountered by the erection and use of an individual transmission system over a track used in common.

If the line over which joint operation is to be performed is long or service is frequent, a double track will be necessary to give satisfactory service. An interurban car entering a city after a long run cannot be operated as close to schedule as city cars and delays at meeting points on a single track would certainly result. If the schedule of interurban and city cars either leaving or entering the city is the same (or nearly so), the interurban cars should precede the city cars. The former should do but little or no city business, and hence will not impede traffic by frequent stops. The delays incident to the following of a city car by an interurban car are very vexatious to interurban passengers, and, if there is active competition with some steam roads, such delay might seriously affect interurban revenues.

The Iowa law affecting joint use of city terminals absolutely forbids competition in city business. There is another statute, which, in the absence of any other provision to the contrary, enables interurban companies to charge a greater fare than five cents. These two features should serve to effectively prevent city passengers from using interurban cars and hence should do away with the necessity of recording city fares and providing extra crews.

The company seeking the privileges of using the tracks of another should, and I think would, be obliged to follow the operating rules of the grantor company so far as applicable. With regard to the question of damages, either to the public or as between companies, I believe they should be assessed to the company responsible, as determined by the facts in each case.

In conclusion and in the face of the law and the facts it would seem that a contract covering joint use and operation over city tracks should be, and, indeed, must be, approached in the spirit that the street railway and interurban railway are not competitive but complementary and are beneficial to each other.

Discussion on Joint Operation over City Tracks.

In the discussion which followed Mr. Smith's paper, Mr. Hippee said that interurban lines should use as few miles of city track as possible and should have a separate loop and terminal station at some point away from the center of the city. He said the Des Moines company will put this arrangement into practice as soon as it is possible to do so, as the plan will enable both city and interurban cars to operate with less delay.

Mr. Crafts believed interurban cars should be given the precedence in operation over city streets, as they are usually compelled to run on a fast schedule and if delayed on the city tracks may find it difficult to make up lost time. He agreed with Mr. Hippee that the city tracks should be used as little as possible in large cities, but believed it was impracticable to consider this point in the smaller cities. Interurban cars should be given the right of way and interurban stations should be situated on the outgoing line. This, he said, decreased the confusion on busy days, as a large number of the incoming passengers would leave the car before it reached the station.

Arrangements for Handling Crowds at the Jamestown Exposition.

President R. Lancaster Williams of the Norfolk & Portsmouth Traction Company, Norfolk, Va., is quoted as saying that the company is spending nearly \$3,500,000 to improve its properties, and within a short time will have in operation one of the finest power plants in the country, which has cost about \$1,000,000. The company is spending from \$1,500,000 to \$2,000,000 for betterments in Norfolk and Portsmouth, which includes extensions and modern equipment. Concerning the arrangements for handling the crowds of visitors to the Jamestown exposition he is reported as saying:

"We will be able to handle 10,000 people an hour each way during the exposition. That means a schedule of two and a half minutes on each line. Taking both lines, we will have a schedule of one and a quarter minutes. Cars will be operated with trailers. The cars will go over a belt, so that no time will be lost in switching. During the rush hours of the morning and evening we will run cars at intervals of a minute and a half on each line. That will make a car from Norfolk to the exposition grounds each 45 seconds."

*Read before the Iowa Street and Interurban Railway Association, Clinton, Ia., on April 20, 1907.

DEVELOPMENTS IN THE CLEVELAND TRACTION CONTROVERSY.

The street railway situation in Cleveland has developed rapidly in the last few days. The Cleveland Electric Railway on Tuesday night ceased operation on its Central avenue and Quincy street lines, on which its franchises have been declared invalid by the supreme court, but by securing injunctions prevented any of the low-fare companies from operating the lines. The peace agreement made on January 11 was broken on Monday and the injunction restraining the Municipal Traction Company from operating over Cleveland Electric tracks was put in force, but the low-fare interests evaded it by turning over the operation of the cars to the Low Fare Railway, which was incorporated for just such a purpose, to nullify the effect of the claim that the Forest City franchises are invalid on account of Mayor Johnson's financial interest.

All negotiations for a sale of the Cleveland Electric Railway property in Central avenue and Quincy streets were declared off on April 19. The Cleveland Electric Railway offered to sell the property for \$448,473 instead of about \$150,000 as offered by the Forest City on April 17, as reported in the Electric Railway Review of April 20. The company also reserved the right to dispute any attempt of the Municipal Traction Company to operate from the western end of the Central avenue line to the Public Square. The company stated that in fixing the price it had followed the method suggested by Mr. du Pont and that if this was unsatisfactory it was ready to abide by the results of an impartial arbitration. This offer was at once refused by the Forest City directors, who stated that their objection was against the terms of the offer and not the price.

On April 19 the Cleveland Electric Railway applied formally to the board of public service for permission to remove its poles and wires from the streets in question. This permit was granted the following day, but with many restrictions calculated to prevent the interruption of service until the Forest City Railway could lay its tracks and begin operation. It was provided that the track should be removed in sections in a prescribed order and that crossovers should be built so as to permit operation during the progress of the work of removal. The Forest City forces put in an active day on Saturday setting poles and stringing wire to bring power from the West Side power house for the operation of the Central-Quincy lines.

On Monday, April 22, the Cleveland Electric Railway, through its attorneys, sent a notice to the Municipal Traction Company and the Forest City Railway Company, stating that they had violated the provisions of the peace agreement as entered into on January 11 and renewed on February 8, and that consequently it would consider the agreement terminated. It was further stated that the temporary injunction against the use of the Cleveland Electric Railways tracks by the Municipal Traction Company, which was suspended during the peace agreement, was again in force, and the low-fare companies were notified to cease at once the operation of cars from Fulton road to and around the Public Square. Another notice was sent to the board of public service stating that the company's franchise contract with the city provided for the removal of the tracks upon the expiration of the contract, that the board of public service had no authority to impose restrictions as to how the work should be done and that the company refused to accept the board's permit and would proceed to remove its property in accordance with the terms of its contract.

On Tuesday, April 23, the Municipal Traction Company made a lease to the Low Fare Railway whereby the latter company may operate its cars between Detroit avenue and West Twenty-eighth street and the Public Square. The object of the arrangement was to prevent the operation of the injunction against the Forest City company on account of the mayor's alleged financial interest. To indicate the transfer of

the property under the lease a 10-foot crossover connecting the Forest City and the Cleveland Electric tracks at Superior avenue and West Twenty-eighth street was removed and then replaced in the presence of witnesses. Operation was then resumed under the name of the Low Fare Railway. The Cleveland Electric Railway then applied to Judge Ford for injunctions against the Municipal Traction Company, the Forest City Railway Company and the Low Fare Railway Company, on the ground that Mayor Johnson is financially interested, to prevent any of them from operating the Central-Quincy lines after the Cleveland Electric Railway should cease operation at midnight. Judge Ford granted a temporary restraining order and called a hearing on a permanent injunction for 9:30 the next morning, saying that he would not permit the interruption of service on those lines for a longer period unless he was convinced that the legal points involved were of more importance than the public convenience.

Promptly at midnight on Tuesday, April 23, the Cleveland Electric Railway ceased operation on Central avenue and Quincy street, and turned off the power, as it had announced it would do in a communication to the city council on April 15. No attempt was made, however, to remove the tracks. About 200 policemen were stationed all along the lines to prevent any violation of the restrictions imposed by the board of public service and the company decided not to attempt any clash with the city. The company announced that it would increase the service on several parallel routes in order to make up partially for the lack of service on the Central-Quincy lines.

At the council meeting on Wednesday night an ordinance was introduced and given its first reading to give the Low Fare Railway a franchise over the entire Central-Quincy route, as an extension of its East Fourteenth street and Sumner avenue lines. It was planned to give the ordinance its second and third readings on Thursday and Friday so that the company might begin operation at once. The Forest City Railway already has a franchise for this route, the validity of which is disputed because of the mayor's alleged financial interest. As it will probably take a long time to settle the financial interest suit now pending in Judge Phillips' court, it is planned to have the Low Fare Railway take over the operation of the 3-cent lines. The temporary injunction cases restraining the three low-fare companies from operating over the Central-Quincy routes, which Judge Ford was to have heard on Wednesday morning, were held over until Thursday, nearly all of Wednesday having been taken up in attempting to decide before what court the cases should be heard.

The Berlin (Germany) Electric Railways.

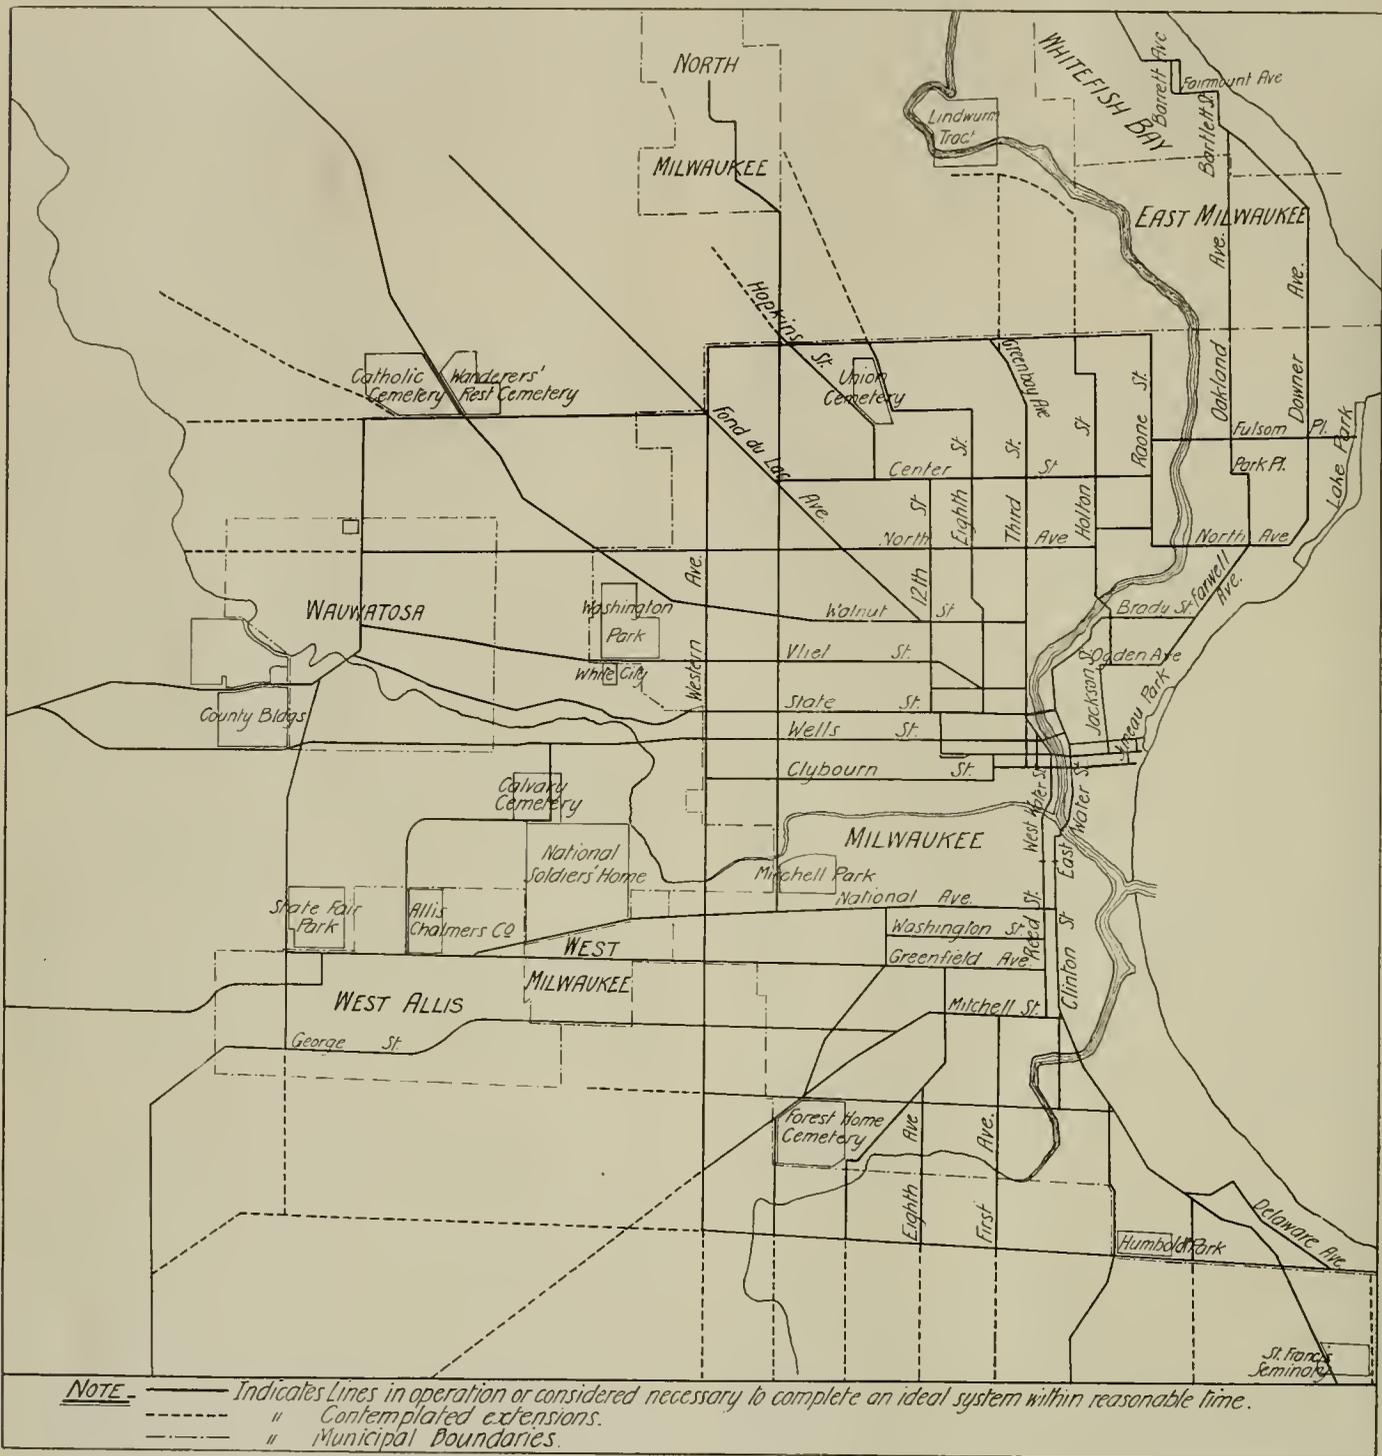

It has been found necessary to remodel the entire system of the Berlin Metropolitan Railways. It is understood that the system will be modeled after the lines now being built between Hamburg and Altona, and will be operated with single-phase alternating current. The third rail is considered impracticable and an overhead line carrying a 10,000-volt alternating current will be used. Two new power stations will be erected, one at Westend and the other at Rummelsburg, each containing six 5,000-kilowatt turbo-dynamos. In the new system it is expected that trains will be run on an interval of every 100 seconds and that each train will accommodate 475 passengers. The trains will consist of four motor carriages and three or four trailers. The cost of converting the system is estimated at £11,000,000, and the capacity will be increased from 200,000,000 passengers a year to about 300,000,000. The annual receipts are estimated at £1,333,000 and the profits at about £333,000. On account of the heavy expense involved it is expected that the fares will be increased about 50 per cent. This vast project is expected to require about four years for completion, during which the whole of the present Stadt, Ring, and Vorortbahn systems will be changed to use the single-phase alternating current.

ARGUMENTS HEARD ON MILWAUKEE SERVICE.

In connection with the investigation by the Wisconsin railroad commission into the railway service provided by the Milwaukee Electric Railway & Light Company, John I. Beggs, president of the company, presented with his testimony on

crimination and said that, compared with St. Francis, Tippecanoe and other suburban points, gross discrimination was practiced against Wauwatosa. He said that the suburban business should be considered as city business.

C. N. Duffy, comptroller of the company, testified that there is no separation of investments on the books of the

Plan for Ideal Street Railway System in Milwaukee as Submitted to Wisconsin Railroad Commission by John I. Beggs.

March 19 a map showing a plan for an ideal street railway system in Milwaukee. The principal features of the plan are shown in the accompanying illustration.

Testimony Before Wisconsin Commission.

Hearings were held by the Wisconsin railroad commission at Madison, Wis., on April 22 and 23 in the cases of Wauwatosa and Milwaukee against the Milwaukee company. L. S. Pease, who represented Wauwatosa in its demand for a 5-cent fare to Milwaukee, based his argument on the ground of dis-

crimination which would determine the value of the Wauwatosa lines alone.

Edwin S. Mack, one of the attorneys for the company, said that the complainants in the case had applied every test except the right one. This, he said, was the legal obligation of the company under its various franchises and the state's policy of regulating the use of streets. Mr. Mack said: "This is a question of classification and distinction, not one of discrimination. It is the established policy of the state

that local governing bodies shall control the terms and conditions under which street railway companies may use the streets. Consequently it is a fact that conditions that apply in Wauwatosa do not apply in West Allis, St. Francis or Tippecanoe."

Mr. Mack said that if an attempt is made to lower the rates of fare at any point the company will insist upon its contract rights as defined in its franchises. "This is a difficult constitutional question," he said, "and I prefer not to go into it until we have reached the reasonableness of fares. This question is not involved now, and cannot be unless the commission determine that there has been discrimination against Wauwatosa."

George P. Miller, attorney for the Milwaukee company, in referring to a statement of Mr. Pease that single fare limits are fixed arbitrarily by the company, said that as the community has grown settlements have developed beyond the city limits. As favors to the people living there, the single fare limit has gradually been extended. But there must be a line drawn; otherwise in the course of time the company would be carrying passengers to Madison for one fare.

John Barnes, a member of the commission, asked if Mr. Miller contended that a franchise grant limiting the rate of fare to "not to exceed five cents" gave the company the absolute right to charge five cents. He replied "yes."

John T. Kelly, city attorney of Milwaukee, in his argument on April 24, said that he would be satisfied with an order which would insure continuance of the present service on the Milwaukee city lines. He asked that the commission order the company to have its cars swept out in the barns during the night and sent out in the daytime with fires lighted.

Mr. Barnes of the commission said that on the question of brakes the duty of the railroad commission is merely to determine whether the hand brake is a reasonably adequate contrivance to control cars. Air brakes may be superior to hand brakes, but, if the latter are reasonably adequate, the commission cannot order their abandonment. If the safety of the public and the rapid operation of the cars demand the use of air brakes, the adequacy of the service is involved and the commission may order their substitution for hand brakes.

Mr. Miller said that the company had been preparing for improvement in its service for over a year and that the new cars were ordered over a year ago. He said that an order relating to the sweeping of cars would be an unjust reflection on the company, because all complaints which had been based on the lack of sweeping were caused by failure of employes to obey orders.

Mr. Miller agreed to file with the company a brief proving that the company has the right to operate construction trains. An order is not necessary, he said. The commission has no jurisdiction over this question because there is no evidence to show that the construction trains inconvenience the public.

As to the substitution of air brakes for hand brakes Mr. Miller said that the duty of the commission was to protect the traveling public and enforce reasonable, adequate service.

"The company has had many years of experience," Mr. Miller said, "but no person has ever been injured on our cars because of the lack of air brakes. Under present conditions people on our cars are much safer than other people using the streets."

Mr. Miller said he hoped the commission would recommend what changes and extensions it deems advisable, and said that the company would be glad to follow the recommendations to the best of its ability.

The commission has taken the cases under advisement.

The Chicago & Milwaukee Electric Railroad, which is extending its line from Kenosha north to Milwaukee, Wis., is employing both a day and a night force on the construction, arc lamps furnishing the light. More than 600 men are now employed.

HENRY J. PIERCE SHOWS THE NEED OF CO-OPERATION.

Henry J. Pierce, president of the International Railway Company of Buffalo, made an address before the Buffalo chamber of commerce on April 18, in which he spoke of the need of settling wisely the questions which confront the country, and suggested a plan for co-operation between the public and the corporations. Mr. Pierce said in part:

The bulwark of the nation is its people and their property, which has been built up by years of toil. The protection of the person and his property is the purpose for which all government exists. Any proposed measures of government that may strike at this fundamental reason for the very existence of government are wrong. Every citizen should uphold the law. But no law should wrongfully hold up the citizen. Government is not intended to be the arbitrary despot of the people and their property. Property, accumulated through years of thrift, should not be endangered by an impulse for experiment. Every man to his trade, gentlemen! In a matter of interpreting the law, let the lawyers be heard. In a matter of business, let the business men be heard.

Commerce has come to mean corporate transaction of the great bulk of business. The merchant, the miller, the manufacturer, the dealer, have incorporated for the better handling of their business, and today we find the world of business peopled with corporations large and small. They represent a vast volume of the nation's wealth. Prominent among them are the public service corporations. Their real owners are not the few, but the many. Here or there a man momentarily may rise only to end in acknowledging that the people, the thrifty citizens who have accumulated more or less money and invested much of it in large and small amounts in stocks and bonds, the great body of the nation, are the owners of the nation's wealth. The builders of great things must borrow the money to build. The people have no wish or time to listen to demagogues. Especially they have no confidence in any who in sheer wantonness or selfishness may attack the business institutions in which the money of the people is invested. The people expect every representative business body, which undertakes to voice their views, to turn its back upon malign clamor designed to undermine the commercial welfare of the country. Honest criticism is always welcome; dishonest criticism is despicable.

In a matter of making the laws let us not leave it to the lawyers alone, especially in laws that pertain well-nigh wholly to business. This I mention not with reference to any individual, but because more than 60 per cent of the members of our national congress and our state legislatures are lawyers. Let us hear what the business men have to say. Let them be consulted; let them be advised with; let their point of view be considered and their information, suggestions and experience be utilized in the framing of legislation which affects the business interests of the country. These are no times for experiments with our prosperity.

It is a time for sincere counsel and not for insincere controversy. Above all, in this impending crisis it is a time for wise and careful consideration of whatever may tend toward governmental action. I believe it would be of tremendous benefit if during the session or after the adjournment of the legislature in each state the governor of the state should call a second assemblage to meet at the capitol, and this second gathering should be composed of representatives of every chamber of commerce in the state. It should not meet for a day, but for weeks if necessary. It should discuss every question of interest or at issue in any way affecting the public service of the people. Its members should aid to bring about a thorough understanding of corporation business from the business standpoint. It would result in a better understanding, and during that time, if later the laws needed to be amended, the state's chief executive and other officials would ascertain the practical business side, apart from the technical legal side, for subsequent use in such amendment, if any, as might be found necessary. Let this second assemblage have regular sessions, let there be no hesitancy in presenting any problem or question pertaining to the business welfare of the country, the commonwealth or the corporation. Let it be all open and above board, so that every citizen of the land may know what occurs. Let its sessions be controlled by a spirit of sincerity and fairness and a true desire for co-operation among all the elements of our national business life. The convening of such second assemblages would mark a new era in our country's development. Certainly no harm can come from hearing all sides of every question. Then we could ascertain just what charges of corruption, if any, in public service corporations are true, and just what accusers and accusations are untrue. Then we could hear in open discussion any allegation that the head of any public service corporation does not know how to

manage his own business or that he is an oppressor and a cheat. Instead of reckless assault or irresponsible defamation there could be sincere discussion and thoughtful consideration. If a dozen or if only one of the foremost states of the union would lead off with such gatherings, officially called, others would follow, and within a year the benefits to business and to the country would be seen and felt throughout the entire land.

In what I have said I have spoken with a freedom born of the feeling that every man here tonight is equally sincere with myself in desiring that every pending problem may have a happy solution. Nothing is settled until it is settled right.

ANNUAL MEETING OF THE OKLAHOMA ASSOCIATION.

The first annual convention of the Oklahoma Electric Light, Railway and Gas Association was held at Oklahoma City on April 22 and 23. The following officers were elected for the ensuing year:

President, F. H. Tidnam, general manager Oklahoma Gas & Electric Company, Oklahoma City; first vice-president, Edward Reynolds, Tulsa, I. T.; second vice-president, J. H. Merrill, general manager Choctaw Railway & Lighting Company, South McAlester, I. T.; third vice-president, Fred Bentley; secretary, Galen C. Crow, general manager Guthrie Electric Light & Power Company, Guthrie, O. T.; treasurer, W. J. Dibbens, manager Guthrie Gas, Light, Fuel & Improvement Company, Guthrie, Okla.

Executive committee: (For two years) H. C. Stetmund, Chandler, O. T.; C. T. Mercer, Geary, O. T.; (for one year) Clarence Klein, Tulsa, I. T.; and J. E. Turner, Elk City, Okla.

Committee on finance: Charles W. Ford, general superintendent Oklahoma City Railway; R. Wonderlich, Sulphur Springs, I. T.; and W. W. Balington, Okmulgee, I. T.

Advisory committee: H. H. Stephens, El Reno, O. T.; J. J. Patterson, Ada, I. T.; and E. M. Cooper, Wilburton, I. T.

J. H. Merrill, general superintendent of the Choctaw Railway & Lighting Company, South McAlester, I. T., read a paper on "Interurban Railways." Mr. Merrill spoke of the development of interurban roads. He urged members who are constructing new roads to avoid cheap rates which would overload the equipment and, considering the cost of maintenance and new equipment, would not yield fair profits. Mr. Merrill also advised against the establishment of a service that would be unprofitable, saying that a four-hour service was often as profitable as an hourly service, and would not require so large an outlay of money.

In his annual address, the president, F. N. Tidnam, reviewed the organization of the association, told of the work of the officers during the last four months in preparing the constitution and by-laws, in answering the questions of members and assisting them with data on rates and franchises, and in keeping in touch with legislation pertaining to public utilities. Mr. Tidnam urged the opening of a question box and that a committee be formed to obtain answers from the most reliable sources, and also that a committee be appointed to report on legislation adverse to the railway, gas and electrical interests. He suggested the appointment of a business committee to report on better methods of increasing the use of electric cars, light, heat, power and gas as offered by large and small properties and suggested that this committee have the power to assist contractors and to supply means of introducing new appliances.

J. Cliff Leavitt of Oklahoma City read a paper on "Car Painting and Other Uses of Paint." Mr. Leavitt gave advice as to the use and durability of different paints and discussed all the parts of cars to which paint is applied.

E. L. Callahan of Chicago, of the General Electric Company, read a paper on "Increasing the Central Station Day Load." He showed the members how to develop interest in heating and cooking by electricity.

The Nebraska railway commission has addressed a letter to the Lincoln Traction Company, the Citizens' Railway of Lincoln, the Omaha Lincoln & Beatrice Electric Railway and the Omaha & Council Bluffs Street Railway notifying them that they are subject to the terms of the new anti-pass law and will be expected to obey it.

DETROIT SERVICE ORDINANCE ENJOINED.

The Detroit United Railway on April 24 secured from Judge Swan of the United States circuit court a temporary injunction restraining the city of Detroit from enforcing the provisions of the city ordinance introduced by Mayor Thompson and approved on April 16, which requires the company to increase greatly its service during rush hours. The company has filed a bill of complaint, stating that to provide all the cars required and to carry out all of the provisions of the ordinance would force it into bankruptcy. Section 1 of the ordinance provides:

That every person, firm or corporation operating cars upon the streets of the city of Detroit shall, between the hours of 5 and 8:30 a. m., 11:30 a. m. and 2 p. m. and 4:30 and 6:30 p. m., except on Sundays, provide a sufficient number of cars of sufficient capacity to accommodate and provide for the transportation of passengers, so that no car, in consequence of the failure to so provide, shall carry a greater number of passengers than the seating capacity of said car and one-half as many more; provided, that it shall not be lawful for any car, when it is filled with passengers to or in excess of the number herein specified, to pass by without stopping for additional passengers or decline to receive passengers, whenever so signaled, unless another car on said line and following in its rear is within a distance of 200 feet; and, provided, further, that the terms hereof shall not apply to any extraordinary condition that could not with reasonable care have been foreseen; and, provided, further, that this section shall not apply to any line that is maintaining continuously, during the time herein named, a service where the cars are 20 seconds apart; or on any line that traverses any street upon which there is maintained continuously during the time herein named a service where the cars are 20 seconds apart.

Certain outlying lines are exempted from these provisions. A fine of \$100 for each violation is imposed.

The company, in its complaint, says that to comply with the ordinance:

Instead of less than 1,000 cars now owned the company would have to have 7,847 cars on the tracks during the hours of 20-second service, and to allow for breakdowns and repairs the company would have to keep on hand 9,600 cars.

It would be necessary to increase the force of conductors and motormen from 1,400 to 19,075 to man the cars and allow for sickness, etc.

An increase of 11,300 employes in other departments of the service would be necessary as follows: Mechanical department, 3,500; transportation, 500; track, 6,400; power, 400; miscellaneous, 500.

The total number of employes would have to be brought up to 34,000, an increase of 29,035 men.

The company asks the court to declare the ordinance unconstitutional and void and of no force or effect whatever, and that the city, the mayor and the corporation counsel be temporarily and permanently enjoined from enforcing or attempting to enforce the ordinance either by suits or prosecutions or otherwise.

The company says that it is now providing more than a sufficient number of cars for the comfortable carriage of all passengers if the passengers would wait for the short period of time between cars and not all rush on the first cars. It is said that every passenger could have a seat by waiting a few minutes, the seating capacity of the cars run at all hours of the day being in excess of the number of passengers carried during those hours.

The order for the city to show cause why the injunction should not be made permanent is returnable on May 13.

Mr. C. C. Cokefair of Duluth and Mr. A. S. White of New York have made application to the courts of Minneapolis for the condemnation of tracts of property along the Mississippi river that are required in connection with the water-power rights secured by them for the power development between St. Cloud and Minneapolis. The distance by the river is 125 miles, although the railroad route between St. Cloud and Minneapolis is only 65 miles. The available fall in this portion of the river is 100 feet, and the only points along this route where water power is available are at Otsego, Clearwater and Monticello, which are those now held by the company in which Mr. Cokefair is interested. It is intended to use the water power available by the installation of a large electric plant for lighting and power purposes, and is also intended to furnish power for the street railways from the new power house when it is completed.

INDIANA TAX HEARING.

The Indiana state board of tax commissioners on April 22 began a series of hearings for representatives of traction companies of the state who desire to present arguments showing why their tax assessments should be reduced or at least not increased. In the course of the hearing testimony was presented giving interesting facts in regard to the condition of Indiana traction lines.

J. Levering Jones, president of the Ft. Wayne & Wabash Valley Traction Company, did not ask for a reduction, but thought there ought to be no increase. An abstract of his statement follows:

The road is spending much money in bettering its property, straightening out the curves and similar work; it is also building a line from Logansport to Lafayette, which is not in operation. When this is completed the company will have lines from Ft. Wayne to Lafayette and from Ft. Wayne to Bluffton.

The line showed a net increase in its earnings this year over last year of about 8 per cent. But even this did not provide a surplus. They had sold no bonds in the last six months because of the condition of the money market. If an increase of 8 per cent in the net earnings of the company would not provide a surplus, then it is plain to see what a shrinkage of 8 per cent would mean. If the net earnings of any of these roads were to shrink 8 per cent it would mean that they would be forced into a receivership. They could not stand it.

So when a road shows a small increase it is not a sign that it is already prosperous. Wages have increased in the last few years—in the last year 5 per cent. Material is high. The Indiana interurban roads are just now going through the transition from their infancy to maturity, and this is an expensive process. They were built independently and in pieces, each little line with its own management and administration. Each had to have its own power house, and the business was not large enough to make these individual lines profitable. Now, however, they are being taken into combinations and the management and administration are being simplified. This will be the salvation of the roads and for the greater convenience of the public.

Mr. Jones said there was no profit in the freight and express business that is now done by the interurban railroads. Interurban roads, he said, were essentially passenger roads. Therefore freight and express cars must be delayed and side-tracked so as not to interfere with the regular operation of passenger cars. But when these lines were extended into trunk lines so that cars might be run long distances, many of the difficulties in the way of freight and express traffic would be eliminated and that branch of the business would produce a profit.

Mr. Jones said that his company had a traffic agreement by which through cars were run between Ft. Wayne and Indianapolis over the lines of his company and those of the Indiana Union Traction Company by way of Peru. He said, however, that he had under consideration the idea of changing the route of those cars so as to run them through Bluffton, Muncie and Anderson and abandon the present route.

F. L. Welsheimer, secretary of the Toledo & Chicago Interurban Railway, thought the assessment of last year, \$5,000 a mile, should be reduced to \$3,000 a mile. He said the road was in bad condition and that the company had had a great deal of trouble from a sink hole. A piece of 200 feet of track sank during the night into a hole 35 feet deep and full of water.

Hugh J. McGowan, president of the Indianapolis Traction & Terminal Company and the Indianapolis & Western Railway, said:

The Indianapolis & Western or Danville line is a new line and has never been assessed. It is capitalized at \$2,500,000 so as to cover the extension to Terre Haute. The property has been under construction for two years. We have been paying 6 per cent on the money obtained for the building of the line and will get no benefit from our investment except from the two cars now running until we get the line into Brazil and Terre Haute. It is now our intention, however, to continue the Plainfield line instead of the Danville line into Terre Haute because of the expensive fills that would have to be made. We hope to get into Terre Haute by next Christmas. The Danville line, compared with the Plainfield line, is a spur and will continue such until we can get a connection between Danville and Amo. We hope to make a loop, extending the Plainfield line to Terre Haute and connecting with the Danville extension by way of Amo. This will give two

routes to Terre Haute, some of the cars running by Danville and some by way of Plainfield.

Mr. McGowan complained of the assessment against the Indianapolis Traction & Terminal Company for last year, saying that it was unfair and entirely too high. The company was assessed last year at about \$9,000,000. Mr. McGowan said that the assessment last year increased the company's taxes \$85,000, the whole tax being \$230,000, including the \$30,000 paid to the city.

REHABILITATION AND REORGANIZATION IN CHICAGO.

Bion J. Arnold of the board of supervising engineers of Chicago is planning a system of accounting to be followed by the Chicago traction companies during the period of rehabilitation. Mr. Arnold said that the board, after its organization, will probably appoint an auditing company to establish the system. When the system has been established different auditors will probably be appointed to represent the city and the companies.

Mr. Arnold wants to accept an offer to act as chief consulting engineer for the railways of Victoria, Australia, if he can do so without interference with his duties in Chicago. Mr. Arnold said he might receive some suggestions for the Chicago work from a study of conditions in Melbourne. Mr. Arnold will address the graduating class of the Armour Institute of Technology on June 13 in the Auditorium on the subject, "The Reorganization of the Traction System."

A call was issued on April 20 for the stock of the North Chicago Street Railroad Company and the West Chicago Street Railroad Company in order that the reorganization of the Union Traction lines, as provided in the new ordinance, may be completed. The call was issued by a committee composed of Frederick H. Rawson, William N. Eisendrath, Wallace Heckman, Edmund D. Hulbert, Azariah T. Galt, R. Floyd Clinch, George E. Adams, Charles L. Raymond, R. W. Hosmer, Charles W. Leland and George E. Marcy.

The call directed the attention of stockholders to the provision of the Chicago Railways Company ordinance that within 165 days after the passage of the ordinance—that is, on or before July 26—there must be deposited with the Chicago Title & Trust Company a majority of the stock of the two companies, excluding the stock held by the Illinois Trust & Savings Bank as trustee. In order that the stock which is outstanding may be assembled for this purpose stockholders are asked by the committee to deposit their holdings with the Union Trust Company of Chicago, which will issue certificates promising to return the stock in case the general deposit with the title and trust company is not made. The call says:

As to the terms of the deposit agreement, it is, perhaps, sufficient to say that the title and trust company is authorized to dispose of the shares of stock deposited with it thereunder according to the terms of a plan of reorganization, to be approved by Peter S. Grosscup and Prof. John C. Gray of Harvard University, as being based on the legal rights of the depositors as of the date of the passage of the ordinance and as being fair and just to each class of depositors relatively to the treatment of every other class of stocks, securities and judgments. The intention of the ordinance in this regard is to provide that, in the purchase of said property by the new company, such class of securities of the old companies, including stock, should receive fair and just treatment.

Protective Device for New York Subway.

A new and simple device to protect travel in the New York subway and incidentally to protect the subway itself is now being installed in the shape of steel strips connecting the supporting pillar on the sides next to the tracks, both express and local. These steel strips safeguard the cars in case a train is derailed from being raked by the pillars and wrecked by the impact. It is a danger which has long been perceived anxiously, and its obviation by this simple device, though involving heavy expense to the company, comes none too soon.

PIPING AND POWER STATION SYSTEMS—XXXVII.

BY W. L. MORRIS, M. E.

Considerable trouble is experienced with the use of metallic packing for piston rods, valve stems, etc., on account of the air leaking past them. The piston rod packing can be improved by carefully removing it from the stuffing box and marking the parts so they will go back in place. The high spots should then be carefully scraped so that they exactly fit the rod and thus assist the packing to wear down to a perfect bearing. The motion of the parts of the packing is quite slight, and as they are made to wear slowly an air tight fit may not be secured for a considerable time if the

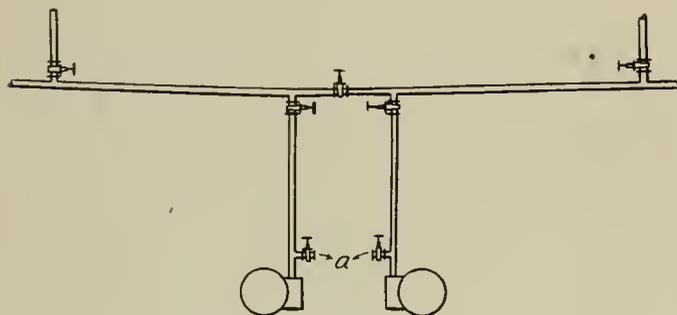

Figure 271—(J2-1).

operator waits for it to wear to a perfect fit, and if the leak is very serious, it would probably never wear tight, as the wear caused by the leakage would exceed that of the rod and therefore the leak would become larger instead of smaller. The low-pressure cylinders are subjected to such low temperatures that almost any form of fibrous packing may be used for them successfully. Fibrous packing may require more frequent attention and renewal and may eventually cost more than metallic packing, but since the loss of vacuum is often two inches in the case of metallic packings, which are apparently in good condition, the fibrous packing will probably be the most economical unless the packing manufacturers will guarantee to install and maintain the packing so that it will remain as tight as fibrous packing.

Each inch of vacuum loss is equivalent to about 1 per cent increase in the cost of operation, which would amount to about \$440 a year in the case of 1,000-horsepower engine operating 12 hours a day. The cost of packing and expense of keeping it in good condition is small compared to the loss caused by a drop in the vacuum. Stuffing boxes should be, if possible, arranged so that either fibrous or metallic packing can be used, and the pump should preferably be so arranged that the change from metallic to fibrous packing and the renewal of packing can be made without dismantling the pump or interrupting its operation. If so arranged, the loss occasioned may be readily ascertained and avoid the possibility of the packing manufacturers shifting the responsibility for air leaks on to the pipe lines, etc. It is invariably good practice to provide the operator with every means possible for determining the efficiency of apparatus so that any difficulty may be easily located in the least possible time and at the least possible expense.

Class J 2, 3, 4 and 5—Dry Vacuum Mains and Branches.

A dry vacuum main is necessary where there is more than one condenser and more than one dry vacuum pump, as it permits the use of one pump on one or both condensers. The mains should be tapped at the top for branches from the condenser and the pump connection should be taken from the bottom. This detail is quite important to insure the draining of all condensation to be removed from the main through the air pumps in a small continuous volume. There is no objection to passing the condensation through the pump if it

is in the form of mist, as it aids in reduction of the compression temperature in the air pump cylinder, but it is unsafe to allow the condensation to enter the air pump in slugs, for the air pump would undoubtedly be seriously damaged, as the piston speed is high and the clearances small. The probable result would be a broken cylinder head, valves, connecting rod or crank pin.

The dry vacuum main should have a slight uniform pitch toward the air pump opening to prevent the accumulation of condensation in pockets and a valve on the pump suction should be located directly below the main as shown in Fig. 271 (J2-1). This arrangement avoids the possibility of the branch filling with condensation down to the valve, a detail which will not permit of draining on account of the line being under less pressure than the atmosphere. The valve between the pump branches is necessary so that repairs can be made to the main while the condenser on the other side of the valve is in operation. The valves, a, located close to the air pump, should not be less than one-fourth the diameter of the pump suction, and they should be of the globe form to insure tightness. These valves are necessary in starting the pump, to permit it being brought up to speed before the full vacuum is put on it. After the pump is in operation the branch line valves should be opened slowly so as to permit the water which has accumulated above them to leak slowly past and through the pump. The temperature of the air entering the pump is generally about 120 degrees, which is increased considerably by the compression in the pump cylinder, so that water jackets are necessary to keep the cylinder cool, as previously stated, under the heading Class H 6. The discharge from the pump is quite dry, due to the heating in the cylinder, and may be discharged over an open sewer or the like, with some provision for getting rid of the oil and grease carried over by the air. As this air is objectionable in the engine room, it can be discharged into the atmospheric exhaust line, as there would be practically no saving in heat units, the temperature of the feedwater in the heater being nearly as high as the air.

The dry vacuum main and branches, as illustrated in Fig. 271, may be used for either an elevated jet or a surface condenser, the details being the same in either case. The elevated jet condenser discharges air together with the tail water whether a dry vacuum pump is used or not, the dry vacuum pump simply being more effective, keeps the condensing chamber freer from air and thus permits a higher vacuum to be maintained. The air which is discharged through the tail pipe into the hot well tends to form vapor, hence if the hot well is located in the engine room it should be ventilated, as this hot vapor is generally very foul, being largely the gas liberated by the decomposed matter carried in the injection water. Fig. 272 (J2-2) shows a well ventilated

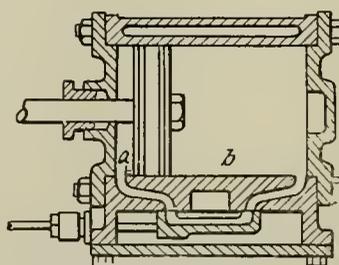

Figure 272—(J2-2).

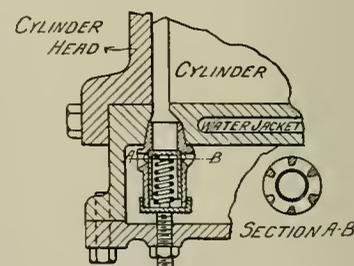

Figure 273—(J2-3).

by an air duct which is carried to the outside of the building above the grade line. The manhole cover and the tail pipe should have an air tight fit at the top of the well to prevent the discharge of gases and vapor into the engine room.

(To Be Continued.)

The Schenectady Railway Company expects to open its line between Saratoga and Ballston, N. Y., on June 1.

News of the Week

Tests of the New Haven Electric Locomotives.

The New York New Haven & Hartford Railroad began on April 19 a series of experimental runs of trains pulled by the new single-phase electric locomotives, between Larchmont and New Rochelle. The tests of the locomotives, as well as of the overhead work, supplied by current from the company's new power house at Cos Cob, Conn., are said to have proved remarkably successful and to have demonstrated that trains operated by the new system will be capable of a speed of 100 miles an hour with safety. The tests are to be continued.

Plans for Ordinance in Philadelphia.

An ordinance which will authorize the city of Philadelphia to enter into an agreement with the Philadelphia Rapid Transit Company is in process of preparation and may be ready for presentation at the next meeting of councils on May 2.

George H. Earle, Jr., a director of the Philadelphia Rapid Transit Company, said that the progress of the city greatly depended upon the passage of an ordinance which would restore the confidence of investors and give the Transit company the financial means to proceed with the needed improvements and extension of its lines.

The Trades League of Philadelphia has withdrawn its opposition to the plans for a new arrangement between the Philadelphia Rapid Transit Company and the city of Philadelphia.

Peoria-Bloomington Line of the Illinois Traction Company Opened.

The first car was operated over the new line of the Illinois Traction Company from Peoria to Bloomington, 42 miles, on April 21, and a regular two-hour service was begun on the following day. The Illinois Traction Company first built a line from Danville to Decatur. Later the line was extended to Springfield and St. Louis from Springfield to Lincoln, and from Decatur to Bloomington. The company is now preparing to build from Lincoln to Mackinaw to connect with the Peoria line. In addition contracts have been let for another line from Springfield to Jacksonville. Next year it is also planned to build from Champaign to Bloomington and from Bloomington to Joliet, thus completing the line from Chicago to St. Louis, paralleling the steam line of the Chicago & Alton.

The construction of the line from Peoria to Bloomington is especially noteworthy from the fact that the company was compelled to build a bridge across the Illinois river at Peoria at an expense of \$200,000, the first important bridge work yet contracted by that company. It is asserted that the Illinois Traction Company connects the most profitable belt of inland cities of any in the west.

Interborough Company Refuses to Bid on New York Subways.

No bids were received for the Seventh and Eighth avenue and Lexington avenue subway routes at the meeting of the New York rapid transit commission on April 25, the date set for receiving bids. The Interborough-Metropolitan Company, which operates the present subways and practically all of the city railways in Manhattan, was expected to submit a bid either for operation or construction and operation of the new routes, but instead President Shonts sent a long letter to the commission pointing out the reasons why the Interborough did not bid. He stated that there would be no profit in operating the proposed subway because of the restriction of the length of lease to 20 years imposed by the Elsborg law and because of the conditions of construction and operation imposed by the commission. The commission is in a quandary, as the four years' work spent in preparing plans, securing consents and in complying with the legal formalities necessary before advertising for bids is apparently wasted. Some of the plans for the Lexington avenue subway, as prepared by George S. Rice, chief engineer of the commission, were published in the Electric Railway Review of April 13.

The rapid transit commission, at its meeting on April 18, awarded the contract for the first section, from Canal to Pearl streets, of the subway loop to connect the Brooklyn and Williamsburg bridges to the Degnon Contracting Company, whose bid was \$2,952,000 for the subway and \$83,000 for the pipe galleries. The contract calls for the completion of the work in 21 months. Four other contracts for the other sections of the same loop are to be advertised at once. The board fixed May 9 as the date for public hearing on the form of contract. The route of the loop was shown in the Electric Railway Review of February 16, 1907, page 221.

Summer School for Artisans at the University of Wisconsin.

The seventh annual session of the summer school for artisans, held under the direction of the College of Engineering of the University of Wisconsin, begins on June 24, and continues for a period of six weeks. Courses of study are offered in the following subjects:

1. Engines and Boilers.—Lectures and laboratory courses covering the theory, construction, management and testing of steam engines, boilers, gas engines and gas producers, refrigerating machines, etc.

2. Applied Electricity.—Lectures and laboratory courses covering the theory of direct and alternating current dynamos and motors, the operation and method of testing electrical machinery, batteries, transformers and other apparatus, photometry and calibration of instruments.

3. Mechanical Drawing and Machine Design.—Elements of ap-

plied mathematics, courses in mechanical drawing and machine design adapted to the preparation of the students.

4. Materials of Construction, Fuels and Lubricants.—Lectures on the properties of materials accompanied by laboratory tests; lectures on fuels and lubricants with laboratory tests on the heating value of coals and efficiency of lubricants.

5. Shop Work.—Practice with hand tools, wood and metal working machinery, and in blacksmithing and pattern making.

6. Manual Training.—Lectures and laboratory courses adapted to the requirements of manual training teachers.

The entire laboratory and shop equipment belonging to the College of Engineering is used by the students in the summer school. The requirements for admission do not extend beyond a working knowledge of English and arithmetic, but the policy is to allow a large amount of individual work, so that the student may take advantage of all the preparation he has obtained. This school offers to those unable to take a regular four years' course an opportunity of obtaining a working knowledge of the methods of testing and the use of instruments, together with such theoretical principles in each case as the nature of the subject and the preparation of the student may permit. Correspondence students have found this school of value in giving an opportunity for laboratory practice along the lines in which they have had theoretical instruction.

A bulletin describing the work of the school for artisans in detail will be sent on application to Frederick E. Turneaure, dean, College of Engineering, Madison, Wis.

Legislation Affecting Electric Railways.

Connecticut.—Several bills affecting the electric railway interests have been considered before the legislature, most of them relating to a reduction of fare to six tickets for 25 cents. General Manager J. F. Punderford appeared before the legislature recently to oppose any reduction. He made the point that everything is going up except car fares. Even wages are going up, for there are two applications before the company for increases. Cars cost \$500 more apiece, rails and copper are more expensive. Merchants can raise prices to meet conditions, but fares cannot be raised. The alternative is to curtail the service and that the company does not want to do.—House bill No. 632 gives to electric railway companies added power in condemning right of way without the approval of the state railroad commission. Corporation Counsel Shipman has introduced a substitute bill, providing that no street railway shall condemn land for a private route until the railroad commissioners shall so authorize.—A bill requiring that all applicants for electric railway charters shall be bonded to build within a certain time has been considered in the house.

Illinois.—The house committee on corporations has reported bills providing that upon petition of 25 per cent of the voters of a city or village, any franchise ordinance passed by the council or board of trustees granting a corporation the use of the streets must be submitted to a vote of the people for ratification or rejection, requiring that in cities of 100,000 population or over all electric wires carrying 100 volts or over shall be placed underground; providing that in cities of 100,000 or over all electric trolley wires shall be placed underground before July 1, 1909; requiring that all live third rails shall be thoroughly guarded.

Massachusetts.—The senate is considering a bill to permit the joint use of tracks and cars by electric railway companies.

Michigan.—The senate has passed the Cady bill which allows interurban railways to refuse to make more than one stop in cities and villages under 20,000 population.

Minnesota.—The house on April 19 defeated the Dalzell bill, which provided that electric railways should have the right of eminent domain through unplatted portions of cities and villages and through platted portions if no franchise could be secured. Several amendments were offered in order to secure the passage of the bill but were defeated.

New York.—The assembly on April 25 passed the Wagner five-cent fare bill, which will compel the Brooklyn Rapid Transit Company to charge only a five-cent fare for a ride to Coney Island. The bill provides that no corporation controlling or operating a railroad of any kind within this state shall charge any passenger more than five cents for one continuous ride from any point on its road, line or branch operated by it or under its control by lease or otherwise within the limits of any incorporated city or village to any other point on such road, line or branch operated by it or under its control by lease or otherwise. If the bill becomes a law it will nullify the effect of the decision of the court of appeals on January 8, which permitted the Brooklyn Rapid Transit Company to charge a 10-cent fare to Coney Island on the ground that some of its lines were owned by leased corporations chartered as elevated and steam roads, and which consequently did not come under the law requiring a single fare over a continuous line of street surface railroad operated by one company.

Pennsylvania.—Governor Stuart signed on April 22 the Homsher "trolley freight" bill, permitting electric railway companies to carry light freight and do a general express business subject to the regulations of the local authorities. The bill goes into effect at once.

Tennessee.—The legislature has passed and the governor signed on March 12 a bill providing that electric railway companies may acquire land for park purposes by condemnation proceedings, in the event of inability to purchase, and that the present laws relating to eminent domain shall apply.

Electrification on the New Haven Road.—T. E. Byrnes, vice-president of the New York New Haven & Hartford Railroad, is quoted as follows: "The Stamford, Conn., electrified zone will undoubtedly be in working order by June 15. Until it has been determined by practical demonstration whether or not the system adopted is a success, we will not think about electrifying the road

so far as the proposed system from Boston to Providence is concerned."

Cannot Carry Mail Carriers at Reduced Rate.—The railroad commission has interpreted the anti-pass law passed by the legislature, which affects electric as well as steam roads, as prohibiting street railway companies from carrying policemen, mail carriers or firemen, or any other persons not exempted by the law, at a rate lower than that open to the general public. This opinion was given in reply to a question by the Lincoln Traction Company, which has a contract with the government to carry mail carriers at a reduced rate, which can only be terminated after June 7 upon 30 days' notice.

Court Upholds Elevated Platform Connecting with Store.—The Illinois supreme court on April 19, in the case of the city of Chicago against the Union Elevated Railroad Company, which owns the Chicago "Union Loop," upheld the right of the company to maintain the platform and passageway connecting the elevated loop station at State and Van Buren streets with the store of A. M. Rothschild & Co. The city had taken the position that the platforms built for this purpose were an encroachment on the street, but the court says this is not true. On the contrary, the decision says the exits are public convenience.

Davenport Commercial Club to Aid Interurbans.—The Commercial Club of Davenport, Ia., has appointed a committee to lay out a route on which interurban roads may come into the city. The suggestion was made by Henry Vollmer, who moved that the committee be appointed and that the result of its work be laid before the city council. The committee will also suggest the amount the roads should pay for the use of the streets and an effort will be made to have the council embody these suggestions in an ordinance. Several interurban roads desire to enter the city, but it is stated that they cannot finance the projects unless they are provided with an independent entrance.

Indiana Railroad Commission to Enforce Safety Appliance Laws.—The Indiana railroad commission has directed the attention of the steam and electric railroads to 13 provisions of the state railroad law, relating to the requirements in regard to safety appliances and the prohibitions against dangerous structures. The requirements include the following: Power brakes, grab-irons, hand-holds, standard drawbars, automatic couplers, safety appliances for passenger trains, air brakes on motor cars, overhead bridges with sufficient clearance above the track. The law provides that the commission may send out inspectors to look for the violation of these different provisions and the companies are required to carry the inspectors free of charge.

Pittsburg Railways Forbids Gambling, Liquor and Cigarettes.—The Pittsburg Railways Company has issued an order directed against gambling and the use of intoxicating liquors or cigarettes by its employes. The order, which is signed by Superintendent Murphy and approved by President Callery, reads as follows: "For the betterment of the service and the safety of the public it will from this date (April 20, 1907) be the policy of this company not to retain in its employ men who use intoxicating liquors or cigarettes or are in the habit of gambling. While it is the privilege of each individual to eat, drink and smoke what he pleases, it becomes the duty of this management to have in the service only men of sober and temperate habits, physically and mentally able to perform the duties to which they may be assigned."

New York Central Will Not Electrify Adirondack Lines.—The New York Central Railroad, through Chairman Chauncey M. Depew, of its board of directors, has notified J. S. Whipple, state commissioner of forest, fish and game, that it will not be possible to consider this year a suggestion offered by the commissioner that the railroad should electrify its lines running through the Adirondacks, in order to further guard against forest fires. Mr. Depew says he considers the suggestion of Commissioner Whipple a valuable one, and adds that his own personal interest in Adirondack preservation is very great, but announces that the railroad has too much other work on hand at the present time to take up with the change suggested. He declares the work of electrifying railroad lines is very expensive, and that it is yet in an experimental stage.

Buffalo Seeks Amendment of Utilities Bill.—The Buffalo chamber of commerce on April 22 passed resolutions against the enactment in its present form of the public utilities bill pending in the New York legislature and appointed a committee of five to secure the co-operation of other chambers of commerce in opposing the bill until it shall be amended in several important features. One objection which Buffalo commercial interests make to the bill is that it does not make proper provision for review by the courts of the findings of the proposed public utilities commissions. The resolution adopted states that the "purpose of the proposed bill is commendable and that a measure to accomplish the ends it aims at is desirable, but that the passage of the bill in its present form would be unjust and seriously harmful to the business interests involved."

New Brooklyn Rapid Transit Transfer Rules.—The Brooklyn Rapid Transit Company will on May 1 institute a new transfer system. Present transfer privileges at all junctions will remain unchanged, but no more than two transfers will be issued on a single fare. The main purpose of the change is to eliminate, if possible, the principal abuses that have characterized the operation of the transfer system since the privilege was accorded, on March 30, 1906, of a transfer on a transfer. The new arrangement will only affect the passengers who have availed themselves of these privileges and abused them to ride indefinitely on the lines of the system and such passengers as have manipulated transfer tickets in order to make a round trip for a single fare. Under the new system a passenger will be limited to three separate and distinct rides for a single fare, except that at feeder lines an additional or fourth ride may be obtained upon a conductor's ticket, or a transfer agent's ticket, without the payment of an extra fare.

Construction News

FRANCHISES.

Albia, Ia.—A franchise for an electric line in Albia and an interurban route to Hocking, Ia., has been granted to Calvin Manning of Ottumwa and others, who are interested in a system of interurban railways serving the coal fields and farming districts in this section.

Fresno, Cal.—The Monterey Fresno & Eastern Railroad, which proposes to build from Monterey to Fresno, Cal., has secured a franchise to enter Fresno on F street.

Montreal, Can.—A subcommittee of the road committee of the city council has submitted a report on the franchise application of the Montreal Street Railway made last June, for several extensions. The subcommittee recommends the granting of franchises for most of the extensions applied for, involving a large amount of double and single track lines, but opposes some routes on residential streets. No action has yet been taken on the report.

Owatonna, Minn.—The Minneapolis Rochester & Dubuque Traction Company, which proposes to connect Minneapolis, Minn., and Dubuque, Ia., has secured a franchise for a line through this city. Preliminary work on the survey has been started and it is stated that the line will touch Grand Meadow instead of Spring Valley, as was the original intention. The junction of the main line and the Rochester branch will be at a point midway between Oslo and Dell River. Right of way from Oslo to a point in Mower county already has been secured. The franchise provides that the road must be in operation within two years and the company must accept the franchise within 30 days.

Salamanca, N. Y.—A franchise has been granted to the Western New York & Pennsylvania Traction Company to operate its interurban line over Broad and Main streets to the West Salamanca village limits. It is stated that franchises covering its entire extension to Little Falls have been secured by the company with the exception of Little Falls itself, application for which is now pending before the village board. Work on the line will be started as soon as possible and continued until completed.

Seattle, Wash.—The Seattle Electric Company, in exchange for a franchise on Twenty-fourth avenue, has agreed to remove its car tracks on Twenty-third avenue south, from Jackson to Dearborn, and on Dearborn from Twenty-third avenue south to Twenty-fourth avenue south.

Summit, N. J.—The ordinance granting a 40-year franchise to the Morris County Traction Company for the operation of its interurban line in Summit has passed the final reading and on May 21 the final public hearing will be given.

Troy, N. Y.—The Troy Rensselaer & Pittsfield Railway, which proposes to build a line from Troy, N. Y., to Pittsfield, Mass., has applied for a franchise in Troy.

RECENT INCORPORATIONS.

Chicago Indianapolis & Terre Haute Railroad.—Incorporated in Indiana to build an interurban line through the counties of Benton, Fountain, Hendricks, Jasper, Lake, Marion, Montgomery, Newton, Park, Putnam, Tippecanoe, Vermillion, Vigo and Warren, connecting Indianapolis, Lafayette, Terre Haute, Bainbridge, Covington, Danville, Gary, Rockville, Sheffield and Williamsport. Capital stock, \$50,000, of which \$10,000 has been subscribed. Incorporators: Daniel W. Bolen, Charles M. Kiler, Frederick M. Strong, Romus F. Steward and Simeon Loftin.

Chicago Ottawa & Peoria Railway.—Incorporated in Illinois to build an interurban railway as a part of the Illinois Traction System from Chicago through the counties of Cook, Will, Grundy, La Salle, Marshall, Woodford and Tazewell, to Peoria, and from Ottawa, through the counties of La Salle and Bureau, to Princeton. The principal offices will be at Champaign. Capital stock, \$500,000. Incorporators: H. E. Chubbuck, Ottawa, Ill., and W. H. Carnahan, C. A. Wright, Charles Zilly and George Mattis, all of Champaign.

El Paso Suburban Railway.—Incorporated in Texas with a capital stock of \$10,000. Incorporators: Frank R. Tobin, John D. Tobin and Windham Camp.

Galveston-Houston Electric Railway.—Incorporated in Texas to construct an interurban line between Galveston and Houston, about 45 miles. Stone & Webster of Boston, owners of the street railway systems in Galveston, Houston, Dallas, Ft. Worth, San Antonio and El Paso, Tex., own the controlling interest in the new interurban project. The principal office will be in Houston. Capital stock, \$3,000,000. Incorporators: M. M. Phinney, Dallas; David Daly, C. R. Wharton, W. B. Chew, Jesse H. Jones, William A. Wilson and Jesse A. Baker, Jr., Houston, Tex.

Inland Electric Company.—Incorporated in Oregon to construct an electric line from Klamath Falls to Bomaza, Yonna and Merrill. Capital stock, \$25,000. Incorporators: W. H. Mason, E. J. Murray and H. L. Holgate, all of Klamath Falls, Ore.

Lake Champlain & Lake Placid Traction Company, Ausable Forks, N. Y.—Incorporated in New York to build an electric railroad in Essex county, from Westport, on Lake Champlain, to Lake Placid, and also to Ausable Forks, N. Y., 49 miles. Capital stock, \$1,500,000. Incorporators: Albert L. Washburn, Norman C. Spencer,

Wilbur T. Halliday, Elizur S. Goodrich, Henry F. Smith, Hartford, Conn.; George S. Raley, William L. Kiley, Thomas D. Trumbull, Glenn Falls, N. Y.; Richard L. Trumbull, Ausable Forks, N. Y.

Peoria Lincoln & Springfield Traction Company.—Incorporated in Illinois to build a branch of the Illinois Traction System from Lincoln, Logan county, to Mackinaw, Tazewell county, Illinois. This line will connect Springfield and the line south to East St. Louis with Peoria and the proposed line to Chicago. Capital stock, \$400,000. Incorporators: Charles Zilly, W. H. Burke, B. E. Eramble, G. A. Wright and George M. Mattis.

Plum Valley Railway.—Incorporated in South Dakota to build an electric railway, 22 miles long, from Plum City to Pepin, Wis. Capital stock, \$500,000.

St. Louis Terre Haute & Quincy Traction Company.—Incorporated in Illinois to construct an electric line from a point in Illinois opposite Terre Haute, Ind., through the counties of Adams, Pike, Scott, Greene, Macoupin, Sangamon, Montgomery, Shelby, Coles, Cumberland, Clark, Fayette, Bond and Madison to Venice and Quincy, Ill. Capital stock, \$25,000. Incorporators: Edward Yates, Pittsfield; Peter Chase, Decatur; H. T. Wilson and H. C. Simons, Virden; E. E. Barclay, Springfield, Ill.

Sonoma & Lake County Railway.—Incorporated in California to build an interurban line from Cloverdale to Lakeport, with a branch to Kelseyville. Surveys have been made from Lakeport to Cloverdale, about 27 miles. The maximum grade will be about 3 per cent. It is stated that one tunnel will be built, the exact location of which is not announced. Work will begin as soon as the weather permits. Capital stock, \$1,000,000, of which \$36,000 has been subscribed. Incorporators: President, M. C. Dickinson, Ukiah, Cal.; vice-president, J. E. Fulton; secretary, W. S. Fry; treasurer, J. R. Garner; J. W. Preston, J. A. Sparks, D. F. McIntire, W. P. Merideth and W. N. Johnson.

Toledo & Ft. Wayne Electric Railway, Ft. Wayne, Ind.—Incorporated in Indiana to build an electric railway from Ft. Wayne, Ind., to Bryan, O. The company also proposes to manufacture and sell electricity for light, heat and power purposes. This line when completed will give a through line from Toledo to Ft. Wayne. Capital stock, \$100,000. Incorporators: John H. Zimmerman, Ira Grubb, Thomas Hood, Scott Swaine, E. G. Hoffman and Granville A. Reeder.

TRACK AND ROADWAY.

Brownsville Masontown & Smithfield Street Railways.—This company, which was recently incorporated to build an electric railway from Brownsville to Smithfield, Pa., 20 miles, has organized by electing the following officers: President, W. J. Sheldon; vice-president, M. H. Cloud; treasurer, C. S. Crawford; secretary, John Lueckhart.

Calais Electric Railway.—It is reported that this company will extend this road from Calais to Woodland and Robinson, Me., the coming summer.

Catawissa & Numedia Street Railway.—This company has applied to the commissioners of Columbia county, Pennsylvania, to occupy all the bridges in the public road between Catawissa and Numedia for its proposed line.

Denton Interurban Railway & Power Plant Company.—H. M. Griffin, president, Battle Creek, Mich., writes that this company, recently incorporated, proposes to build six miles of electric line in Denton, Tex., surveys for which have been completed. Construction is expected to begin in July, or as soon as the rails arrive. Work on the power house has been started. The equipment will consist of Atlas engines and boilers and the generating equipment will be of Allis-Chalmers manufacture, including Bullock generators and complete electrical equipment. Headquarters, Denton, Tex.

Eastern Pennsylvania Railways.—F. A. Hewitt, superintendent, writes that this company will probably begin construction this summer on an extension from Middleport to Tamaqua, eight miles, via Tuscarora and Newkirk. The line has been surveyed. W. E. Harrington, Pottsville, Pa., is president.

Evansville & Eastern Electric Railway.—It is announced that the extension to Rockport, Ind., will be in operation by June 1. Tracklaying will be completed in about a week and the power house at Hatfield will be finished soon afterward.

Florence, Colo.—The Florence Business Men's Association is soliciting stock subscriptions for a company to be organized to build an electric motor line to several surrounding coal towns, including Coal Creek, Rockvale, Williamsburg and several smaller coal camps.

Ft. Wayne & Springfield Railway, Decatur, Ind.—It is reported that surveys are being made for an extension south from Decatur through Portland and Winchester to Richmond, Ind.

Fresno, Cal.—Surveys are being made for an electric railway from Fresno to the Yosemite valley.

Girard Coal Belt Electric Railway.—L. H. Phillips, secretary, Girard, Kan., writes that this company proposes to build from Girard to Mulberry, a distance of 16 miles, through a rich coal territory, including the towns of Dunkirk, Bradley, Western, Arma, Curranville and Fuller, besides a number of coal camps. The entire route has been surveyed and grading is in progress between Girard and Dunkirk, six miles. The date of letting contracts has not yet been set. James McFarland, president; F. P. Daniels, chief engineer. Headquarters, Girard, Kan.

Grand Central Traction Company.—D. W. Morgan, secretary, writes that this company, recently incorporated, will build from Indianapolis to Evansville, Ind., with a branch from Bloomington to Terre Haute, 251 miles in all. Surveys have been completed from Indianapolis to Bedford and from Bloomington to Patricksburg and surveys are now under way from Bedford to Evansville. Construction will begin soon. The third-rail system will be used. W. D. Whitney, Muncie, president; Will Duncan, Bedford, chief engineer. Headquarters, 403 State Life building, Indianapolis.

Gray's Harbor Railway & Light Company, Aberdeen, Wash.—It is reported that this company will soon begin the construction of a new line from Aberdeen to Montesano, Wash. E. A. Bradner, Aberdeen, chief engineer.

Hartford & Springfield Street Railway.—This company is surveying an extension of the Somers branch to West Stafford, Mass., four miles, to connect with the line under construction from Stafford Springs to Rockville.

International Railway, Buffalo, N. Y.—This company expects to contract, during the present summer, for about four miles of new single-track extension on its lines in Buffalo and vicinity.

Interurban Railway, Des Moines, Ia.—H. H. Polk, president, has denied the reports, founded on his recent visit to Council Bluffs, that this company contemplates building a cross-state line to connect with the lines of the Omaha & Council Bluffs Street Railway. The company has purchased the Colfax-Newton line of the Newton & Northwestern Railroad, which will be electrified and used in connection with the Interurban company's Colfax line for through service between Des Moines and Newton. The Newton & Northwestern retains trackage rights for steam service.

Jackson Ann Arbor & Detroit Railroad.—Several carloads of ties have been delivered for the construction of this line through Dearborn, Wayne and River Rouge, Mich. About 100 men are engaged in grading near Dearborn.

Johnstown Ebensburg & Northern Railroad, Johnstown, Pa.—C. R. Frederick has been elected vice-president and general manager of this company, which is promoting an electric railway to connect Johnstown and Ebensburg, Pa., succeeding W. E. Hildebrand. Another effort will be made to secure a franchise in Johnstown. If this fails it is stated that an arrangement can be made with the Johnstown Passenger Railway to enter the city over its tracks.

Lafayette & Logansport Traction Company.—It is reported that the tracklaying on this extension of the Ft. Wayne & Wabash Valley Traction Company from Lafayette to Logansport, Ind., has been completed, with the exception of a few short stretches aggregating about one-fourth of a mile. The workmen are now engaged in stringing the high-tension and telephone wires and it is expected the line will be open for traffic shortly after May 1.

Lima & Toledo Traction Company.—It is reported that a contract has been let for a reinforced concrete bridge over the Maumee river, just south of Waterville, O., on the extension from Leipsic to Toledo. The bridge will be 1,400 feet in length and is expected to be completed about the time the line into Lima is finished. F. T. Hepburn, general manager, Lima, O.

Los Angeles & Owens Valley Railroad.—It is reported that construction work on this line will begin in about three months. The line is proposed to connect Los Angeles, Brandeburg, Independence, Big Pine and Bishop. The company is capitalized at \$10,000,000 and has the following officers: President, S. P. Jewett; vice-president, George Chaffey; secretary and treasurer, A. M. Chaffey, and electrical engineer, F. B. Jewett, all of 411 South Main street, Los Angeles, Cal.

Louisville & Eastern Railroad.—Regular operation has been started on the new line between Louisville and Lagrange, Ky., over which cars have been running as far as Beard for several months. General Manager Percival Moore of Louisville states that by January 1 cars will be operated from Louisville to Frankfort, via Shelbyville.

Marengo & Midland Railway.—D. M. Rowland, secretary and treasurer, Marengo, Ia., writes that surveys are about to commence on this proposed road from Fairfield to Cedar Rapids, Ia., 96 miles, with branches from Millersburg to Oskaloosa and from Marengo to Midland, 78 miles additional. H. H. Brimmer, Marengo, president; J. W. Andrews, Fairfield, chief engineer.

Missouri Central Electric Railway.—This company proposes to build an electric railway from St. Louis to Kansas City, Mo., through St. Charles, New Florence, Fulton, Columbia, Marshall and Higginsville. The route has been surveyed and grading has been completed for 25 miles between Glasgow and Higginsville. George B. Harrison, Glasgow, president; W. B. Cawthorne, Columbia, chief engineer. Headquarters, Glasgow.

Missoula-Bitter Root Traction Company.—This company, recently incorporated to build from Missoula to Hamilton, Mont., has organized by electing the following officers: President, J. L. Humble of Corvallis; vice-president, P. J. Shannon of Hamilton, secretary, E. O. Lewis of Stevensville; treasurer, O. C. Cooper of Hamilton. One-third of the right of way has been secured.

Monroe (La.) Street Railway.—The city council has passed an ordinance authorizing the Jackson street extension of the Monroe municipal street railway. The property owners along the line are to loan the city \$25,000 for 10 years, without interest, for building the line, and it has been decided to ask for bids for construction in a short time.

Monterey Fresno & Eastern Railway.—H. H. Sanborn, assistant to the president, writes that this company proposes to build a line

from Monterey to Fresno, Cal., 110 miles, via Salinas, San Juan, Tres Pinos and Panoche, with a branch to Watsonville, 15 miles. The route has been surveyed from Monterey to Panoche, 80 miles, and surveys are in progress from Panoche to Fresno, 60 miles. Grading has been completed from Monterey to Salinas river, 10 miles, and work will be resumed about May 1. Contracts are to be let shortly. A. D. Bowen, San Francisco, president; F. M. Fairchild, Monterey, chief engineer. Headquarters, San Francisco.

New Jersey & Pennsylvania Traction Company.—It is announced that this company will build an electric line from Princeton to Somerville, N. J., a distance of 18 miles, during the coming summer. T. G. Kitchen, the engineer in charge of the surveys, says that part of the railway will be on private right of way from 50 to 100 feet wide and some distance from the public roads. There will be no grade crossings at any railroad. The road will carry freight at night, and freight and passenger stations will be established in all towns along the line. There will be numerous bridges along the line, the largest being across the Raritan river, where the bridge and its approaches will exceed 1,500 feet in length. Charles Serfass of Yardley, Pa., chief engineer. The company now has a line in operation between Newtown, Pa., and Trenton, N. J.

Oklahoma City Railway.—John W. Shartel, vice-president, has announced that this company has appropriated \$665,000 for improvements and extensions to be built this year to its Oklahoma City system.

Pacific & Oregon Railway, Falls City, Ore.—This company is reported in the market for 60-pound steel rails, locomotive, cars and other materials and supplies for about 50 miles of new electric and steam railway. C. A. Barnum, general manager.

Pittsfield (Mass.) Electric Street Railway.—This company is planning to build four miles of new track, using 75-pound T-rail.

South Shore Traction Company.—This company, which is building an electric line on Long Island, connecting Islip, Babylon, Amityville and other towns, has been enjoined from proceeding with its work in Islip, pending a settlement of a right of way dispute with the Suffolk Traction Company. The New York railroad commission will this week hold a hearing for both companies in regard to applications for certificates of necessity. The South Shore and Cross Island Traction companies have been reorganized under the name of the latter and at a meeting in New York last week elected James T. Wood of Sayville, L. I., president, and James A. Hawes vice-president.

Spokane & Inland Empire Railroad.—It is reported that this company will make a preliminary survey of the branch line to Rockford and through Rock Creek Valley into the Coeur d'Alene reservation.

Spokane, Wash.—F. A. Blackwell, formerly general manager of the Spokane & Inland Empire Railroad, is reported to have begun the construction of a railroad from a junction with the Spokane International, at or near Rathdrum, Idaho, to Spirit Lake, thence to Newport and a considerable distance down the Pend Oreille river.

Springfield Troy & Piqua Railway, Springfield, O.—It is reported that this company expects to build a branch line to St. Paris, O., about five miles.

Texas Traction Company.—This company has put an additional grading outfit at work on the line between Sherman and Dallas, Tex. There are four grading outfits now at work on the Sherman-Dallas interurban. One of the outfits is operating between Sherman and Howe; one between Howe and Van Alstyne, another between Anna and Melissa, and the fourth between Melissa and McKinney. The fifth will establish camp at Caruth Switch and work northward. Rapid progress is being made on the grading and the ties are being delivered. Rails will be delivered in July, by which time it is expected to begin tracklaying. The apparatus for the power plant at McKinney will be delivered in July.

Toledo Bucyrus & Columbus Electric Railway.—An engineering corps in the employ of this company has begun making surveys for a line from Bucyrus to Tiffin, O., via Oceola, Benton, Plankton and Melmore, 25 miles.

Toledo Fostoria & Findlay Electric Railway.—It is announced that this company expects to extend its line north from Pemberville to Toledo, O., 17 miles, this summer. The company will also make improvements to Reeves Park, a resort between Fostoria and Findlay. J. E. Reeves of Canal Dover is president.

Tri-City Railway, Davenport, Ia.—President J. F. Porter and Manager J. F. Lardner have made a compromise with the city council whereby an ordinance will be introduced permitting the sale of the Davenport & Suburban Railway to the Tri-City company, releasing the company from building certain extensions required by the D. & S. ordinance, and giving the company the right to do away with the six tickets for 25 cents on the D. & S. line. In return the company is to extend the D. & S. line from Eleventh and Le Claire streets to Eastern avenue and provide increased service in several particulars.

Union Street Railway, New Bedford, Mass.—This company is planning to build one and one-half miles of track extension this spring, in addition to rebuilding considerable track. The new Arnold street line will be in operation this summer.

United Railways, Portland, Ore.—C. E. Loss of Los Angeles, president, has disposed of his holdings in this company to C. G. H. MacBride of San Francisco, who proposes to carry on the work to completion. It is stated that the Front street line in Portland will be completed within 30 days and that work will then begin on the line to Hillsboro.

Wagner Lake Shore & Armour Traction Company, Wagner, S. D.—It is reported that this company expects to begin grading about May 1 for a line 25 miles long to connect Wagner and Armour, S. D. A summer resort will be established at Andes.

Walla Walla Valley Traction Company, Walla Walla, Wash.—The first car was operated over this line from Walla Walla to Free-water and Milton, Ore., on April 17.

Washington Spa Springs & Gretta Railroad.—This company, recently incorporated to build from the Maryland-District of Columbia line near Bladensburg to Gretta, Md., has organized by electing the following officers: President, B. D. Stephen; vice-president, S. S. Yoder; secretary, Fillmore Beall; treasurer, R. N. Ryon, and general counsel, James C. Rogers. These officers and William W. Poultney, William P. Magruder, J. Enos Ray, Jr., and J. Harris Rogers will constitute the board of directors.

Washington Water Power Company.—This company is building a double-track line to connect its Maple street line and Pacific avenue line on Maple street, Spokane, Wash.

Winnipeg Selkirk & Lake Winnipeg Railway.—This company is now building an electric line between Winnipeg and Selkirk, Man., 22 miles. Power will be derived from the plant at Lac du Bonnet. Equipment is being furnished by the Canadian General Electric Company.

Yakima Intervalley Traction Company.—This company, which was incorporated last year and has secured several franchises for the use of the county highways, proposes to build about 60 miles of line this year, radiating from Yakima, Wash., according to a recent announcement by E. M. Kenly, chief engineer. Gasoline electric motor cars will be used. It is stated that the full capital stock of \$250,000 has been subscribed. The officers of the company are: President, H. B. Scudders; vice-president, W. A. Bell, and treasurer, W. L. Steinweg, all of Yakima, Wash.

Yellville, Ark.—Several business men of this city are raising subscriptions and securing the right of way for an electric line to run from Yellville to the mouth of Cedar Creek, along the Buffalo river, about 20 miles south of Yellville.

Youngstown & Ohio River Railroad.—Actual construction on this line between West Point and East Liverpool, O., is to begin at once and is expected to be completed this year. The grading between Washingtonville and West Point will probably be completed by June 1. In connection with the Youngstown & Southern this company will connect Youngstown and East Liverpool.

POWER HOUSES AND SUBSTATIONS.

Consolidated Railway Company.—It is announced that this company is considering plans for the construction of a power house at Thamesville, Conn., to furnish power for operating the electric railways in New London, Montville, Norwich and Willimantic. It has not been definitely announced when work will be begun on the power house.

Frederick (Md.) & Middletown Electric Railroad.—It is announced that this company will probably build a new power house, located at some point in Frederick, during the coming summer, to avoid the expense of hauling coal to the present power house in Middletown Valley. The system has outgrown the capacity of the present plant and the new plant will be built with a view to meeting the requirements of future extensions, which the company has under consideration, but has not yet determined upon.

Galveston-Houston Traction Company.—It is announced that Stone & Webster of Boston have practically completed plans for this line and all surveys of all possible routes and entrances into Galveston and Houston have been completed, but the exact location of the power house has not yet been determined, as fuel is high and it is desirable to have a power house located on deep water, so that the coal can be unloaded directly from schooners into the coal hoppers. The locations which have been examined for the power house are Texas City and Harrisburg, Tex., and one or two other points.

Kansas City & Olathe Electric Railway.—It is announced that this company has received a grant of two acres of land from Benjamin Earnshaw of Shawnee, Kan., which is to be used for the erection of a power house. The entire community through which this line runs is anxious to have the line completed, and it is probable that work on the new power house will begin at an early date.

Norfolk & Portsmouth Traction Company.—This company has announced that power was first generated in its new \$1,000,000 power plant at Brambleton, Va., on April 10. Only one generator was started at that time, but it is expected that the remaining portion of the plant will be in operation in the near future.

Toronto Railway Company.—It is announced that this company has ordered a chloride accumulator from the Canadian General Electric Company, which will have a capacity of about 1,500 horsepower for two hours. This battery will be installed to take care of the peak from 5 to 7 p. m., and thus the installation of the new generating machinery has been avoided and a very much higher load factor will result.

Wilmington (Del.) City Railway Company.—The engines and generators at the power house of this company have been nearly erected and as soon as the machinery of the Brandywine plant is placed in regular operation the Delaware avenue plant, which adjoins the main power house of the company, will be dismantled and the power house converted into additional quarters for the storage of cars. This change will permit the company to store all its cars under cover.

Personal Mention

Mr. E. R. Gilbert has resigned as manager of the New York & Port Chester Railway, Port Chester, N. Y.

Mr. J. M. Atkinson has resigned as vice-president of the Chicago & Southern Traction Company of Chicago, Ill.

Mr. George A. Murch has resigned as superintendent of the Atlantic Shore Line Railway, with office at Kennebunkport, Me.

Mr. E. J. Rauch has been appointed superintendent of car repairs of the Old Colony Street Railway, with office at Fall River, Mass.

Mr. A. R. Piper has been appointed general freight agent of the Brooklyn Heights Railroad, Brooklyn, N. Y., effective on April 15.

Mr. Uriah Foss has resigned as superintendent of transportation of the Connecticut Railway & Lighting Company, New Britain, Conn., and that position has been abolished.

Mr. Bertram E. Wilson, park manager of the Rochester Railway Company and the Rochester & Suburban Railway, has been appointed general passenger agent of the Rochester & Eastern Railway, Rochester, N. Y.

Mr. William H. Dunkerley, heretofore connected with the accounting department of the Utica & Mohawk Valley Railway, Utica, N. Y., has resigned to become auditor of the Rockford & Interurban Railroad of Rockford, Ill.

Mr. E. J. Wilcoxon, superintendent of transportation of the Rochester (N. Y.) Railway Company, has been appointed general superintendent and will take over many of the duties of the general manager, Mr. R. E. Danforth, resigned.

Mr. M. H. Brondson, chief engineer power stations of the United Railroads of San Francisco, has been appointed chief engineer of the Rhode Island Company, Providence, R. I., succeeding Mr. Fred N. Bushnell, who resigned some time ago.

Mr. Matthew Slush of Detroit has been elected president of the Chicago & Southern Traction Company of Chicago, succeeding Mr. W. S. Reed, who has been elected vice-president. Mr. C. J. Reilly of Detroit has been elected secretary and treasurer.

Mr. Samuel P. Hunt, heretofore connected with the electrical engineering department of the Boston & Northern Street Railway, Boston, Mass., has been appointed assistant general manager of the Manchester Light & Power Company, Manchester, N. H.

Mr. Clement C. Smith, president of the Columbia Construction Company of Milwaukee, Wis., and a director of the Sterling Dixon & Eastern Electric Railway, has been elected a director of the Fidelity Trust Company of Milwaukee and president of the Citizens' Gas Company of Kankakee, Ill.

Mr. Louis Russell Gaw, formerly master mechanic of the Toledo & Indiana Railway, resigned his position on March 15, to become master mechanic of the Ohio Central Traction Company at Galion, O., as noted in the Electric Railway Review of April 6. Mr. Gaw was born in 1872 and at the age of 18 years entered the shops of the Toledo Consolidated Street Railway, where he remained for several years, mastering the details of the different departments until qualified to fill the more important position of master mechanic, which was offered to him by the Toledo Traction Company. He held this position until 1899, when he resigned to become master mechanic and chief electrician of the Atlantic Coast Electric Railroad at Asbury Park, N. J. He remained with this company for four years, resigning in 1903 to accept a similar position with the Toledo & Indiana Railway Company at Delta, O. During the last

L. R. Gaw.

two years of his service with this company Mr. Gaw supervised the installation of its rotary-converter substations and was given entire charge of the power house, substations, line and cars. The Ohio Central Traction Company is now controlled by the Cleveland Southwestern & Columbus Railway and operated as a division of that company.

Mr. William A. House, who has been acting president and general manager of the United Railways & Electric Company of Baltimore, Md., since the death of Gen. John M. Hood last fall, has been elected president of the company. Mr. Thomas A. Cross, superintendent of overhead construction, has been elected general

manager to succeed Mr. House. Mr. Frank A. Furst has been elected first vice-president, succeeding Mr. George C. Jenkins, resigned, and Mr. William Early has been elected secretary, succeeding Mr. H. C. McJilton.

Mr. D. H. Sawyer, heretofore superintendent of the Springfield & Northeastern Traction Company, at Decatur, Ill., has been appointed superintendent of the Peoria Bloomington & Champaign Railway, the new line of the Illinois Traction System between Peoria and Bloomington, with headquarters at Peoria, effective on April 13.

Mr. Edward G. Connette, general manager of the Worcester (Mass.) Consolidated Street Railway Company, has had his jurisdiction extended over the Worcester & Southbridge Street Railway, the Worcester & Webster Street Railway and the Webster & Dudley Street Railway, which have been consolidated with the Worcester Consolidated Company, as noted in the Electric Railway Review of April 6, 1907. Mr. Connette's early railroad experience was obtained in the engineering and transportation departments of various steam railroads. About 17 years ago he became identified with the street railway industry, when he was appointed general manager of the street railways of Nashville, Tenn., where he remained for eight years. When the street railway and the lighting systems of this city were merged Mr. Connette retained his position as general manager of the combined properties, resigning after two years of service with the merged companies to become vice-president and general manager of the Syracuse (N. Y.) Rapid Transit Company. During his five and one-half years' management of this system several important extensions were planned and built and the service and equipment noticeably improved. During his connection with this company Mr. Connette served for one year as president of the New York State Street Railway Association of the State of New York. In June, 1905, he was offered the position of general manager of the Worcester Consolidated Street Railway and on October 1 of that year assumed active charge of the property.

E. G. Connette.

The following appointments were recently announced by the Boston Elevated Railway: George R. Tripp, superintendent of division 6, is appointed superintendent of transportation, in place of Julius E. Rugg, who is appointed superintendent of employment and discharge. Mr. Karl S. Barnes is appointed superintendent of division 4 and Mr. Lemuel T. James is appointed acting superintendent of division 6, succeeding Mr. Tripp.

Mr. A. E. Reynolds of Crawfordsville, Ind., heretofore general manager of the Indianapolis Crawfordsville & Western Traction Company, has been elected president, succeeding A. F. Ramsey, who died recently. James Lucas of Frankfort, Ind., has been elected a director to succeed Mr. Ramsey. Mr. A. M. Hewes, secretary and treasurer of the Electrical Installation Company of Chicago, has been elected general manager in place of Mr. Reynolds.

Mr. B. I. Budd, heretofore purchasing agent of the Metropolitan West Side Elevated Railway of Chicago, has been appointed general manager of that company, effective on April 15, with headquarters at Chicago. Mr. Budd will have direct charge of all matters pertaining to operation, including the purchase of supplies. The office of purchasing agent has been discontinued. Since the resignation of Mr. H. M. Brinckerhoff as general manager, in September, 1905, most of the duties of that office have been conducted by Mr. H. G. Hetzler, president. Mr. Budd has been connected with the Metropolitan company for 14 years, starting as a clerk in the storekeeper's office. For five years he was storekeeper and in 1898 was appointed purchasing agent, which position he has held until his present appointment.

Mr. W. M. Kessler, who recently was appointed chief dispatcher and assistant superintendent of the Pittsburg & Butler Street Railway, as previously noted in the Electric Railway Review, was born in Kessler, O., in 1876. At the age of 22 years he entered the service of the Cincinnati Hamilton & Dayton Railway as telegraph operator, where he remained for 4½ years. In 1902, concluding that the electric traction field offered better opportunities, he became connected with the Dayton & Troy Electric Railway, first as motorman and conductor, then as dispatcher and later as chief dispatcher of this road, with entire charge of all trainmen and of the operating department of the system. While serving in this capacity he organized a complete system of operation with written train orders, timetables and book of rules similar to those used on steam roads. During the last year of his service with this company he was assistant superintendent, resigning that position to become chief dispatcher and assistant superintendent of the Pittsburg & Butler Street Railway.

Financial News

Anderson (S. C.) Traction Company.—It is reported that interests identified with the Columbia (S. C.) Electric Street Railway Light & Power Company have secured control of the Anderson Traction Company.

Boston Elevated Railway.—Shareholders will meet on April 30 to authorize the proposed issue of \$8,000,000 stock and \$5,800,000 bonds, referred to in the Electric Railway Review of April 20 last.

Calumet Electric Railway, Chicago.—The following officers and directors have been elected: President, Ira M. Cobe; vice-president, J. W. McKinnon; secretary and treasurer, Frank H. Murray; directors, L. E. Meyers, B. F. Harris, G. F. Shaw, J. W. McKinnon and Ira M. Cobe.

Chicago & Southern Traction Company, Chicago.—At the annual meeting of shareholders on April 19 Matthew Slush, C. J. Reilly and John M. Mulkey of Detroit and W. S. Reed, W. H. Conrad and Fred G. Marbois of Chicago were elected directors. Matthew Slush was elected president, W. S. Reed vice-president and C. J. Reilly secretary and treasurer.

Chicago Subway Company.—Plans are said to be under way for the formation of the holding company which will acquire the properties of the Chicago Subway Company and the Chicago Edison Company.

Cleveland Southwestern & Columbus Railway, Cleveland.—It is announced that the securities of this company will be listed on the New York stock exchange.

Illinois Traction Company, Champaign.—A press dispatch from Montreal says that a Montreal syndicate has offered the Sun Life Insurance Company \$65 a share for the \$6,359,500 outstanding common stock of the Illinois Traction Company and that the offer was refused.

Montreal (Que.) Street Railway.—Earnings of this company for the six months ended March 31, with a comparison, follow:

Six months—	1907.	1906.	Increase.
Passenger earnings	\$1,568,204.88	\$1,390,915.29	\$177,289.59
Miscellaneous earnings....	30,843.57	15,407.10	15,436.47
Total	\$1,599,048.45	\$1,406,322.39	\$192,726.06
Operating expenses.....	1,073,656.96	928,631.56	145,021.40
Net earnings	\$ 525,391.49	\$ 477,690.83	\$ 47,700.66
Rent of leased lines.....	1,019.88	1,019.88
City percentage of earnings	69,788.36	58,686.72	11,101.64
Interest on bonds and loans	88,326.99	85,590.54	2,736.45
Contingent for renewals...	79,743.19	34,347.65	45,395.54
Total charges	\$ 238,878.42	\$ 178,624.91	\$ 60,253.51
Surplus	286,513.07	*299,065.92
Expenses, per cent of car earnings	67.14	66.03

*Decrease, \$12,552.85, equal to 4.20 per cent.

Philadelphia & Western Railroad, Philadelphia.—A plan of reorganization is announced, which is designed to permit expansion and the admission of new interests into a one-third ownership in the property. Announcement that the property will be sold at West Chester, Pa., on May 20, has been made by the Trust Company of North America, Philadelphia, which was recently appointed trustee under the mortgage. It is stated that George J. Kobusch of St. Louis, the president of the company, will dispose of his interests to a banking firm which represents capitalists who are largely interested in electric railways in Indiana, Virginia and other states. It is reported that George R. Sheldon of New York will be elected president and that William H. Sims, the superintendent of construction, will be made general manager of the road. The sale will not conflict with the proposed opening of the road on May 1. The road is completed from Sixty-ninth and Market streets, Philadelphia, to Strafford, 12½ miles. The company holds franchises permitting it to extend its line from Parkesburg, and also to construct a line from Philadelphia to Norristown. Regarding the reorganization Joseph S. Clark, second vice-president of the Trust Company of North America, said: "All the members of the old company will be in the new, but the company will be larger and broader. This foreclosure is merely a matter of form in connection with a reorganization scheme. We are expanding, and this step is a formal necessity. The reorganization syndicate is in possession of all the bonds and stock of the old company. Of the authorized issue of \$15,000,000 first mortgage bonds, \$2,149,000 are outstanding. Besides this, there are debts of \$1,500,000. The company's capital stock is \$900,000. This will be increased to between \$3,000,000 and \$4,000,000. About the same amount of the proposed authorized issue of \$50,000,000 bonds will be actually issued. Owing to certain peculiar provisions in the laws of this state, the foreclosure plan is the most advantageous method of attaining the results at which we aim."

Rutland (Vt.) Railway Light & Power Company.—Supplementing the figures given in last week's issue of the Electric Railway Review, the following information, contained in a report of G. T. Rogers, the president, to the underwriters and bondholders, is presented: "The combined properties are at present earning sufficient to pay interest not only upon the present bond issue, but upon the prospective increased bond issue of \$300,000, for the completion of the purchase of the electric light company, leaving a surplus

of \$15,000 in net earnings to be applied upon the capital stock of the consolidated companies. The consolidation of the various public utilities of Rutland with the electric light company is well under way and will soon be consummated. The bond market still remains in an unsettled and somewhat uncertain condition; therefore no determined effort has been made to dispose of the bonds, we believing it to be to the advantage of all parties concerned to await the coming of a more settled and active market, thereby assuring a more advantageous price for the securities when offered."

Schenectady (N. Y.) Railway.—The report of this company for the quarter ended March 31, with a comparison, shows:

Quarter ending March 31—	1907.	1906.	Increase.
Gross	\$230,056	\$192,187	\$37,869
Expenses	182,494	140,925	41,569
Net	\$ 47,562	\$ 51,262	*\$3,700
Other income	1,933	615	1,318
Total income	\$ 49,495	\$ 51,877	*\$2,382
Fixed charges	29,881	55,056	*\$25,175
Surplus	\$ 19,614	†\$ 3,179	\$22,793

*Decrease. †Deficit.

United Railways Company of St. Louis.—This company has listed on the New York stock exchange \$4,000,000 additional 5 per cent cumulative preferred stock, making a total outstanding of \$16,983,200. The additional preferred stock was used in the purchase of the St. Louis & Suburban Railway, which was acquired by a deed of conveyance dated December 31, 1906. The St. Louis & Suburban stock was deposited with the Mississippi Valley Trust Company, as trustee for the St. Louis & Suburban shareholders. The trust will continue until January 15, 1908. The stock in the hands of the trustee is not to accumulate or accrue dividends until after that date, unless the Suburban Railway Company's shareholders deposit with the trustee cash to the amount of dividends that would accrue to January 1, 1908, and thereupon receive a certificate of stock which will be on a parity, when registered, with all the preferred stock of the United Railways Company of St. Louis previously outstanding. The report of the St. Louis & Suburban, including constituent companies, for the year 1906, was as follows:

Gross earnings	\$1,141,540
Operating expenses and taxes	833,577
Net earnings	\$ 307,963
Charges	404,772
Deficit for year.....	\$ 96,809

The report for the quarter ended March 31, with comparisons, follows:

	1907.	1906.	1905.
Gross earnings	\$2,494,162	\$2,286,291	\$1,843,022
Expenses, taxes, etc.....	1,722,595	1,475,738	1,298,702
Net earnings	\$ 771,567	\$ 810,553	\$ 544,320
Charges	693,734	695,521	598,472
Surplus	\$ 77,833	\$ 115,032	*\$ 54,152

*Deficit.

For the purpose of comparison the figures for 1906 also include earnings of the St. Louis & Suburban Railway, acquired by the United Railways Company in October, 1906. Gross earnings also include the item "other income," amounting to \$2,190 in 1907 and \$4,546 in 1906.

United Railways Investment Company.—This company has issued \$2,400,000 additional 5 per cent collateral trust bonds, making a total outstanding of \$18,150,000. The additional bonds were issued in exchange for stock of the Philadelphia Company of Pittsburg.

United Traction Company, Albany.—Authority has been given to this company by the New York state railroad commission to issue \$500,000 additional consolidated mortgage 4½ per cent bonds, to provide for improvements and additions. This will increase the outstanding bonds to \$1,729,000, exclusive of the \$3,912,000 which are reserved to retire underlying bonds at maturity. There are still available for future improvements \$859,000 of the total issue of \$6,500,000 bonds.

Winnipeg (Man.) Electric Railway.—In addition to the figures published in the Electric Railway Review of last week, the annual report for 1906 gives the following:

	1906.	1905.	1904.
Operating expenses, per cent of earnings	49.56	51.42	51.47
Average capital	\$4,144,480	\$4,000,000	\$2,099,723
Net income, per cent of capital.....	11.17	9.86	12.77
Transfers	3,109,094	1,682,685	2,497,952
Railway earnings per capita, on basis of 90,000, as against 80,000.....	8.30	6.80	5.51

William Mackenzie, the president, said: "The roadbed, rolling stock, buildings and other properties of the company have been efficiently maintained."

Dividends Declared.

Central Traction Company, Pittsburg, 1½ per cent.
Consolidated Traction Company, Pittsburg, preferred, 3 per cent.

Manufactures and Supplies

ROLLING STOCK.

Columbus Railroad, Columbus, Ga., has ordered three 12-bench open cars from The J. G. Brill Company.

International Railway, Buffalo, N. Y., has placed an order with the G. C. Kuhlman Car Company for 50 cars.

Dallas Consolidated Electric Street Railway, Dallas, Tex., has ordered five 12-bench open cars from The J. G. Brill Company.

Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., is having one express car built by the Cincinnati Car Company.

Pittsburg & Westmoreland Railway, Pittsburg, Pa., is reported to have placed orders for a number of cars for delivery on June 15.

Lafayette & Logansport Traction Company, Ft. Wayne, Ind., is having six city and five interurban cars built by the Cincinnati Car Company.

Consolidated Railway, New Haven, Conn., has placed an order for 20 double-truck vestibule cars for use on the Providence & Burrillville Street Railway.

Springfield Railway & Light Company, Springfield, Mo., expects to place an order shortly with the St. Louis Car Company for four closed cars and two open cars.

Sarnia Street Railway, Sarnia, Ont., has recently placed an order with the Ottawa Car Company for one double-truck car. It will be equipped with Taylor trucks and Westinghouse motors.

Radford Water Power Company, Radford, Va., has placed an order with The J. G. Brill Company for one new semi-convertible car, to be 37 feet 5 inches long over all, and to be equipped with four Westinghouse 101-B motors.

York Street Railway, York, Pa., has under consideration the purchase of four large combination passenger cars with smoking compartment and one snow plow and baggage car. We are advised that no bids have yet been asked.

Mineral Wells Electric System, Mineral Wells, Tex., has placed an order for six semi-convertible cars with the St. Louis Car Company. This road is being built and its equipment purchased by the Howard-Burke Engineering Company of New York.

Columbus Traction & Light Company, Columbus, Miss., will place contracts within the next few weeks for two combination summer and winter cars, three trailers, double-truck equipment for three 35-foot cars, shades for six summer cars, and other equipment.

New York & Queens County Railway, Long Island City, N. Y., as reported in the Electric Railway Review of April 13, will soon ask bids on 40 all-steel cars. These cars are to be 38 feet in length, equipped with automatic air brakes and cross seats and to accommodate 40 passengers.

Chicago-New York Electric Air Line Railroad, Chicago, has purchased from the Niles Car & Manufacturing Company two combination passenger, baggage and express cars. These cars are 49½ feet in length, seats upholstered in leather, weigh about 35 tons and will be put into service at once upon the track west of La Porte, Ind.

Pittsburg Railways, Pittsburg, Pa., was reported in the Electric Railway Review of April 6 as having been authorized by its board of directors to purchase additional rolling stock. We understand that this company has placed an order for 100 semi-convertible double-truck cars with the St. Louis Car Company. They will be 50 feet in length and equipped with high-speed motors and air brakes.

Consolidated Railway, New Haven, Conn., as reported in the Electric Railway Review of April 6, has placed an order with the Cincinnati Car Company for five double-truck closed cars with 30-foot bodies and 41 feet in length over all, to be equipped with Brill 27-E1 trucks, four Westinghouse 101-B motors, Christensen AA4 air brakes, Providence fenders, Sterling-Meaker No. 5 registers and Consolidated Car Heating Company's heaters.

SHOPS AND BUILDINGS.

Cincinnati Georgetown & Portsmouth Railroad.—The car barns at Cincinnati, O., were totally destroyed by fire on the night of April 23. The loss, which is fully covered by insurance, is estimated at \$80,000.

Duluth (Minn.) Street Railway.—This company has applied for a building permit for a two-story brick office building, 40 by 80 feet, to cost \$17,000, to be erected on Twenty-sixth avenue west, and a contract has been awarded to Alexander Roberts. The structure is to be ready for occupancy by October 1. The present offices, located in the power station at Eleventh avenue west, will be removed to the new building, where facilities will be had for all departments. The company now owns the entire block bounded by Twenty-sixth and Twenty-seventh avenues west and Superior and First streets, and intends to assemble its entire plant, with the exception of the Eleventh avenue west power station, on the west end block. Between the office building and First street will

be constructed a long one-story building with an extension roof on the inner side, covering the work car track. In this building will be located a waiting room, blacksmith shop, stables, wagon room, etc. Between the office building and the woodworking shop will be constructed nine new storage tracks running the entire length of the block. These tracks will have sufficient length to accommodate about 50 cars.

Illinois Traction Company.—This company has purchased a tract of land, 100 by 120 feet, at Carlinville, Ill., upon which will be erected a combination passenger and freight station, with office rooms.

Los Angeles-Pacific Electric Railway.—Surveys have been completed and plans accepted for the combination passenger and freight station which will be erected at Los Angeles, Cal. Work will commence at once. The company is also making extensive improvements at Sherman, Cal., including the erection of a new repair shop of brick, one story high and 140 feet square, which is nearly completed. A brick car shed, 100 by 350 feet, is also in the course of erection.

Utah Light & Railway Company, Salt Lake City, Utah.—Plans have been prepared for completely renovating the old Tribune building on West Temple street, Salt Lake City, and converting it into an office building for all departments. It is expected that the offices may be moved in three or four months.

Vallejo Benicia & Napa Valley Railroad.—It is reported that this company has decided to erect a new \$10,000 car barn and repair shop at East Napa, Cal. L. J. Perry, Napa, general manager.

TRADE NOTES.

American Mason Safety Tread Company, Lowell, Mass., will soon begin the erection of a three-story factory building, 50 by 100 feet.

Ford, Bacon & Davis, engineers, now located in the Blair & Co.'s building, 24 Broad street, New York, on May 1 will move their offices to 115 Broadway.

Wendell & MacDuffie, 26 Cortlandt street, New York, have been appointed eastern sales agents for the Russell Car & Snow Plow Company, Ridgway, Pa.

Westinghouse, Church, Kerr & Co., New York, has been incorporated in Canada under the name of Westinghouse, Church, Kerr & Co. of Canada, Limited.

C & C Electric Company, of Newark, N. J., has been incorporated in Chicago, with a capital stock of \$25,000. The capital stock of the Newark company is \$1,400,000.

Stone & Webster Engineering Corporation, 84 State street, Boston, announces the opening of its Chicago office on May 1 in the First National Bank building, in charge of Arthur J. Veitch.

The J. G. Brill Company, Philadelphia, has declared its first dividend of 1¼ per cent on its new preferred stock, payable on May 1, and 1 per cent on its new common stock, payable on June 1.

Green Fuel Economizer Company, 90 West street, New York, has removed its Chicago office from the Monadnock block to the Old Colony building, where larger quarters have been secured.

Security Register & Manufacturing Company, 42 Broadway, New York, has moved its offices from the nineteenth floor of this building to the fourth floor, where it has secured rooms better fitted to its needs.

Clarence E. Delafield has resigned as St. Louis manager of the Wagner Electric & Manufacturing Company and has been appointed manager of the high-tension insulator department of the Ohio Brass Company of Mansfield, O.

Chicago Pneumatic Tool Company has removed its Philadelphia office to 820 Arch street. G. A. Barden, who is in charge of the Philadelphia branch, reports splendid business and the necessity for larger quarters as determining the change.

Wagner Electric Manufacturing Company, St. Louis, Mo., announces the appointment of F. Johnson as district manager of the St. Louis territory, with headquarters in the Frisco building. Mr. Johnson was formerly connected with the sales department of the General Electric Company at St. Louis.

McLeer Engineering Company, 338-340 Pearl street, New York, dealer in electric railway supplies and equipment, both new and second-hand, reports that it has had a large sale this season for second-hand cars and has disposed of all of its stock in this line with the exception of a few 8, 9 and 10 open-bench cars, which may be used as trailers or may be fully equipped as motor cars.

Blake Signal & Manufacturing Company, 246 Summer street, Boston, announces the establishment of the following agencies for its Blake tube flux: George F. Schoen, 108 South Forsyth street, Atlanta, Ga.; Syles R. Fralick, 269 South Canal street, Chicago; Wesco Supply Company, St. Louis; Brooks-Follis Electric Corporation, 212 First street, San Francisco, and the Norton System Telephone Company, Toronto, Can.

B. F. Sturtevant Company of Boston, Mass., reports recent sales of generating sets to the Alton Paving, Building & Fire Brick Company, Alton, Ill.; Minneapolis St. Paul & Sault Ste. Marie Railway, Minneapolis, Minn.; Votey Organ Company, Garwood, N. J.; Hermann Manufacturing Company, Evansville, Ind.; H. J. Kunzig, Philadelphia, Pa., and Polson Iron Works, Toronto, Ont. Sales are reported of Sturtevant high-pressure rotary type blowers to the

Otis Elevator Company, Chicago, Ill.; Macallen Company, South Boston, Mass.; United Oil & Refining Company, Beaumont, Tex.; Lunsden & Van Stone Company, Boston, Mass.; Johnson & Blanding, Providence, R. I., and Sharpless Separator Company, West Chester, Pa.

John W. Seaver, one of the founders of the Wellman-Seaver-Morgan Company of Cleveland, O., has severed his active connection with the company and has opened offices as consulting engineer at 519 Caxton building, Cleveland. Mr. Seaver will devote his personal attention to the design and construction of manufacturing and power plants, iron and steel foundries, buildings and special cranes and appliances for handling machinery.

Westinghouse Companies, Pittsburg, have been awarded the contract by the United States government for the complete electrical equipment for the new power station to be erected in connection with the congressional buildings at Washington, D. C. The contract calls for four Westinghouse-Parsons and four Westinghouse generators, all of 3,000-horsepower capacity. All of the machinery is now under construction and will be delivered before the end of the year.

Chicago Pneumatic Tool Company, Chicago, has issued a statement of profits for the quarter ending on March 31, which shows an earning on the stock of 2.8 per cent. The profit for the first quarter was \$255,528.82 which after deducting cost of depreciation, development of new tools and bonded interest, the profit available for dividends was \$171,561.45. A quarterly dividend amounting to \$61,087.83 was paid, leaving a balance of \$110,473.62 to be added to the previous surplus, making a total surplus to be carried forward of \$988,883.06.

Noiseless Car Wheel Company has been incorporated with a capital stock of \$1,000,000 for the purpose of manufacturing a noiseless car wheel for street railways. The directors of the company are: George H. Bryant, August Ziesling, Bethune Duffield, J. L. Carleton and Fred M. Delano. The officers are: President, George H. Bryant, at present western representative of the Krupp Company; vice-president, August Ziesling, president of the American Bridge Company; treasurer, Bethune Duffield, Detroit, and secretary, W. F. McCorkle, Detroit.

Central Inspection Bureau, New York, has received an order from the Newburg & South Shore Railway for the inspection of 100 all-steel gondola cars, which will be built by the Pressed Steel Car Company. An order has also been received from J. G. White & Co. for the inspection of a large number of dump cars for export shipment and an order from the Philadelphia Rapid Transit Company for the inspection of a large amount of lumber. The company has thoroughly equipped itself with competent inspectors for the inspection of all classes of railroad and builders' equipment.

Allis-Chalmers Company, Milwaukee, has received an order from the Elkins Coal & Coke Company of Morgantown, W. Va., for new machinery, comprising a 300-kilowatt Allis-Chalmers alternator, a 200-kilowatt rotary converter, three 75-kilowatt transformers, a 27½-kilowatt exciter, standard induction motors of 20 to 150 horsepower capacity, with switchboard equipment. An order has also been received from the Jones & Langhlin Steel Company of Pittsburg for two direct-current generators, with a capacity of 1,000 kilowatts each, for installation in its Ahiquippa (Pa.) plant.

TRADE PUBLICATIONS.

Allis-Chalmers Company, Milwaukee, Wis.—Leaflet No. 2002 consists entirely of illustrations of the valve gear, piston details and governor of the Reynolds Corliss engine.

Alliance Machine Company, Alliance, O.—An imposing list of users of electric cranes who placed orders with Alliance Machine Company in 1906 has been published in pamphlet form.

Sprague Electric Company, 527 West Thirty-fourth Street, New York, N. Y.—Catalogue No. 315 is a 36-page publication listing a large number of types of electric fans for both direct current and alternating current.

C. W. Leavitt & Co., 220 Broadway, New York.—A four-page leaflet offers advice regarding the deoxidation of brass and bronze alloys by the use of magnesium and states how this deoxidizing agent should be handled as distinguished from other deoxidizers.

Wickes Brothers, Saginaw, Mich.—This company issues monthly stock lists of boilers, engines, dynamos, motors and machinery. The list of April 15 shows a large stock on hand of tubular, water-tube and upright boilers, Corliss engines, and other horizontal automatic engines, vertical engines, throttling governor engines and gasoline engines. Pumps, condensers, feed-water heaters, locomotives and metal-working machinery are also listed.

General Electric Company, Schenectady, N. Y.—An extensive line of fan motors, both alternating and direct current, are the subjects of an illustrated catalogue. Bulletin No. 4393C is devoted to small, moderate-speed, engine-driven, revolving-field alternators. Electric pumping plants are the subject of Bulletin No. 4496, which describes the 25,000,000-gallon municipal plant at Buffalo, N. Y., and the 172,000-gallon electric pumping plant recently completed for the village of Scotia, N. Y.

Western Electric Company, Chicago.—A pamphlet which should be of interest to those having to do with the installation and maintenance of telephone machines is that published by the Western Electric Company under date of April 11, 1907. The various features of installation are considered and are conveniently indexed for reference. Another recent publication of the company is a

pamphlet giving facts regarding the immensity of its organization and plants. Two mailing cards call attention to ceiling fans and ventilating fans.

Browning Engineering Company, Cleveland, O.—An eight-page pamphlet has been issued to introduce to investors \$250,000 of 7 per cent cumulative preferred stock. This increase in stock is to provide for the rapid increase in the business of the company.

Hill Publishing Company, 505 Pearl Street, New York, N. Y.—This company has just issued a book catalogue of 168 pages, 3½ by 6 inches, containing a comprehensive list of books on civil, mechanical and electrical subjects and scientific works of every description. The book is conveniently arranged, enabling the location of a work in any class an easy matter.

TRACK-CLEANING BROOMS.

The equipment of a wagon as employed on street and inter-urban railways for cleaning track on frogs and curves consists of a steel wire broom, a corn broom and a can of oil. The steel broom is for cleaning out refuse and obstructions which have become tightly impacted in grooves by the passage of many wheels, the corn broom for the finishing touches and the can of oil for administering lubricant upon the rail on curves. The J. W. Paxson Company, 1021 North Delaware avenue, Philadelphia, manufactures the wire broom illustrated herewith and makes the claim that this broom is an indispensable part of such an outfit. The broom, as shown, is made of such a width as to fit into the groove on frogs and curves and the wire is of sufficient stiffness to remove any ordinary obstruction even when solidly packed. The corn broom will not do this; hence the claim for the indispensability of the wire broom as made by the manufacturer.

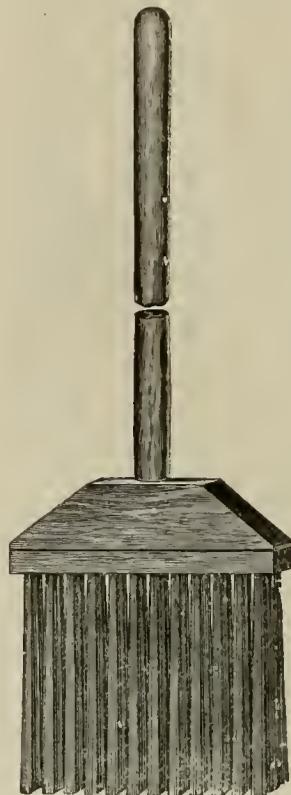

It is of interest to note that the use of the wire broom for this purpose was suggested by its efficiency in the foundry for cleaning sand from castings, the Paxson company also manufacturing foundry facings, supplies and equipment. The brooms are inexpensive and durable.

THE VICTOR PORTABLE COMBINATION METER.

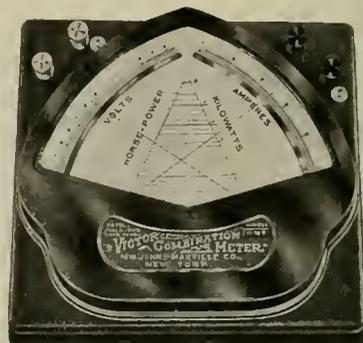

The desirability of being able to tell at a glance exactly the kilowatt or horsepower output of a generator is well recognized by most engineers, as it saves the trouble of making mental calculation required in multiplying the volts pressure by the ampere output to obtain kilowatts and then dividing by 746 to obtain the horsepower of an electric circuit. The convenience

of being able to read the horsepower and kilowatts directly is shown by the favorable reception which was given to the Victor combination switchboard power meter, introduced a year or so ago. The combination meter, an illustration of which is presented herewith, consists of two separate instruments, a voltmeter and ammeter mounted within the same case. The scales for reading the two instruments are so located that the needles of the two instruments cross each other. It is evident that no matter in what position the two needles may be, the point located by their intersection may be taken to represent the product of the volts by the amperes, or the product of the volts by the amperes divided by 746. The instruments, after being carefully calibrated by hand to read volts and amperes accurately, are then calibrated for the central triangular graduations, which give the power readings direct. These are clearly shown in the accompanying illustration. The horsepower readings are taken from one side of the triangular scale and the kilowatt readings from the other. The instrument, therefore, serves the purpose of voltmeter, ammeter and wattmeter and has an additional advantage of giving the reading reduced to horsepower.

To meet the great demand for a portable instrument of this type the H. W. Johns-Manville Company of 100 William street,

Wire Track-Cleaning Broom.

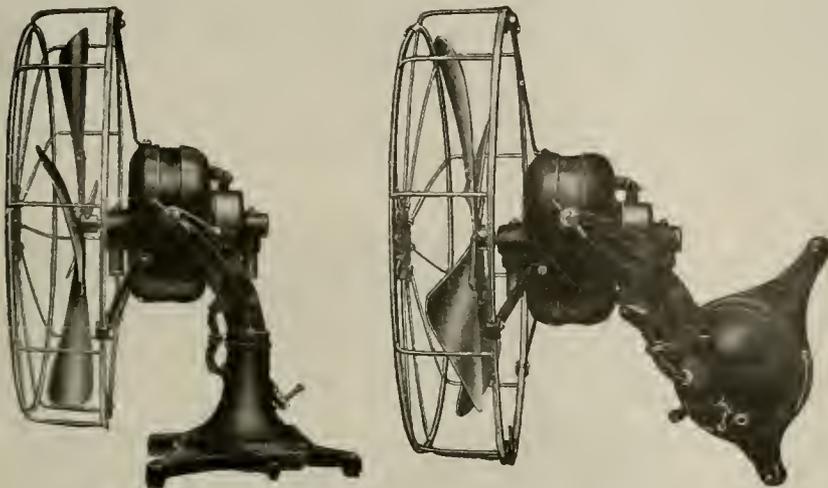

Portable Combination Meter.

New York, has placed a portable Victor meter on the market, which has all the advantages of the station type meter, combined with portability. These instruments are particularly useful for making such tests as in calibrating recording wattmeters and lamps, and are particularly useful and convenient for the testing of electric cars and electric elevators. The advantage of being able to read the power direct in making elevator tests and car tests where the current consumption fluctuates rapidly will be evident, and in cases where it is desirable to read both the volt and ammeters separately the convenience of having the two readings on the same dial, which facilitates the rapidity with which readings can be taken, will no doubt also be found of value in testing work. As shown in the illustration the volt and ammeter scales are provided with mirrors directly below the scale, which permit obtaining accurate readings. Extra shunts and multipliers can be furnished with these instruments, which extend the range of the readings.

NEW ALTERNATING-CURRENT FAN MOTOR.

There is probably no piece of electrical machinery which so thoroughly illustrates the great advance made in the design and

New Alternating-Current Fan Motor Used as a Desk Fan. New Alternating-Current Fan Motor Used as a Wall Fan.

manufacture of electrical apparatus as does the fan motor, which has been developed from the crude, inefficient toy to a highly efficient piece of machinery, being in detail of design and manufacture the counterpart of the larger motors. The latest development and improvement, marking one of the greatest steps of advancement in the fan motor industry, are shown in the alternating-current commutating fan motor of high efficiency, with great starting torque and sparkless commutation, recently developed and placed on the market by the Western Electric Company of Hawthorne, Ill.

This fan motor is illustrated in the accompanying view, showing one of its unique features, a diagonal joint, which permits it

either direct or alternating current. It is therefore unnecessary to purchase a new motor should the service be changed from direct to alternating, or alternating to direct current.

It is stated that the blades are of new construction, following specially designed lines, thereby furnishing maximum breeze with minimum current consumption.

THE KEARNEY CABLE CLAMP.

One of the great difficulties which has been experienced in constructing overhead lines with heavy cables has been that of making turns and fastening up the dead ends of cables. To overcome the difficulty experienced at these troublesome points W. N. Matthews & Brother, 217 North Second street, St. Louis, have designed the Kearney cable clamp, which is of extreme simplicity and of highly satisfactory construction.

The Kearney cable clamp is designed to supplant the extra joints and fastenings necessary in the ordinary methods of cable suspension at angle poles and dead ends. As will be seen from the accompanying illustration, which shows it applied in making a right angle turn of heavy wire cable, the clamp consists essentially of two wrought-steel plates with four clamping bolts. The two parts of the clamp are designed to fit the bare surface of the cable and when the nuts on the four bolts joining the two parts are tightened the clamp grips the bare cable so that the strain is transmitted through the upper plate to a globe strain or similar insulator fastened to the pole at the curve. By the use of two of these clamps, one holding the cable in either direction from an angle pole, the curved portion of the cable between the two clamps may be made short and relieved of any great amount of strain. This method of construction does away with the necessity for serving the heavy cable about an insulator at an angle pole, and then making a joint to continue the cable after it has turned the angle. The Kearney cable-clamp is made in but one size, suitable for cables from 600 to 2,000,000 circular mills. The great advantage of using these clamps is that they do away with cutting the cable at angle poles, and thus, should it at any time be decided to change the location of the pole or remove the cable, the cable can be made as good as new by simply taping the portion of the cable where the insulation was removed to attach the clamps. As compared with the old method of constructing corner turns it is claimed that these clamps save cable, time, labor and material.

Savannah Blow Pipe Company, Savannah Ga., has been awarded a contract for the blow pipe system for the new shops of the Atlantic Coast Line at Waycross, Ga. This company, during the past few years, has equipped many of the large planing mills and woodworking plants in the south, and was awarded the contract for equipping the Waycross plant over many of the leading manufacturers of blow pipes in the United States.

Heine Safety Boiler Company, St. Louis, has recently received a large number of orders for boilers, a partial list of which is as follows: Asano Cement Company, Tokio, Japan, four boilers aggregating 900 horsepower; Atlantic Gulf & Pacific Company, four 200-horsepower boilers, to be installed on two hydraulic dredges; American La France Fire Engine Company, Elmira, N. Y., two 230-horsepower boilers; American Locomotive Company, Richmond, Va., four 400-horsepower boilers; Bridgeport Forge Company,

The Kearney Cable Clamp.

to be changed in a few moments, and with very little trouble, from either a desk to a wall fan or vice versa.

The motor is of the usual Western Electric high-standard construction, with a multipolar laminated sheet steel field magnet, and a specially constructed commutator, which entirely eliminates the sparking caused by faulty commutation in the older types of commutating alternating-current fan motors.

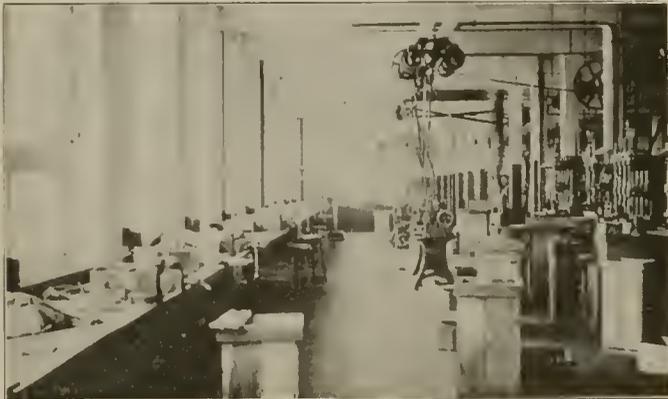

The character of the motor is similar to that of an ordinary series-wound direct-current motor, having a high starting torque, which causes it to start as readily as an ordinary direct-current motor, but it has the additional advantage that it can be used on

Bridgeport, Conn., three 250-horsepower boilers; Crown Cotton Mills, Dalton, Ga., two 400-horsepower boilers; Home Brewery, Columbus, O., three 200-horsepower boilers; Hudson Companies, two 316-horsepower boilers, making a total to this company of 4,513 horsepower on 11 orders; Independence (Kansas) Cement Company, Independence, Kan., three 400-horsepower boilers; James S. Kirk & Co., Chicago, two 500-horsepower boilers; Joseph J. Little building, New York, three 275-horsepower boilers; Quincy Horse Railway & Carrying Company, Quincy, Ill., three 316-horsepower boilers; City of New York, for Ridgewood pumping station, eight 300-horsepower boilers.

NEW PLANT OF THE O. M. EDWARDS COMPANY.

The O. M. Edwards Company has recently erected a new plant at the corner of Plum and Solar streets, Syracuse, N. Y. The location is within the half-mile circle from the business center of

The main entrance and reception room for visitors, which is 16 by 18 feet, is handsomely finished and furnished. A main corridor connects the offices and the stock room. This is 80 feet in length and 8 feet wide. The main office is of generous proportions, being 55 by 40 feet. Adjoining this office is a fireproof vault, 24 by 12 feet,

O. M. Edwards Company's Plant—Machine Shop.

O. M. Edwards Company's Plant—Main Office.

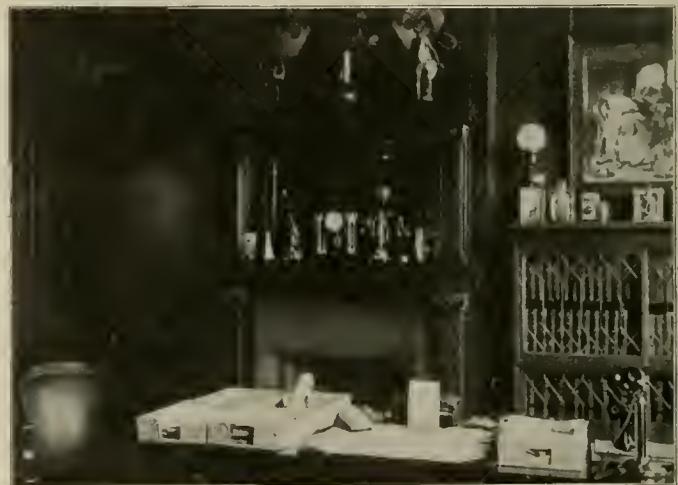

the city, which has at the present time a population of about 130,000. No expense has been spared in the building and equipment and the result is a model in the matter of efficiency.

The buildings are located upon a plot of ground consisting of four acres, with a frontage of 575 feet upon Plum street and 350

feet upon Solar street. The factory building stands 20 feet from the line of each of the streets. The main factory building is 211 feet long, 55 feet wide and is five stories in height. A wing, which is used for woodworking purposes, is 80 by 40 feet, and the wing

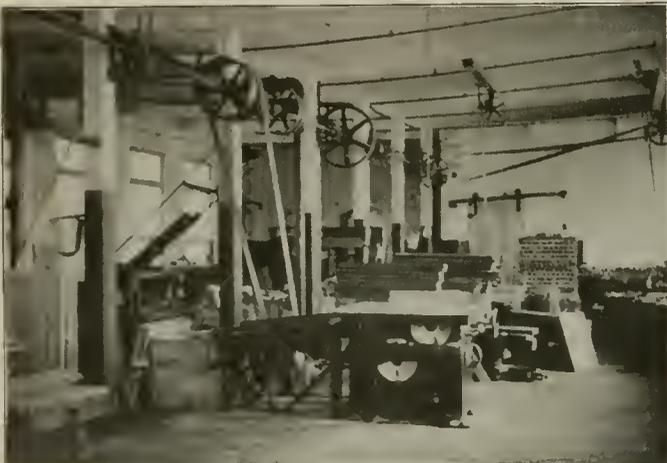

O. M. Edwards Company's Plant—Main Building.

feet upon Solar street. The factory building stands 20 feet from the line of each of the streets. The main factory building is 211 feet long, 55 feet wide and is five stories in height. A wing, which is used for woodworking purposes, is 80 by 40 feet, and the wing

apartment. Connecting with the private office is the reception room. The finish of the offices throughout is in weathered oak and the walls are handsomely decorated in oil finish. The drawing room is a well-lighted apartment, 28 by 32 feet. Connecting with

O. M. Edwards Company's Plant—Woodworking Department.

O. M. Edwards Company's Plant—Brass Foundry.

devoted to the brass foundry is also 80 by 40 feet. There is also connected with the plant a detached building, 55 by 115 feet, one end of which is used as a stable for trucks and the opposite end for tinning and tempering work. The central portion is occupied by dry kilns.

this room is a fireproof vault, 8 by 12 feet, for the safe keeping of tracings and other drawing room records.

An interesting part of the plant is the model or sample room, the walls of which are surrounded with mahogany models, showing the various designs of windows, platform trap doors and other

parts manufactured by the company. The size of this room is 16 by 28 feet. The main stock room is 88 by 55 feet and has an additional room adjacent, 80 by 40 feet. One of the accompanying illustrations shows a portion of one of the woodworking rooms. This is devoted almost exclusively to the making of exhibition

nished by a "Straight-Line" engine direct-connected to a general electric generator having a direct-connected exciter. The power is transmitted to the various line shafts by means of motors, driving groups of machines. In the principal machine rooms there are four line shafts, each run independently by a separate motor. The

O. M. Edwards Company's Plant—General View.

models and sample parts, which are sent out in the interests of the salesmen's department. This room is 80 by 40 feet. The first floor of the main building is used for manufacturing purposes. The size of the room is 211 by 55 feet. The third floor is of the same dimensions, 211 by 55 feet, and is arranged for machine work. The brass foundry, 80 by 40 feet, has in connection a fireproof vault for the safe storage of patterns. This vault is 24 by 12 feet.

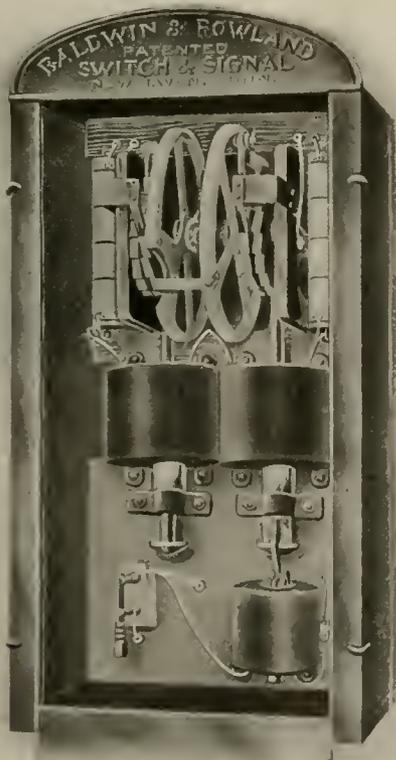

As shown in the general illustrations, the plant is substantially built and well arranged for its intended purposes. The electric wiring throughout the building is in iron conduits and was in-

generator is three-phase alternating current and furnishes 124 volts for the lighting system and 220 volts for the power circuits.

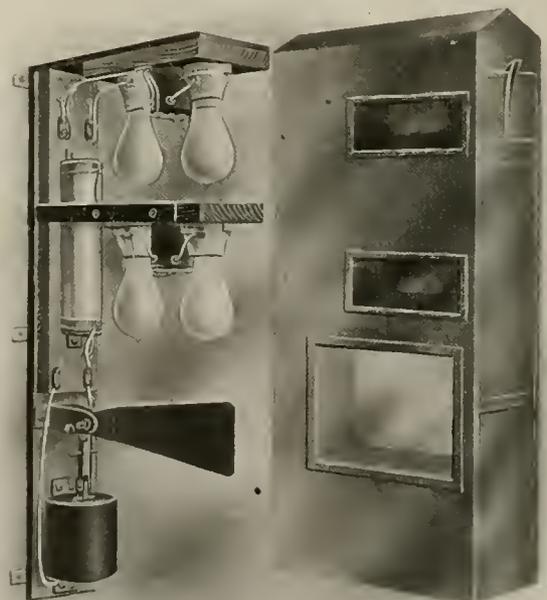

The accompanying illustrations will give a satisfactory idea of the general appearance of the plant and a few of the more interesting features of the interior arrangement and equipment.

A MULTIPLE INTERLOCKING RECORDING BLOCK SIGNAL.

The Baldwin & Rowland multiple interlocking block signal is both a position and light signal. As the name suggests, it is capable of protecting any number of cars passing in the same direction through the block up to 17 in number. The first car sets the signal and automatically locks it, so that a car approaching

Multiple Interlocking Recording Block Signal—Signal Movement.

Multiple Interlocking Recording Block Signal—Semaphore Arrangement.

stalled by the Wheeler-Green Electric Company of Rochester, N. Y. The plant is equipped throughout with an automatic sprinkler system and steam-heating apparatus, both of which were installed by E. P. Bates of Syracuse. The specifications for the power plant were drawn by Prof. John E. Sweet of the Straight-Line Engine Company, Syracuse, and the engine and boiler rooms are a model in the matter of appointments and equipment. The power is fur-

in the opposite direction and disregarding the signal cannot change the signals that are set, neither can it set a signal of its own. Every succeeding car entering the block is recorded and protected by signals set by the first car, while the last car leaving the block clears the signal and unlocks it. The signals are all equipped with auxiliary lights, so that if the active light burns out the second light takes up the work of the first. They are also equipped with

a fusible link that opens the circuit before any harm can be done to magnets should a live wire become crossed with the signal circuit. All magnets used in this mechanism are of the solenoid type, made of large size wire, automatically wound, put up in Sterling insulating varnish and incased in cast-iron shells. While all parts are perfectly protected from weather conditions, the case can be removed so that access to all parts is easy. Provision is made on resistance tubes to accommodate varying voltages of the line. Sleet and snow are no liable to cover the semaphore cases so that light or arm is hidden.

Multiple Interlocking Recording Block Signal—Overhead Contact.

Realizing the absolute necessity to the successful operation of signals for a trolley contact that will not only be absolutely reliable but capable of operating under a high rate of speed, without liability of throwing the trolley or be subject to mechanical injury, the company, after a working experience of two years, has adopted the contact illustrated, which is guaranteed to meet all requirements. This is made in three different lengths to accommodate different speeds. It is reported to have worked successfully for a year on roads that maintain a speed of 55 miles an hour. These signals are now operating on the following named railroads: Consolidated Railway Company, New Haven, Conn.; Rochester Syracuse & Eastern; Auburn & Syracuse Electric; Syracuse Rapid Transit; Altoona & Logan Valley; Central Pennsylvania Traction; Farmington Street Railway, Hartford, Conn.; International of Buffalo, N. Y.; Bay Shore Terminal and Norfolk & Portsmouth Traction of Norfolk, Va.

INDESTRUCTIBLE FIBER.

Three varieties of indestructible fiber, known as "Fibrite," "Durite" and "Kantlite," for use in steam and street railway car headlinings, steamboat panels and partitions, are manufactured by the Indestructible Fibre Company, the sole agents of which in the transportation field are Wendell & MacDuffie, 26 Cortlandt street, New York. The very satisfactory appearance of this material when used for car headlinings is shown in the accompanying engraving of the interior of a car built by the American Car &

Indestructible Fiber—Interior of Long Island Railroad Coach with Indestructible Fiber Headlining.

Foundry Company for the Long Island Railroad. The material is light, strong and durable and it is claimed that it is economical to decorate and finish and will not blister or splinter. Fibrite is considered especially adapted for the headlinings of old cars which have become leaky, because it is not liable to blister under the severest conditions. The material is as light as ordinary soft wood veneer and its strength is claimed to be 75 per cent of that of hard wood of the same thickness. It is said to retain its shape perfectly and can be made to conform to any contour specified.

Durite is not recommended for marine work on account of its weight, which is 10 per cent greater than that of oak and is of the

same strength for the same thickness. This is not fireproof, but slow-burning, and is susceptible to the same degree as is wood veneer. It is capable of a high finish and the cost of decorating is the same as on wood veneer.

Kantlite is especially intended for steel cars and marine work, partitions and panels of steamboats, where fireproofing qualities are required. The fireproofing ingredients are applied to the raw wood pulp before the material is worked into boards, and it is said that the fireproofing qualities are retained almost indefinitely. It is claimed that it will not retain a flame and that under the heat

of the severest tests it will not carbonize. The several brands are made up in sheets of various sizes and thicknesses.

NEW STANDARD PORTABLE MULTIMETER.

As electric railways are becoming more and more extensive and are reaching into the field formerly occupied by steam railroads, the demand for the utmost refinement in all matters pertaining to the operation and testing of materials and machinery is becoming daily of greater importance, so that it is now the custom on even the smallest roads to carefully test all new apparatus which is purchased and that which is already in operation, in order to furnish the management with exact knowledge of its efficiency and condition.

On many of the smaller roads, no doubt, the testing of electrical apparatus has been considerably neglected because the number of instruments required to cover the field of electrical testing has been so great that many of the smaller companies could not afford to purchase all the instruments necessary; but in spite of the large investment required when separate instruments were needed for each test, it is a question whether even on small roads it was not near-sighted economy to hesitate to make the investment in instruments necessary for carrying out thorough tests on all electrical apparatus at regular and frequent intervals. The obstacle of so large an investment in a great number of instruments has been almost completely surmounted by the Weston Electrical Instrument Company of Newark, N. J., in placing upon the market a new instrument—the Weston multimeter—which is illustrated in the accompanying engraving. This instrument should receive a hearty welcome from street railway managements in that it combines in practically one instrument all the instruments necessary for making electrical tests. It may be used as a voltmeter, milli-voltmeter, ammeter or mill-ammeter, ohmmeter, ground detector and wheatstone bridge. The range of the instrument is as follows:

Weston Portable Multimeter.

Voltmeter.	Ammeter.
.075 volt	.015 ampere
3. volts	1.5 amperes
150. volts	15. amperes
750. volts	150. amperes

The bridge with three dials measures to 999 ohms, with even ratio arms. Inside of the case there are also contained 12 silver chloride cells, bridge resistance coils and shunts for the volt and ammeter.

A special feature which has been carefully considered in the construction of this instrument is the insulation, which is of highest type, and is so constructed that the rubber is not exposed to the deteriorating effects of light, dirt and moisture. This instrument, which is thoroughly portable, is well adapted for making practically all the tests required in electrical railway work. The manufacturers, however, call special attention to the fact that, while this instrument combines a number of separate instruments, and is capable of a very high degree of accuracy, it, of course, cannot embody the same degree of accuracy for each separate part as could be secured by the use of the separate Weston instruments covering the same range of operation, but for practical street railway work it is sufficiently accurate.

In acquiring rights of way when the Puget Sound Electric Railway was built the company purchased considerable timber land. To utilize this timber the company erected a sawmill, which has been in operation for the last three years, cutting timber for commercial purposes. As this mill is located near the line of the company the shipments of lumber have formed a part of the freight business of the road, but only a comparatively small part. Ownership of the land and mill, therefore, gives an additional source of revenue to the company and adds to its receipts from freight.

Recent progress in the development of large producer gas engines has brought the status of these engines to a point that units of even 6,000 horsepower, suitable for electric railway service are operating satisfactorily with a reduced cost of maintenance over that of prime movers of the same power operated by steam. One of the disadvantages for city plants, however, of a producer gas plant and gas engines is the large floor space required, and when this is taken into consideration it may be questioned whether the saving of one-half the fuel required by a steam plant will, in the case of cities where land is of great value, be sufficient to counterbalance the difference in interest depreciation and taxes on the extra ground and increased size of building required by the producer gas plant. At a regular meeting of the Western Society of Engineers, held on Wednesday, May 1, 1907, an exceptionally interesting paper on "The Present Status of the Producer Gas Power Plant in the United States," was presented by R. H. Fernald, who is in charge of the producer gas test of the United States geological survey fuel testing plant. Mr. Fernald's paper presented the results of a large number of tests on producers and comparisons with a non-condensing Corliss engine of practically the same power and showed the coal consumption of the producer engine was practically only one-third of that of the steam engine. Another

interesting part of Mr. Fernald's paper was the result shown in burning various kinds of low-grade fuel, including peat, lignite and low-grade coals, many of which it would be practically impossible to burn in an ordinary furnace. Although the test showed that it is at present impossible to burn certain grades of fuel in the gas producer the number of different fuels which could not be burned in the furnace and could be used in the producer is much greater than the number of fuels which can be burned on the grate and cannot be burned in a producer, and, as Mr. Fernald stated, had the producer employed by the geological survey been specially designed, there is no doubt that even those fuels which were unsuccessfully tried could have been successfully and economically employed.

The Interborough-Metropolitan Company of New York has wisely refused to construct the proposed Lexington avenue and Seventh and Eighth avenue subways under the conditions imposed by the rapid transit board. In taking this step, which was not wholly unexpected by the city representatives, the company shows that before entering into an irrevocable enterprise, it has counted the cost of construction and the chances of adequate interest and the return of principal. The weakness of some companies in ignoring these fundamental facts contributes to the public fallacy that street railways in large cities will gladly accept franchises founded on any rigorous terms that may be framed. The tendency of municipalities in this day is to exact much and to concede little, and it is refreshing to find one company with sufficient courage to withstand the temptation to build for present revenue and to let the future take care of itself. A franchise which does not provide for proper allowance for depreciation and amortization of investment is elusive and deceptive; but municipalities will continue to grant such franchises so long as companies can be found to accept them. In his letter Mr. Shonts made it plain that the company desires to construct the subway, if accept-

Timber Lands Aid Railway Revenue.

Producer Gas Plants.

Must Profit on Subway Contract.

able conditions can be arranged. Among other things, he points out the need for provision for depreciation.

ADVANTAGES OF TRAILER OPERATION.

The problem of properly handling rush-hour traffic demands the best energies of any operating organization. How to carry the excessive passenger increase each morning and evening and how to supply not only the equipment but the men and power to operate the cars comprise the essential demands. The trackage facilities are usually ample if the cars can be kept moving. This requirement for comparatively excessive seating capacity during the short periods is met in different ways. The usual practice is to have extra motor cars and arrange the runs so that crews will be available to operate part of the cars during the day and practically all the equipment at rush hours. The labor conditions and crowded streets in some localities warrant the operation of some cars in multiple units. This practice is observed by the Columbus (O.) Railway & Light Company. Still another method of providing for rush-hour traffic and one which has been widely discussed, pro and con, is the use of trail cars attached to the regular motor cars.

The latter method of employing trail cars has been developed to a successful stage by the Denver City Tramway Company, as is evidenced by the description of this company's methods of operation described elsewhere in this issue. Compared with the practice of providing separate motor car units for handling rush-hour traffic the use of trail cars of suitable design offers several advantages.

The question of idle investment is always an interesting one. The type of motor car used for single-unit operation during the middle of the day and for hauling trailers during rush hours seats 52 passengers and weighs 38,000 pounds as equipped with four 43-horsepower motors. The cost of such cars is about \$6,000. The trail cars seating 46 passengers and weighing 13,000 pounds cost but \$2,000. Thus it is seen that if sufficient motor cars are provided to handle the midday loads the idle investment for rolling stock, which is seldom, if ever, called into use except for rush-hour traffic, is a considerable amount. Trailers not having motors to be affected by severe changes of weather may safely be stored in open yards. The insurance rates on trailers thus stored and with no electrical equipment should afford a considerable saving when compared with similar charges for motor cars of like seating capacity. A secondary advantage is exhibited in the increased motive power available for use during the middle of the day when speeds may be increased and fewer units used.

The expense of maintaining a trail car which has practically no apparatus on it except the brakes is said to be less than one-tenth that for motor cars of the same size. The low weight per unit seating capacity of the Denver type of trailer, which is 282.6 pounds, demands but light service from the wheels and brakes, therefore the repair and maintenance of these parts is slight. The low weight has another desirable resultant in the reduced wear and tear on track structures.

As regards the details of operation when trail cars are used, there are several features afforded which are quite desirable. The presence on the streets of only a uniform number of trains or units assures that accidents will be less frequent than when the number of units is doubled during rush hours. It is more economical to move the crowds on the same number of units with normal headway than with an increased number of units and decreased headway. And the adding of trailers need in no way interfere with the regular schedules which obtain throughout midday, thus relieving the transportation department of the duty of supplying competent motormen for rush-hour work on single units.

The changing of a large number of runs and sending out "trippers" is done away with when, as traffic demands, a

trailer is coupled to a motor car whose crew has been operating during the hours of light traffic. The addition of the trailer requires but one extra man qualified to act as a conductor. Thus it is seen that but 50 per cent is added to the labor cost for handling approximately 100 per cent more passengers.

Next to the saving in platform labor the greatest direct financial saving appears in the reduced current consumption. It has been found at Denver that wattmeter readings on a large number of cars, observed for several months, show the additional power consumption required for doubling the load by adding a trail car to be only 35 per cent of that required to operate the motor car as an independent unit during the day. In the descriptive article, earlier referred to, the results of wattmeter readings taken during the month of January are exhibited in detail. For a railway system that is now demanding the highest available overload capacity of its generating station, this method of reducing the peak loads by the use of trailers is very desirable. Thus the purchase of additional electrical machinery may be postponed.

It is our opinion that the near future will see many street railways equipped for train operation. Not perhaps as is practiced at Denver with trail cars in the strictest sense of the word, but with multiple unit control, mounted either on all motor cars so that they may be coupled for operating in the heavily traveled streets or on motors and trail cars, so that the latter may serve as a control equipment and be operated ahead, thus doing away with the necessity for loops in the centers of business districts. Such careful study as is being given the subject by the management of the Denver City Tramway Company must result in substantial advancements.

SPECIFIC HEAT OF SUPERHEATED STEAM.

From the time Regnault made his classic experiments on the properties of steam until recently the specific heat of superheated steam as determined by him was accepted as correct almost without question. Though some investigators doubted the correctness of Regnault's experiments, and though later experiments were made, the question was not seriously taken up till it was found that steam turbines operated with superheated steam showed a greater increase in economy than theory demanded. The same had, it is true, been found to be the case in reciprocating engines, but this was easily explained by considering the reduced cylinder condensation. In the turbine, however, where there is not the constant heating and cooling of the parts, the gain in economy exceeding that demanded by theory could not be so easily explained. Even granting that the skin friction was reduced was not sufficient to satisfy engineers with an investigating turn of mind.

It is interesting to note how the viewpoint of the user affects the specific heat, now that it is definitely known that it is not constant. On the one hand, the manufacturer of boilers with superheaters, in stating the results of tests, assumes a value ranging from 0.7 to 0.8, while, on the other hand, the engine and turbine manufacturers assume values suitable to their purposes, generally from 0.48 to 0.55, and between the two extremes are found the values of disinterested investigators. At first thought the question may be asked why there should be such a difference of opinion as between the manufacturers of boilers and manufacturers of engines, and the answer is simply that it is a matter of personal interest.

The assumption of a high value for the specific heat of superheated steam favors the manufacturers of superheaters, in that the efficiency of the boiler and superheater is apparently higher than it actually is. A low specific heat favors the prime mover, in that apparently a greater proportion of the heat is being turned into work than is actually the case.

The determination of the specific heat of superheated

steam is very difficult, and, so far, judging from the great variation of the values obtained by different experimenters, it seems evident that the question is far from being definitely settled. One of the greatest difficulties in such experiments is the accurate determination of the temperature, and in many methods the slight inaccuracies of the steam tables make it impossible to get accurate results no matter how carefully and accurately the tests may be carried on. Methods which have been tried are the cooling of the steam by the injection of a known weight of water, passing superheated steam through a condenser and measuring the heat taken up by the water, throttling steam from one superheated condition to another (thus avoiding inaccuracies of the steam tables) and heating the superheated steam to a still higher temperature by a measured amount of electrical energy.

The latter method, it seems, should give the most accurate results and least difficulty of manipulation. A method which, to our knowledge, has not been tried and seems to offer certain advantages, is the determination of the ratio of the specific heats at any given temperature and pressure by finding the velocity of sound in the superheated steam. If the ratio of the specific heats and the density are known, the specific heat at constant pressure can be easily calculated. This method has the advantage that a slight error in the temperature readings would not affect the results appreciably, and the velocity of sound in the steam as well as its density can be more easily determined than the heat measurements of the present methods can be made.

All of the more recent experimenters agree that the specific heat at constant pressure increases, and nearly all agree that it varies practically directly as the pressure varies. A great difference of opinion is, however, shown regarding the specific heat at constant pressure with varying degrees of superheat. Some experimenters found from their tests that the temperature does not influence the value of the specific heat. Others found that the specific heat increases with increase of temperature, while still others find that it decreases with an increase in temperature.

The latest experiments by Messrs. Knoblauch and Jakob show that the specific heat increases with the pressure, and that it first decreases and then increases with rising temperature. Further, they have shown by extrapolation that the specific heat at zero pressure is not constant, but increases with increasing temperature. If this is true, as indications tend to show, the widely divergent results of nearly all the investigators agree fairly well.

The average specific heat, according to the results obtained by Knoblauch and Jakob, at pressures of 100 to 200 pounds per square inch absolute and a range of 200 degrees F. superheat, would be about 0.59, and the average specific heat for all pressures from 0 to 200 pounds and 200 degrees superheat would be about 0.5.

In support of the general trend of their experimental values, Messrs. Knoblauch and Jakob advance the considerations that, in monatomic gases, the specific heat should be independent of the pressure and temperature, while in polyatomic gases the specific heat should increase with rising temperature, as work is done in separating the atoms even before disassociation begins to take place. Change of pressure in this case should not effect the specific heat. In monatomic vapors, however, both pressure and temperature should influence the specific heat, as the molecules in easily condensed vapors must exert a considerable attraction for each other. As the force of attraction varies inversely as the square of the distance between the molecules, the force of attraction increases directly with density, and hence the specific heat should increase with the pressure, and decrease with the temperature when the pressure remains constant.

The behavior of polyatomic vapors, such as water, is the complex effect resulting from the combination of the characteristics of the monatomic gas and vapor, and the resultant would depend entirely upon which predominated. In general, the tendency is for the specific heat to increase with the

pressure and decrease with temperature until the disassociation effect exerts the prepondering influence, after which the specific heat again increases till disassociation has completely taken place, after which the fluid approaches the condition of a perfect gas and the specific heat remains constant.

These facts explain the divergence which is found in the results obtained by different experimenters, and may, in a small measure, be of value in interpreting the results which have been published. At present it seems hardly advisable to accept any of the results as final, but, if properly considered, they will serve reasonably well until more accurate information is available.

THE PROTECTION OF LIFE AND PROPERTY.

Almost daily our attention is called to the unnecessary loss of life and the destruction of property by accidents in power plants, the most common accidents being the explosion of boilers and the bursting of flywheels. There are also many others of such frequent occurrence that it seems time that both the designers and owners of power houses should stop and consider the subject carefully, with a view to making every effort to prevent the occurrence of accidents, and, what is far more important, to protect the men who would be endangered by them. How often, for instance, are seen plants which have been so arranged that in case of a break in the main steam pipe, escape in time to avoid serious, if not fatal, injury would be impossible. Or, again, men are sent to work in a boiler which is to be cleaned and repaired, and no safeguard is provided to prevent steam from other boilers being turned in on the men who are at work inside the boiler.

Likewise, engines are seldom provided with automatic stops to prevent a flywheel bursting from overspeeding. True, the engine is provided with a governor which may itself have a safety-stop attachment, but if the safety of life and property is duly regarded, those who are responsible will not depend upon the governor—the duty of which is to regulate the speed of the engine—to act as a safety stop as well. Unguarded flywheels, connecting rods, high-tension lines, etc., are other frequent sources of danger which could be easily eliminated.

The dangers to which engineers, firemen and other employes of a power house are constantly necessarily exposed, under the most favorable circumstances, when all possible precautions have been taken, are so great, that no reasonable expense should be spared which would tend to reduce the possibility of accidents. In many cases the safety of employes could be assured without the expenditure of money if sufficient forethought were given to the subject. For example, it would cost no more to provide swinging doors opening outward from the fire room, than to provide heavy sliding or lifting doors which it is impossible to open quickly in an emergency.

Neither would it in general be more costly to arrange the steam piping so that the steam could be shut off in the engine room from the boiler room, and vice versa, non-return stop valves on the boilers and a sufficient number of generous sized exits from the boiler and engine rooms could do much to lessen the danger to employes when an accident happens, and their presence would be of no avail. When men are compelled to work in a boiler that is connected to others which are in operation, the valve should be fastened down with a chain and lock to prevent the steam from being accidentally or thoughtlessly turned into the boiler undergoing repairs, as so often happens. There are many accidents which could be as easily prevented as those here mentioned, which are cited to call attention to the needless sacrifice of life and loss of property which is constantly occurring, largely through thoughtlessness in design and unwillingness to spend a small amount of money.

Fuel containing excessive quantities of sulphur can be used in producer gas engine plants absolutely without injury to the cylinder, provided they are kept free from moisture.

THE SUCCESSFUL OPERATION OF TRAIL CARS IN DENVER.

The operation of trailers during the hours of heavy traffic has been shown to be economical by the Denver City Tramway Company. John A. Beeler, general manager of this company, and his assistants have developed types of trail and motor cars designed particularly for combined operation during a part of the day, which form a train unit affording especially satisfactory results as regards the service offered the public and financial returns. It is the purpose of this article to describe the types of motor and trail cars used in this service at Denver. The article also includes detail statements of the current consumption of the two types of cars when operated singly and as train units. It is thought that these data

a motorman who is well acquainted with his work, the plan of regular meets and stops is not interfered with and there is only one train unit, consisting of two cars, to negotiate its way through a crowded street, in contrast with two units, the extra one of which is frequently manned with an inexperienced crew.

The original investment for rolling stock is considerably lessened when trail cars of an acceptable design are used. In Denver, the 4-motor cars, seating 52, which are standard, cost about \$6,000 each, and the trailers, which seat 46 passengers, cost \$2,000 each. It is thus seen that if a property has a sufficient number of motor cars to handle its mid-day traffic, a considerable original investment for rolling stock is avoided if preparation for the handling of the rush-hour traffic is made by the purchase of properly designed trail cars, which

Trail Cars in Denver—Motor Car and Trailer In Service.

will be found of especial interest at this time when such thorough consideration is being given the problem of train service for rush-hour traffic in metropolitan districts.

Advantages of Train Operation.

The apparent advantages which are to be gained by the use of motor cars hauling trailers during the hours of rush-hour traffic, and which advantages have shown themselves to the management of the Denver City Tramway Company as worthy of careful consideration, may be enumerated briefly. There appears a marked advantage as regards freedom from accidents to passengers and employes. Probably this freedom results from the use of a uniform number of car units on the streets during the entire day. This uniformity is especially noticeable at the rush-hour periods in contrast with the plan of single-unit operation, when the downtown districts in most cities are well crowded with single cars on much shorter headways than exist during the middle part of the day. With the use of trailers to accommodate the extra night and morning traffic the daily service can be offered with a constant number of train units. Thus it is seen that the same headway exists during the entire day; all cars are operated with

can be operated in train units, including the same motor cars. With such cars for handling the rush-hour traffic a considerable amount is saved in insurance charges, which amount, combined with the saving in interest charges on the idle investment, makes a sum worthy of consideration.

As regards the repair and maintenance of the trail cars used in Denver, which will be described later, it is stated that although these cars when in service are practically always fully loaded and at other times are stored out of doors, the average charge for repairs is less than one-tenth that for motor cars. There are very few of the usual repairs that are necessary. It is found that practically nothing on the car is subject to wear or disorder except the brakes and wheels. Owing to the especially low weight per unit of seating capacity of these Denver-type trailers, 282.6 pounds, the wear on the wheels and brakes is very light.

Another advantage of using light trail cars for handling the rush-hour traffic is the increased acceleration of the motor cars which is available for maintaining close schedules during the middle of the day, when trailers are not used.

As will be shown later, the results of wattmeter readings taken over extended periods and on a generous number of

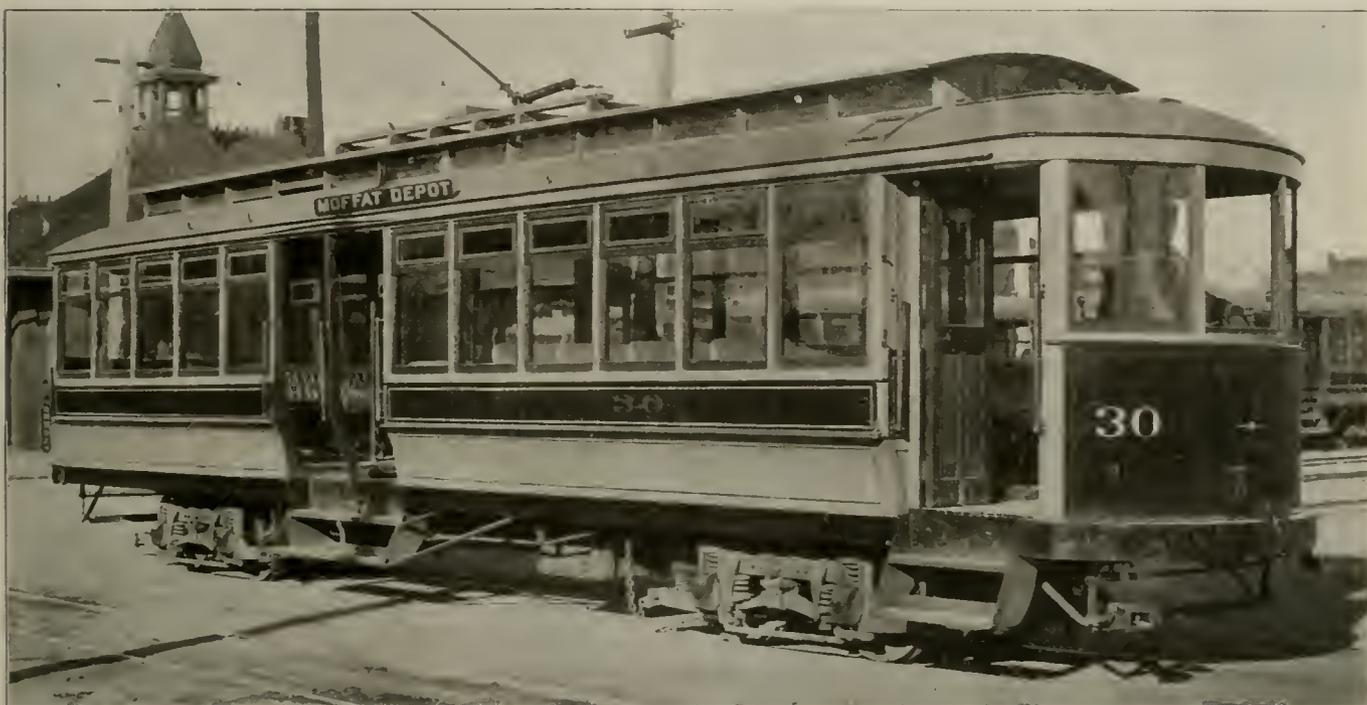

cars, prove that the increased power consumption necessary to haul almost double the load carried by the motor car ranges from 27 to 41 per cent. Therefore it is easily seen how effective the use of trailers may be in reducing the peak loads on a power generating equipment. This necessarily results in one of two things: if in originally designing the road the use of trailers were considered, then the fixed charges for the power plant installation could have been reduced; and, secondly, if trailer operation is begun at a later date, when the power equipment is fully loaded, it will be found that by the reduction of peak loads the existing plant is made capable of handling a heavier average service.

The labor question, which is usually more or less a delicate one when considering the handling of rush-hour traffic, is more easily solved by the use of trailers since they require but one additional man, a conductor. In Denver the average cost for platform labor on a motor car is 50 cents per car hour, and therefore the addition of a trailer makes possible

senger's never have to walk more than one-half car length to reach the door. The forward end of the car may easily be set apart for non-smokers and the rear part for smokers, the bulkhead in the middle of the car forming a positive division between the two classes of passengers.

These cars are mounted on two substantial trucks with 33-inch cast-iron wheels and 5-inch axles. The electrical equipment consists of four motors, each of a rated capacity of 43 horsepower. To facilitate safety in train operation both the motor cars and trailers are equipped with the Westinghouse SME schedule straight air brakes provided with emergency features. To permit the saving of time and afford a freedom from accidents when cars are being coupled for the rush-hour service all motor and trailer units are provided with Tomlinson automatic couplers. The air hose is brought out from under the car attached to the drawbar, so that the operation of coupling may be made a simple one.

This type of motor car, seating 52 passengers and pro-

Trail Cars In Denver—Exterior Standard Four-Motor Car.

the doubling of the passenger carrying capacity at an increase of but 25 cents per car hour.

Types of Motor Cars and Trailers.

The accompanying illustrations reproduced from photographs and drawings will serve to show the general appearance and construction details of the standard motor cars and trailers of the Denver City Tramway Company. By reference to the illustrations of the motor car, it will be noted that the car body is 43 feet long over all and 8 feet 4 inches wide at the belt. The seating capacity is sufficient for 52 passengers, the seats being arranged as shown in the plan view. It will also be noted that this car is provided with a center entrance on the right-hand side. This entrance is 5 feet 2 inches wide, the width of two window sashes.

There are several advantages claimed for the center side entrance, among which may be enumerated the following:

As the entrance is at the middle of the car the conductor is at all times within one-half car length of the door and thus more able to keep close watch of his passengers. The conductor's station is normally at the door, where he can best watch the loading and unloading. It is thought that with a center entrance the time of stops is greatly shortened, because in contrast with cars having but one end door the pas-

senger's never have to walk more than one-half car length to reach the door. The forward end of the car may easily be set apart for non-smokers and the rear part for smokers, the bulkhead in the middle of the car forming a positive division between the two classes of passengers.

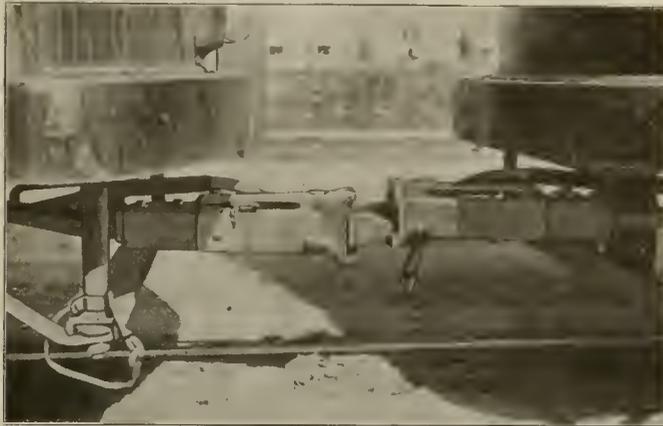

Trail Cars.

The trail cars, which have been developed along individual lines, suggested as suitable for use in Denver and cities demanding similar service, are of an especially interesting design, as will be noted by reference to the illustrations. The standard car is 38 feet long over all and 8 feet 2 inches wide over all; the center entrance has the width of three window sashes, 8 feet 2 inches in all. This extra width over that of the motor car entrance is given the trailer with a view to facilitating the loading so that when stops are made the trailer will not delay the starting of the train. It will be noted that the car has a roof without deck, thus saving greatly in the weight. The seating capacity of this standard trailer is sufficient for 46 passengers, and when equipped with air and hand brakes the car complete weighs but 13,000 pounds.

Current for lighting the trailer is obtained by means of a bus wire connected to the motor car through a plug and socket. It is stated that no trouble has ever been occasioned by this method of lighting. The bell cord on the trailer is arranged to ring a signal bell at the rear end of the motor

car so that the starting and stopping signals for the motor-man at the head of the train must be given by both conductors.

The accompanying drawings of the trailer car truck illustrate how particular care has been taken to design a truck having sufficient mechanical strength and yet carrying no idle metal. This same principle is exhibited throughout the

Trall Cars in Denver—Tomlinson Automatic Couplers Used on Cars.

entire car, and all material not absolutely necessary has been left out of the design.

Methods of Operation.

Under normal operation the schedules of the Denver City Tramway Company during the rush hours require the use of 23 trailers. During the middle of the day these cars are stored in yards at the car houses, which are situated at about

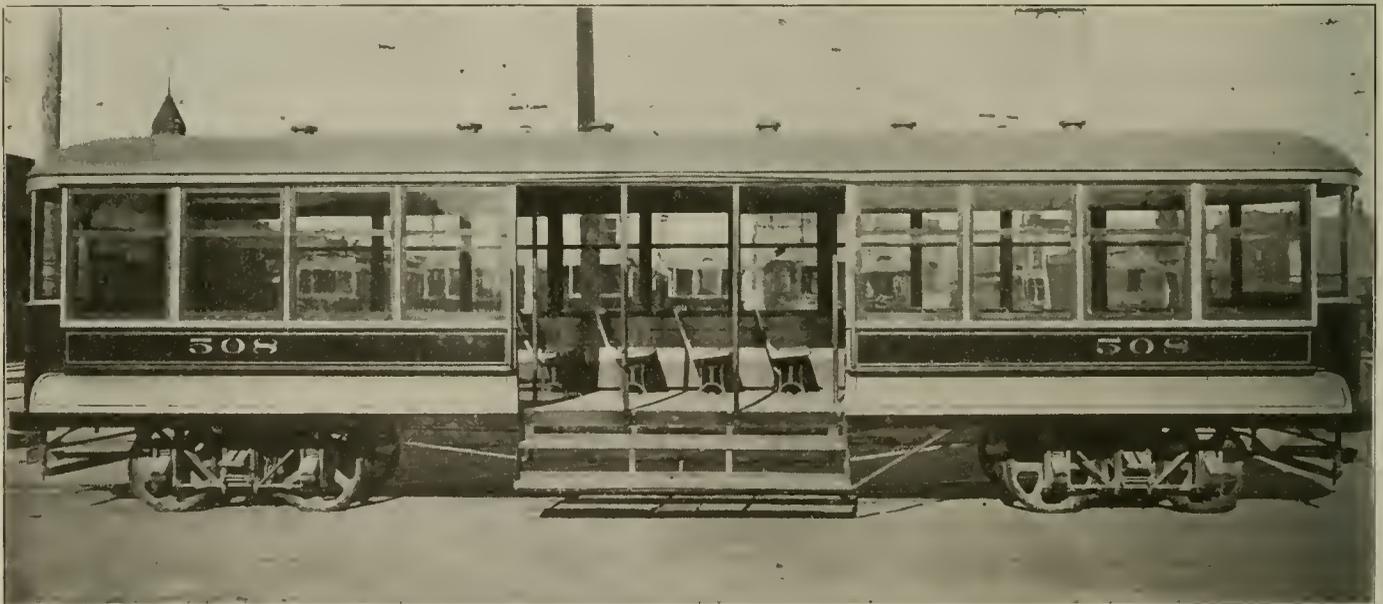

and connecting the bell cord, are performed by one man who has these tasks as his regular duty.

When a motor car has taken one trailer from the waiting line the remaining trailers are moved ahead with the switching car so that the end trailer is in readiness for the next coupling. At one of the car houses the sidetracks are on a

Trall Cars in Denver—Interior Standard Four-Motor Car.

grade, so that the entire number of trailer equipments can be let down by gravity to the coupling track and the use of a switching car dispensed with, except after the rush hour, when the trailers are to be uncoupled and again stored in the yard. It is found that by these methods trailer cars can be attached to motors on lines having 4-minute service, and no time allowance be included in the schedule for the coupling. The methods for uncoupling the cars after the rush-hour pe-

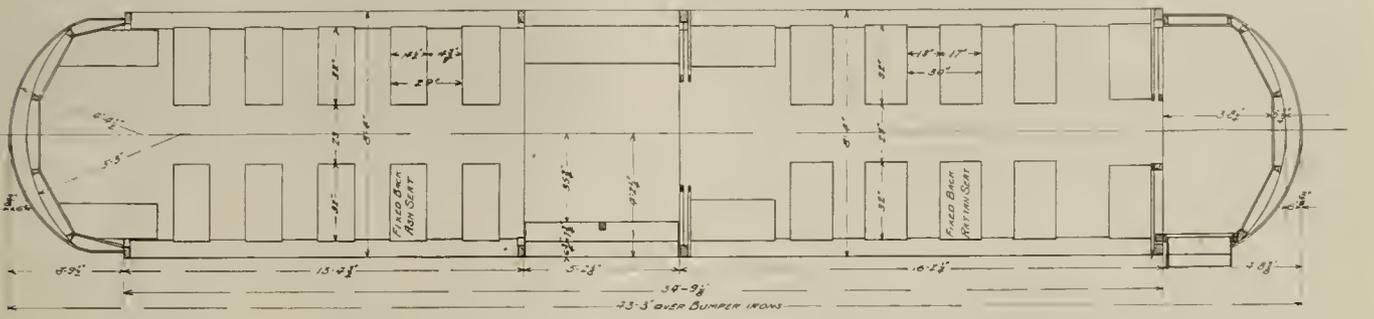

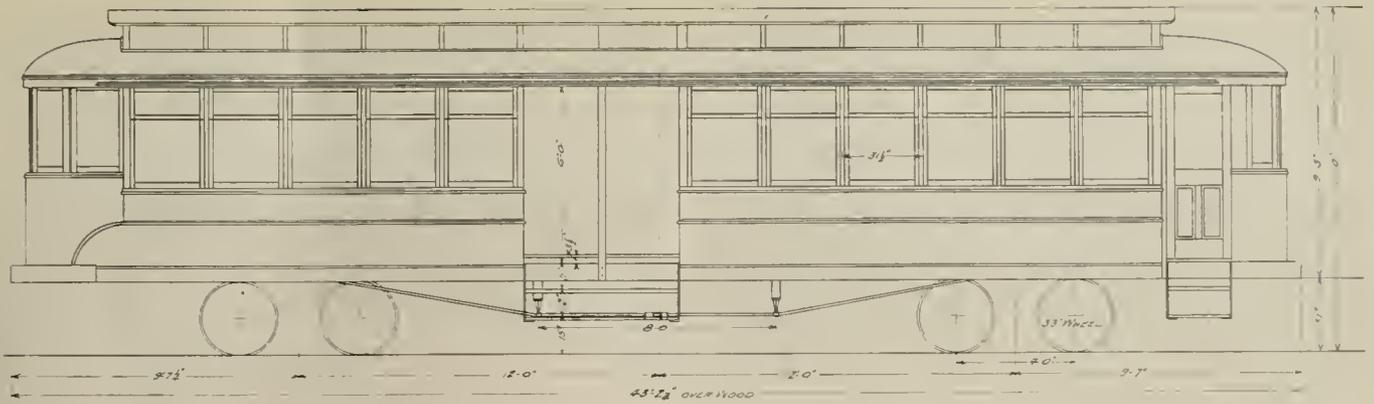

Trall Cars in Denver—Exterior of Standard 13,000-Pound Trailer.

the middle of the lines on which trailers are used. When in the yards the cars are coupled in trains so that just before the rush-hour periods a train of trailers may be taken to a siding close to the main line on which the motor cars are operating. When the loads on the motor cars begin to increase instructions are given for certain of these cars to pick up trailers as they pass the car houses. As a motor car reaches the siding on which the trailers stand it backs in on the siding and couples with the first car of the string of trailers standing there in readiness. The regular train crew is not called upon to do this coupling, but all the details of joining the two cars ready for train operation, such as coupling the air hose, inserting the plug of the lighting bus

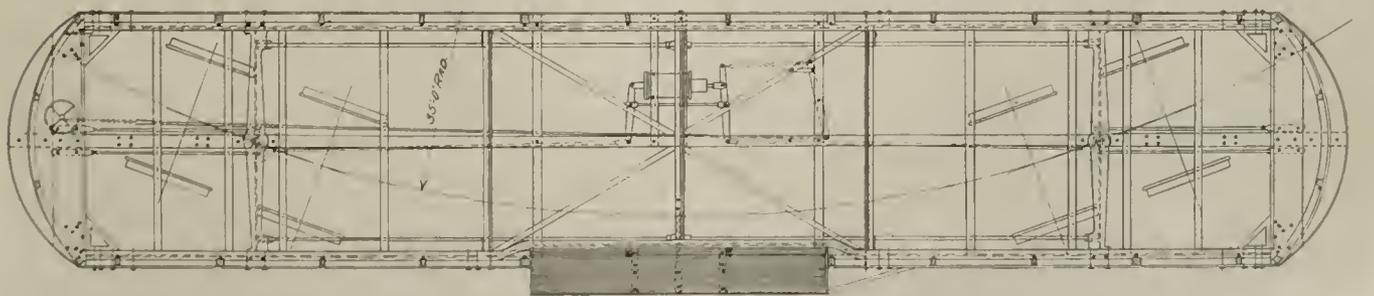

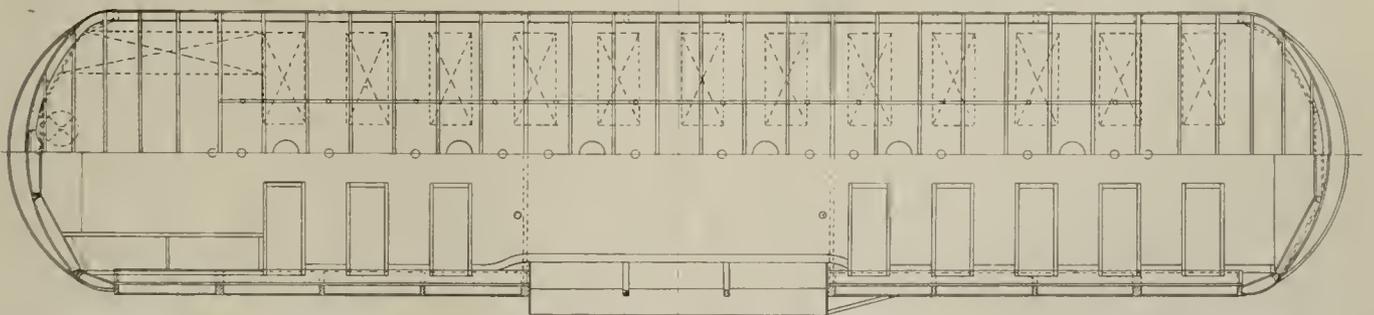

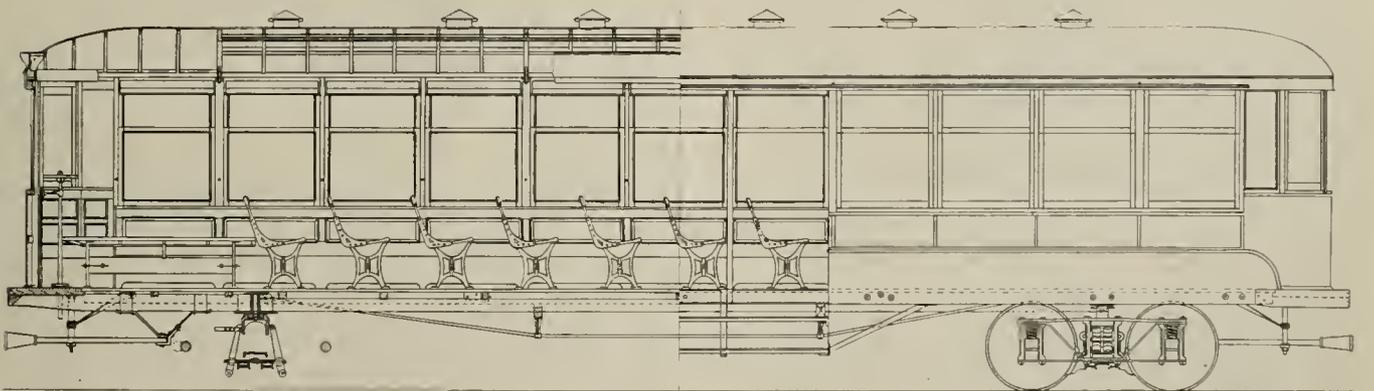

rod are exactly the reverse of those used when making up the train units.

Interurban Cars with City Trailers.

An advantageous feature of this system of trailer operation is illustrated by the method pursued in handling city traffic with the interurban cars that reach the center of the city during the rush-hour periods. There are three such lines which operate from nearby towns to a terminal loop in the center of Denver. The route of two of these lines of cars as they enter the city is past the "North Division" car barns, located well toward the edge of the city. When an interurban car reaches these barns on a trip that will take it to the busi-

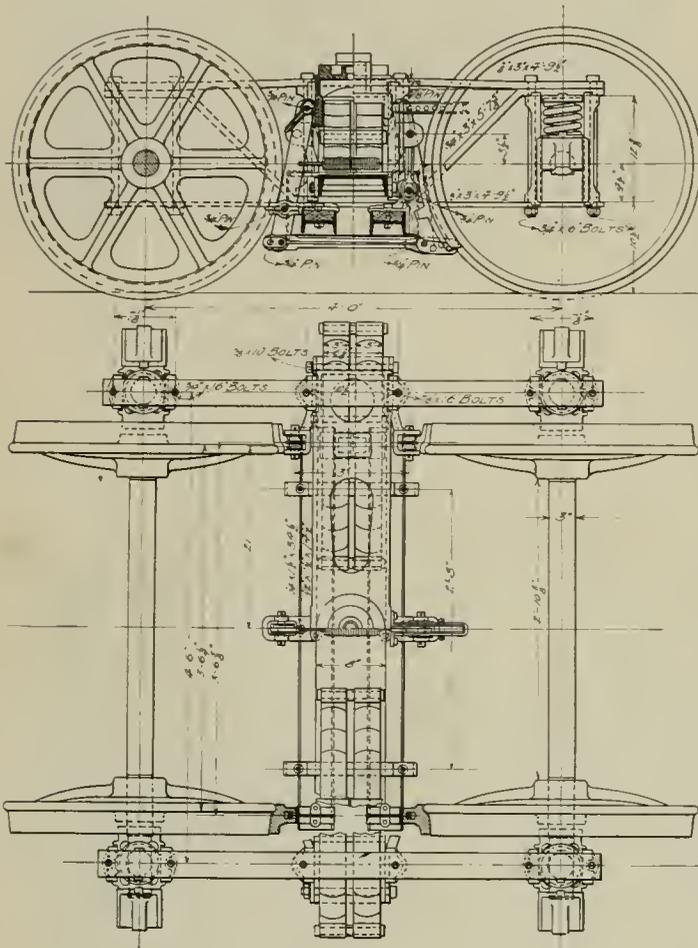

Trail Cars in Denver—Elevation and Seating Plan of 43-Foot Four-Motor Car.

Trail Cars in Denver—One-half Vertical Section and Elevation, Seating Plan and Framing Plan, Showing Standard Trail Car on 35-Foot Radius Curve.

ness district during a rush-hour period, a standard trailer is coupled to the rear of the interurban car, so that it may be loaded there for the return trip. In this way service is offered to city passengers in the trailer and to suburban passengers in the interurban motor car. Before this method was put into practice the passengers who rode between the edge of the city and the business district crowded the interurban cars during the rush hours, but since, they have found it to their advantage to use the trailer, which practice is also to the advantage of the railway company. These trailers are drawn by the interurban cars only as far as the edge of the city, where a man is stationed who disconnects them from the out-

Trail Cars in Denver—Details of Light Truck for Trail Car.

going interurban cars and connects them with the next incoming car, leaving them ready for a similar duty.

On some of the long city lines the motor cars haul trailers for only a portion of their routes, and on one line in particular by thus adjusting the service to satisfy the needs of the traffic six trailer cars are found sufficient to operate in connection with 10 motor cars.

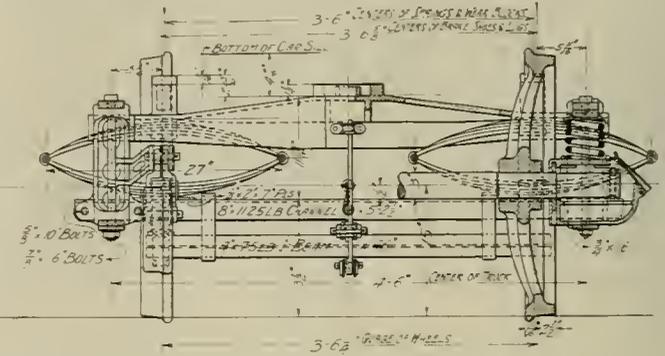

It is specially interesting to note that although trail cars were operated under these various methods of service during the past year, the actual speed for all the cars of the entire Denver City Tramway system averaged 9.85 miles per hour throughout the year 1906. This commendable average speed included all lay-overs at the ends of lines and, in fact, all delays of any sort to any equipment throughout the year.

Power Consumption of Cars.

Believing that there are advantages in knowing the current consumption of individual rolling stock equipments the Denver City Tramway Company has equipped 13 of its motor cars with wattmeters and systematically records the power consumption as measured by the meters.

An accompanying illustration is a reproduction of the blank form on which the motorman records the period during which he operated a car, the particular line over which the car was run and the instrument readings at the beginning and end of his service on that car. Under the blank spaces set aside for these records are spaces to be filled in by the auditing department. The latter exhibits totals for the power consumed during the period, the mileage performance, and the average number of kilowatt-hours used per mile.

During the year 1906 the average power consumption per car-day for the entire system, including all equipments, was 405 kilowatt-hours. The average power consumption for the

same period was at the rate of 2.32 kilowatt-hours per car-mile, and the cost of current at the power station switchboard was 0.66 cent per kilowatt-hour.

It has been found that the approximate load at the switchboard for the three standard types of cars is as follows:

	Kw.-h. per car-mile.
Two-motor car, seating 48 passengers.....	2.0
Four-motor car, seating 52 passengers.....	3.5
Trailer car, seating 46 passengers.....	1.25

The wattmeter records for the month of December, 1906, showed that the consumption at the car for a 4-motor equipment, rated at 172 horsepower, on a car weighing 43,000 pounds, was 3.24 kilowatt-hours per car-mile. The consumption for this same car, during the same period, when hauling a 13,000-pound trailer seating 46 passengers, was 4.56 kilowatt-hours per car-mile. This is an increase of 38.6 per cent in the power consumption, at a cost for which there is obtained seating capacity for 46 passengers.

Tables I and II exhibit the results of wattmeter readings on nine cars operating during the month of January, 1907, over two runs in Denver known as "Short Broadway" and "South Broadway."

The following information pertains to these runs:

Short Broadway.	
Length of run.....	3 miles
Mean average gradient.....	0.26 per cent
Schedule speed, without trailer.....	10 miles per hour
Schedule speed with trailer.....	9 miles per hour
Average number stops.....	8 per mile
South Broadway.*	
Length of run.....	6.3 miles
Mean average gradient.....	0.22 per cent
Schedule speed without trailer.....	10.3 miles per hour
Schedule speed with trailer.....	10.3 miles per hour
Average number of stops.....	5-6

*Includes run over Short Broadway.

Both of these runs serve the business district for about seven blocks of their lengths. The motor cars on which the readings shown in the tables were taken seat 48 passengers,

that the average length of ride was two-thirds of the run.

It will be noted from Table I that the average power consumption per car-mile, for motor car only, on South Broadway was 2.80 kilowatt-hours. With trailer this consumption was

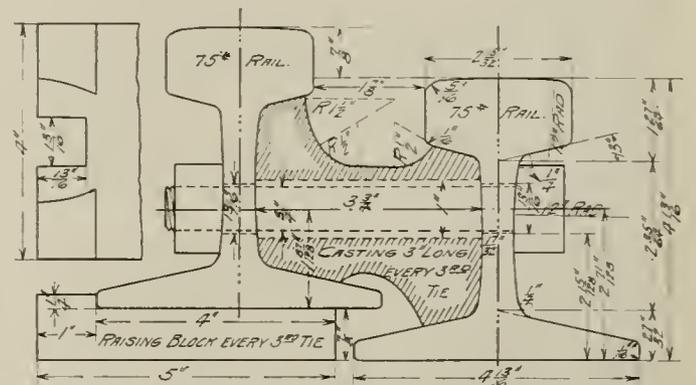

3.95 kilowatt-hours, an increase of 41.1 per cent. In Table II, for Short Broadway, the results show the consumption for the motor car only to be 3.42 kilowatt-hours per car-mile and for motor car with trailer 4.68 kilowatt-hours per car-mile, an increase of 36.9 per cent, due to the trailer.

A comparison of these results for the two runs, identical for half the length of the longer one, shows that due to the infrequency of stops on that portion of the South Broadway run not included in Short Broadway, there was a decrease in the average power consumption, for motor cars only, of 0.60 kilowatt-hours per car-mile, and for motor cars with trailer 0.73 kilowatt-hours per car-mile on the longer run.

In Table III are shown the mileage and wattmeter records of the individual motormen. This tabulation is interesting because it serves to illustrate how the personal equation enters into the operation of the ordinary controller. In the course of the month various motormen handle the different cars on different runs so that any variation from the average can hardly be said to have been caused by inequalities in the equipments or wattmeters.

GUARD RAIL CONSTRUCTION ON PITTSBURG & BUTLER STREET RAILWAY.

On the line of the Pittsburg & Butler Street Railway Company, which was described in last week's issue of the Electric Railway Review, guard rails are used on all curves

Guard Rail Construction, Pittsburg & Butler Street Railway.

greater than 9 degrees. In developing a substantial guard rail construction, Hudson F. Layton, chief engineer, designed the raising block and filler as shown in the accompanying illustration. The block and filler are inserted at every third tie. The guard rail used is of the same cross section and weight as the main rails of the track, above which it is elevated seven-eighths of an inch.

STATUS OF ELECTRIC RAILWAY CASES BEFORE INTERSTATE COMMERCE COMMISSION.

We have received from James S. Harlan, member of the interstate commerce commission, a statement giving the status of the formal complaints by or against electric railways which are pending before the commission, as follows:

Cedar Rapids & Iowa City Railway & Light Company versus Chicago & Northwestern Railway Company. Refusal to join in through routes and joint rates. Case heard and to be argued at a time to be hereafter fixed.

West End Improvement Company versus Omaha & Council Bluffs Railway & Bridge Company and others. Unreasonable passenger fare over bridge between Omaha and Council Bluffs. March 8, 1907, complaint filed. March 27, 1907, answer filed. April 22, 1907, order entered bringing in additional defendant. Case at issue, May 12, 1907.

Chicago & Milwaukee Electric Railroad versus Illinois Central Railroad Company and others. Cancellation of joint freight tariff formerly in effect, thereby depriving shippers of the benefits of competitive rates. Case at issue.

ONEROUS CONDITIONS MAKE CONSTRUCTION OF PROPOSED NEW YORK SUBWAYS UNPROFITABLE.

In his letter to the New York rapid transit commissioners, presented on April 25, Theodore P. Shonts, president of the Interborough-Metropolitan Company of New York, explained the refusal of his company to bid on the construction and operation of the proposed Lexington avenue and Seventh and Eighth avenue subway lines, as reported briefly in the Electric Railway Review of last week. As there were no other bidders the plans upon which the commission has been so long engaged may have to be abandoned or else the legislative and proposed contractual restrictions imposed upon the constructing and operating company will have to be modified considerably. An abstract of the letter of Mr. Shonts, which is addressed to Alexander E. Orr, president of the board of commissioners, under date of April 24, follows:

Ever since the opening of the existing subway this company has hoped that it would have an opportunity of completing the system of municipal rapid transit subways by continuing the east side line north of Forty-second street to the Bronx, and, by continuing the west side line south from Forty-second street to the Battery, so that there would be, as originally planned by your board, two complete longitudinal rapid transit lines, connected by a cross-town line under Forty-second street. The increasing congestion in the subway, particularly on the express trains during the rush hours, has emphasized the need of these additional lines, and this company has fully intended to submit a bid for their construction and operation.

It is, therefore, with great regret that I have now to advise you that, after very careful study by our engineers and officers of the plans and specifications and the proposed form of contract for their construction and operation, the directors of our company have concluded that the building of the proposed 4-track double-deck Lexington avenue subway, north of Forty-second street, and the 4-track west side subway south of Forty-second street, and the operation of those lines in connection with the existing subway under the burdens imposed by your proposed contract and the existing law are financial impossibilities.

Our engineering advisors, including William Barclay Parsons and John B. McDonald, agree in the conclusion that the proposed extensions (exclusive of pipe galleries), built in conformity with the plans and specifications, would, under existing conditions, cost (including an allowance for easements and interest during construction) not less than \$64,000,000, without equipment, and that the necessary equipment, including tracks, rolling stock, power plant, etc., would involve an additional expenditure of not less than \$24,000,000, making the aggregate cost of building and equipping about 39 miles (single track) approximately \$88,000,000, as compared with \$71,000,000 for building and equipping the existing rapid transit lines (including the extension to the Battery), comprising about 63 miles of single track.

This increase in cost is due partly to the requirements of the present law, the increase in the price of materials and labor, and the fact that about 14 miles (single track) of the existing line is on an elevated structure, while all the new lines are underground; but the increase in cost is chiefly due to onerous provisions (not required by the existing law) of the new contract, and of the new plans and specifications which provide, first, for unnecessary increase of cost of construction; second, for adding the cost of all easements to the cost of the subway; third, for the purchase of private property for station entrances; fourth, for a greatly increased responsibility for damages; and, fifth, for an increase in the diameter of the tunnels—an increase which will be of no value for extensions to the existing subway system. The fact that the express and local tracks on Lexington avenue are upon different levels also adds materially to the cost. The result is that our engineers estimate that the cost of the new subways fully equipped will be at the rate of \$2,250,000 per mile of single track as compared with the cost of \$1,130,000 per mile for the existing rapid transit lines.

Under the proposed form of contract and the existing law, the expenses which must be provided out of income are very much increased as compared with the original subway contract. It may be assumed that the interest upon city bonds issued for the cost of the proposed subways will be from one-half to three-fourths of 1 per cent higher than in the case of the original rapid transit bonds, and this conclusion is based on the supposition that the city can sell its bonds on a 4 per cent basis. In the second place the entire investment in the new subway, including the lessee's property in the streets and equipment, will be subject to taxation. In the third place, various advantages conferred by the origi-

nal contract are now eliminated; and, finally, the lease is limited to 20 years (subject to a renewal upon a revaluation, the terms of which cannot be fixed in advance), making it necessary to increase the annual charges by an amount sufficient to provide for the difference between the original cost of such of the equipment and other property as may be taken over by the city at the expiration of the lease and the probable value at which such property will be appraised at the end of the 20 years.

Another important consideration is the exceptionally broad power conferred by your form of contract upon the public authorities to require from time to time any changes in the construction of the subway and in the equipment and other appliances used therein, as shall to them seem proper. Such a requirement, especially in the case of a subway operated under a lease for only 20 years, creates a serious liability for additional expenditures for which adequate allowance would have to be made.

If we were to build the proposed extensions in conformity with your plans and specifications and the proposed contracts, using the city's credit for the entire cost of construction under the contract, and outside investment capital in the equipment, etc., and assuming that the new lines received all the traffic which it would be feasible for them to carry under the limitations imposed by traffic conditions in New York, it would not be possible to make net earnings above operating and maintenance expenses, sinking fund payments and taxes, sufficient to provide the interest upon the city's bonds and 5 per cent upon the additional capital invested. Indeed, a study of the reports of the Interborough Rapid Transit Company on file in your office will demonstrate that a subway costing twice as much per mile as the existing rapid transit lines, operated under a lease less than half as long, subject to much higher taxation, and operated under a distinctly less liberal contract, would not earn even the rate of interest payable upon the city's bonds.

We are prepared to enter into a contract for the construction, at actual cost, of two extensions of the existing municipal subway, one upon the west side extending south from Forty-second street to the Battery, the other upon the east side extending north from Forty-second street into the Bronx, and for the equipment and operation of such extensions, provided the cost of construction can be brought within the city's borrowing capacity, and provided the terms of the contract are such that we may reasonably expect the earnings from these additional subways to be sufficient to cover the interest and sinking fund upon the bonds of the city issued for their cost, a proper annual charge for depreciation in equipment and other property which the city may take over at an appraised value at the end of the 20 years' lease, and interest upon our additional investment for which city bonds would not be issued. In other words, we are willing to complete the existing rapid transit system so that there shall be, as originally planned by your board, two complete longitudinal lines, one upon the east side and the other upon the west side of the city, without any prospect of profit beyond a fair rate of interest upon the additional investment involved; and obviously without an expectation of such a return no capital could be secured for additional subway construction.

The estimated cost by the engineers of \$64,000,000 for construction was divided as follows: Construction, \$56,200,000; easements, \$2,500,000; terminals, \$1,300,000; interest during construction, \$4,000,000.

George S. Rice, chief engineer of the rapid transit commission, said that at the hearings held by the commission on the form of contract, the representatives of the company had never raised any of the objections outlined in the letter of Mr. Shonts.

Annual Report of Chief Engineer Rice.

Mr. Rice has just submitted his annual report to the rapid transit commission, which, in view of the foregoing, is of especial interest. This report, of which only a part has been made public, treats exhaustively of the traffic conditions in New York, with figures regarding the daily carriage of passengers on all transit lines in the city and on the remarkable increase in population and traffic, together with recommendations as to future requirements in the way of transportation facilities which will strongly emphasize the seriousness of the situation due to the non-appearance of bidders for the new subways. With reference to the increase of passenger traffic Mr. Rice says:

Considering all the boroughs grouped into one great population center, it appears that during the four years

ended June 30, 1905, the total number of paid passengers traveling on all street railways—surface, elevated and subway roads—increased practically in a straight line. During 1906, however, there was a sudden marked increase in the traffic. While the average increment for the four preceding years was only about 63,000,000 a year, during 1906 it amounted to nearly 110,000,000. No census of the population of the greater city was made in 1906. It is therefore impossible to determine whether this large additional number of riders is due to a corresponding increase in the population or to an increase in the number of riders per capita, but an increase in the population is the most probable cause.

Mr. Rice draws six important conclusions as the result of his investigation and statistics compiled from present ticket sales and population estimated. They are:

That the population of the territory comprising greater New York has practically doubled itself each 25 years during the last half century, and will probably double itself again by 1930.

That the total paid passenger traffic is increasing at such a rate that it will probably about double itself within the next decade.

That to bring about the discontinuance of the notorious overcrowded and indecent conditions now prevailing on all transportation lines in the greater city, it is imperative that the following additional subways be constructed and put in operation:

Within the next five years, or by 1911, as follows: For Brooklyn, two 4-track subways, in which 10-car trains can be operated, providing for eight additional tracks crossing East river either in tunnels or on bridges and traversing the borough; for Manhattan and the Bronx, three 4-track subways, for operating 10-car trains, traversing the two boroughs.

Within the second five years, or by 1916, as follows: For Brooklyn, two more 4-track subways; for Manhattan and the Bronx, three more 4-track subways.

Or, within the next decade altogether, for Manhattan, the Bronx and Brooklyn ten 4-track subways.

CAR PAINTING AND OTHER USES OF PAINT.*

BY J. C. LEAVITT, OF OKLAHOMA CITY, WITH SHERWIN-WILLIAMS COMPANY, CLEVELAND, O.

The rapid development of the street railway business in the United States has naturally caused a correspondingly rapid development in finishing materials, particularly paints and varnishes, for use on the rolling stock and equipment necessary for this particular class of trade. Of course, in a general way, the paints and varnishes suitable for use on steam railroads are suited for use on the equipment of electric railways, but the very fact that the motive power used by electric railroads is essentially different from the motive power of steam railroads has necessitated a rapid development along such lines as insulating varnishes, semi-solid impregnating compounds for use on dynamos and field coils and similar varnish products especially desired for electrical work.

While the painting and varnishing of street railway cars follow the general rules applicable for the painting of passenger coaches on steam railroads, yet a successful paint for street railway use must be used with particular reference to beauty of finish, durability and economy of maintenance, and to this should be added the rather rare but equally important factor of uniformity. It is now customary for each street railway company to adopt standard color shades for use not only on its rolling stock, but also on its equipment. The painting and proper finishing of street car bodies is most important.

In the exterior painting of car bodies the best colors and the most expert workmanship count for nothing unless the foundation coats or those coats that are between the wood and the first coat of color are absolutely without fault. For this reason, for the initial priming coat on such bodies, a material should be used in which the pigment is ground exceedingly fine and in which the binding vehicle is as elastic and at the same time as tough as can possibly be had. This should be followed with a surfacer but it should be so made that it can be rubbed down to a splendid surface for receiving the coats of color. This surface should dry rather slowly so as to give the fullest measure of durability, and it should present a tough and elastic surface which will for the longest time hold out the color and varnish coats. The car body colors adopted for use by a street railway company should be of such shades as will give the best service; by this I mean they should be shades which are permanent as

to color and which combine brilliancy of tone with great durability. The varnishes used over the color coats should be hard gum varnishes and should be of that class known as straight wood linseed oil and turpentine varnishes; for they must withstand extremely hard usage and should be of such a character as to stand repeated washing and scrubbing. The following are specifications for the finishing of the outside of cars as used by the larger car builders:

First day, one coat car primer. (Let stand two days.) Where the condition of weather or surface makes it necessary the primer should be thin.

Second day, putty. (If preferred, putty on first coat of surfacer.)

Third day, one coat of surfacer.

Fourth day, one coat of surfacer.

Fifth day, one coat of surfacer.

Sixth day, rub out.

Then apply two or three coats of car body color. All lettering, ornamenting and color stripes should be laid directly on the last coat of flat color. Next apply two or three coats of a durable railway body varnish.

The use of rubbing varnish has been almost discarded by all the large car shops, for the reason that more durable results are obtained without it. It will give a more glossy and sometimes smoother appearance at the start, but after a month or two in service a car usually shows very plainly the difference in value of the two methods, the difference being in favor of the use of the finishing varnish only.

Most companies allow but two coats of varnish. A car should be re-varnished every year. If this policy is not adopted true economy would demand the use of a third coat of varnish at the start.

I have been speaking of the exterior body of the car, but the careful painting of such parts of the car as the roof, the floor and the vestibule also should be carefully looked after. It is particularly desirable that for the roofs a paint should be used that is impervious to moisture and which combines with great elasticity the quality of drying very hard; for roof paint is subjected to very hard usage owing to the necessity of employes climbing on the roof to adjust the trolleys, etc. In selecting a color for roof paint due regard should be had for the color tone of the body so that the two shades will harmonize well.

For the car floors it is important that the paint shall be what is known as a varnish paint, which means a paint that contains in it some varnish gum and which will dry very quickly and at the same time very hard. The colors should be such as will not easily show dirt and which will not clash with the other interior finishing.

The fenders of the cars should be painted with a good grade of fender paint, not only for the sake of appearance, but also to preserve the life of the iron. The handrails should be painted with a lustral varnish paint in colors desired.

The interior finishing of the car is a matter largely of individual taste, but it is the custom nowadays to stain the interior woodwork with such shades as weathered oak, flemish oak, brown oak, mahogany, etc., and then to apply over this, first a coat of rubbing varnish and then two coats of finishing varnish. This results in giving very beautiful effects for the interior of cars and at the same time leaves a surface that will stand a great deal of hard wear.

Where the seats in cars are of cane or rattan they should be finished, if new, with a coat of transparent seat enamel, and, if old, they should be re-finished with a coat of seat enamel of the same shade as the original color of the rattan. A seat enamel of this character dries up very quickly and presents a very hard surface and one that will not soften under body heat.

The stations of shelter houses along the lines of electric railways usually are painted with an oil paint of a shade that will harmonize well with the body colors used on the rolling stock. The poles along the right of way also should be painted a standard uniform color. For this purpose a special pole paint should be used which will not only serve to improve the appearance of the poles, but should be of such a character as will serve to protect the poles against decay.

In certain sections of the west where the soil is full of alkali it is customary to paint the rails with a special alkali-resisting rail paint, which serves the double purpose of preventing the steel from being affected by the alkali and also of protecting it from rust.

In the power house there is a multiplicity of uses for paints. On the engines and dynamos it is necessary occasionally to re-paint with an especially prepared machine enamel, and the leading manufacturers now furnish this material in any shade desired. The enamel is composed of pigment, ground in a tough wear-resisting varnish, and can be used with entire satisfaction over work that has been painted previously.

For the steam pipes and radiators an aluminum or gold bronze paint is usually used, and on smokestacks and stand-

*Read before Oklahoma Electric Light, Railway and Gas Association, Oklahoma City, on April 23.

pipes a good metal protective paint which is intended to withstand the extreme heat and cold.

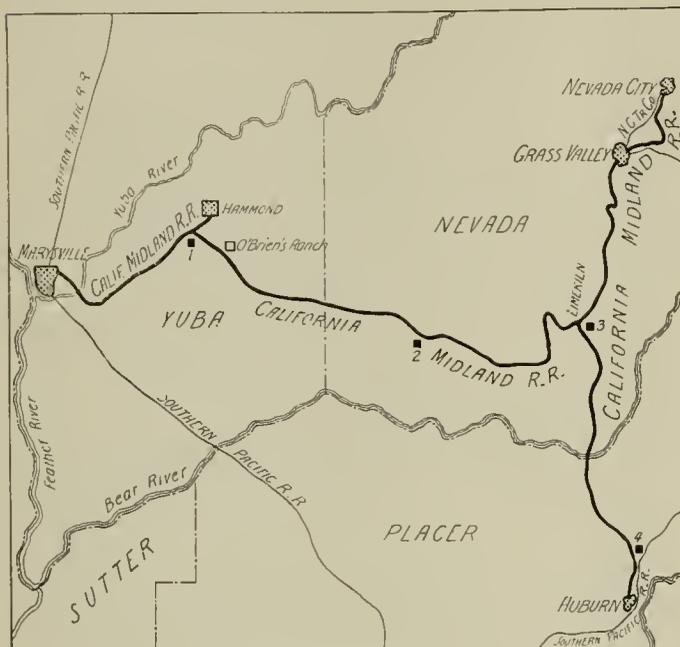

I have touched only briefly on the many paints and varnishes used in connection with railroads and street railways, but what I have said will indicate in a general way the special line and some of the characteristics of paints and varnishes that are regularly used in street railway work.

PROPOSED 1,200-VOLT THIRD-RAIL LINE IN CALIFORNIA.

Preliminary work is now well advanced toward the construction of the California Midland Railroad. The new line will include 70.5 miles of roadway, connecting Marysville, Auburn and Nevada City. It is proposed to operate the cars with 1,200-volt direct current, distributed by an underrunning third rail.

Roadway.

Marysville will be the western terminus of the present lines. This city has a population of 5,500. Here the new route will connect with the 65 miles of operating lines of the Northern Electric Company. From Marysville the new road will extend 34 miles east to Limekiln Junction. From here one branch will be built almost directly south, 17 miles, to Auburn on the Southern Pacific Railway. A second branch will

Proposed Lines of the California Midland Railroad.

extend from Limekiln Junction northeast to Grass Valley and Nevada City, 12 miles. There is now a line of the Nevada County Traction Company operating between the two latter named towns. From the main line at Marygold, 8 miles from Marysville, a spur 1.5 miles long will be built to the mining center, Hammond. The total length of route as now planned is 70.5 miles. Sidings, each 1,000 feet long, will be placed 4 miles apart.

As the locality to be served by the new line is in the mountains, heavy earthwork and several large bridges will be necessary. Near Marysville a trestle 9,000 feet long will cross the Yuba river and a marsh. The earthwork quantities for the entire project have the following totals: Excavation, 519,000 cubic yards; embankment, 1,128,000 cubic yards. The maximum rate of curvature is 16 degrees and the most severe grade will be one of 3 per cent for 7 miles. The trackwork will be of standard dimensions with 60-pound rails.

1,200-Volt Third Rail.

Direct current will be distributed between the substations through an inverted contact rail. The operating potential will be 1,200 volts. It is proposed to use a special low-carbon steel rail weighing 22.4 pounds per yard. The section will

have the form of the letter "T," and it will be inverted, being supported by channel-section brackets, spaced 12 feet apart. These channel-iron brackets will be spiked to the ties, and each will support a porcelain insulator, from which will hang a wrought-iron stirrup. The stirrups, in turn, will be keyed to the web of the inverted T-section.

It is estimated that with this light rail section, permissible on account of the high voltage, there will be a weight of but 100 pounds to be supported by each insulator. The inverted T-section may carry, if necessary, four No. 0000 auxiliary copper feeders. Owing to the peculiar shape of the rail, it may easily be protected by covering with three narrow strips of wood, normally held in place by gravity.

With low-carbon steel, having a relative conductivity of one-eighth that of the same cross-section of copper, the equivalent cross-section of the underrunning rail, without supplementary feeders, will be 345,000 circular mils, and the conductor will offer a resistance, including bonds, of 0.16 ohm per mile.

Substations.

Current for the operation of the new road will be purchased from the California Gas & Electric Corporation, which has hydraulic generating plants and 60,000-volt transmission lines in this territory. There will be four substations of reinforced concrete construction, each equipped with a 400-kilowatt capacity motor-generator set, and the necessary step-down transformers. The motor-generator sets will each comprise one 60-cycle motor, direct connected to a 1,200-volt, 400-kilowatt generator. The substations are located at the points marked 1, 2, 3 and 4 on the map.

Rolling Stock.

The standard passenger cars for the California Midland will be of the combination type, 52 feet long. The motive power will comprise quadruple equipments, of 75 horsepower, 600-volt motors, connected two in series for 1,200-volt operation. To prevent any disastrous effects from the slipping of one motor of a pair, potential relays will be shunted across the motor terminals.

Each car will have, in addition to four underrunning collector shoes, a pantagraph trolley for operation on city streets where there is trolley wire. These pantagraph collectors will be pneumatically controlled from the motorman's cabs.

It is proposed to erect a telephone line for dispatching purposes, and there is a possibility of further improving the train dispatching system by the introduction of the telautograph. A complete block signal system also will be installed.

The president of the California Midland Railroad is Mr. John Martin, who, it will be remembered, is now or has been interested in the following California electric lines: North Shore Railroad Company; Sacramento Electric, Gas & Railway Company; San Jose & Santa Clara Railway Company; Santa Cruz Union Traction Company.

The design of the electrical system is being executed under the care of Mr. C. C. Manker, electrical engineer, 925 Franklin street, San Francisco, Cal.

The steam railroads and electric railways doing business in Indiana have been notified by the Indiana railroad commission that inspectors will soon be sent out to examine the car equipment, track, rolling stock, etc., of each road, in accordance with the recent law passed by the legislature. The commission also notified the companies that blanks would soon be furnished them for accident reports. The law provides that railroad companies shall make two reports of every accident; one a preliminary report to be made within five days after the accident, which shall state the date of the accident, the probable cause, the number of persons killed or injured, etc. Within the next 20 days a second and complete report of said accident must be sent in to the commission, showing whether the accident was due to a collision, derailment or whatsoever cause, on what road and division, and near what station, the number of train or car, the names of the engineer, firemen, motormen and conductors, the exact time of the accident, etc.

NEW CARS FOR THE PHILADELPHIA & WESTCHESTER TRACTION COMPANY.

The Philadelphia & Westchester Traction Company has just received seven new cars from the Jewett Car Company of Newark, O. These cars have the same general appearance as the cars previously built for the road by The J. G. Brill

Philadelphia & Westchester Traction Company—New Car.

Company, but are 4 feet 2½ inches longer and have wider vestibules. The cars have seats for 50 persons.

The new cars are 48 feet 6¼ inches long over all and 8 feet 8½ inches wide over all, the length of the body being 38 feet 10¼ inches. The bottom framing is of extra heavy construction, the side and center sills consisting of 6-inch steel I-beams reinforced on each side with wood fillers. Intermediate sills are 4 by 6 inch yellow pine. The bolster is of the steam coach type, made up of 10 by 1 inch steel plates.

Philadelphia & Westchester Traction Company—Interior View of New Car.

The buffer is made of 6-inch steel channel and the entire bottom is covered with steel plate ¼ inch thick. The under truss is 1¼-inch round iron. The body framing throughout is of white ash, except the long plates, which are of yellow pine in one continuous piece. The roof is strengthened by 12½ by ½ inch steel car lines. The cars are equipped with Baldwin trucks with 34-inch steel wheels. The wheel base is 6 feet and the gauge 5 feet 2½ inches. The cars are designed to round a 35-foot curve. The drawbars are the Van Dorn type, 28 inches from the rail.

The new equipment is designed for operation by the

General Electric type multiple-unit control, if the traffic shall demand it, and each car has four G. E. 73 motors of 75 horsepower each. The cars are equipped with the Westinghouse automatic air brakes. End doors have been placed in the vestibule so as to permit passage from one car to another when the cars are operated in trains.

The interior finish of the car is a very handsome design and is of vermilion wood, inlaid with neat marqueterie lines and ornaments. The ceiling is of full empire type, painted light green with gold decorations. The floor side windows are made to raise to any height with the ratchet stops and locks. The gothic lights and deck lights and the transom lights present a very pleasing appearance and are of the leaded type with colored glass. The cars have been provided with seats of the Heywood Bros. & Wakefield Company walk-over type with head roll backs and corner grab handles, and are upholstered in green leather. Each car has a smoking room with a seating capacity for 12 passengers and this room has the same finish and seats as the main compartment. The trimmings of the car are of solid bronze throughout. Heat is provided by the Consolidated Car Heating Company's truss plank heaters. The windows are equipped with pantasote curtains.

The cars are provided with arc headlights and pilots of locomotive type. The exterior of the car is of very pleasing design and the railroad company and the builders should be given credit for having given prominent attention to the question of artistic outline.

We are indebted to A. M. Taylor, president of the Philadelphia & Westchester Traction Company, for the privilege of publishing this description and the accompanying illustrations.

COMMUNICATION.

Wrong Motor Connections.

To the Editors:

Some time ago I had some difficulty with a car, the details of which I present herewith. The car was direct from the shops and it seemed there could be no possible chance of wrong cable connections.

The car was of single-ended construction, with a new K-6 controller and four new 1,000 motors. There was a separate cable to each motor, which made grounds and wrong connections seemingly impossible, and, further, the cables when tested out were found clear. The symptoms of the trouble with the car were as follows: With all four motors in, numbers 1 and 4 would work, number 2 would roll along, but number 3 would lock its pair of wheels on both forward and reverse. With numbers 1 and 3 in on the ahead, number 1 would work, but number 3 would still be locked. Reversing the direction with numbers 1 and 3 in, the car would not move and the circuit-breaker opened. With numbers 2 and 4 in, number 4 did all the work, forward and reverse. The E¹ and E³ wires were in this case run from their motors to the controllers and joined in the E¹ binding post in the controller. When the E³ wire was disconnected, number 3 motor would unlock its wheels.

If any of the readers of the Electric Railway Review can tell me what the trouble was and what was wrong that caused this behavior of the car, I would be greatly pleased to have the answer appear in the paper.

Chicago, May 3, 1907.

CAR TROUBLE.

S. C. Dickey, general manager of the Winona Interurban Railway and the Winona & Warsaw Railway, controlled by the Winona assembly, has issued an official statement to the effect that under no circumstances will any car be operated on these lines on the Sabbath day during the summer. This decision has brought about a considerable disappointment because of the thousands of people who depend wholly upon the interurban line for transportation between the towns in the vicinity of Winona Lake.

CONSTRUCTION OF THE LAFAYETTE & LOGANSFORT RAILWAY.

BY R. M. FEUSTEL, ASSISTANT ENGINEER, FT. WAYNE & WABASH VALLEY TRACTION COMPANY.

In the fall of 1905 the Ft. Wayne & Wabash Valley Traction Company, which operates an interurban line between Ft. Wayne and Logansport, Ind., a distance of 76 miles, decided to extend its line from Logansport to Lafayette to connect with the city properties which it controls in Lafayette. A

Lafayette & Logansport Traction Company—Rock Creek Viaduct, 394 Feet Long.

construction company was organized under the name of the Lafayette & Logansport Traction Company for the purpose of carrying the project to completion.

After much preliminary work it was decided to parallel the Wabash Railroad between the two cities. This route reaches the following cities and towns: Logansport, Clymers, Burrows, Rockfield, Delphi, Colburn, Buck Creek and Lafayette. The road connects with the Pittsburg Cincinnati Chicago & St. Louis, the Wabash and the Vandalia railroads at Logansport, the Vandalia at Clymers, the Monon at Delphi,

Lafayette & Logansport Traction Company—Trestle Approach to Wild Cat Bridge.

the Cleveland Cincinnati Chicago & St. Louis, the Monon and Lake Erie & Western at Lafayette, Ind. Connections are also made with the Ft. Wayne & Wabash Valley Traction Company and the Indiana Union Traction lines at Logansport and with the Indianapolis & Northwestern and the Battle Ground line at Lafayette. The territory through which the road passes is the well settled Wabash valley country, and the outlook for a large business in both the passenger and express departments is bright.

The location for the entire space between the terminal points was chosen with regard to its adaptability for high-speed service, as the maximum curvature of 4 degrees and

a maximum grade of 1.5 per cent were rigidly adhered to. One special feature of the alignment was the route obtained through the city of Delphi entirely on private right of way and with a maximum curvature of 4 degrees. This is considered an exceptional feat, as Delphi is a county seat with a population of over 5,000. The passenger station is located only two blocks from the business portion of the city.

Features of the Construction.

Another feature of the location is the route by which the line passes out of Logansport. The junction of the Little Wabash and the Eel rivers at this point to form the Wabash, and the number of railroads which run into the city, make an entrance to the city rather difficult. The alignment which was chosen met with a great deal of opposition at first, but after the company made known its intentions of installing substantial construction in a first-class manner, tending to beautify instead of detracting from the appearance of the locality, the permission of the board of public works was obtained. The track is on Third street, crossing the four tracks of the Pittsburg Cincinnati Chicago & St. Louis Railroad on a curve and running upon two 144-foot through truss

Lafayette & Logansport Traction Company—South Bridge over the Wabash River.

spans across the north branch of the Wabash river. From there the line continues across Biddle island under the Wabash Railroad, which is elevated at that point. It was necessary to move the abutment of the Wabash Railroad bridge a distance of about 12 feet. In addition to this, the high water level of the river made it necessary for the company to construct a 200-foot concrete tunnel and retaining wall. This wall, coming next to a public street, was topped with a suitable iron railing, and a cement walk and combined curb and gutter was constructed along its entire length. The bottom of the tunnel consists of a layer of concrete 12 inches thick, the ties being concreted in place as in a paved street. A 12-inch Palmer non-return drain valve was placed in the lowest point in the tunnel and a drain carries the water to the north branch of the Wabash river. Continuing across Biddle island the line crosses the south branch of the Wabash river, using two 100-foot through truss spans and one 48 and one 58 foot through girder span. Both bridges across the river were constructed on substructures formed by building concrete extensions to the piers and abutments of the highway bridges at these points.

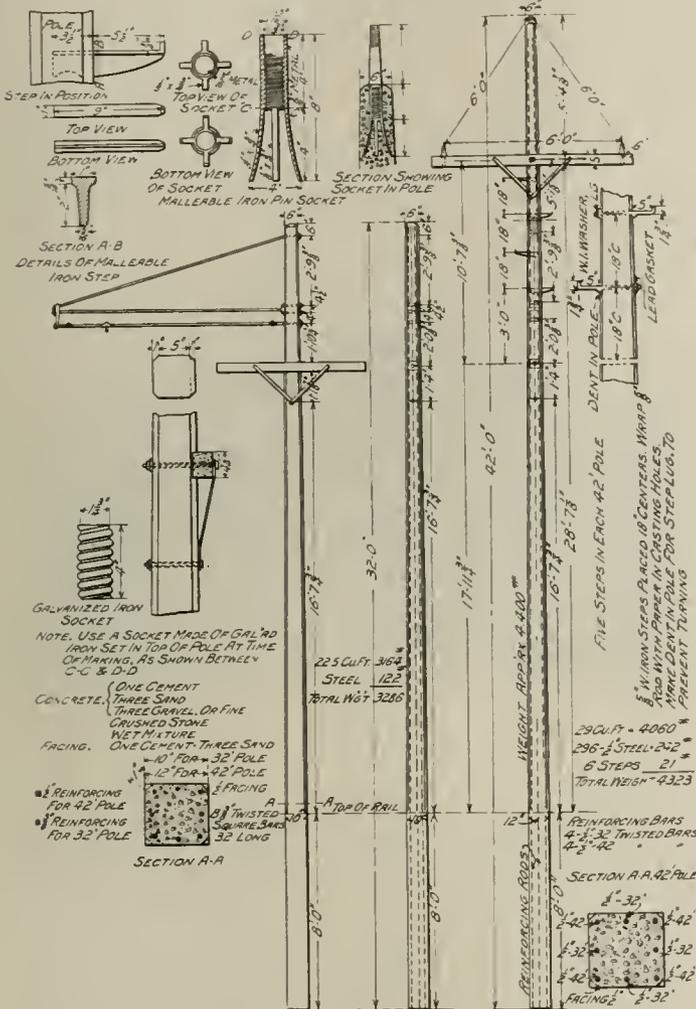

The alignment in the main consists of stretches of tangent ranging from 5 to 11 miles in length, with only light curves in and out of the smaller towns. The Wabash Railroad is crossed twice, once at Logansport with an underway and once

at Delphi with an underway. The Monon Railroad also is crossed at Delphi with a subway. The only railroad grade crossing outside of the city of Logansport is over the Vandalia Railroad at Clymers, where an interlocking switch will be operated jointly with the Vandalia and Wabash from a tower.

Materials of Construction.

Siding connections with the Wabash Railroad were obtained at Buck Creek, Colburn, Rockfield and Burrows. The shipments of all material were distributed at these four material yards. The unloading of material was assumed by a

was still incomplete in the fall of 1906, the company put its own men on the grading and started to complete the work on force account. A steam shovel equipment was put in the 34-foot cut at the Lafayette end and locomotives with Roger dump cars were used to haul the material. Gravel of a quality fit for ballasting was found in this cut and the stripings were used to make some of the high fills along the line where temporary trestles had been built. These trestles, with the exception of the decking, had been constructed of

Lafayette & Logansport Traction Company—Details of Reinforced Concrete Trolley Poles.

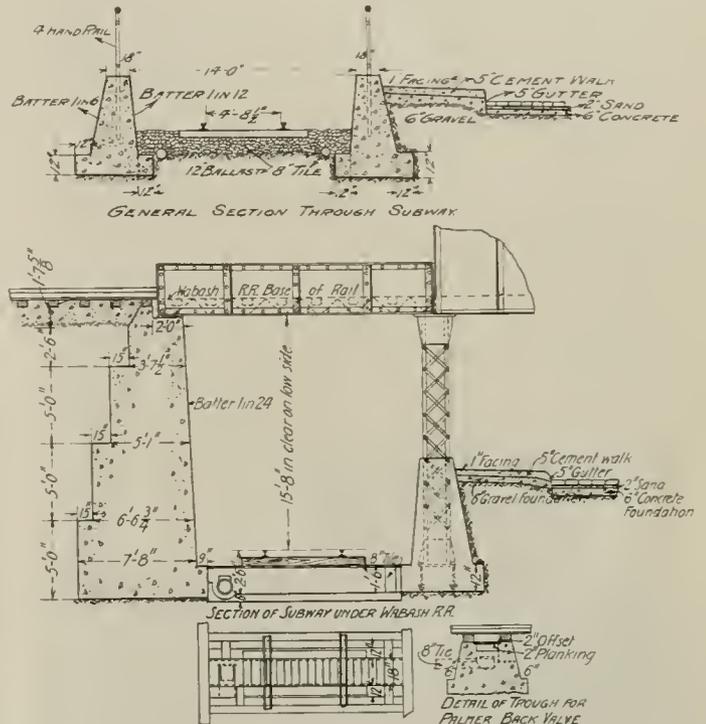

separate contractor. The distribution of the material along the line was facilitated by the use of these four storage yards.

Track and Roadway.

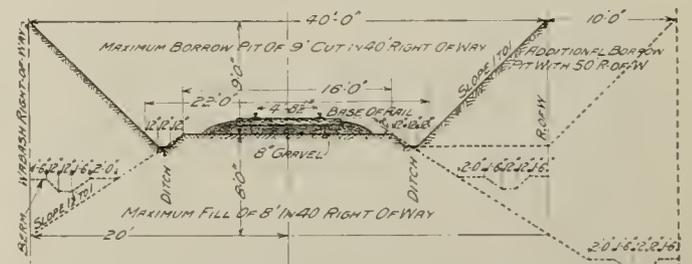

The railway is built on private right of way throughout except at the two terminal cities. The width of the right of way varies from 10 to 200 feet, as the cuts and fills required. The average width is about 50 feet. The line is laid 21 feet outside the right of way line of the Wabash Railroad, thus allowing for any future necessity for double-tracking.

The roadbed is constructed 16 feet wide on fills and 22 feet wide in cuts, with a shrinkage allowance on all fills over 10 feet. The side slopes on fills are one and one-half to one, while those in the cuts are one to one. The deepest cut is 34 feet and the highest fill is about 49 feet, both of these being just outside of the city of Lafayette.

Contracts for the grading were let in four pieces of about nine miles each, and payment was made only as one-way work, with a special allowance for overhaul. As the work

Lafayette & Logansport Traction Company—Sections of Subway Under Wabash Railroad.

Lafayette & Logansport Traction Company—Section Through Standard Cuts and Embankments.

timber cut on the right of way. In this manner a considerable saving was accomplished, as no materials were wasted. When the gravel was of such quality that it was unfit for ballasting it was used to make these fills.

The rails are 70-pound A. S. C. E., purchased from the Pennsylvania Steel Company. A 4-hole continuous joint is used throughout and these were full bolted at the time the track was laid, as brazed bonds were to be used. All sidings have stub ends and are spaced about three miles apart, being equipped with upright switch stands and electric signal lights. The ties are all first-class southern white oak, shipped by the Standard Tie Company from Joppa, Ill. In laying the rails, which was done as force account work, the best results were obtained by distributing with teams only half the number of ties needed. The rails were placed upon these ties and the remaining ties were hauled out by the work train. The rail train consisted merely of a locomotive and a number of ordinary flat cars, two of which were equipped with a homemade arrangement of spools, on which the rails were

lowered. With this simple equipment, however, and a force of 40 men an average of 6,000 feet of track a day was laid.

Bridges and Culverts.

All bridge work was let by contract, the Lafayette Engineering Company obtaining all the steel work, while the concrete substructures were let to local contractors along the line. The bridges were all designed for a loading of a standard 100-ton electric locomotive. Of the steel bridges there were five of importance. The first of these was that required by the north branch of the Wabash river, where two 144-foot through trusses were used. The south branch of the Wabash river required two 100-foot trusses, and one 48 and one 58 foot through girder. Rock creek at Rockfield required a 394-foot deck girder viaduct with a height of 40 feet above the water level. Two 75-foot through girder spans were used across Deer creek at Delphi at the point where the Wabash Railroad uses a 200-foot deck truss. Wildcat creek, at Lafayette, required three 100-foot deck trusses, with pile trestle approaches 500 and 600 feet long, respectively.

In the substructures crushed stone concrete was used

Lafayette & Logansport Traction Company—Standard Shelter Station.

except in the Rock Creek viaduct, where suitable gravel was obtained at the site of the structure. In the smaller culverts preference was given to the flat rail top arch form, which was found to be the most economical for spans up to 12 feet. This type of culvert was reinforced with old low T-rails, of which the company had large quantities on its other lines.

Two of the three subways were constructed of concrete and one of sandstone and steel. A great assistance in the subway work was the hearty co-operation which came from the officials of both the Monon and the Wabash railroads. The latter road constructed both of its subways complete. In all three of the subways the general clearance dimensions were 16 feet from the top of the rail to the trolley and 14 feet wide in the clear.

Overhead Construction.

The overhead construction consisted merely of the ordinary type of trolley bracket supports on alternating 33 and 45 foot poles. These poles were placed every 100 feet and the high tension line was carried on the 45-foot pole, giving it a 200-foot span. This high tension line is a part of the continuous line from Ft. Wayne to Lafayette, and is constructed according to the standard 6-foot triangle position adopted by the company. The special feature of the overhead work was concrete poles, which were erected for a mile as an experiment in the use of concrete for this purpose. These poles were built in lengths of 32 and 42 feet, being 12 inches square on the bottom for the 42-foot pole and 10 inches for the 32-foot pole, and tapering to a 6-inch square on top. Bolt holes were left for the brackets, cross-arms and steps, and a galvanized iron socket was placed in the top of the long pole to carry

the pin for the high tension line. Reinforcement for the poles consisted of eight $\frac{3}{8}$ -inch twisted bars running the entire length of the pole. The increased cost of these poles was not excessive and if no unexpected accidents occur to increase the cost of maintenance they will easily demonstrate their superiority over the cypress poles. The overhead work was all constructed by the company as force account work. The overhead material was furnished by the Ohio Brass Company of Mansfield, O.

Stations and Buildings.

There are three substations between the terminal points, one at Burrows, one at Delphi, and one at Buck Creek, dividing the line into about four equal stretches of nine miles each. These substations were constructed after the pattern of the standard combined substation and waiting room of the company. They are 42 by 44 feet and are constructed mainly of brick and concrete. Concrete is used for floors, pits and roof. The substation proper is absolutely fireproof and is cut off from the rest of the building by a 12-inch brick wall and a good substantial fire door. The man in charge of the sub-

Lafayette & Logansport Traction Company—Standard Waiting and Substation.

station also takes care of the ticket office and baggage room. Each substation contains one 300-kilowatt rotary of the G. E. type, and three 100-kilowatt transformers. The complete equipment was furnished by the General Electric Company. The high tension voltage is 33,000, while that of the trolley is 550.

In addition to these larger stations provision was made in the way of smaller waiting rooms to be placed at such road crossings as the expected traffic would warrant. These smaller stations were all built after the plan of the Ft. Wayne & Wabash Valley standard shelter shed. They consist of a substantial frame structure inclosed on four sides and provided with two screened windows and a door. Concrete or wooden floors are used at the discretion of the engineer and benches are provided for the accommodation of passengers. Another convenient feature of the station is the sign on each end giving the name of the stop and the mileage distance from the terminal point. About 20 of these buildings were erected, ranging in size from 8 by 8 feet to 12 by 14 feet.

The operating headquarters of the new line will be located for the present at Huntington, Ind., on the old line, although it is probable that the permanent headquarters may be moved nearer the center of the division at some later date. The Central Union telephone system of dispatching will be used as on the other lines of the company, and will be taken care of by the company's men. The rolling stock will be a part of the new equipment, which is now being operated on the old line. The cars are of the new type of combination baggage, smoking and general passenger compartment cars built by the Cincinnati Car Company. They are

61 feet in length over all and are equipped with four 75-horsepower motors and a Westinghouse pneumatic multiple control. They are geared up to 65 miles an hour, although the schedule to be operated will not call for more than an average of 35 miles an hour.

The construction work was all supervised from the chief engineer's office located at Ft. Wayne, the work being directly in charge of H. L. Weber, chief engineer, under the direction of C. D. Emmons, general manager.

CUT RATES BY STEAM ROAD COMPETING WITH ELECTRIC RAILWAY HELD DISCRIMINATION.

The Ohio railroad commission has rendered a decision holding that the Hocking Valley Railway Company has practiced unjust and unreasonable discrimination against certain localities on its line because of the fact that the company reduced rates between some points in order to meet the competition of the Scioto Valley Traction Company.

The case was brought before the commission by Aaron B. Price of Athens, O., who represented that the Hocking Valley Railway charged \$1.55 for a ticket from Athens to Columbus, a distance of 76.3 miles, or, for a round trip, \$3.10. The Hocking Valley sells "twin" tickets good for a round trip between Columbus and Logan, a round-trip distance of 99.2 miles, for \$1.60, or from Lancaster to Columbus, a round-trip distance of 63 miles, for 75 cents. One of these "twin" tickets will pay the fare of two passengers on the same train from one point to the other. The complainant charged that in making this arrangement the Hocking Valley Railway was showing undue and unreasonable preference to Lancaster and Logan, and was subjecting Athens and the immediate locality surrounding it to undue and unreasonable prejudice and disadvantage and was thereby violating the laws of the state of Ohio.

In its answer to this petition the Hocking Valley Railway stated that on or before May 13, 1905, to meet electric interurban and suburban competition between Marion and Lancaster and to preserve its local passenger business between those points, it made a schedule of commutation rates between Columbus and Marion and Columbus and Logan, and to encourage suburban residence and travel, it reduced its rates for a radius of 50 miles north and south of Columbus, and to meet the business, which had thus become highly competitive, put on additional trains. When the Scioto Valley Traction Company's line was opened it established a passenger rate of approximately two cents per mile when the maximum legal rate of passenger fare was three cents per mile, which rate the Hocking Valley Railway had been charging on this division. Soon after the opening of the Scioto Valley line the Hocking Valley reduced its fare between Columbus and Lancaster to two cents a mile and subsequently cut this rate below that established by the electric line, making it, as at the present time, 1.2 cents per mile between these points, while the rate on the electric line has remained practically unchanged, being now the maximum legal rate. Subsequent to the change in the Lancaster rate the Hocking Valley road also reduced the rate of fare between Logan and Columbus and return to approximately 1.6 cents per mile. The Hocking Valley contended that it had the right to reduce its fares to meet competition. In its decision the commission states:

It is just as essential that citizens living in one locality along the line of the defendant's railroad should be given the same proportionate rate in passenger fare to and from that particular point, as it is that shippers, at that particular point, should be given the same proportionate freight rate by the defendant company. In fact, it is more essential that passenger rates to and from different points along the line of any railroad company should be uniform, for a uniformity in passenger rates, or a discrimination against a locality, or the citizens of a locality, in passenger rates, affects more people than a discrimination in freight rates to and from the same point.

The policy of the law is, as it should be, that a carrier serving, as it is compelled to serve, the people and that

portion of the state through which the line of railroad runs, shall give proportionately equal facilities, fares and service, and when the fares and services are out of proportion, then one locality is being discriminated against and the other is receiving an undue preference, which the law, if it is intended to be effectual and enforced as intended, certainly does inhibit. It is the policy of the law, especially at the present time, that common carriers shall not create any inequalities, nor seek to make equal, persons and communities not similarly situated. Wherever conditions are similar, it is the policy of the law that rates and fares shall be similar.

What the act creating this commission seeks to do is to give each individual and each locality a "square deal," and not to permit the carrier, obligated alike to the several localities along its line, an opportunity to build up one at the expense of another, to give one a service and deny another the same service, or to give one an undue preference "in any respect whatsoever," over a locality or a person, firm or corporation along the line of its road.

The Scioto Valley Traction Company is a competitor of the defendant only in one branch of defendant's business, viz., the carrying of passengers. It is true the traction company does a light freight, or express business, but only in a comparatively small way, and does not compete with the defendant in its heavier and more important freight transportation; the traction company depending entirely upon its passenger receipts. The contrary is the case with respect to the defendant railway, its principal receipts and dependence being the revenue from the freight traffic. Thus while the traction line must have its passenger receipts to live upon, the steam line does not depend upon its passenger receipts to the same degree, but having two sources of revenue—freight and passenger—may sacrifice a portion of the lesser, if need be, without any appreciable diminution in its revenue in order to destroy its strictly passenger competitor.

Again, the traction company has but a limited line of road, one division extending from Chillicothe to Obetz Junction, where it is joined by the Lancaster division, passing on to Columbus, making in all but 70 miles. The defendant, on the other hand, has a mileage, including branch lines, of 347 miles, traversing Ohio from Pomeroy to Toledo, via Columbus.

The steam road, therefore, being the much larger system, with valuable connections, might, if permitted, sacrifice its passenger business between the competing points in order to wreck and destroy its competitor and render its property valueless while it makes up the loss elsewhere on its line. To permit such practice is contrary to public policy. The public concern is paramount. Public interest is injured by the destruction of proper competition in carriers, not to take into account the loss and injury which stockholders and investors in securities may suffer by reason of a policy which would permit the stronger corporation to use its facilities and franchises in wiping out its competitor. It is not the purpose of the law to require the state to act in a paternal manner toward its creatures, but it should be the policy of the state to prevent the destruction of one public service concern, which exercises a part of the sovereign power, at the hands of another and stronger competitor.

Competition is a natural right but when exercised by a corporation enjoying a part of the sovereign power, limits must be set to this right that no ultimate injury be done to the public. Healthful and proper competition is not denied. Such competition, however, must not disregard the rights of those whom it would serve; nor can it be permitted to destroy a competitor in whom the public has a vital interest. Service is the end desired, and when competition in rates and fares has reached the degree which prudence indicates is the proper limit in a compensatory sense, improved service and facilities are the means with which to court patronage. The public does not want destructive competition. It does, however, demand service.

The commission therefore orders that the Hocking Valley road cease from the "unjust and unreasonable discrimination," which is "found to exist."

The Des Moines (Ia.) City Railway Company obtained gratifying results last year by setting aside certain days during the park season at Ingersoll park as bargain days. No admission fee to the park is charged, but seats in the pavilion are sold for 10, 15 and 25 cents. On certain days during the park season last year it was advertised that \$25 would be distributed among the patrons of the park. This money was divided into eight packages, one containing a \$10 bill, two containing \$5 bills and five containing \$1 bills. With every admission ticket sold was given a ticket which gave the holder a chance of winning a part of the prize money. The scheme proved very successful and attracted a large number of people who otherwise would not have patronized the attractions.

FREIGHT HANDLED BY THE TOLEDO & WESTERN RAILROAD.

Figures showing the tons of freight delivered to connecting roads by the Toledo & Western Railroad Company, the tons received from connecting lines and the tons of local freight carried in the years 1905 and 1906 have been received through the courtesy of C. F. Franklin, president of the company.

On account of car shortage the amount of freight delivered to connections in 1906 was smaller than in 1905. The principal commodities interchanged, the carrying of which originated on the Toledo & Western road, are as follows: Grain, hay, sugar, live stock, stone, logs, staves, heading, paper and merchandise. The principal commodities delivered to the Toledo & Western road by connecting lines were: Flour, sugar beets, live stock, coal, stone, sand, lumber, machinery, tile, cement, plaster and merchandise. The figures are as follows:

	1906.	1905.
Total freight revenue	\$87,296.28	\$86,008.23
Total number of carloads	4,773	4,478
	Tons.	Tons.
Local freight	29,120	40,919
Freight delivered to connecting lines	17,087	30,336
Total freight originating on Toledo & Western	46,207	71,255
Freight received from connecting lines	89,830	66,705
Total freight handled	136,037	137,960

H. B. FLEMING ON BOARD OF SUPERVISING ENGINEERS, CHICAGO.

Harvey B. Fleming, chief engineer of the Chicago City Railway Company, has been appointed a member of the board of supervising engineers created by the new Chicago ordinances. Under the ordinances Bion J. Arnold becomes chairman and the city of Chicago selects a member of the board. The Chicago Union Traction Company will also probably be represented in the organization of the board. Mr. Fleming has been with the Chicago City Railway Company since 1900.

Plans for Subways in Chicago.

A conference which was attended by Thomas E. Mitten, president, and John P. Wilson, counsel of the Chicago City Railway Company, Bion Arnold, Walter L. Fisher, special traction counsel for the city, and representatives of the Commercial Club, was held in Chicago on May 1. Plans for relieving congestion on the downtown streets and for beautifying the city were discussed.

Mr. Arnold explained the plan of double-deck subways which he has developed for the central district. He said that it was his intention to urge upon the city and the companies the immediate construction of the smaller subway system contemplated by the settlement ordinances. This will consist of two east and west and two north and south tunnels in the loop district, and will be so constructed as to be incorporated in the larger plan at a later date. The smaller system will cost \$5,000,000.

It was stated after the meeting that both Mr. Arnold and Mr. Mitten said that a comprehensive system of subways would be a necessity in Chicago within the next 10, certainly within 20, years. They declared that construction plans are being made with the view eventually of running cars underground throughout the business district.

A committee of stockholders of the Chicago West Division Railway Company, an underlying company, has issued a call for deposit of the stock with the Chicago Title & Trust Company, as part of the reorganization of the Chicago Union Traction Company.

New offices have been opened for the Chicago Union Traction Company in the Borland block, in the downtown district.

James Dalrymple, manager of the corporation tramways of Glasgow, Scotland, in a letter to Thomas Hunter, chief

bailliff of the municipal court, Chicago, said: "It must be a great satisfaction to know that the traction question has now been entirely taken out of politics. I am convinced that if municipal ownership is ever to be realized in your city and the other cities of the United States the step which you have taken is the right one to bring about that result."

HEARINGS BEFORE INDIANA TAX COMMISSIONERS.

The hearings before the Indiana state board of tax commissioners for representatives of traction companies who wish to present arguments in regard to their tax assessments, which were begun at Indianapolis on April 22, were concluded on April 25. An abstract of some of the testimony was presented in the Electric Railway Review of April 27, 1906, page 561, and we present herewith extracts from some of the statements made on April 25.

Arthur W. Brady, president Indiana Union Traction Company, said that the equipment now used by his company and other lines in the state which use the direct-current system is depreciating rapidly since the advent of the more modern electrical machinery, such as that used in the single-phase alternating current and similar systems. At the same time, he said, the prices on the new equipment are so high that it is a serious question with the roads to get sufficient capital to install the more modern machinery so as to compete properly with the other electric roads and the steam roads. While he admitted that the gross earnings of his company were greater in 1906 than in 1905, he said that the surplus for that year was much less, due to the expense of taking over additional lines, taxation and other causes. He said that his company is having difficulty in raising funds for improving its lines, and he believed that the interurban companies will soon find it necessary to set aside special renewal funds in order to obtain capital with which to renew their equipment. He said that the city line in Alexandria and the line between Jonesboro and Gas City were operating at a loss, and that practically all of the company's earnings in 1906 were turned back into the property. The stockholders, he said, have taken out practically nothing. The Indiana Union Traction Company was assessed last year at \$9,600 per mile. He said the company had 329 cars of all kinds. These he valued at \$312,285 in 1906 and \$285,310 this year. He said it cost about \$105,000 a year to maintain these cars and their equipment. The gross earnings of the company during the last year were \$1,940,000, and out of this there was created a surplus of \$115,000. He asked that the assessment of the road be not raised.

George F. McCulloch, president Muncie & Portland Traction Company, Muncie, said it is the intention of the company to extend the road from Portland to Celina, O., and make it a part of a through line from Indianapolis to Toledo, Cleveland and Detroit, but the high price of material made it inadvisable to build the extension this year. Poles that cost \$7.85 each last year are now worth \$9.40; ties that were 56 cents each are now 75 cents. Copper wire for the line would have cost \$30,000 more this year than last. Common labor would cost \$2.00 a day this year. Last year it cost from \$1.25 to \$1.75. He asked that the company be assessed at a minimum figure, because the heavy cost of coal, due especially to the heavy tariff fixed by the railroads, will make it doubtful whether the Muncie & Portland line will pay the interest on its bonds during the first year.

In speaking of the Indiana Union Traction Company, which he also represented, he said he believed the road was assessed too high. Last year the board placed the assessment at \$9,600 a mile for the entire 335 miles of track. This includes all the lines, interurban and local. He said the rate was all right for the Indianapolis-Muncie and the Indianapolis-Kokomo lines, but was too high on the others.

"The interurban business," he said, "has grown beyond expectations. We didn't expect to have stations, to sell tickets or to have freight houses. But competition with the steam lines brought them and the business has grown and will continue to grow. In fact, I don't think we are yet in the beginning of it. The interurban people of today are living on hope. Improvements and changes in the equipment of interurbans are coming so rapidly that a road can scarcely keep abreast of the times. Under such circumstances a road soon becomes antiquated and must be rebuilt and re-equipped, and all this costs enormous sums of money. This constant change and improvement represents the water in the stocks of the interurban companies. People may talk all they please about the water in the stock of the Indiana Union Traction Company, but without this water the road could not have lived and been developed.

"When it comes to fixing the assessment of interurban

railroads this board should bear in mind that very few roads earn \$8,000 a mile a year. This represents the 'excellent figure' in earnings; \$6,000 is fine, \$5,000 is good, \$4,000 is fair, \$3,000 permits existence, and \$2,500 or less means a receivership."

W. G. Irwin, president Indianapolis Columbus & Southern Traction Company, Columbus, said that his company is satisfied with its last year's assessment of \$9,000 per mile, and asked that it be not increased. He said: "Our company will be running cars into Seymour within three months. Good progress is being made with the extension north from Louisville to Scottsburg, and it will be read for operation by the first of June. North of Scottsburg the workmen are compelled to use dredge boats in building 10 miles of line through the swamps. However, we expect to be running cars through from Indianapolis to Louisville by the end of the year."

PLAN FOR NEW PHILADELPHIA FRANCHISE.

The Retail Merchants' Association of Philadelphia presented to Mayor Reyburn on April 26 the plan for settlement of the traction situation. The important features of the plan are:

A contract for 50 years is to be entered into between the city of Philadelphia and the Philadelphia Rapid Transit Company, at the end of which the city may possess itself of the leases, franchises and property of the company without cost. During the 50 years the company is to maintain a sinking fund which shall extinguish its \$30,000,000 of capital. The mayor, the president of the Rapid Transit company and the president of the board of city trusts are to compose the sinking fund commission.

The mayor, the president of the board of education and the president of the board of city trusts are to compose the rectors of the company with the right to vote, but they incur no liabilities for themselves or the city. The city and the company are to share equally the net profits after a 6 per cent dividend is paid on the stock.

A fixed sum is to be paid yearly to the city for car licenses, snow removal, street paving, taxes and the like, which shall be equal to the present cost of these items. This sum is to be fixed by the city every year.

No contracts are to be made by the company extending beyond 50 years, and in this period the company shall have the right to build elevated and subway lines as they may be needed, issuing securities for no greater amount of money than is actually needed. The city is also to join with the company to have the present route of the Frankford elevated line changed so as to make its construction possible.

The ordinance of 1857 giving the city the right to take existing railway lines at their appraised value, and the ordinance requiring the company to put wires under ground when directed to do so by the authorities, are to be repealed.

The company is to call the remaining \$9,000,000 still assessable on its stock, and the money is to be used in improving the service.

During the term of the contract the city comptroller or experts in the employ of the city shall have the right to audit the company's accounts.

MEETING OF STANDARDIZATION COMMITTEE, CENTRAL ELECTRIC RAILWAY ASSOCIATION.

The standardization committee of the Central Electric Railway Association held meetings on April 25, 26 and 27 at the offices of the association in Indianapolis. The matter of standardization of equipment for electric railway cars and other equipment was carefully considered and certain recommendations were agreed upon.

The committee selected the following subjects to be considered by subcommittees, members of which will be appointed by the chairman of each subcommittee.

1. Standard height of drawbars for interurban and city cars; also standard form of coupler for interurban and city cars. R. C. Taylor, superintendent motive power Indiana Union Traction Company, Anderson, Ind., chairman.

2. Standard form of trolley base; standard length of trolley poles; standard form of trolley harp and wheel. M. Baxter, electrical engineer and master mechanic Western Ohio Railway Company, Wapakoneta, O., chairman.

3. Standard classification lights and signals and location of same on car. W. A. Gibbs, general manager eastern division, Indiana Columbus & Eastern Traction Company, Newark, O., chairman.

4. Standard foundation brake gear, brake jaws, pins,

levers and brake rods. Fred Heckler, superintendent motive power and cars Lake Shore Electric Railway, Fremont, O., chairman.

5. Car painting. Fred Heckler, superintendent motive power and cars Lake Shore Electric Railway, Fremont, O., chairman.

6. Standardization of electric equipment. Motors recommended for ton-mile speed car; detail dimensions of electric equipment and supplies which enter into the maintenance of electric car service supplies. R. C. Taylor, superintendent motive power Indianapolis Union Traction Company, Anderson, Ind., chairman.

A report was formulated, to be presented at the meeting of the Central Electric Railway Association, which will be held at Indianapolis on May 23, on the following subjects: Brakeshoes, axles, journals and journal boxes, tread and flange of wheels, rails for street and interurban railways.

CLEVELAND TRACTION SITUATION.

Following the introduction in the city council on April 25 of an ordinance granting a franchise on Central avenue and Quincy streets, on which the Cleveland Electric Railway had ceased operation on April 23, to the Low Fare Railway, the controversy between the Cleveland Electric Railway and the 3-cent fare companies took the form of a vigorous contest for the consents of the property owners on those streets. Both companies sent solicitors among the property owners, the Cleveland Electric Railway offering \$4 per front foot for consents to a renewal of its franchise or revocations of previous consents to the Forest City Railway. The Forest City company, although it already claimed to have sufficient consents, also made strenuous efforts to secure additional consents, offering \$3.00 per foot. It was claimed that city employes were used as solicitors for the Forest City consents. At the council meeting on Friday night the Cleveland Electric Railway filed several hundred consents and revocations with the city clerk, claiming to have enough to make inoperative any grant to the Low Fare Railway.

The Low-Fare franchise was passed at a special meeting of the council on Saturday morning by a vote of 21 to 9, having been railroaded through its first and second readings on Wednesday and Friday nights. An amendment requiring a bond to insure the construction of the lines was defeated. The Cleveland Electric Railway immediately secured a permit to remove its tracks without restrictions.

At the meeting on Monday night a resolution requesting the Cleveland Electric Railway to resume service on its abandoned lines was defeated and a resolution was passed authorizing the Low Fare Railway to begin laying tracks under a temporary permit to be issued by the board of public service, as soon as the Cleveland Electric Railway should remove its tracks. Councilman Felton introduced an ordinance granting the Cleveland Electric a franchise over the Central-Quincy route on the basis of seven tickets for a quarter. Several ordinances granting extensions to the Low Fare Railway were also introduced.

At Tuesday night's meeting Mr. Felton and the republican councilmen attempted to pass the Cleveland Electric ordinance. Mr. Felton declared that the residents of Central avenue and Quincy street, whom he represented, objected to being made martyrs to the 3-cent fare cause. The ordinance was made sport of by the administration party and after being loaded down with amendments which would make it impossible of acceptance, it was tabled.

The Cleveland Electric Railway on Tuesday morning, April 30, began the work of removing its tracks in Central avenue and Quincy street. The work of tearing out the special work of the crossing at Central avenue and East Fifty-fifth street was stopped by the police, but was allowed to be resumed after midnight.

The Low Fare company on Tuesday secured from the board of public service a permit to lay tracks in place of those removed by the old company.

The hearings on the several temporary injunction suits brought by the Cleveland Electric against the low-fare companies were taken up before Judge Chapman on Tuesday and resumed on Wednesday. Judge Phillips had made several efforts to induce the companies to determine upon a suit which would finally settle the principal points of difference, as the public interest was being interfered with by the continual state of unrest, but the attorneys could not reach an agreement.

The Low Fare company on Wednesday began laying tracks in Central avenue, where the Cleveland Electric had removed its rails the day before, and was immediately notified by the attorneys of the latter company that an injunction would be applied for to stop the work.

PIPING AND POWER STATION SYSTEMS—XXXVIII.

BY W. L. MORRIS, M. E.

A strong and inexpensive method of constructing the floor over the hot well is to embed rods in cement, thus making a reinforced concrete cover over the hot well. The condenser is carried on the I-beams as shown, this construction being necessary to permit the installation of the condenser before the floor is put down.

As previously stated the dry vacuum pump is a much more efficient device for removing the air from the condenser than the wet vacuum pump because of the small clearance spaces which are permissible at the cylinder ends. In addition to this they have mechanically operated suction valves, usually of the form shown in Figure 273 (J 2-3).* This valve is of the well-known Trick design, having a "flash port" passing through it. The object of this port is to reduce the pressure of the air which remains in the clearance space immediately after the completion of the compression stroke and by communicating with the opposite end of the cylinder increase the pressure on the other side of the piston shown at b, which

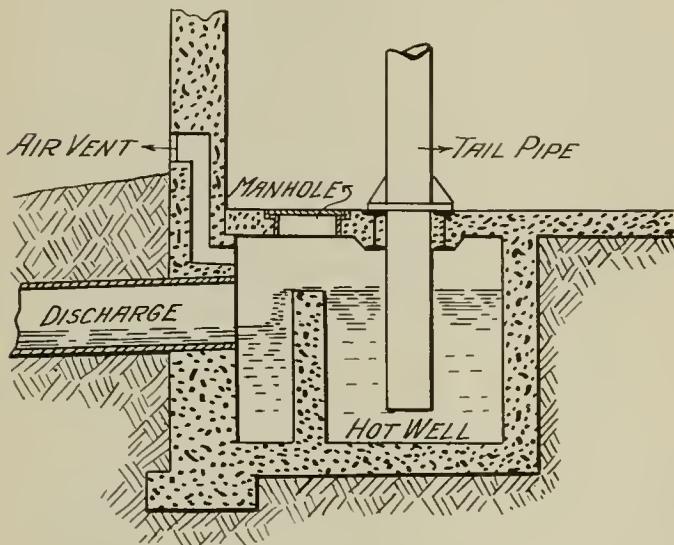

Figure 272—(J2-2).

is about to be compressed, so that the air can be discharged into the atmosphere through the poppet valves shown in detail in Figure 274 (J 2-4).*

These poppet valves should be securely held in place, but in such a manner that they will not be burned in, as would be the case if threaded and screwed into the cylinder. The valve proper should be as light and as strong as possible. The best material to use for the valves is bar steel or steel castings machined so as to reduce the weight, the shell of the moving part being about 1-16 of an inch thick. The bridges shown in the section AB, Figure 274 (J 2-4) should have at least $\frac{1}{4}$ of an inch bearing to guide the steel poppet valve. By making the poppet of steel the valve faces will wear better than if both parts of the valve are made of brass. The set screw in the cap should be set firmly against the valve and secured from movement by a lock-nut set up tight, this construction taking the strains without endangering the small bridges in the air port. The usual construction is to place the valve at the side of the cylinder lying horizontally. A better construction is to place the valve at the bottom of the cylinder in a vertical position, thereby reducing the wear of the valves and also insuring the pump against injury from water, as the valves located in this position will keep the cylinder drained of water. The admission valve shown in Figure 273 is

mechanically operated to avoid the resistance offered by the poppet valve. The area of this type of valve must be about $6\frac{1}{2}$ times that of the discharge poppet valves to avoid throttling on the suction stroke. A back pressure of one pound would hardly be noticed in the discharge, but such a drop through the suction valves would materially reduce the capacity of the pump. The capacity of the pump would be reduced fully one-half and would necessitate a 2-inch higher vacuum in the pump than in the condenser to overcome the resistance through the valves. By employing mechanically operated valves the area of the ports can be made sufficiently large and tight to avoid slippage, which would occur in large poppet valves closing slowly when lightly loaded. If a high vacuum, say 28 inches, is desired, it is necessary to use a dry vacuum pump or at least a pump with mechanically operated suction valves.

A type of pump which is now being quite extensively installed for high vacuum service, which is designed to handle air and water mixed, is that termed the suction valveless pump, of which the Edwards design is shown in Figure 275 (J 2-5). In this design the piston is pointed so that it strikes the water without shock and drives the water of condensation under the piston out through the ports of the cylinder at a high velocity, which carries the air with it on the same principle as an injector. The movement of the piston closes the

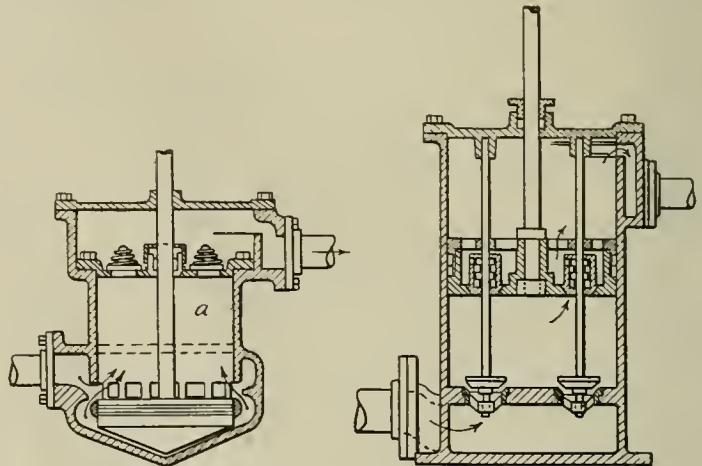

Figure 275—(J2-5).

Figure 276—(J2-6).

ports and the air and water are discharged through the head valves after compression. On the downward stroke of the pump a higher vacuum is formed in the cylinder, a, than exists in the condenser at the same instant, and the air therefore rushes into the cylinder as soon as the ports are uncovered by the piston, and this is further assisted by the injector action of the water which follows immediately, and as the piston is moving very rapidly the ports would probably be covered before any backflow from the cylinder had a chance to occur. Be that as it may, however, the high efficiency and successful operation of this type of pump is fully established and demonstrates its ability to remove air and condensation under a vacuum of 28 inches.

There are several other designs of suction valveless pumps, among which may be mentioned the Bailey and the Mullins, which are also well adapted to handle air and water in the same cylinder. The special advantages of the suction valveless pump are that it has no bucket or foot valves, which constantly need care and renewal, and are generally very difficult to get at for repair.

It is possible to use poppet suction valves, but in such cases they should be mechanically operated, as shown in Figure 276 (J 2-6). Both suction and discharge valves are mechanically operated in this pump, the operation of the valves being accomplished by the friction packing rings inside of the discharge valves. In the accompanying illustration the suction valves are shown open on the upstroke, the valve

*By an error Figures 273 and 274 were inserted in Chapter XXXVII, page 562, and numbered incorrectly 272 and 273.

rods being drawn upward by the friction, which likewise closes the discharge valves when the piston is on the upstroke. On the downstroke the friction of the packing pushes the valve rods down, thus closing the suction valves and opening the discharge valves. The friction of the packing rings must always be maintained sufficient to sustain the weight of the valves and valve rods. This arrangement of valves permits the air and water to be discharged and drawn into the pump without any appreciable loss of head.

When the piston starts on the downward stroke the discharge valves will not be seated until the pressure under the piston is nearly equal to that above it, the rods slipping through the friction or packing rings. The suction valves are closed as soon as the piston has traveled a distance equal to the travel of the valves. This arrangement may be used for either the suction or discharge valves and as all the valves are kept in perfect alignment, insures perfect valve faces. The wear on the packing rings is similar to that of any metallic piston packing. The packing rings are split, alternate rings closing against the case and rod respectively.

The air pumps shown in Figures 275 and 276 are operated with suction jet condensers taking the injection water and air from the condenser bowl. These may also be used in connection with surface condensers as they are capable of handling air and water. The pump shown in Figure 276 may also be applied as a dry vacuum pump if the cylinder is water jacketed. If a counter current condenser is used, as shown in Chapter IV, Figure 28, then it is necessary to handle the air and water separately, the air pump being in this case a dry vacuum pump and the condensation pump handling solid water, and part of the time with air and water mixed, as a certain amount of air would at times be taken in its suction.

It sometimes becomes necessary to place the dry vacuum pump in the engine room when the condensers are located in the basement. This makes an inclined pipe line necessary. Such a line can be successfully operated if the piping is laid out in such a manner that it will be impossible for water to accumulate in it. When the pump is in operation the water will be constantly carried in small particles and cause no difficulty in operation, but when the pump is out of service the pipe line should be drained of all water which may collect in it by drips properly located. The pitch of the pipe line should be such that the water will drain back to the pump when the latter is not in operation. The more regular the pitch is, the less liability there will be for water to collect in pockets at the bottom of the steep grades, which is then liable to be picked up in large quantities and discharged into the pump when it is again put in operation.

(To Be Continued.)

Chicago Elevated Traffic.

The figures for the daily number of passengers carried by the elevated railroads of Chicago for the first four months of the year all show gratifying increases over the corresponding months of last year. The Metropolitan made a new record for the month of March, with an increase of 13.67 per cent. The figures for three of the companies follow:

Metropolitan West Side Elevated Railway.				
	1907.	1906.	Increase.	Per cent.
January	150,165	129,720	20,445	15.76
February	154,444	135,570	18,874	13.91
March	154,790	138,169	16,621	12.02
April	156,275	137,477	18,798	13.67
Northwestern Elevated Railroad.				
January	\$8,632	\$1,204	7,428	9.15

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. ROSENBERGER, LL. B.

Equipment of Car with Powerful Searchlight.

It is no evidence of negligence, the supreme court of errors of Connecticut says, *Garfield v. Hartford & Springfield Street Railway Company*, 65 Atlantic Reporter, 598, that a street railway car is equipped with a powerful searchlight, but it may be evidence of negligence if a car, thus equipped, is run at an unlawful rate of speed, in a narrow road, with no proper lookout for travelers upon the tracks whose eyes may be so dazzled by such a light as to prevent them from seeing which way to turn in order to escape injury.

Liability for Road Officer Who Causes Wrongful Arrest.

A road officer who is shown to be the superior officer of a conductor and to have the right to take charge of his car at any point on the road, the St. Louis court of appeals holds, *Carmody v. St. Louis Transit Company*, 99 Southwestern Reporter, 495, has the same authority as the conductor to order the arrest of a passenger on the car, who refuses to pay his fare, or for other statutory causes, and the company will be liable if he wrongfully causes the arrest of a passenger by a police officer.

May Secure Use of Tracks Without Exchange of Transfers.

In the absence of an ordinance requiring street railroads in a city generally to exchange transfers, the supreme court of Ohio holds, *Interurban Railway & Terminal Company v. City of Cincinnati*, 79 Northeastern Reporter, 240, that neither section 2505c of the revised statutes of that state, nor section 3443-11 thereof, makes the power it confers upon urban and interurban street railroad companies to agree as to the use by the latter of so much of the tracks and other property of the former as may be necessary or desirable to enable it to enter or pass through the municipality conditional upon an exchange of transfers.

Drinking Water on Cars Not Required by Statute.

Section 5368 of the Alabama code of 1896 provides that railroad companies must keep a sufficiency of good drinking water on all trains, and that every conductor, who runs any train without water, as required by this section, must, on conviction, be fined, etc. The supreme court of Alabama holds, *Dean v. State*, 43 Southern Reporter, 24, that the statute does not apply to street railways, or, for that matter, to an electric railway operated between cities 14 miles apart by a street railway company, it being said that, in the absence of some affirmative evidence to the contrary, it will not be presumed the road was not a street railroad.

Power to Compel Removal of Unauthorized Railway.

The supreme court of Michigan says, in the case of *Bangor Township vs. Bay City Traction & Electric Company*, 110 Northwestern Reporter, 490, that the defendant purchased a street railway constructed in a highway, within the township of Bangor. The latter filed a bill in chancery to have the railway removed, alleging that it was built without the consent, and against the repeated protests, of the township authorities, and had been so maintained and operated ever since. The defendant maintained, among other things: (1) That the court had no jurisdiction of this cause, because there was an adequate remedy at law, if the complainant's claim was valid; (2) that it was estopped from asking the relief sought, because of the acquiescence of its officers in the building and maintenance of the road. But the supreme court holds against these contentions. It says that a railway which is built in a highway without authority of law is not rightfully there, and the public has a right to have it removed, whether it be called an encroachment, an obstruction, or a nuisance.

The defendant appeared to contend that this was neither an obstruction nor a nuisance, for the reason that this court

has held that the use of public highways, by street railway companies, is a legitimate use of the highway, and does not create an additional servitude upon the land of the adjoining proprietor, and that it must, therefore, be an encroachment or a trespass; if the former, not the subject of equitable relief; and, if the latter, waived by the conduct of the officers. However, while a railroad lawfully constructed on a highway, and rightfully there, cannot be held to be an unlawful obstruction of, or encroachment upon, the highway, it is an obstruction in the sense that any structure or new use may be an obstruction to its use by the public generally to a greater or less extent.

This defendant was not an adjacent land owner, and has no color of right to occupy the street, except such as the statutes then in force conferred, and, in building its line, placed an obstruction in the way, of which the township authorities had a right to complain and to take measures to remove, and the court hesitates to say that it may not have been a nuisance which they might ask equity to abate, for it thinks that it does not follow, from the recognition of a lawful street railroad, as a proper adjunct to a highway, that an unlawfully constructed one cannot be a nuisance. If it was so claimed, equity had jurisdiction to try the question, and the township might bring the suit.

The defendant's alleged estoppel could not be sustained. If private persons can create easements by estoppel, under the statute of frauds and decisions of the state, or if a license may be implied from the acquiescence of a private person, who stands by and sees, without protest, his land used for a railway, the same cannot be said of township officers, who have no authority except such as the statute gives.

Rights as to Switch to Haul for Express Company.

The primary purpose of the bill in the case of Dulaney and others v. United Railways & Electric Company, 65 Atlantic Reporter, 45, the court of appeals of Maryland says was to procure an injunction restraining the said United Railways Company, of Baltimore, from constructing and maintaining a switch from its main track across a sidewalk to a warehouse owned and used by a city and suburban express company. But the court holds that the city, in permitting the United Railways Company to lay and maintain the proposed switch to connect its lines by a curved track, as shown on a plat referred to in the ordinance, with the express company's warehouse, to facilitate conducting an express business by hauling freight and express only in cars used for the business of such express company, was appropriating the public street to legitimate uses for the benefit of the community at large, and that it did not exceed its powers in so doing. Assuming that the United Railways Company was authorized to transact an express business on the street in question and other lines formerly operated by the Baltimore Consolidated Railway Company, there was good authority for holding that it would have the right to limit the express business on its lines to a single express company, if it thereby afforded to the public reasonable express facilities.

When the proposed switch is constructed, neither the United Railways Company nor the express company, the court says, will have any exclusive or superior right to use or occupy the portions of the street or sidewalk over which the switch runs. The right of the complainants as property owners in that connection, as well as those of persons passing along the street, will be the same after the switch is made that they were before. The railway company and the property owners have equal rights to the use of the public streets, which each must exercise reasonably with respect to the right of the other. Cars cannot be permitted to so stand upon the switch as to prevent other vehicles from passing. The portion of the ordinance imposing a penalty for hindering or delaying the cars by the use of other vehicles on the switch must be construed to relate only to an unreasonable hind-

rance or delay, and cannot be held to have been intended to prevent or punish the reasonable use by adjacent property owners or persons having business with them of the public streets in front of their premises.

Both the railway company and the express company must so use the switch, when constructed, as not to unnecessarily or improperly interfere with the rights of the public or the adjacent property holders, and if they fail to do so, and injury results from such failure, the proper tribunals will afford relief to the injured persons. But the court cannot anticipate defaults or acts of negligence or abuse on the part of the companies in maintaining and using the switch, or in the storage or handling of such inflammable or explosive substances as may be lawfully committed to them for transportation.

Liability for Injury by Crowd at Subway Station.

While attempting to enter one of the defendant's cars at a subway station the plaintiff in the case of Kuhlen v. Boston & Northern Street Railway Company, 79 Northeastern Reporter, 815, was injured by the pushing of the crowd at the station. The supreme judicial court of Massachusetts, in overruling exceptions to a verdict for damages in her favor, holds that an instruction could not have been given that, if it was not practicable for the defendant to carry on its business without the crowding of its platforms and cars at certain hours of the day, it was not negligence on its part to fail to employ a large force of men at those hours to prevent jostling and crowding at the entrance to the cars. It was for the jury to say whether or not, if the crowding of its platforms and cars at certain hours of the day was unavoidable in carrying on its business, that the high degree of care which it was bound to exercise called for the employment of an increased number of men to prevent such jostling and crowding at the entrance of the cars as would involve danger to passengers, and whether or not it was reasonable, in view of the nature and extent of the defendant's business, to require this precaution to be taken.

It could not have been said as a matter of law that the plaintiff herself was not in the exercise of due care, or that she had assumed the risk of the injury that was done to her. She had been in similar crowds before, and the circumstances were important to be considered by the jury in passing upon the question of her due care. But they were not conclusive against her as a matter of law. The jury might say that in spite of the failure of the defendant's servants and agents to control the crowd on previous occasions she might depend somewhat on the hope that they would not continue to fall short of their duty.

Instructions could not have been given the jury, as the defendant requested, that, on all the evidence, the plaintiff was not entitled to recover; that the plaintiff was not in the exercise of due care; the plaintiff assumed the risk of being jostled and all danger and inconvenience incident thereto when she entered the crowd endeavoring to get upon the car; that in choosing to travel on a street car when the same was crowded, the plaintiff assumed the risk of injury incident to such crowding.

Furthermore, in view of the fact that the defendant held this out as the proper place for its passengers to come for the purpose of taking its cars, so that its passengers had a right to regard themselves as having come thither by its invitation, the court does not see that the defendant was injured by the exclusion of the agreement showing the conditions of its occupation of the subway. The general principle has been established that one who, though not strictly in control of a defective thing or dangerous place, yet uses it for his own benefit and for his own purposes invites another to enter it, may, if the other elements of liability concur, be held responsible for an injury caused by the defect or danger.

News of the Week

Decision Against City of Toronto in Service Regulation Suits.

The judicial committee of the privy council of Great Britain on April 26 gave a decision in the cases of the city of Toronto versus the Toronto Railway Company, appealed from the supreme court, and the Toronto Railway Company versus the city, appealed from the court of appeal for Ontario. The decision states that under the agreement between the city and the company neither party has any street railway powers over the streets within new territorial additions to the city; that to grant privileges to new companies is the only remedy the city has for failure of the company to build extensions and extend its service; that it is for the company, not the city engineer with the approval of the city council, to determine what routes shall be adopted by the company; that it is for the company, not the city engineer, to determine where cars shall be stopped; and that the city is to pay the company the costs of these appeals.

Salt Lake City Strike Settled.

The strike of motormen and conductors of the Utah Light & Railway Company, Salt Lake City, which was declared on Sunday morning, April 28, was settled late Monday night and service was resumed on Tuesday morning. The strike affected about 450 men and caused nearly a complete tie-up of the street railway service of the city while it was in progress. Scenes of disorder were numerous. The strike was caused by the refusal of the company to grant the demands of the men for a wage scale of 25 cents an hour for the first year and 30 cents an hour thereafter, recognition of the union, plan for arbitration of grievances, 10 per cent increase for barn and shop employes, and several other minor matters, and followed several attempts at arbitration. After the strike was declared the company gave former Congressman Brigham H. Roberts full powers to effect a settlement and an agreement was reached whereby the men were granted the wage scale they had asked for and the other matters were to be arbitrated.

Michigan Supreme Court Decides Against Municipal Ownership for Detroit.

The Michigan supreme court on May 1 decided by a vote of 5 to 3 that the city of Detroit has no constitutional right to build a street railway line to be leased to an operating company. The case is the outcome of the municipal ownership agitation several years ago. The city council on October 31, 1905, ordered the department of public works to lay tracks on several streets and appropriated \$10,000 for beginning the work. This step was taken as a part of the fight against the Detroit United Railway, and was begun as an experiment, the idea of the city being that if it could build tracks to be leased to a competing company or to the Detroit United Railway as its franchises expired, it could more effectually contend for a reduced fare. The circuit court enjoined the city from putting its scheme into operation and the city appealed to the supreme court. The case was argued before the full bench and the circuit judges granted the petition, but recommended that the supreme court be given an opportunity to pass on it. The case was argued before five of the supreme court judges last spring and before the full bench in December, and the decision now handed down is the result of that hearing.

Labor Troubles in San Francisco.

A strike of conductors and motormen of the United Railroads of San Francisco is said to be threatening. On April 19 President Calhoun of the company announced that the scale recently decided upon by the arbitration committee of \$3.10 per 10-hour day for the men in their first year's service, \$3.20 for the second year and \$3.30 for the third year, which took effect as of September 5, 1906, would be continued for the year beginning on May 1, although this scale, which represented an increase of about 20 per cent over the previous scale, was based on the extraordinary conditions of last year. On April 27 the executive committee of the car men's union called upon President Calhoun and presented a demand for an eight-hour day at a flat rate of \$3.00 per day, with one and one-half times the regular rate for overtime. President Calhoun has announced the determination of the company not to recede from the position taken in the announcement of April 19, pointing out that a further increase is financially impossible. He states that materials and labor are now higher than ever, that since the fire the number of fares has decreased, and that the company is now paying higher wages than are paid in any large city in the country. The men have not yet decided what action shall be taken on the company's refusal and the company is making preparations to meet a strike.

New England Street Railway Club.

James F. Jackson, chairman of the Massachusetts railroad commission, gave the members of the New England Street Railway Club an informal talk at the monthly meeting of the club in Boston, on April 30. President H. C. Page of Springfield presided and a brief business meeting followed the usual dinner at the American house.

Mr. Jackson's subject had to do with the public service aspects of the street railway business. He emphasized the cordial relations which have existed between himself and the street railway officials of Massachusetts during his seven years' tenure of office, contrasted old and recent methods of street railway operation and advanced two suggestions in the way of improving present

conditions. It was pointed out that it is most essential to ideal railway service that all officers and subordinate employes of transportation companies shall realize the distinction between an ordinary private business and their own. In steam railroad circles particularly this appreciation is not always in evidence, although the courts have held over and over again that a railroad is a public highway. Mr. Jackson urged that a broader attitude than that which looks upon transportation as merely something to be sold, like any other merchantable commodity, is desirable. Complaints may be avoided in some degree by improved equipment, but more is likely to result from tactful and courteous work by conductors and other employes than from mere machinery.

The concluding suggestion favored a dominant personality in each of the executive chairs of street railway companies, which will foster increased efficiency, loyalty and pride in the service by the individual employe. Men prefer to work for a man rather than a board of directors or a system. The realization of the brotherhood feeling in street railway work is most desirable.

Legislation Affecting Electric Railways.

New York.—Governor Hughes on April 29 signed the Miller bill, which prohibits electric railway companies operating wholly or in part in cities of 1,000,000 population, from collecting fare from a passenger more than once during a continuous ride on a single car, except that a fare may be collected once within the city and once outside.—Senator Cassidy has introduced a resolution providing for the appointment of three senators and three members of the assembly for the purpose of making an investigation into the merger of the New York City street railways by the Interborough-Metropolitan Company.

Pennsylvania.—The senate committee on city passenger railways on April 30 decided to report favorably on the Homsher eminent domain bill for electric railways, in the form in which the bill was passed by the house. This action was taken after a hearing in which representatives of the Property Owners' Association of Philadelphia presented numerous amendments to the bill, imposing restrictions, and members of the Temporary Street Railway Association, composed of 75 electric railway companies of the state, presented arguments for the passage of the bill in its present form.

Missouri.—The senate has passed a bill giving cities the right to regulate rates for public service corporations. The bill was amended to provide for a court review of the legality of proceedings and the reasonableness of the rates fixed.

Rhode Island Company Increases Wages.—General Manager A. E. Potter of the Rhode Island Company of Providence, R. I., which controls most of the electric lines of the state, has announced a 10 per cent increase in wages, based on a 10-hour day, for trainmen, effective on April 28. The increase affects 615 motormen and 598 conductors.

T-Rail Hearing in Columbus.—The new board of public service of Columbus, O., on April 26 held a hearing for the purpose of listening to arguments on the subject of T-rail construction in the city streets. The old board refused to permit the use of T-rail but many of the merchants of the city who are interested in securing as many electric railways as possible for the city are seeking to induce the new board to favor the T-rail, which is desired by the interurban companies. The hearing was asked for by the Interurban Loop Association, an organization of business men, and several members spoke in favor of the T-rail.

Detroit United Railway in Court.—The Detroit United Railway was found guilty on 20 charges of violations of the city ordinances, by Judge Conolly in the recorder's court on May 2. The cases are a part of the campaign which Mayor Thompson has been waging against the company for several months. Thirteen cases were for violation of the ordinance requiring the company to post time schedules in its cars, which has never been enforced, five were for failing to maintain certain red lights and two were for failure to file with the city treasurer quarterly reports on the company's freight traffic. The matter of sentences was taken under advisement by the court.

Twin City Trolley Trips.—A. W. Warnock, general passenger agent of the Twin City Rapid Transit Company, Minneapolis, Minn., has recently issued the 1907 edition of its well-known booklet, "Twin City Trolley Trips," which describes and illustrates the many interesting trips which may be taken on its suburban lines and contains much useful information in regard to the numerous amusement resorts in the vicinity of Minneapolis and St. Paul. The booklet has 24 pages and contains excellent maps, timetables, rates of fare and a large number of halftone illustrations of beauty spots reached by the company's lines. The company has also issued another excellent folder describing and illustrating the attractions of Big Island Park, the company's new amusement resort at Lake Minnetonka.

Trolley Trip Story Contest.—The report of the judges in the prize trolley trip story contest, which was conducted by the passenger department of the Boston & Northern and Old Colony Street Railway companies during the winter months, has been announced. The department offered a prize of \$25 in cash for the best story of the best trolley trip taken on the lines of either of these two companies, \$15 for the second best and \$10 for the third best. The response to this offer was very general, a large number of excellent and interesting stories being received by the department from all over the district covered by these lines. The first prize has been awarded to Katherine Keefe of Danvers, Mass.; the second to Mary I. Coggeshall of Melrose, Mass., and the third to Ellen M. Dole of Salem, Mass. The winning story is printed in this month's issue of the Tri-State Tourist, the monthly publication of the passenger department.

Construction News

FRANCHISES.

Battle Creek, Mich.—The Michigan United Railways Company has applied for a 30-year franchise, and it is stated will apply for a similar franchise in Kalamazoo. The company's present franchises in those cities run for 17 or 18 years more, but it is desired to float a new 30-year bond issue.

Bridgeport, Ala.—A franchise has been granted to T. W. Pratt, Huntsville, Ala., to build and operate an electric railway, light and power plant in Bridgeport. The line also will connect Bridgeport with Copenhagen and South Pittsburg, and ultimately will be extended to Jasper, Ala., on the north and Huntsville, Scottsboro and Stevenson on the south, with Bridgeport as headquarters for the company. Work is to begin within six months and must be prosecuted continuously until completed.

Detroit, Mich.—The Detroit United Railway, through its general manager, F. W. Brooks, has applied for a franchise to build a line from the city limits to the site of the Ford Motor Company's new plant in Highland Park and a cross track on some street near the Ford site to Woodward avenue in order to allow the Oakland avenue cars to make the Palmer park run. A 20-year term is asked for the Woodward avenue franchise in Highland Park, which would overlap the Oakland avenue franchise about four years. The Oakland avenue line is a part of the so-called "3-cent system," on which tickets at the rate of eight for a quarter are good the greater part of the day, with six tickets for a quarter the rest of the time. The application has been referred to a committee.

Fairfield, Ia.—A franchise has been granted to the Iowa-Missouri Traction & Power Company, which proposes to build from Memphis, Mo., to Iowa City, Ia. J. W. Andrews of Fairfield is the promoter.

Lawrence, Kan.—The city council has granted a franchise to the Lawrence Electric Transportation Company, which is to build a trackless trolley line in this city. O. W. Murphy of Lawrence is interested.

Salt Lake City, Utah.—The Utah Light & Railway Company has applied for an amended franchise in place of the present blanket franchise, under which it is operating. The principal feature of the new grant is the provision permitting the company to use a large number of streets and portions of streets not now covered by a franchise. Another feature is that all wires must be placed underground by 1910. As amended the franchise also provides that the company, in addition to its present right to haul gravel and crushed stone, may haul freight between the hours of midnight and 6 o'clock a. m., or at any other hours which may be specified later by the council. No action has been taken.

Seattle, Wash.—The Seattle Renton & Southern Railway has been granted a franchise for the extension of its line to the northern part of the city. The company is to pay 2 per cent of the gross receipts of the line to the city until 1920 and 3 per cent from 1920 until the expiration of its franchise. W. R. Crawford, Seattle, president.

Syracuse, N. Y.—The Syracuse Rapid Transit Company has applied for a franchise for extensions to its present system, including the laying of additional track in Court and Butternut streets and Cortland avenue; also commencing at Gifford and West streets, through South West street, south one block, connecting with the present tracks at that point. The petition has been referred to the highway committee.

RECENT INCORPORATIONS.

Buffalo Rochester & Eastern Railroad.—Incorporated in New York to operate a standard-gauge railroad by steam, electricity or gasoline. The road will run from Buffalo to Rochester and Troy, about 300 miles. The principal office will be at Rochester and the line will pass through Erie, Genesee, Orleans, Monroe, Wayne, Cayuga, Onondaga, Madison, Oneida, Herkimer, Montgomery, Schoharie, Schenectady, Albany and Rensselaer. Capital stock, \$3,500,000, of which \$1,835,000 has been subscribed by Ralph D. Gillett of Westfield, Mass. Incorporators: Ralph D. Gillett, Henry W. Ely, Archie D. Robinson, Westfield, Mass.; Arthur W. Eaton, Pittsfield; Franklin Weston, Dalton; Harry W. Bowman, Fred L. Ley, Springfield; Joseph O. Skinner, Holyoke; James H. Caldwell, Troy; John J. Whipple, Brockton; James F. Shaw, Manchester, Mass.

Columbus Marysville & Bellefontaine Railway.—Incorporated in Ohio to build a line from Columbus to Marysville and Bellefontaine, O. The route will parallel the Toledo & Ohio Central steam road and interests identified with the Findlay-Marion Railway & Light Company are interested in the project. Capital stock, \$25,000. Incorporators: R. P. Hankey, Detroit; G. W. Meeker, Columbus; Emmitt Tompkins, Eugene Gray and W. A. France.

Mentor Street Railway.—Incorporated in Pennsylvania to construct 10 miles of electric road in Elizabeth, Pa. Capital stock, \$60,000. Incorporators: D. B. Neagley, president; F. L. Kern, J. K. Neagley, George McKain and N. F. Bicking, all of Pittsburg.

Perkiomen Valley (Pa.) Traction Company.—Incorporated in Pennsylvania to build a line from Collegedale to Schwenksville, Pa. The line will be 11½ miles long, from Collegedale to Green Lane, via Schwenksville and Perkiomenville, and will use the Perkiomen

turnpike part of the way. I. H. Bardman, Schwenksville, is president.

Redlands Central Railway.—Incorporated in California to build 25 miles of electric railway from Redlands east to Craftonville and from Redlands west to Riverside. This is the company which recently obtained franchises in Redlands. Capital stock, \$25,000. Incorporators: A. G. Hubbard, J. H. Fisher, O. T. Higgins, E. S. Graham and F. E. Sanford.

Sand Mountain Electric Company.—Incorporated in Alabama, with offices at Montgomery, to build a hydro-electric plant on Short creek, in Marshall county, and build a railway from Gadsden to Scottsboro, Ala. Capital stock, \$50,000. Incorporators: Edgar O. McCord, Rena B. McCord, Leon C. McCord, G. M. E. Mann, W. E. Snead, J. B. Roberts and the Albertville Realty Company.

Tri-City Traction Company, Champaign, Ill.—Incorporated in Illinois to build a line from Edwardsville to a point on the Mississippi river near Venice, where the proposed bridge of the Illinois Traction Company to St. Louis is to be located, and from Granite City to East St. Louis. Capital stock, \$1,000,000. Incorporators: Charles Zilly, B. E. Bramble, C. A. Wright and George M. Mattis, all of Champaign, Ill., and all associated with the Illinois Traction Company.

TRACK AND ROADWAY.

Albany & Hudson Railroad, Hudson, N. Y.—It is reported that this company is considering the construction of a line from Nassau to Brainard Station, N. Y.

Allentown & Reading Traction Company, Allentown, Pa.—It is reported that this company is planning to build an extension from East Texas to Emaus and Lyons, Pa.

Atlantic City & Ocean City Railroad, Philadelphia, Pa.—An official report from this company states that it is now building an extension of the Atlantic City & Shore Railroad from Somers Point to Ocean City, N. J., about two miles. The line passes across the Great Egg Harbor bay; about half is trestle work built of creosoted piles, with two steel drawbridges and one fixed span. The remainder of the line passes across several islands in the bay, on which embankments have been formed by pumping in beach sand. Current for the operation of the line will be taken from the substation of the Atlantic City & Shore Railroad at Somers Point, and the latter company's cars will be used. The Atlantic City & Shore now connects Atlantic City, Pleasantville and Somers Point.

Atlantic Northern & Southern Railroad.—J. W. Cuykendall has been elected president of this company, which proposes to build an electric line from Atlantic to Villisca, Ia., 72 miles, succeeding J. A. McWaid, resigned. Headquarters, Atlantic.

Belmont Electric Railway.—We are officially advised that the Riggs & Sherman Company of Toledo, O., is making preliminary surveys for an electric line from Bellaire to St. Clairsville, O., 12 miles, via Neff. J. F. Anderson of Bellaire is president.

Canandaigua Southern Electric Railroad.—This company has completed the preliminary surveys for its line from Canandaigua south to Atlanta, N. Y., via Centerfield, South Bloomfield, Bristol Center and Naples, 33½ miles. George H. Switzer, 42 Broadway, New York, is president and chief engineer.

Center & Clearfield Street Railway, Phillipsburg, Pa.—It is reported that this company expects to place contracts within the next few weeks for the construction of about 4½ miles of track from Phillipsburg to Osceola, Pa.

Central Texas Traction Company, Corsicana, Tex.—It is reported that the rails have been ordered for the line from Corsicana to Palestine, Tex., 52 miles, and that contracts are to be let at once for the ties. It is the intention to begin construction in June. T. J. Galvin, superintendent of construction; M. P. Taret, chief engineer.

Chambersburg & Southern Railway, Chambersburg, Pa.—This company has completed surveys for its proposed road from Chambersburg to Marion and Greencastle, Pa., and it is stated that contracts will be awarded soon. T. M. Nelson, president; William McGowan, chief engineer.

Chicago Ottawa & Peoria Railway.—This company, whose incorporation was noted in the Electric Railway Review of April 27, 1907, page 564, will build to connect the Peoria lines of the Illinois Traction Company with the Illinois Valley Railway, and will give a Chicago connection for the Illinois Traction system. W. B. McKinley is president and H. E. Chubbuck general manager of the Chicago Ottawa & Peoria.

Duquoin Belleville & St. Louis Electric Railway.—It is reported that this company has made all of the preliminary arrangements for building its electric line from Zeigler to Belleville, Ill., and St. Louis, Mo., via Benton and Duquoin. The following officers have been elected: President, William R. Hayes; vice-president, Thomas H. Davison; secretary, Thomas J. Howell; treasurer, Harry E. Ross; general manager, J. Henry Ward. Surveys for the line have been completed, and it is expected to enter St. Louis over the tracks of the East St. Louis & Suburban Railway.

Evansville & Southern Indiana Traction Company, Evansville, Ind.—This company has nearly completed the work of rebuilding and improving its track between Evansville and Princeton. Considerable regrading is being done to eliminate steep grades so as to permit of faster time and it is expected to make the run to Princeton, 28 miles, in one hour.

Falkenau Construction Company, Chicago, Ill.—This company

has secured the right of way and will build an electric line from Benton Harbor to Coloma and Paw Paw Lake, Mich.

Fayetteville (N. C.) Street Railway & Power Company.—The James D. Lator Company, Washington, D. C., is preparing plans and specifications for the construction and equipment of this company's 20-mile line at Fayetteville, including a power house.

Georgia Railway & Electric Company, Atlanta, Ga.—This company has filed an amendment to its charter authorizing the building of the extension from East Point to Hapeville, Ga.

Hanover & York Street Railway, York, Pa.—A charter has been granted this company for an extension of 1½ miles in the township of Penn and the borough of Hanover, which was authorized at a meeting of the stockholders on April 20. L. C. Mayer chief engineer, York, Pa.

Indiana Columbus & Eastern Traction Company.—J. C. Carland of Toledo, O., the general contractor for the construction of the Lima-Bellefontaine line, has sublet the work to W. F. Gibson of Toledo.

Indianapolis & Louisville Traction Company, Louisville, Ky.—It is now stated that the line between Indianapolis and Louisville, which will be operated by this company, the Indianapolis Columbus & Southern Traction Company and the Louisville & Northern Railway & Lighting Company, will be opened for traffic about August 1. The Louisville & Northern is now operating as far north as Sellersburg. Between Sellersburg and Scottsburg the track is practically completed, but the power house at Scottsburg is not yet ready for operation. The construction force between Scottsburg and Seymour is to be doubled this week and the track should be completed in July. The Indianapolis & Louisville is building the line from Sellersburg to Seymour and the Indianapolis Columbus & Southern, which has a line in operation from Indianapolis to Columbus, is extending south to Seymour, 18 miles. Of this distance track has been laid and the rails bonded for seven miles south of Columbus and nearly all the grading is completed.

Ithaca & Seneca Falls Interurban Railway.—This company, which was incorporated in January, is making preparations for beginning construction in July on its proposed line from Ithaca to Seneca Falls, N. Y., 47 miles. The power station and repair shops will be located at Ithaca. Jacob Rothschild of Ithaca is president.

Kansas City St. Joseph & Excelsior Springs Electric Railway.—The city council of Kansas City, Mo., on April 25 voted a franchise to the Kansas City St. Joseph & Excelsior Springs Electric Railway for the construction of its railway, wagon and foot roadway bridge across the Missouri river at Kansas City, with a south approach on Locust street, which will serve as an entrance to the city for the company's proposed double-track line to St. Joseph and Excelsior Springs. The company was also granted franchises for the use of certain streets in order to connect the interurban tracks with those of the Metropolitan Street Railway. The company has a permit from the federal government for the construction of the bridge, with a provision that work must be started by May 16. The company has already secured the right of way for the line and is ready to begin work both on the bridge and on the roadbed at once. A contract for the four piers of the bridge was let some time ago to the Kansas City Construction Company. Plans have also been prepared for a subway under Locust street, from Fourth to Twentieth streets. Ira G. Hedrick, Kansas City, is consulting engineer.

Kansas Traction Company.—S. D. Frazier, secretary and treasurer, Coffeyville, Kan., writes that this company has been incorporated to build an electric line from Coffeyville to Lawrence, Kan., with branches from the latter point to Topeka and Kansas City, a total distance of 225 miles. The route includes Coffeyville, Parsons, Chanute, Iola, Colony, Garnett, Ottawa, Lawrence, Rosedale and Argentine. Final surveys are to be commenced by May 1 and contracts are to be let as soon as surveys are completed. It is intended to build a road of the highest type of construction for high-speed passenger, freight, mail and express service. Eighty-pound rails will be used. The power house is to be located at Coffeyville. F. E. Shirley, president, Coffeyville.

Lake Erie & Youngstown Railroad, Youngstown, O.—This company, recently incorporated to build an electric or gasoline motor railway between Conneaut, Ashtabula and Youngstown, O., has organized by electing the following officers: President, John H. Ruhlman; vice-president, George J. Chapman; second vice-president, W. F. Stanley; secretary, W. H. Ruhlman; treasurer, G. M. Brown; general counsel, A. W. Jones. Surveys have already been started.

Lake Shore Electric Railway.—This company is reballasting its entire road between Cleveland and Toledo, O., in preparation for the expected heavy summer traffic. It is announced that the Sandusky-Fremont cut-off will be ready for operation by June 1.

Louisville & Southern Indiana Traction Company, New Albany, Ind.—It is reported that this company is considering an extension from Jeffersonville to Madison, Ind., via Charlestown or Scottsburg.

Macon Americus & Albany Electric Railway, Macon, Ga.—This company, recently incorporated to build from Macon to Atlanta, Ga., has organized by electing the following officers: President, Joseph S. Davis; first vice-president, W. J. Kincaid; second vice-president, John T. Moore; secretary, N. J. Cruger; treasurer, W. J. Massee; assistant secretary and treasurer, Stuart C. Davis, and general counsel, M. Felton Hatcher. The surveying, engineering and other preliminary arrangements which have been going on as rapidly as possible for the last six months are now nearing a state of

completion and at an early date the actual construction of the railway will be begun.

Marion-Logansport Traction Company.—It is reported that this company has secured most of the right of way for its line between Marion and Logansport, Ind. J. O. Wilson of Marion is secretary of the company.

Maryland Electric Railways, Baltimore, Md.—This company, acting for the United Railways & Electric Company of Baltimore, has closed a contract with J. G. White & Co. of New York for preparing plans and supervising the work of electrifying the Baltimore & Annapolis Short Line between Baltimore and Annapolis.

Mexico Perry & Santa Fe Traction Company.—This company, which proposes to build an electric railway from Mexico to Perry, Mo., has organized by electing the following officers: President and general manager, S. L. Robinson, Belleville, Ill.; first vice-president, C. W. Gaither, St. Louis, Mo.; second vice-president, W. W. Mundy, Mexico, Mo.; third vice-president, J. D. Bates, Centralia, Ill.; secretary and treasurer, H. D. Ahlbrandt, St. Louis. It is stated that work on the line will begin shortly. The power house is to be located at Mexico.

Mineral Wells Electric Railway.—The Howard-Burke Engineering Company, Mineral Wells, Tex., has the contract for building this company's 10-mile street railway system in Mineral Wells, also car barns, power house and ice plant for the company.

Mt. Hood Railway & Power Company, Portland, Ore.—F. C. Finkle, consulting engineer, Portland, writes that construction will begin about July 1 on this proposed line from Portland to Bull Run, Ore., 25 miles, via the most direct route. Surveys are now in progress, with the first 20 miles, from Portland to Sandy, completed. Bids have been received for a power house and substation. E. P. Clark, Los Angeles, president.

Nashville Interurban Railway.—H. H. Mayberry, president, Nashville, Tenn., writes that this company's proposed line will extend from Nashville via Franklin, Spring Hill and Columbia to Mt. Pleasant, Tenn., a distance of approximately 60 miles, through an excellent territory, with a population of 45,000, exclusive of Nashville. The maximum grade will be 1½ per cent and there will be few curves, as the line is to be built for high-speed service. The Interurban Company, Patrick Hirsch, manager, 25 Broad street, New York, has the contract. The final surveys and the work of securing the right of way are expected to be completed by May 10 and May 25 has been announced as the date of beginning actual construction. The officers of the railway are: President, H. H. Mayberry; vice-president, Nat Baxter, Jr.; secretary, C. R. Cockle; treasurer, Joseph Frank, and chief engineer, D. A. Proctor, all of Nashville, where the company's offices are located in the First National Bank building.

Northwestern Ohio Electric Railway.—E. C. Bell, Toledo, O., a director of this company, writes that it is proposed to build an electric railway from Defiance to Montpelier, O., 34 miles, via Bryan and Evansport. Surveys have been made and contracts for the construction are to be let at once. Grading is to begin on May 20. President, G. A. Rigrish; chief engineer, M. Steinberg, Defiance, O.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has been authorized by the city engineer of Omaha to build a double-track line on Fortieth street, from Dodge street to Cumming street, and work is to begin at once. Work is also to begin on a new line from Thirteenth to Fifteenth streets, on Davenport street.

Omaha & Nebraska Central Railway.—The contract for grading this road between Omaha and Hastings, Neb., has been let to C. D. Conover of Omaha and work is to begin at the Hastings end of the line at once.

Philadelphia & Western Railroad.—The first train was operated over this road on Saturday, April 27, from the terminal station at Sixty-third and Market streets, Philadelphia, to Strafford, Pa., 12½ miles, carrying a party of officials. The current was turned into the third rail on Thursday and it is the intention to run trains each day for the purpose of training the crews and testing the equipment. Work is now in progress on the station at Beechwood Park, a large new amusement resort, which will be opened about the time the road is completed. It is now announced that regular operation will probably be started about the last of the month.

Pittsburg & Butler Street Railway.—This new line between Pittsburg and Butler, Pa., which was described at length in the Electric Railway Review of April 27, 1907, is expected to be opened for traffic on May 2. The first car was operated over the road on April 24, carrying a party of officials.

Puget Sound Electric Railway, Tacoma, Wash.—It is reported that Stone & Webster of Boston propose to double-track this line between Tacoma and Seattle, Wash. W. S. Dimmock, manager, Tacoma.

Rockford Oregon & Southern Railway.—This company is now making a preliminary survey from Rockford to Oregon, Ill., for the proposed line which is to connect those towns with Dixon, Ill. F. G. Jones of Oregon is interested.

Rock Island Southern Railroad, Monmouth, Ill.—It has been announced that this company has decided not to build the proposed line between Rock Island and Monmouth, Ill., this summer, on account of the high prices of construction materials. The project

has not been abandoned, but will be postponed until the fall or next spring.

San Francisco Vallejo & Napa Valley Railway.—General Manager L. J. Perry, Napa, Cal., states that this extension of the Vallejo Benicia & Napa Valley Railroad from Napa to St. Helena, Cal., 18 miles, will probably be in operation by the end of summer. A shipment of 900 tons of rails is expected from the east this month and a shipment of Japanese oak ties is expected daily. Work on the grading, bridges and culverts is progressing rapidly and the poles and wires have been ordered.

Shore Line Street Railway.—This company has been organized at New Bedford, Mass., to build an electric railway to Horse Neck Beach and Westport, Mass., 13 miles. Capital stock, \$75,000. The directors are the following: Charles F. Parkerm of Woonsocket, R. I.; A. C. Ralph of Taunton; Andrew H. Sowle of Westport; B. W. Gleason of Boston; J. M. Shorrocks of Westport; Jeffers F. Richardson of Albany, N. Y.; N. L. Sheldon of Boston.

Southwest Missouri Railroad, Webb City, Mo.—Surveyors have been locating a change of route on the Lakeside Park-Carthage line north of Lakeside Park, in order to avoid two sharp curves at a crossing over the Missouri Pacific tracks. The steam road would only permit a right-angle crossing when the line was built. The new line will pass under the Missouri Pacific tracks and by straightening the line will save a considerable distance between Webb City and Carthage. A. H. Rogers, president, Webb City.

South Texas Traction Company.—James T. Sanford, J. T. Gossett, O. B. Greeves and I. D. Polk of Beaumont, Tex., are interested in the construction of an electric line from Beaumont to Port Arthur, Tex., 19½ miles, which has been surveyed by Mr. Sanford. The promoters recently made a trip of inspection over the line and it seems probable that the construction will begin at an early date.

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis, Ind.—H. J. McGowan has announced that the line will be extended from Danville to Amo, Ind., as originally planned, but that instead of extending the Danville line to Brazil, where connection can be made for Terre Haute, the Plainfield line will be extended to Brazil and also connected later with the Danville line at Amo, making a loop, so that there will be two entrances to Indianapolis from Terre Haute, one via Danville and the other via Plainfield. Work has been started between Danville and Amo, seven miles, in preparing the grade for tracklaying.

Utica Southern Railroad.—The New York railroad commission has granted this company a certificate of necessity for its line from Clinton to Hamilton, Norwich and Waterville, N. Y., 26 miles. At a recent hearing it was shown that the road is generally desired by the citizens of the towns through which it will pass. Practically all of the right of way has been obtained. Frank H. Baxter of Utica, N. Y., is chief engineer.

Vincennes Washington & Eastern Traction Company, Vincennes, Ind.—This company has filed copies of a mortgage for \$1,250,000 on its property, right of way, etc., between Vincennes and Washington, Ind. W. H. Schott of Chicago is president.

West Penn Railways, Pittsburg, Pa.—A contract will soon be let for the construction of the last five miles of the Brownsville extension, from Orient to Brownsville.

Yakima Intervalley Traction Company.—This company, which proposes to build a system of electric railways radiating from North Yakima, Wash., has begun grading at that point, under the direction of E. M. Kenly, chief engineer.

POWER HOUSES AND SUBSTATIONS.

Indianapolis & Cincinnati Traction Company.—It is reported that this company is installing a 1,000-kilowatt turbine at its power house in Rushville, Ind. This will produce sufficient additional power for the operation of all the divisions of this road.

Indianapolis Columbus & Southern Traction Company has decided to build two substations, one at Columbus, Ind., and one at Redding, six miles south, and will construct an addition to the Edinburg power plant.

Kokomo Marion & Western Traction Company.—This company has recently installed a new 2,000-horsepower turbine in its power plant at Kokomo, Ind., and another of the same capacity has been ordered.

Omaha & Council Bluffs Street Railway.—It has been announced that this company has been authorized to spend about \$300,000 in improvements to its power house at Omaha, Neb. The contract for laying the new underground conduit and high-voltage cables for transmitting energy from the new plant to outlying stations has been awarded to James Jensen.

Portland (Ore.) Railway Light & Power Company.—It is stated that this company has secured a right of way for a transmission line to Salem and another right of way to the Oregon Electric Railway in order to supply the latter railway with current for operating its cars.

Tri-City Railway & Light Company, Davenport, Ia.—It is announced that work on the erection of a new substation for this company has progressed favorably and the concrete floor of the station has now been put down and machinery is being installed.

Twin City Rapid Transit Company.—This company has recently installed in its substation at College avenue and Wabasha street, St. Paul, Minn., one complete battery, consisting of two oil switches, three transformers and one rotary converter.

Personal Mention

Mr. John F. Rutherford has been elected president of the Citizens' Light & Transit Company of Pine Bluff, Ark., to succeed Mr. J. B. York, resigned.

Mr. Robert Dunbar has resigned as superintendent of the Haverhill and Salem divisions of the New Hampshire Electric Railways, Haverhill, Mass., to engage in other business.

Mr. Frank J. Doyle, whose appointment as master mechanic of the Schenectady Railway Company was noted in the Electric

Frank J. Doyle.

Railway Review for April 6, 1907, was born in Buffalo, N. Y., and received his education in the public schools of that city. In 1894 he entered the service of the General Electric Company at Schenectady, where he remained for seven years, receiving practical training in its armature, railway motor-testing and experimental third-rail track departments. In 1901 he became connected with the Schenectady Railway as instructor of motormen; was later barn foreman and more recently general foreman of the operating barns and repair shops. Upon the resignation of Mr. L. L. Smith as master mechanic, Mr. Doyle was appointed his successor and assumed the duties of this office on April 10, as previously announced.

Mr. C. C. Long, manager of the Tazewell Street Railway, has been appointed superintendent of the Accomac Traction & Power Company, organized to build a line from Ocancock to Occomac Court House, Va., with office at Ocancock. Mr. Long will also retain his position with the Tazewell Street Railway, with office at Tazewell, Va.

Mr. Edwin J. Wilcoxon, heretofore superintendent of transportation of the Rochester Railway, the Rochester & Suburban Railway and the Rochester & Sodus Bay Railway, has been appointed general superintendent of those companies, with headquarters at Rochester, N. Y. Mr. Wilcoxon was born in Seneca Falls, N. Y., on April 27, 1871, and was educated in the public schools of that city. In 1888, after completing a course in the Mynderse Academy and the Taylor Business College at Rochester, he entered the car service department of the Buffalo Rochester & Pittsburg Railway, having headquarters at Bradford, Pa., and later at Buffalo, N. Y. He was afterward given a position in the office of the superintendent, but resigned to become connected with the Wagner Palace Car Company of Buffalo, as secretary to the assistant manager.

Edwin J. Wilcoxon.

In 1896 he was appointed general passenger agent of the Geneva & Cayuga Lake Railroad. During his connection with this road it was converted from steam to electricity and it was here that he obtained his first experience in electric railway work, devoting the years 1898 and 1899 to the study of electrical operation in the company's shops and power house. In 1900 he was appointed assistant superintendent of construction of the Rochester & Sodus Bay Railway and after its completion was successively assistant superintendent and general freight and express agent. Two years later he was made general superintendent of this company, then division superintendent of the Rochester Railway and more recently superintendent of transportation, which position he has held for about a year.

Mr. F. T. Buchanan, heretofore superintendent of the railway and amusement department of the Key West (Fla.) Electric Company, has resigned, effective on May 1, and will return to his former home at Woburn, Mass., in the hope of regaining his health. He was formerly general superintendent of the Cape Breton Electric Company at Sydney, N. S., which is managed by the Stone & Webster interests of Boston, Mass., but more recently was trans-

ferred, for the benefit of his health, to the Key West property of the company. Mr. N. B. Rhoads of Savannah, Ga., has been appointed his successor.

Mr. F. J. Hanlon, whose portrait is presented herewith, is well known to the street railway circles of the middle west by reason of his long service with the Mason City & Clear Lake Railway, and by his connection with the Iowa Street and Interurban Railway Association since it was first organized. At its third annual meeting Mr. Hanlon was elected president and that his successful management during his term of office was appreciated by his associates is evidenced by his re-election as president of that body at its fourth annual meeting, held at Clinton, Ia., on April 19 and 20, 1907. Mr. Hanlon was born on August 12, 1876, and at the age of 15 years he entered the general freight department of the old Mason City & Ft. Dodge Railway, now a part of the Chicago Great Western system. After two years of service with this road he resigned to become chief clerk in the general superintendent's office of the Iowa Central Railway at Marshalltown, Ia., where he remained for four years. At this time, like other well-known managers of electric railway properties whose early experience was obtained in the service of steam roads, Mr. Hanlon became convinced of the great opportunities afforded in electric railway work, and, in 1897, resigned his position to become connected with the Mason City & Clear Lake Railway, then under construction. This road operates in Mason City and reaches Clear Lake Park, a resort about nine miles from Mason City, and under his efficient management has developed into one of the important interurban properties of the state of Iowa. In connection with his duties as vice-president and secretary Mr. Hanlon also has entire charge of the traffic department, which the rapid growth of the company's interurban freight business has recently made necessary.

F. J. Hanlon.

Mr. L. D. Mathes, who was re-elected secretary and treasurer of the Iowa Street and Interurban Railway Association at its fourth annual meeting, held at Clinton, Ia., on April 19 and 20, has held this office since the association was first organized, and has contributed in no small measure to its rapid growth from a new and necessarily small organization to its present size and standing among the street railway associations of the country. Mr. Mathes is about 35 years of age and is a native of the south. After graduating from the University of Tennessee he entered the shops of the Memphis & Charleston Railroad at Memphis, Tenn. He left this company shortly after to take up electrical work with the Edison General Electric Company (now the General Electric Company) and later with the Westinghouse Electric & Manufacturing Company, with which companies he was engaged in the construction and equipment of electric railways in various sections of the country for about five years. Deciding to familiarize himself with the details of operation he accepted a position as general foreman of the Buffalo & Niagara Falls Electric Railway, later resigning to become superintendent of the Norfolk (Va.) & Ocean View Railway, then in the hands of a receiver. During his two and one-half years of service with this company, during which he developed a considerable freight business, his successful financial policy resulted in the restoration of the road to the original owners and the placing of its finances on a sound basis. He subsequently became general superintendent of the Charleston (S. C.) & Seashore Railway, resigning at the end of a year to accept a similar position with the Norfolk & Atlantic Terminal Company, which, in addition to its freight and passenger business, also operated a line of steamers. Deciding later, however, that more important work commensurate with his wide experience in all branches of the electric railway field was afforded in the west, Mr. Mathes severed his connection with this property and is now general manager of

L. D. Mathes.

the Union Electric Company of Dubuque, Ia., which position he has held for several years.

Mr. O. D. Collins, superintendent of the Home Gas & Electric Company, Redlands, Cal., has resigned to become superintendent of the Redlands & Yucaipa Railroad at Redlands, Cal. Mr. Collins was formerly superintendent of the San Bernardino Traction Company.

Mr. N. B. Rhoads, formerly with the Savannah Electric Company at Savannah, Ga., has been appointed superintendent of the railway and amusement department of the Key West (Fla.) Electric Company, succeeding Mr. F. T. Buchanan, recently resigned on account of ill health.

Mr. Edwin E. Johnson has been appointed to the newly created position of manager of the publicity department of the Georgia Railway & Electric Company, Atlanta, Ga. Mr. Johnson is well known in newspaper circles in Atlanta, having been connected with local papers for about six years.

Mr. A. R. Whaley, superintendent of the New York division of the New York New Haven & Hartford, has resigned to accept a position with the New York Central & Hudson River as manager of the Grand Central station and general superintendent of the electric zone, succeeding Mr. I. A. McCormick.

Mr. E. W. Robertson of Columbia, S. C., has been elected president and treasurer of the Anderson Traction Company, Anderson, S. C. Mr. William Elliott, Jr., has been elected vice-president and general manager. Mr. J. A. Brock, heretofore president of the Anderson company, has resigned to devote his attention to his cotton mill interests.

Mr. Dewitt C. McMonagle has been appointed general manager of the Walkkill Transit Company, Middletown, N. Y., succeeding Mr. E. C. Folsom, who has gone to Bay City, Mich., as general superintendent of the Saginaw-Bay City Electric Railway & Light Company. Mr. William N. Gould has been appointed superintendent, succeeding Mr. J. P. Beale, who has been appointed superintendent under Mr. Folsom at Bay City.

Obituary.

L. P. Huntoon of Ft. Wayne, Ind., died in that city on April 16. He had been connected with railway engineering work in the central states for several years and at the time of his death was chief engineer of the Ft. Wayne & South Bend Railway.

Thomas Whinston Peoples, formerly for many years chief engineer of the Manhattan Elevated Railway, New York, died at his home in East Orange, N. J., on Saturday, April 28, after a brief illness, aged 77 years. He was born in Harrisburg in 1830 and at the early age of nine years entered the shops of the Pennsylvania Railroad, where he remained until his appointment 12 years later as master mechanic of the Harrisburg division of the road. At the opening of the civil war he organized a company of volunteers from among his railroad associates and accompanied it to the front.

David Willcox of New York, N. Y., who resigned on April 9 as president of the Delaware & Hudson Company, committed suicide on April 24 on board the North German Lloyd steamship Barbarossa, while returning from a trip abroad for his health. Mr. Willcox was also president of two prominent electric railway companies controlled by the Delaware & Hudson Company, the United Traction Company of Albany, N. Y., and the Hudson Valley Railway of Glens Falls, N. Y. He was succeeded as president of the Delaware & Hudson by Mr. L. F. Loree, formerly president of the Baltimore & Ohio and the Chicago Rock Island & Pacific railways.

Electric Railways in New Jersey for 1906.

The annual statement of the New Jersey state board of assessors for the year 1906 shows an increase in the gross receipts of the 68 companies reporting, of \$2,471,815 over the previous year. The aggregate figures of all the companies reporting show the following: Trackage, 1,060.982 miles; capitalization, \$98,377,860; funded debt, \$97,152,087; other debts, \$28,132,749; cost of roads and equipment, \$178,420,733; cost of repairs and operation, \$7,289,409; gross receipts, \$12,209,733. Only nine of the 68 companies which filed reports paid dividends last year, the total payments under this item amounting to \$885,890. The tax is based on the gross receipts of each company. Under the Voorhees franchise tax law the tax was 2 per cent, but under the act of 1906 the amount is increased one-half of 1 per cent each year until it reaches 5 per cent in 1912. Thereafter it is to remain at that figure. This year the total tax in the state will be \$305,243.

Service on Ft. Dodge Des Moines & Southern.

J. L. Blake, manager of the Ft. Dodge Des Moines & Southern Electric Railway has completed the preliminary schedule for the interurban service on the new line. The Boone-Des Moines line will be in operation during the first week in June, the Ames-Des Moines service will start about July 1 and the Ft. Dodge-Des Moines service about August 1. In the Boone-Des Moines service cars will leave Boone and Des Moines every hour and 50 minutes, starting at 6:55 in the morning and continuing until 11:30 at night. The Ames-Des Moines service will consist of cars leaving each town about every hour and 30 minutes between 6:55 a. m. and 11:30 p. m. It is expected to have cars leave Ft. Dodge and Des Moines every two hours. The Boone and Ames services will be kept separate, that is, cars will run direct from Boone to Des Moines and return and from Ames to Des Moines and return. This will make double service between Des Moines and the junction where the Boone and Ames lines meet. At present 2 cents per mile will be charged on one-way tickets, but a rate of 1½ cents will be made on round trip tickets. Mileage books will be sold at a lower rate.

Financial News

Berkshire (Mass.) Street Railway.—Authority has been given to this company by the Massachusetts railroad commission to issue \$250,000 additional capital stock, which will be offered to stockholders at \$100 a share. The proceeds will be used for retiring floating debt and for the purchase of additional property.

Cleveland Southwestern & Columbus Railway, Cleveland.—This company has filed a mortgage securing the issue of \$10,000,000 of 5 per cent bonds. The Cleveland Trust Company is trustee.

Columbus (O.) Railway & Light Company.—David E. Putnam, vice-president of the Commercial National Bank of Columbus, has been elected a director to succeed Charles H. Lindenberg, resigned.

Consolidated Railway Company, New Haven, Conn.—It is announced that about \$12,000,000 of the \$21,000,000 outstanding 4 per cent debenture bonds have been exchanged for the stock of the New York New Haven & Hartford Railroad Company. The property owned by the Consolidated company, it is stated, will be formally acquired by the New York New Haven & Hartford road.

Detroit United Railway.—Earnings of this company for the three months ended March 31, with comparisons, are as follows:

Quarter ended March 31—	*1907.	*1906.	1905.
Gross earnings	\$1,437,727	\$1,235,164	\$1,048,018
Expenss and taxes	941,542	760,084	676,453
Net earnings	\$ 496,185	\$ 475,080	\$ 371,565
Other income	13,624	11,285	12,077
Total	\$ 509,809	\$ 486,365	\$ 383,642
Fixed charges	332,677	288,314	276,693
Surplus	\$ 177,132	\$ 198,051	\$ 106,949

*Figures for 1907 and 1906 include operations of the Rapid Railway System, the Sandwich Windsor & Amherstburg Railway and the Detroit Monroe & Toledo Short Line Railway.

Duquoin (Ill.) Belleville & St. Louis Electric Railway.—This company has given a mortgage to the Carnegie Trust Company of New York, as trustee, to secure an issue of \$2,000,000 of 20-year 5 per cent bonds, dated February 1, 1907.

International Railway System, Buffalo.—The earnings for the quarter ended March 31 were as follows:

Quarter ended March 31—	1907.	1906.	1905.
Gross earnings	\$1,173,170	\$1,065,546	\$933,169
Operating expenses	764,831	686,609	589,748
Net earnings	\$ 408,339	\$ 378,937	\$343,421
Other income			13,064
Total	\$ 408,339	\$ 378,937	\$356,485
Fixed charges	295,054	285,430	402,828
Surplus	\$ 113,285	\$ 93,507	*\$46,343

*Deficit.

Eastern Ohio Traction Company, Cleveland.—An order permitting the sale of the property of this company was entered by Judge Ford in the common pleas court at Cleveland on April 30.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.—Hugh J. McGowan of Indianapolis has been elected second vice-president to succeed W. Kelsey Schoepf of Cincinnati. Other officers were elected as follows: President, J. Levering Jones of Philadelphia; first vice-president, Charles Murdock of Lafayette, Ind.; secretary, S. B. Fleming, Ft. Wayne, and treasurer, H. C. Paul, Ft. Wayne. The officers, together with Randal Morgan, Bayard Henry and H. H. Kingston of Philadelphia, form the board of directors.

Kenosha (Wis.) Electric Railway Company.—This company has increased its capital stock from \$150,000 to \$1,000,000.

La Crosse (Wis.) City Railway Company.—This company has increased its capital stock from \$250,000 to \$500,000.

Lewiston (Me.) Augusta & Waterville Street Railroad.—This company has purchased control of the Augusta Winthrop & Gardiner Railway of Augusta, Me., and is negotiating for the purchase of control of the Lewiston Brunswick & Bath Street Railway.

London (Ont.) Street Railway Company.—It is reported that negotiations are under way for the purchase of this company by the city of London. The property is controlled by the Everett-Moore syndicate. The London company has \$550,000 capital stock and \$500,000 bonds outstanding, and operates 33½ miles of road. It controls the Springbank Park Railway and Springbank park.

Memphis (Tenn.) Street Railway.—The earnings for 1906, with comparisons, were as follows:

	1906.	1905.	1904.
Gross	\$1,428,931	\$1,114,022	\$979,513
Expenses and taxes.....	838,227	578,289	483,781
Net	\$ 590,708	\$ 535,733	\$495,732
Interest, etc.	372,783	349,154	311,451
Surplus	\$ 217,925	\$ 186,579	\$184,281

After allowing for the 5 per cent dividend on the \$2,500,000 preferred stock, the balance of surplus shows 3.72 per cent earned on the \$2,500,000 common stock outstanding.

Milwaukee Northern Railway Company.—This company has given a trust deed to the Fidelity Trust Company of Milwaukee to secure an issue of \$4,000,000 bonds, maturing in 30 years. The road is projected from Milwaukee to Sheboygan and Fond du Lac, and construction is now in progress between Milwaukee and Port Washington.

Northern Ohio Traction & Light Company, Akron, O.—Earnings for the three months ended March 31 compare as follows:

Quarter ended March 31—	1907.	1906.	Increase.
Gross earnings	\$375,882	\$334,607	\$41,275
Operating expenses	235,506	224,371	11,135
Net earnings	\$140,376	\$110,236	\$30,140
Fixed charges	124,029	119,841	4,188
Surplus	\$ 16,347	*\$ 9,605	\$25,952

*Deficit.

Philadelphia Company, Pittsburg.—Earnings of the company for the three months ended March 31 were as follows: Gross earnings from operators, \$5,102,113.89; expenses and taxes, \$2,947,214.74; net earnings from operations, \$2,154,899.15; miscellaneous income, \$89,077.71; total earnings and income, \$2,243,976.86; fixed charges, \$1,072,574.82; balance, \$1,171,402.04; dividend on preferred stock, \$75,000; surplus, \$1,096,402.04; proportion due to other owners of common stock of affiliated corporations, \$13,012.92; available for Philadelphia Company, \$1,083,389.12.

Philadelphia Rapid Transit Company.—The recent call of \$5.00 per share upon the capital stock will net \$3,000,000 approximately. Upon payment of the present call a total of \$21,000,000 will have been paid in on the 600,000 shares of the company. Each assessment since organization of the company has been \$5.00 per share. The various dates upon which they have been made are given below:

Date of call—	Total assessment.
July, 1902	\$3,000,000
July, 1903	3,000,000
January, 1904	3,000,000
January, 1905	3,000,000
July, 1906	3,000,000
December, 1906	3,000,000
April, 1907	3,000,000
	\$21,000,000

Portland (Ore.) Railway Light & Power Company.—This company has given a mortgage to the Trust Company of North America of Philadelphia, as trustee, to secure an issue of \$15,000,000 general mortgage bonds, of which \$1,500,000 will be issued at present. The \$1,500,000 bonds will be used as collateral security for an issue of \$1,000,000 of 3-year 5 per cent notes dated March 1, 1907.

Rochester Corning & Elmira Traction Company.—This company, which has been given authority by the New York railroad commission to construct a road from Rochester to Elmira, has asked the commission for authority to issue \$8,000,000 first mortgage bonds.

Twin City Rapid Transit Company, Minneapolis.—Earnings for the quarter ended March 31, with comparisons, were as follows:

Quarter ended March 31—	1907.	1906.	1905.
Gross earnings	\$1,355,941	\$1,206,500	\$1,034,303
Operating expenses	694,296	592,418	518,361
Net earnings	\$ 661,645	\$ 614,082	\$ 515,942
Charges, taxes, etc.	345,775	329,125	291,975
Surplus	\$ 315,870	\$ 284,957	\$ 223,967

United Railroads of San Francisco.—Ernst Thalmann of New York, president of the United Railways Investment Company, which controls the United Railroads of San Francisco, denies that it is proposed to sell the San Francisco properties.

West Penn Railways Company, Pittsburg.—The report for the year ended March 31, 1907, compares as follows:

	1907.	1906.	1905.
Gross earnings	\$1,449,408	\$1,116,333	\$934,917
Expenses and taxes.....	806,515	600,535	522,645
Net earnings.....	\$ 642,893	\$ 515,798	\$412,272
*Charges	382,596	326,675	325,625
Balance	\$ 260,297	\$ 189,123	\$ 86,647
Dividends	137,500	137,500
Surplus	\$ 122,797	\$ 51,623	\$ 86,647

*Charges include subsidiary company's charges and interest on West Penn Railways Company bonds.

Dividends Declared.

Ohio Traction Company, Cincinnati, preferred, quarterly, 1½ per cent.
 Union Street Railway Company, New Bedford, Mass., quarterly, 2 per cent.

Manufactures and Supplies

ROLLING STOCK.

Topeka Railway, Topeka, Kan., will soon purchase eight new cars.

Cincinnati Georgetown & Portsmouth Railroad, Cincinnati, O., is in the market for 10 new cars.

Louisville & Eastern Railroad, Louisville, Ky., is in the market for new equipment on one work car.

Jacksonville Electric Company, Jacksonville, Fla., has ordered eight additional cars for delivery by July 1.

Danville Car Company, Danville, Ill., has contracted with A. S. Partridge for rebuilding twelve 12-bench open cars.

Indiana County Railways Company, Indiana, Pa., is in the market for four 50-foot double-truck cars and one gravel car.

Bellaire Southwestern Traction Company, Bellaire, O., recently purchased five semi-convertible cars from The J. G. Brill Company.

Nashville Interurban Railway, Nashville, Tenn., is reported to be placing orders for a number of interurban cars, a chair car and dining car.

Chicago & Milwaukee Electric Railroad, Chicago, has ordered two switching locomotives of the 0-6-0 type, with cylinders 17 by 24 inches, from Hicks Locomotive & Car Works.

Portland Railway Light & Power Company, Portland, Ore., is reported to have placed an order for 40 flat cars of 60,000 pounds capacity with the American Car & Foundry Company.

Anaconda Copper Mining Company, Anaconda, Mont., is in the market for one motor car, to be equipped with four 50-horse-power motors and to weigh approximately 60,000 pounds.

Tampa Electric Company, Tampa, Fla., has ordered twelve 12-bench open cars from The J. G. Brill Company. These are double-truck cars and will be equipped with two GE-67 motors.

Amarillo Street Railway, Amarillo, Tex., has placed an order with the Danville Car Company for four 22-foot car bodies, to be equipped with Brill 21-E trucks. The cars are for August delivery.

Illinois Traction System, Champaign, Ill., has placed an order with the American Car & Foundry Company for six motor express cars, 20 trailers for express service and four refrigerator cars. This road has also placed an order with the Niles Car & Manufacturing Company for two cars.

Pennsylvania Railroad has placed an order for 200 all-steel passenger cars as follows: With the American Car & Foundry Company, 90 coaches, 75 feet in length; with the Pressed Steel Car Company for 60 coaches, 75 feet long, 20 baggage and 5 combination cars 60 feet in length, and with the Altoona shops of the company for 25 coaches, to be 75 feet in length.

SHOPS AND BUILDINGS.

Detroit United Railway.—This company is said to be preparing plans for a new terminal station in Highland Park, on North Woodward avenue, on property purchased three years ago.

Indiana Columbus & Eastern Traction Company.—It is reported that this company has secured an option on property at Wayne and Second streets, Defiance, O., and will purchase it for a site for an interurban passenger station.

International Railway, Buffalo, N. Y.—This company has begun work on the new car house on Broadway, east of Bailey avenue, Buffalo, the preliminary plans for which were announced in the Electric Railway Review of March 16, 1907. The new car house will be of concrete and steel construction, 561 feet long and 148 feet deep, and will accommodate 108 46-foot cars. The storage yard along the south side of the building will accommodate 135 46-foot cars. Work is also to be started soon on the remodeling of the Hertel avenue barns. New tracks are to be constructed which will give a total storage capacity of 250 cars.

Interstate Traction Company, Duluth, Minn.—It is reported that this company will erect a car house to cost about \$10,000. O. C. Hartman, general manager.

Portland Railway Light & Power Company.—F. I. Fuller, vice-president, writes that the plans for the new terminal station and office building to be erected at Portland, Ore., are not yet fully prepared and consequently no details are available at the present time. The general plan is for a building which will include a steam-heating plant, distributing and transformer station, union depot for suburban lines, with waiting rooms and accessories, the offices of the company and several floors for general office purposes. The building will be 200 by 200 feet and probably six or seven stories in height.

St. Louis Electric Terminal Railway.—This company, which is securing terminal facilities in St. Louis for the Illinois Traction Company, which soon proposes to build a bridge across the Mississippi river from Venice, has completed the purchase of the property at the northeast corner of Twelfth street and Lucas avenue, with a 160-foot frontage, for its terminal station. The site will be used

for car sheds, waiting rooms, offices and a depot for handling freight and express. R. D. Smith, manager, St. Louis.

Toledo Railways & Light Company.—The city council has refused to grant a permit for the tracks required for the proposed interurban terminal station on Huron and Superior streets.

United Railways & Electric Company, Baltimore, Md.—This company has commissioned Baldwin & Pennington, architects, Baltimore, to prepare plans and specifications for a car barn, to be erected at the corner of Fulton and Druid Hill avenues, Baltimore; one story, 576 feet frontage, reinforced concrete construction, sprinkler system, metal frames and sashes, electric wiring and fixtures, sanitary plumbing, heating system, steel rolling doors.

Utica & Mohawk Valley Railway, Utica, N. Y.—Plans are being considered for the erection of an express depot and storehouse at the corner of Broadway and Lafayette streets.

Washington Baltimore & Annapolis Railway.—This company has commissioned Simonson & Pietsch, architects, Baltimore, to prepare plans and specifications for a railway station, to be erected at the corner of Park avenue and Liberty and Marion streets, Baltimore; two stories, 75 by 100 feet, brick with stone and ornamental terra cotta trimmings, electric wiring and fixtures, sanitary plumbing, heating system.

TRADE NOTES.

Pressed Steel Car Company has declared its regular quarterly dividend of 1 3/4 per cent on its preferred stock, payable on May 22.

Nathan C. Grover, formerly assistant chief hydrographer of the United States geological survey, has been appointed assistant hydraulic engineer of J. G. White & Co., New York.

Seattle Frog & Switch Company, Seattle, Wash., has been incorporated in the state of Washington with a capital stock of \$20,000 by Martin J. Henehan and James McDonough.

Warren Electrical Manufacturing Company, Sandusky, O., is in the market for about \$8,000 worth of machine tools, including a boring mill, radial drill, grinders, 35-inch lathe and a shaper.

Electric Storage Battery Company, Philadelphia, announces the removal of its sales office from Oakland, Cal., to 11 Hawthorne street, San Francisco, Cal., where it will occupy temporary quarters.

Blake Signal & Manufacturing Company, 246 Summer street, Boston, announces that it has appointed the Erner & Hopkins Company of Columbus, O., agents in the state of Ohio for the sale of its Blake tube flux.

Northern Engineering Works, builder of cranes, Detroit, Mich., has furnished the plant of the Edison Sault Electric Company, Sault Ste. Marie, Mich., with a second 15-ton alternating-current electric traveling Northern crane.

C. W. J. Neville, formerly engineer for the Expanded Metal Fireproofing Company, has been appointed manager of the southern district of the General Fireproofing Company of Youngstown, O., with headquarters at 409 Hennen building, New Orleans, La.

Railway Traction Construction Company, New York, has been incorporated with an authorized capital stock of \$100,000 to do a general contracting business. The incorporators are: Robert Gerbracht, Jr., 85 Taylor street; Martin A. Schenck, 50 Willow street, both of Brooklyn, and Kenneth R. Shand, Montclair, N. J.

The J. G. Brill Company, Philadelphia, which, as reported in the Electric Railway Review of April 13, lost its foundry building, located at Sixtieth street and Woodland avenue, Philadelphia, has awarded the contract to Henry E. Baton for the erection of a new building at that place. It will have ground dimensions of 109 by 240 feet and will be a steel frame and galvanized iron structure.

Indianapolis Switch & Frog Company, Springfield, O., lost by fire on April 23 the main building of its machine shop. This building, which was 400 by 225 feet, will be rebuilt at once as a fire-proof structure. The company has made arrangements to finish all unfilled orders and will, upon the completion of its new building, install new machinery and facilities, resuming operations on a much larger scale.

C. C. Long, general manager of the Tazewell Street Railway Company, Tazewell, Va., who has also been appointed superintendent of the Accomac Traction & Power Company, with offices at Onancock, Va., desires to have manufacturers of street railway equipment and appliances send him advertising literature. The Accomac Traction & Power Company has recently been organized to build a line from Accomac to Onancock.

Allison, Campion, McClellan Company, successors to the John W. Allison Company, has been organized to engage in general engineering work, with offices at 1623 Land Title building, Philadelphia, and 205 West Street building, New York. The members of the company are: H. T. Camplon, William McClellan and H. N. Twells. The company announces that it is prepared to carry a project through the periods of design, construction and successful operation.

National Railway Equipment Company, 1 Exchange place, Jersey City, N. J., has been incorporated under the laws of New Jersey, with a capital stock of \$10,000, for the purpose of manufacturing passenger and freight cars for steam roads and street cars for electric railways, all kinds of steel castings, journals, bearings, air

brakes and safety appliances. The incorporators are: Charles R. Barnes of Rochester, N. Y., and P. Anthony Brock and Howard C. Griffith of Jersey City.

Atha Steel Casting Company of Newark, N. J., manufacturer of railway steel castings, has recently opened several branch sales offices. An office has been opened in the Board of Trade building, Boston, in charge of George T. Paraschos as New England sales agent. R. N. Barrows, southern sales agent, is in charge of the Richmond, Va., office, located in the American National Bank building, and C. W. Gennet, Jr., is western sales agent, with offices in the New York Life building, Chicago.

J. M. Carpenter Tap & Die Company, Pawtucket, R. I., has commenced work on a new factory building that will add 24,000 square feet of floor space to its present plant. It will be a brick fireproof structure and will increase its manufacturing facilities 75 per cent. This company, whose products have been standard for nearly half a century, is the pioneer machine screw tap maker in this country, and upon completion of its new building will be in a position to serve its patrons promptly.

J. H. Wagenhorst & Co., Youngstown, O., manufacturers of the Wagenhorst electric blue-printing machine, announce a partial list of recent sales as follows: S. M. Green, Holyoke, Mass.; Monongahela River Consolidated Coal & Coke Company, Pittsburg; George S. Mills, Toledo, O.; Eugene Dietzgen Company, New York; Babcock & Wilcox, Barberton, O.; J. W. Gaddis, Vincennes, Ind.; Multicolor Copying Company, Detroit, Mich.; American Steel & Wire Company, Joliet, Ill.; Thomson Stationery Company, Vancouver, B. C.

James Ohlen & Sons Saw Manufacturing Company, Columbus, O., is building an addition to its plant, 125 by 140 feet, to be two stories in height and of fireproof construction. It will be equipped with new machinery for the manufacture of band and cross-cut saws. The demand for saws manufactured by this company has been rapidly increasing and the company is now contemplating the erection of additional buildings during the coming year for the purpose of providing more floor space to be devoted to the manufacture of band saws.

Paterson Brass Foundry has been incorporated under the laws of the state of New Jersey, with a capital stock of \$25,000, as manufacturer and furnisher of brass castings for general use and mixers of metals for special requirements, including brass, bronze, babbitt, composition and aluminum. The castings works and general office will be located at 42 Van Houten street, Paterson, N. J., and the New York office at 10 Wall street. The officers of the company are: President, P. O. Dixon; vice-president and general manager, Samuel Hart; secretary and treasurer, O. O. Dixon.

Bidwell Electric Company, 133-139 South Clinton street, Chicago, has purchased property at Chicago Heights, Ill., upon which it proposes to erect a new plant. The main building will be 80 by 500 feet, equipped with a 15-ton electric traveling crane and in which new machinery will be installed. An office building and a large blacksmith and forge shop will also be erected. In addition to this the company will erect in the near future another building, approximately 150 by 500 feet, and will also equip it with new machinery suitable for the manufacture of electric machinery and supplies.

General Electric Company, Schenectady, announces that its San Francisco office is now permanently located in the Union Trust building, San Francisco, Cal. The company has recently received an order from the Chicago City Railway for 1,200 direct-current railway motors with controlling apparatus, to be used for the operation of 300 new cars. Power for the new rolling stock will be supplied by additional electrical generating machinery aggregating 6,000 horsepower. Each car will be equipped with four motors of 40-horsepower capacity each, this size of motor being the standard for urban railways.

Allis-Chalmers Company, Milwaukee, during the month of March received more contracts for turbo-generator units than for any similar period since the building of turbines was begun by the company. As a result of this increased volume of business every effort is being put forth by the company to insure prompt delivery. Some of the orders received for turbo-alternator units include the following: Virginia Passenger & Power Company, Richmond, Va., one of 3,250 kilowatts capacity; Citizens' Light Heat & Power Company, Johnstown, Pa., one of 1,000 kilowatts capacity; Delaware Lackawanna & Western, one turbine unit of 2,000 kilowatts capacity for the Hampton Collieries, Scranton, Pa.

Silliker Car Works, Limited, Halifax, N. S., which has been incorporated with a capital stock of \$500,000 for the purpose of manufacturing street cars, has prepared plans for the erection of the following buildings: Woodworking shop, 75 by 200 feet, with dry kiln, paint shop and warehouse; car shop, 80 by 160 feet; machine shop, 75 by 150 feet; blacksmith shop, 75 by 125 feet; molding shop, 75 by 200 feet; erecting shop, 100 by 300 feet, and a central power house. These buildings will be equipped with modern tools and all machinery will be motor driven. As reported in the Electric Railway Review of March 16, the plant will be erected on a site of 25 acres recently purchased in Halifax, and will cost when completed about \$200,000.

Westinghouse Machine Company, Pittsburg, completed its third fiscal year on March 31 as a regular business organization marketing and selling its own product. Until 1904 the Westinghouse Machine Company was a manufacturing concern, its product being made for another company. It is interesting to note that during the last three years the business of the company has been trebled in orders and output. Many additions to the plant have been made and the manufacturing facilities have been repeatedly increased

to meet the growing demands for its product. The greatest impetus to the company's business was given when the Westinghouse-Parsons steam turbine was placed upon the market and when the company entered upon the manufacture of gas engines in large units. The orders which the company has secured during the first three months of the present year exceeded by far the aggregate of the business for the same period of last year and there is every indication that the Westinghouse Machine Company's business during 1907 will show a steady increase.

Underfeed Stoker Company of America, manufacturer of the Jones stoker, Marquette building, Chicago, desires to announce the appointment of Paul M. Chamberlain, M. E., as chief engineer. Mr. Chamberlain was graduated in engineering at the Michigan Agricultural College in 1888 and at Cornell University in 1890. After several years spent in practical work with the Brown Hoisting & Machinery Company of Cleveland, O.; the Frick Company, engineers, of Waynesboro, Pa., and the Hercules Iron Works of Aurora, Ill., he accepted the assistant professorship of mechanical engineering at the Michigan Agricultural College. At the opening of the Lewis Institute in Chicago he took charge of the engineering work and brought it up to its well-known degree of excellence. During his connection with the Lewis Institute he carried on much consulting and testing work, with special reference to power production. For the last year he has devoted his time to consulting work in Los Angeles, Cal., from where he comes to accept his present position. Mr. Chamberlain is a member of the American Society of Mechanical Engineers, also of the American Society for the Advancement of Science. His wide experience in both the practical and theoretical sides of his profession qualifies him in every respect to fill his new position with great credit, and, because of his wide acquaintance in the engineering fraternity the Underfeed Stoker Company considers him a valuable acquisition to its working force.

Heine Safety Boiler Company, St. Louis, Mo., reports the following recent sales: Asano Cement Company, Tokio, Japan, four boilers, aggregating 900 horsepower; Atlantic Gulf & Pacific Company, four 200-horsepower boilers for two hydraulic dredges, fifth order; American La France Fire Engine Company, Elmira, N. Y., two 230-horsepower boilers; American Locomotive Company, Richmond, Va., four 400-horsepower boilers; Bridgeport (Conn.) Forge Company, three 250-horsepower boilers; Crown Cotton Mills, Dalton, Ga., two 400-horsepower boilers; Home Brewery, Columbus, O., three 200-horsepower boilers; Hudson Companies, two 316-horsepower boilers, making a total to this company of 4,513 horsepower on 11 orders; Independence (Kan.) Cement Company, three 400-horsepower boilers, second order; James S. Kirk & Co., Chicago, two 500-horsepower boilers; Joseph J. Little building, New York, three 275-horsepower boilers; Quincy Horse Railway & Carrying Company, Quincy, Ill., three 316-horsepower boilers; City of New York for Ridgewood pumping station, eight 300-horsepower boilers; Pueblo & Suburban Traction & Lighting Company, Pueblo, Colo., one 378-horsepower boiler; Denver (Colo.) Gas & Electric Company, three 524-horsepower boilers; Texas Company, Beaumont, Tex., thirty-two 200-horsepower boilers for eight pipe-line oil-pumping stations in Texas; Victor Talking Machine Company, Camden, N. J., two 316 and two 270 horsepower boilers; Warren (R. I.) Manufacturing Company, one 323-horsepower boiler, making a total of 2,881 horsepower on six orders; Willamette Pulp & Paper Company, Oregon City, Ore., one 250 and two 366 horsepower boilers, third order; United States navy department, for Norfolk Navy Yard, two 428-horsepower boilers and four 350-horsepower boilers; United States navy department, for Charleston Navy Yard, through Muralt & Co., New York, four 350-horsepower boilers; Philadelphia House of Refuge, Glens Mills, Pa., four 250-horsepower boilers.

ADVERTISING LITERATURE.

Allis-Chalmers Company, Milwaukee, Wis.—Construction Book No. 5009 contains directions for the installation and operation of Allis-Chalmers direct-current motors and generators, type "K."

W. N. Matthews & Brother, St. Louis, Mo.—A conveniently arranged catalogue, well printed in two colors, gives the net prices on the line of electric specialties handled by this company. The line includes the Stonbaugh guy anchor, Kearney cable clamp, which was described in the Electric Railway Review of April 27, 1907, Lima jack box and plug and other well-known devices.

Massachusetts Chemical Company, Walpole, Mass.—A substantial catalogue, arranged in loose-leaf style for future additions, has been issued to describe the long line of insulating materials manufactured by this company. The company advocates the liquid and heat method of impregnating armature and field coils and offers a comparative treatise of that method of impregnation, as compared with the vacuum impregnation system.

Indestructible Fibre Company, 45 Broadway, New York, N. Y.—Wendell & MacDuffie, 26 Cortlandt street, New York, sole selling agents for this company, have just issued a 4-page pamphlet describing the material manufactured by it for car headlinings and marine work. There are three grades made up in various qualities for these classes of work and sold under the trade names of Durite, Fibrite and Kantlite.

Western Electric Company, Hawthorne, Ill.—Bulletin No. 4007 is devoted to the line of fan motors manufactured by this company. It shows the good things included in the 1906 line and embodies descriptions of motors, showing a number of new points of construction. The line includes alternating-current and direct-current wall bracket and desk fans; ceiling fans, for both alternating and direct current, the Hawthorne Universal fan and a number of fan-motor accessories.

Failure on the part of the public to appreciate the difficulties which continually harass operating officials of electric railways is responsible for much of the unwarranted criticism of companies that is current in large cities. In places where unjustified criticism prevails it might be advisable for companies to give the fullest

publicity to the rules which have been formed as a result of the experience of many years to lead conductors, motormen and other employes to treat the public with courtesy and to do all in their power to prevent accidents. People who are not familiar with the inner workings of street railways do not always realize that stringent rules exist to prevent inconvenience to the public, and that if all rules were followed at all times, many happenings which are now the cause of complaint would never occur. Such rules as directly affect the relations of employes with patrons could be brought to public attention in different ways. The daily newspapers might consider the information of sufficient interest to justify publication. It is doubtful if anyone could read thoughtfully the rules of the Denver City Tramway Company, which are referred to on another page of this issue, without feeling convinced that this representative company is doing all it can to assure the safety and comfort of those who travel on its lines.

On some interurban railways, and especially those built more than five years ago, the duties of the substation attendants include only the operation of the rotary converters and their auxiliary machinery. Unless a substation attendant has, as a part of his work, some duties other than these, he must be idle a large portion of his time. It frequently is the practice to have a substation inspector or repair man who may be called upon by substation attendants to put in operating condition damaged apparatus in any station. The Pacific Electric Railway, Los Angeles, Cal., with a view to economy and to the keeping of its employes interested in their work, hires for its sub-

station operation only men who are competent or can soon learn to repair any of the apparatus in the substations. The employes in each substation are held responsible for the good operating condition of their equipment, and additional help is called for only when time is an important element. This practice seems to appeal to the employes, as is shown by their desire not only to learn to operate the apparatus so that it will give the least trouble, but to know its constructional details so that they can make the repairs in the cheapest and best way. There is also the additional and very desirable feature that the attendant's time is more fully occupied and he therefore does not become anxious to leave substation work.

The cars of the San Francisco Oakland & San Jose Railway, known as the "Key Route," are of the large interurban type, but differ from the more usual high-speed car in that the platforms are longer and the steps wider. This change of design was required on account of the quick loading and unloading necessary at the ferry terminal common for all of the radiating lines. The schedules are arranged so that trains from each of the several lines arrive at the ferry terminal at about the same time, meeting there one of the company's large ferry boats which transfer the passengers across the bay between Oakland and San Francisco. Directly after a boat has left for San Francisco another lands its passengers coming from across the bay, and it is necessary quickly to reload the same trains. As a means of lessening the accidents, which it is well recognized occur most frequently at the steps, incandescent lamps are used to illuminate the grab handles and the steps. One 16-candle-power lamp with a reflector is supported above the door. The second lamp is placed under the supporting framework of the stanchion which divides the length of the steps in half. The bulb is thus protected from injury and illuminates the steps and the ground near the car. It has been found that this special illumination is highly appreciated by pas-

Publicity for Rules of Operation.

Lamps over Car Steps.

Keeping Busy in Substations.

sengers, as it affords on dark and rainy nights a well-lighted area on the street surface within which they may alight. The commendation from the public, together with the tendency of well-lighted steps and platforms to prevent accidents, should warrant consideration of this simple scheme not only for other interurban roads, but for cars operating in suburban and city service.

LABOR CONDITIONS IN SAN FRANCISCO.

After firmly refusing to grant the very extraordinary and seemingly unwarranted demands of the labor unions the United Railroads of San Francisco now faces a very serious strike condition. The management has announced that it will no longer recognize the unions and will attempt to operate its cars peaceably; but that if this is not possible the rights of the company will be defended by force. Much credit is due the management of the United Railroads for the firm stand it has taken against the exorbitant demands of the unions.

The various controversies between the labor organizations and the United Railroads led to the appointment on September 18, 1906, of a board of arbitration. The board considered the grievances of the several unions separately and listened to a very considerable amount of testimony. The hearing was commenced on October 31, 1906, and was not completed until January 9, 1907. As the result of the evidence presented, both by the unions and by the railway company, the arbitrators made the following awards, effective September 6, 1906, to May 1, 1907: Armature winders and electrical machinists to receive \$4.00 per day; station operators, \$96, \$102 and \$108 per month; dynamo tenders, \$2.50 per day; linemen, \$4.00 per day; car barn and truck men, \$100 and \$85 per month. Except in the case of the station operators, eight hours was defined as a day's work and the men working overtime were to receive time and a half up to 12 o'clock midnight, and double-time wages after midnight. Work on holidays was to be paid for at double-time rates. In the case of the station firemen an 8-hour day was decided upon and water-tenders and wipers were to receive \$3.00 and \$2.50 per day, respectively. The grievances of the street railway construction men, whose union included those engaged in track work, were adjusted by awarding day laborers \$2.25 per day during the first month of their employment and \$2.50 per day afterward; pavers, \$3.50 per day, and night watchmen, \$2.50 per day. In each of the classes of workmen just referred to, all three arbitrators concurred, but in the case of the members of the street railway and electric employes' organization, which demanded an 8-hour day and a flat wage of \$3.00 for the platform men, with a proportionate advance amounting to 40 per cent for all other employes who were members of the union, the board disagreed.

Briefly stated, the award of the majority of the board, which was binding for the period between September 6, 1906, and May 1, 1907, was as follows: Platform men were to be paid at the rate of 31 cents per hour, with 37.2 cents per hour for overtime during the first year; the same employes were to receive 32 cents per hour, and 38.4 cents per hour for overtime during the second year; for the third and following years of service the same employes were to receive 33 cents per hour and for overtime 39.6 cents per hour. No changes were made in the existing arrangements based on the 10-hour division of the day. These agreements as to wages and hours terminated on May 1, 1907, and the unions again demand from the United Railroads of San Francisco an 8-hour day and a flat wage of \$3.00 for all platform men.

The testimony before the board of arbitration which temporarily settled the last dispute brought out several interesting facts. It will be remembered that there were two questions, which, as regards the operation of the road, were to be considered by the board: (1) The employes' claim that the work required of them had very materially increased since

the fire of April, 1906; (2) the earlier mentioned demand for a day of eight hours and a wage of \$3.00.

In reply to the first claim Mr. E. D. Hibbs, general superintendent of the United Railroads, introduced in his testimony some interesting statistics comparing conditions before and after the earthquake. During the period from March, 1906, to July, 1906, the trackage had been reduced from 257 to 182 miles, a reduction of about 29 per cent. The track destroyed, however, represented the lines most heavily traveled. In March, 1906, the number of passengers per car-mile was 10.69, while after the earthquake, in July of the same year, the average was 12.42 passengers per car-mile, or an increase of 1.73 passengers. This increase of an average of less than two passengers per car-mile undoubtedly afforded a strong argument against the claim of the employes that their work had been much more severe since the fire.

Comparing still further the conditions before and after the fire it was noted that the concentration of traffic on a few of the lines now operated has been caused by the shifting of the centers of population, brought about by the moving of the shopping district. Before the earthquake the average increase in seating capacity necessary to accommodate the rush-hour traffic was 53.19 per cent and since the earthquake, owing to the lack of equipment, the number of extra cars available has permitted an increase of but 12.46 per cent in the seating capacity during the time of rush traffic. It was pointed out to the arbitration board by representatives of the railway that since April, 1906, the class of passengers handled consisted of a larger proportion of mechanics and laborers than before and that at least 90 per cent of these classes persist in riding on the platforms. This, it is seen, will give a crowded appearance to a car when there may be seats available inside. The regularity of operation also is greatly hampered, first, by the conditions of the streets in general, a large proportion of which are as yet impassable, except on the railway company's tracks, and second, by the character of the teaming in the burned district, which consists largely of heavily loaded trucks conveying building materials.

The testimony which tended to show the unreasonableness of the wage demand of the platform men also included some interesting comparisons and other information. As a basis for the arguments it was stated that no large electric railway system in this country operates on a flat 8-hour basis. The reasons for this are various and apply largely to cities of a class in which the traffic increases considerably during the rush hours. The normal car-day in San Francisco is 20 hours, which may conveniently be divided into two periods of 10 hours each. If the 8-hour day, as demanded, were granted, it would mean dividing the car-day into two periods of eight hours each and one 4-hour period. This in turn would result in so many short runs that even at the excessively high wage scale demanded it would be impossible for a part of the men to earn living wages. To illustrate how different an organization would be required to operate the equipment of the United Railroads of San Francisco on an 8-hour as compared with a 10-hour basis, maintaining the same headway, running time, trips, etc., it was stated that under such conditions an increase of 57 per cent in the number of employes would be necessary.

Compliance with the demand for a flat wage of \$3.00 per day for all platform men, it is thought, would work greatly to the disorganization of any large body of men such as that employed by the United Railroads for operating its cars. On the lines of this company almost 66 per cent of the car employes have been in service for more than two years and the gradual increase in the rate of pay is an inducement for them to remain permanently with the company. Another logical reason for a graduated scale is that the company provides penalties for offenses against good discipline, and it is only fair that the employe should have a reward for good service, which would be offered him if the wage scale in-

cluded the raising of his pay after a certain length of continued service.

MUNICIPAL OWNERSHIP.

The members of the committee on municipal ownership of the American Street and Interurban Railway Association are under no illusions regarding the extent of the sentiment in the United States in favor of public ownership. This is shown by their able report presented at the meeting of the association in Columbus in October, 1906, extracts from which are published on another page. Out of 159 replies which the committee received to its circular letter of inquiry to members of the association regarding municipal ownership, only 27 stated that there was agitation for municipal ownership in the localities of the writers. Of these 21 indicated that the agitation was but "slight." But figures such as these, as the committee evidently recognized, are apt to be misleading. Every person who keeps his finger on the public pulse knows that there has grown up in this country within the past decade a widespread sentiment for public ownership. This sentiment has developed into actual agitation in only a comparatively few communities, because in only a few have there occurred expirations of franchises or other events which have afforded opportunity for those favoring municipal ownership to attempt to crystallize their theoretical views in practical political and economic changes. These facts must be candidly recognized if the growth of the sentiment for public ownership is to be arrested.

The replies to the committee's question as to the causes of the agitation leave much to be desired. It is not surprising that none of the 58 companies responding held itself responsible for the municipal ownership sentiment in its community. Corporations, like men, usually feel that they safely can leave to others the task of pointing out their faults and mistakes. But no intelligent and candid person will deny that for the public opinion adverse to private ownership of public utilities which exists the managements of public utility corporations are themselves in considerable degree responsible. A large majority of these corporations have been conducted honestly and with a view no less to the best interests of their stockholders than to the rights of the public. But here and there corrupt bargains have been driven with city councils and legislatures anxious to be debauched. Here and there poor service has been given. Bad financial methods, involving in some instances excessive capitalization, and in many more the payment of excessive dividends and failure to charge proper sums to depreciation, have tended to cripple the companies and to give the public an exaggerated idea as to their earnings.

But, while these and other mistakes of public utility corporations unquestionably have helped foment the agitation for municipal ownership, it is equally indubitable that in the main, and fundamentally, this agitation has its roots in the socialistic sentiment which within recent years has spread so rapidly throughout the United States. The most marked characteristic of the socialistic propaganda is its tendency utterly to ignore practical facts and conditions; and doubtless there would have been agitation for municipal ownership, although it would not have grown so widespread and dangerous if every public utility corporation in this country had been managed as faultlessly as, humanly speaking, was possible.

The committee's recommendations regarding the best methods to adopt to arrest the growth of sentiment for municipal ownership are excellent. Giving the best service practicable and wiser methods of financing will contribute potently toward this end. The contrast between the progressive and efficient methods of private management and the slothful and inefficient methods of public officialdom should be made so great and so conspicuous that the least observant cannot fail to be impressed. The policy of giving

entire publicity to the facts as to the operation and position of the various companies, which many corporations favor, may then be adopted with the confident expectation that it will produce beneficial results from the standpoint of both the stockholder and the public.

The vital, fundamental need in the United States now, however, as the committee on municipal ownership evidently recognizes, is a thorough campaign of education on the subject of socialism in all its phases. From the time of the foundation of American institutions until within recent years the keynote of economic policy in this country, national, state and municipal, was encouragement to private initiative and enterprise. It was believed that the true interests of both individuals and the public would be best subserved in the long run if governments refrained from entering the fields of production and transportation except for the purpose of compelling the private individuals engaged in cultivating those fields to do justice to one another. The wonderful industrial progress which America has made—a progress which, both in its rapidity, and in the material blessings which it has brought to all classes, is without precedent or parallel in the history of mankind—should be ample vindication of this policy. That it is not accepted as such the widespread agitation for governmental interference with and regulation of businesses of all kinds, for public ownership and operation of public utilities of many kinds, and even for socialism in its most revolutionary form, makes only too clear. So far as reason and the entire experience of the human race are capable of demonstrating anything, they demonstrate that, while unfettered private initiative and enterprise promote the economic welfare of both individuals and the public, governmental management of industry, and excessive governmental interference with private management of industry, produce economic stagnation or paralysis. The check which would surely be caused to the development of the traction business in this country by the general adoption of municipal ownership is indicated by statistics given by Prof. H. R. Meyer in his work on "Municipal Ownership in Great Britain." Professor Meyer says:

"In the United States in the year 1902, in a total of 530 cities, groups of cities and towns, and groups of towns, there was, in 24.7 per cent of the cases, more than one mile of street railway track for each 1,000 people; in 32 per cent of the cases, one mile of street railway track for each 1,000 to 1,499 people; in 21.9 per cent of the cases, one mile of track for each 1,500 to 1,999 people; in 10.7 per cent of the cases, one mile of track for each 2,000 to 2,599 people. In the United Kingdom, on the other hand, there was, in 1903, no case of one mile of track for each 1,500 people or less. The most common ratios between street railway trackage and population were one mile of track for each 5,000 to 5,999 people, and one mile for each 7,000 to 7,999 people. The next most common ratios were one mile of track for each 1,000 to 4,999 people, and each 13,000 to 19,999 people. The third most common ratio was one mile for each 3,000 to 3,999 people, and the fourth most common ratio, one mile for each 11,000 to 11,999."

The managers of public utility corporations who shall contribute through educational and other legitimate means to stay the spread of socialistic sentiment will have the satisfaction of feeling that they not only are protecting the rights and interests of their stockholders, but also are performing a patriotic duty as citizens; for the growth of this sentiment is the most serious menace today, not only to the continued prosperity and progress of the United States, but to the very existence of modern civilization.

The Kokomo Marion & Western Traction Company, Kokomo, Ind., is making extensive improvements on both its city and interurban lines. The tracks in Kokomo will be entirely rebuilt, and the interurban line will be straightened and ballasted with stone between Kokomo and Marion.

THE CAZADERO GENERATING STATION OF THE PORTLAND RAILWAY LIGHT & POWER COMPANY.

The Portland Railway Light & Power Company of Portland, Ore., has recently placed in operation a large water-power generating station at Cazadero on the Clackamas river. The new station is near the terminus of one of the company's interurban lines and 40 miles from the center of the city. This interesting installation comprises a dam across the Clackamas river, a flume and waterway 1.7 miles long, the generating station and, across the river from the latter, a step-up transformer station.

Water Supply.

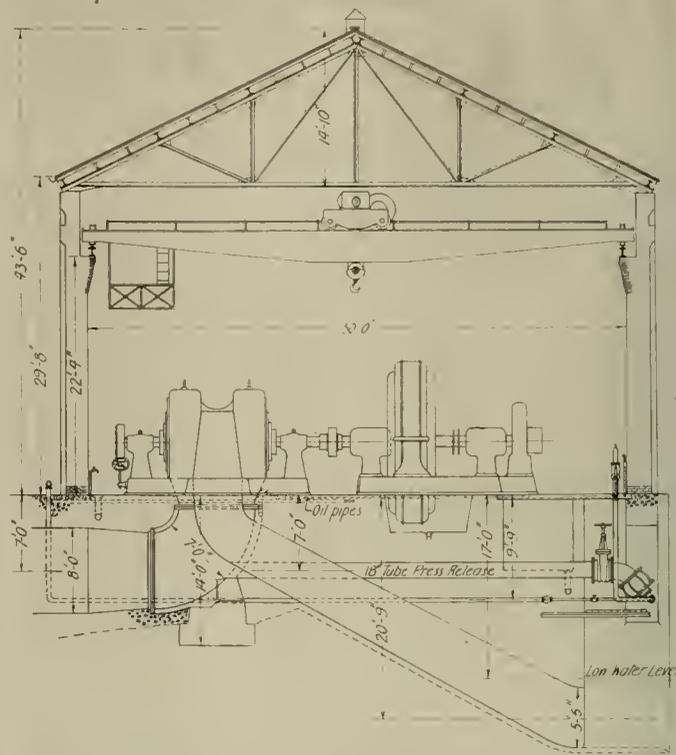

The watershed of the Clackamas river and its tributaries includes about 900 square miles. An abundant supply of water during the summer months is assured by the melting snows of the Cascade mountains, near which is the main source of the river.

As originally built for a former plant the dam consisted of a wedge-shaped structure of rough logs, each about two feet in diameter, laid across and in the line of the stream. This structure inclosed vertical pockets approximately 15 feet square, which were filled with clay and broken stone. During the summer of 1906 the old dam was strengthened by a rock fill and additional crib work. The reinforcement also included five rows of steel-capped piles across the stream at the upper edge of the dam. The dam is now 230 feet long and 176 feet wide on the base, and has a total length of 400 feet. A spillway 153 feet wide is provided, its crest being 51 feet above low water below the dam. An accompanying illustration shows a view of the crest of the dam and the four headgates of the flume.

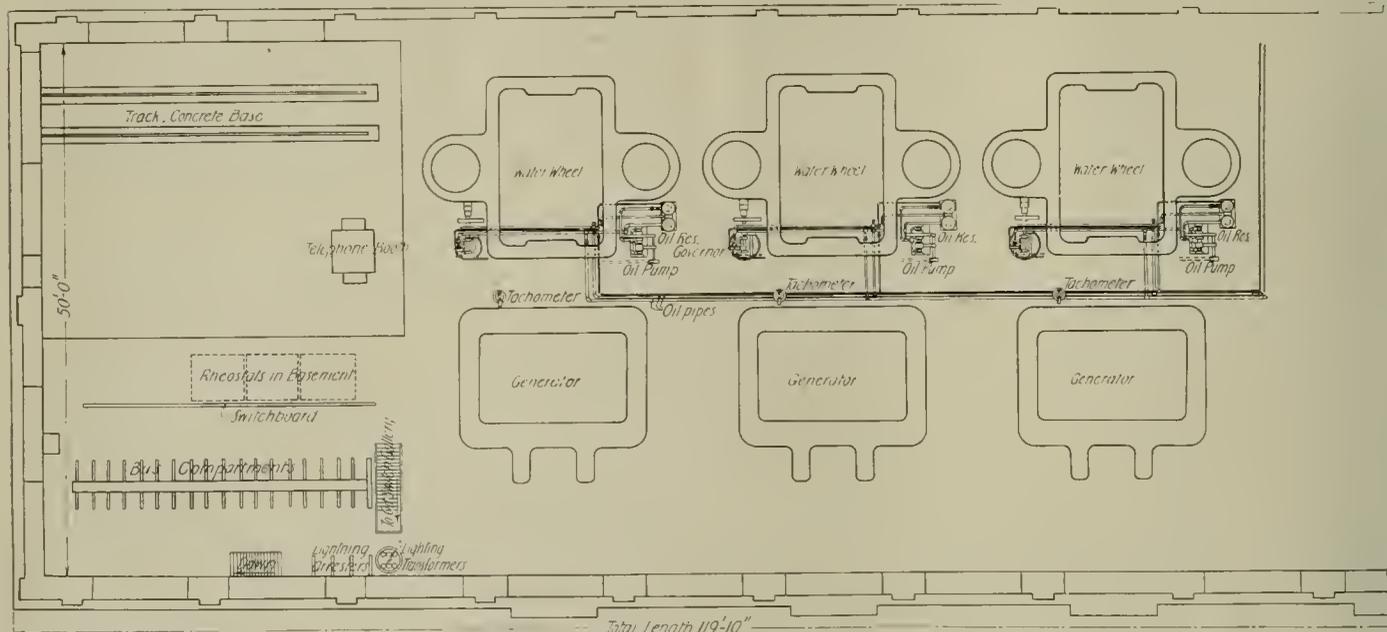

Leading from the gates at the dam is an open timber flume which follows the contour of the river bank for a dis-

large a volume should afford a valuable factor for continuous operation at such times as repairs must be made to the flume, ditch or dam.

The forebay gates which control the supply of water

Cazadero Station of the Portland Railway—Plan of That Part of Station Now Utilized.

tance of 2,622 feet, where it empties into a ditch 2,898 feet long, which in turn discharges water into a storage lake near the power station. At the inlet and outlet of both flume and ditch are protecting walls and aprons of concrete. The lake, into which the supply water discharges and from which water is taken through steel penstocks to the wheels, covers an area of 50 acres, and when filled as under normal operating conditions has an average depth of 20 feet. The volume of water thus stored close to the power station is sufficient to operate the plant for six hours after the headgates at the dam have been closed. This immediate supply of water of so

at the top of the penstocks are set in a heavy reinforced concrete wall on the river bluff. An accompanying illustration shows the forebay side of this wall before the gates were placed. At the left-hand side of the wall will be noted the sectional openings for the spillway gates, by which the water level in the reservoir may be regulated. The concrete wall, which retains the lower end of the reservoir and the penstock and spillway gates, is 290 feet long, 20 feet thick at the bottom, 8 feet thick at the top and 33 feet high. The wall itself rests on a foundation 47 feet wide, built into the sandstone bedrock. This foundation extends as an apron 27 feet

Cazadero Station of the Portland Railway—Interior of Power House, Showing Generators and Water Wheels.

below. There are five gate openings and five penstocks, but three of which are now in use.

Each of the forebay gates controls the entrance of water to a steel penstock eight feet in diameter leading down at an angle of approximately 45 degrees to the wheels in the power station below. The steel penstocks are supported at

elevation, connect with the under side of the wheels. At present there are in operation three Victor turbines, each comprising two 41-inch wheels on one shaft. These pairs of turbines are rated to develop 5,000 horsepower each, with a head of 125 feet. However, as now installed, there is an available head of 138 feet at low water, with the lake full, or

Cazadero Station of the Portland Railway—Open Flume Along River Bank.

frequent intervals by concrete piers resting on bedrock under the bluff.

Power Station.

The power station building has a brick superstructure 180 feet long and 50 feet wide resting on concrete foundations extending to bedrock. An accompanying illustration taken from across the stream shows the power house close to the stream and the penstocks extending up the bluff to the retaining wall of the reservoir.

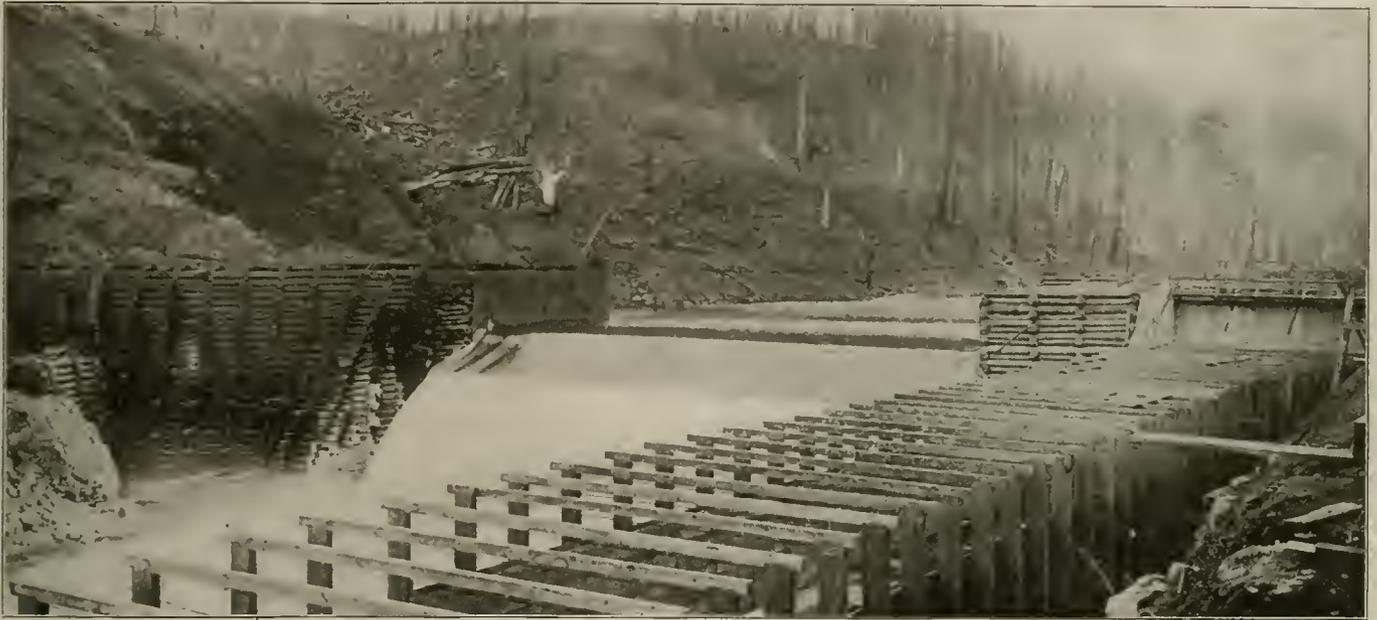

The buildings is well lighted by 13 arched windows 8 by 14 feet, on the stream side and lower end. A 20-ton

13 feet greater head than that for which the units were designed. Each pair of wheels is controlled and regulated by a Lombard governor, and is protected against severe water-hammer by a Lombard relief valve discharging in a line with the entering penstock. The waterwheel governors are driven by belts over the main shaft and are also controlled electrically from one of the main switchboard panels.

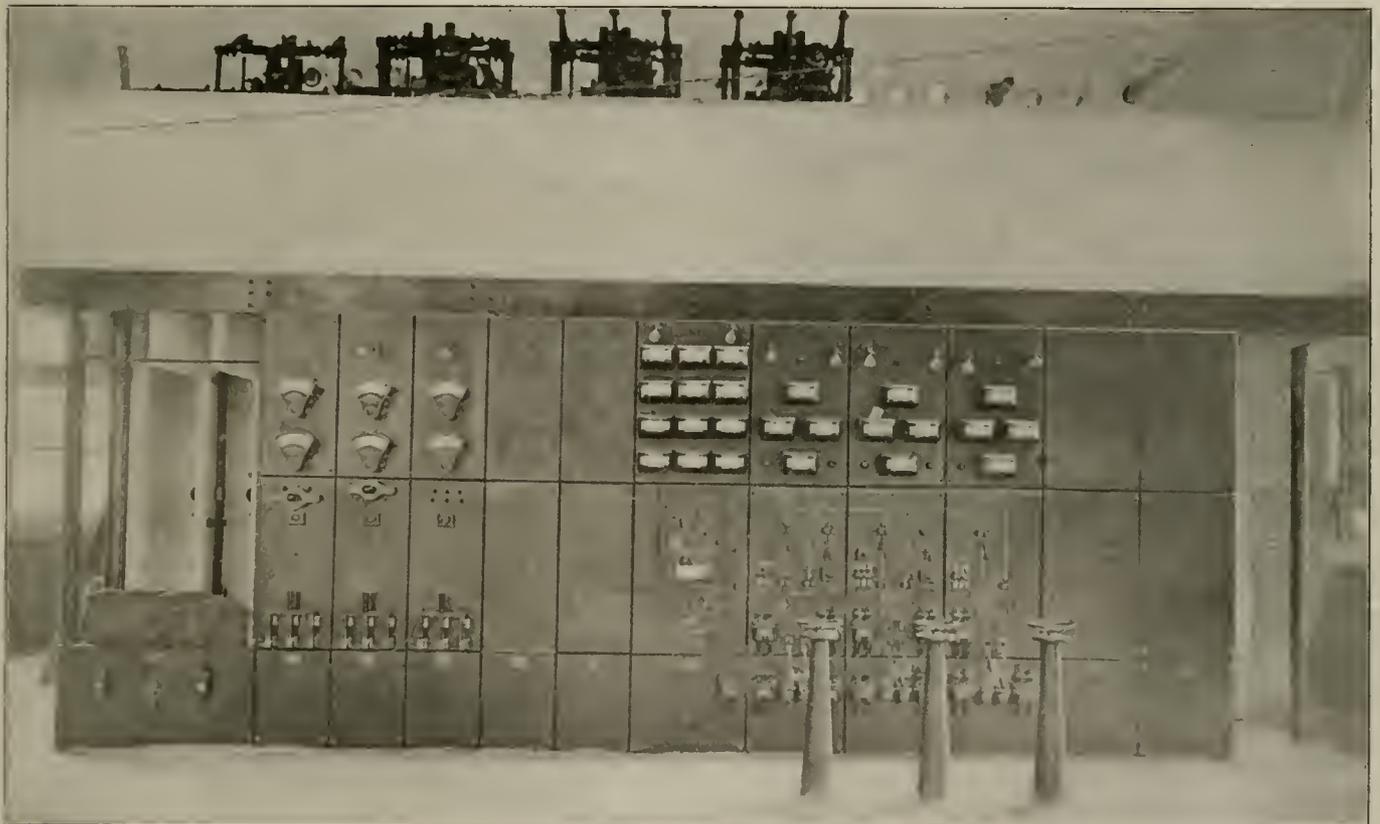

Each pair of wheels is direct connected, as shown in the accompanying illustration, to one Allis-Chalmers-Bullock 3-phase, 33-cycle, 10,000-volt generator, operating at 330 revolutions per minute, and having as its rated normal load 131

amperes at the stated voltage. Exciting current for each generator is furnished by a 120-volt, 625-ampere generator, with its armature mounted on an extension of the main generator shaft. The present building includes ample space and

The output of the generators, which is at 11,000 volts potential, is taken through cables to busbar compartments made of concrete. A portion of this structure is shown at the rear of the switchboard. Here there are two sets of buses

Cazadero Station of the Portland Railway—Crest of Dam Across Clackamas River.

the penstocks and foundations have been placed for two additional units.

The bearings of the waterwheel, generator and exciter are piped for lubrication with oil circulated under pressure. A supply of oil is furnished by a triplex pump, belt driven from the main shaft. The suction for each of these oil pumps is taken direct from a closed storage reservoir standing on the machine floor near the water wheels.

so interconnected with remote-control, oil-break switches and air-break, hand-throw switches that either or all of the machines may be connected with either bus. Connecting with each set of buses is a line switch. From these line switches there are two 3-wire transmission lines, which span the river and enter a brick transformer station on the opposite side. In this building are nine 850-kilowatt oil and water cooled Stanley transformers, which raise the potential from that of

generation, 10,000 volts, to that of transmission, 30,000 volts. From this transformer station there are two 30,000-volt transmission lines on individual pole lines leading to Portland, 40 miles distant.

There is also a third transmission line which is fed through a line switch from the machine buses. This line

Cazadero Station of the Portland Railway—Gates Leading to Penstocks and Spillway.

follows the railway track to Portland, serving the substations of the railway.

The main switchboard of the power station, illustrated herewith, presents a very neat appearance. The board comprises three generator panels, three exciter panels, one house panel, one high-tension control panel for 10,000-volt line to

Cazadero Station of the Portland Railway—Step-up Transformer Station.

intermediate substations along the railway line to Portland and two control panels for 10,000-volt lines across the river to the step-up transformer station. There are also five blank panels to accommodate the switches and instruments for new generating units. At the rear of the switchboard and behind the busbar compartments are General Electric curve drawing wattmeters and recording wattmeters for each outgoing line.

F. G. Sykes, general manager of the light and power department of the Portland Railway Light & Power Company, has been in general charge of the entire work, and, with the engineers in direct charge of the various features of construction, has assisted in carrying to completion the plans of the

entire plant at Cazadero. T. W. Sullivan, hydraulic engineer of the Portland Railway Light & Power Company, has had charge of the construction of the dam, reservoir, and all hydraulic work connected with the new plant. The electrical construction and operation of the plant are in charge of O. B. Coldwell, operating engineer of the company, while the work of constructing the lines for the transmission of current to Portland was executed by H. S. Sladen, transmission engineer of the company.

STRIKE IN SAN FRANCISCO.

A strike of the conductors and motormen of the United Railroads of San Francisco was declared early on Sunday, May 5, after the company had repeatedly refused to grant the demands of the men for a flat wage scale of \$3.00 for an 8-hour day. This is the same demand that precipitated the strike of last summer, which lasted from August 26 to September 5, and which was settled by the appointment of a board of arbitration. The board reported on February 28, 1907, in favor of a scale of \$3.10, \$3.20 and \$3.30 per 10-hour day, for the first, second, third and following years of service, respectively. This scale was put into effect as of September 5, 1906, and on April 19, 1907, President Calhoun of the United Railroads offered to continue the rate for the year beginning on May 1, although it was based on the unusual conditions of last year following the earthquake. This offer has been refused by the men, who have repeated their demands of last year for a flat \$3.00 scale for eight hours. Several conferences have been held between representatives of the carmen's union and the officers of the company, but the company has declined to make any further concessions.

The strike has completely tied up the street railway service of the city, whose situation is further complicated by strikes of the telephone operators, stationary firemen and structural iron workers. No attempt was made by the company to run cars on Monday, May 6, but that night President Calhoun issued an order for all the men to return to work at 8 o'clock on the following morning or to consider themselves discharged. In anticipation of a strike the company had imported several hundred non-union men and on Tuesday seven cars, manned by armed guards, were run out of the car house at Turk and Fillmore streets. These cars were immediately attacked by the strikers with bricks and stones and the guards fired several shots into the crowd. The rioting lasted several hours and two men were killed and several injured. The guards were arrested by the police, acting under instructions from Mayor Schmitz to arrest any one carrying arms. The cars, badly wrecked, were finally allowed to return to the car house. On the following day, Wednesday, two cars were sent out and operated over about six miles of track in the residence district and the protection of the police was sufficient to prevent serious violence or bloodshed, although the cars were attacked by the mobs several times. The men on the cars were not armed. Mayor Schmitz has given orders to the chief of police to swear in more officers if such a step is found necessary and special reserves of police have been stationed near the car barns. The mayor has declined to call upon the governor for state troops or to station policemen on the cars, stating that their presence would only inflame the rioters.

The company has announced through Thornwell Mulally, assistant to the president, that it would no longer recognize the union. President Calhoun issued a statement that the company would attempt to operate its cars peaceably, but that it would not hesitate to defend its rights. Mayor Schmitz on Wednesday declared that he would appoint a committee of 50 citizens to pass upon the questions at issue. This statement was made following a conference between the mayor, President Calhoun and President Cornelius of the carmen's union. Neither side would agree to abide by a decision of the committee.

MUNICIPAL OWNERSHIP.*

Report of the Committee on Municipal Ownership of the American Street and Interurban Railway Association.

Out of 164 companies, we find that the franchises under which they are operating are derived as follows:

State	9
United States government	1
City	44
City and state	36
Government and city	1
City and county	44
State, city and county	23

Total 158

The bearing of this mixed parentage with reference to a possible attempt on the part of cities to take over the business of the companies is obvious.

In answer to the question, "What municipally-owned utilities are now in operation in your city or field or operation?" 158 replies were received as follows:

None	58
Waterworks	51
Electric lighting	14
Waterworks and electric lighting	21
Electric lighting and gas	1
Waterworks and gas	1
Waterworks and sewers	2
Waterworks, electric lighting and gas	4
Waterworks, electric lighting, gas, sewer and electric railway ..	1
Waterworks, electric lighting and electric railway	1
Waterworks, electric lighting and sewer	1
Ferry	1
Bath houses	1
Waterworks, ferry, subways and tunnel	1

Total 158

The municipal electric street railways reported in the above list are one in West Seattle, Wash., 1½ miles long with 2 cars, and the other in Guelph, Ont., with 7½ miles of track and operating 11 cars. Within the last month the electric railway at West Seattle has been sold to the Seattle Electric Company, a privately owned corporation.

One hundred and fifty-nine answers were received to the question, "Has there been any agitation in your locality for the municipal ownership of street railroad properties?" as follows:

No	132
Yes	6
Slight	21

To the question, "What have been the causes of such agitation?" the companies apparently found difficulty in replying, since out of 164 only 58 responded. Of these 33 asserted that there was no definite cause, and the others assigned as reasons, socialistic movements, the general municipal ownership wave in the country, political and newspaper agitation, and disagreements growing out of attempts at franchise renewal.

In answer "To what extent does this movement prevail today?" 75 companies replied as follows:

No agitation at present	54
Slight	15
Growing	2
Active	3

To the question as to the sentiment of the local press in regard to the movement, 116 companies answered that the movement was not receiving support by the newspapers, 10 that it was advocated to some slight extent, and 8 that the press in their vicinity was pronouncedly in favor of the doctrine.

One hundred and fourteen companies stated that the municipal ownership movement was not a feature in the politics of their city or town, two that it entered into same to some slight extent, while by six it was pronounced a prominent factor in the work of political organizations.

One hundred and thirty-one replies were received to the effect that there had been no expression regarding the doctrine by the voters or taxpayers of the city or county, one that it had been quite openly advocated and three that it had been made a subject of referendum.

To the question as to whether the city charters or any legislative enactment required a referendum of the question of the municipalities acquiring or owning and constructing street railways, out of 103 answers it appeared that about one-half of the municipalities or towns are required to refer such a question to the voters, and the others are free to take action as the civil authorities may desire, subject, of course, to general restrictions with reference to the issue of securities for municipal undertakings.

One hundred and thirty-two of the companies stated that there had at no time been any very complete discussion of the question of municipal ownership in their locality, and that no presentation of the arguments for or against the proposition had been made in the local press by any civic body or in any public assembly; while eight replied that the matter had been the subject of popular discussion. From Halifax, N. S., it was reported that the conclusion of a general and public consideration of the subject in that city had resulted adversely to its trial.

To the question "Has your company made any public statement of its position, either in the papers or otherwise, in regard to the question?" 132 companies replied, "No," and 3, "Yes."

It will be interesting to carefully note the answers received to the following question: "What, in your opinion, is the best method of meeting and controverting the sentiment for municipal ownership?" Of the 110 replies, five methods were especially emphasized:

(1) Education. (2) Good service. (3) Publicity as to facts of company's operation and position. (4) A liberal policy in the matter of extensions, rates, etc. (5) Square treatment of everybody.

From these replies, it is evident that as regards the electric street railroads in this country the movement for their municipalization has not as yet assumed any very grave proportions, but we cannot be blind to the fact that a strong sentiment in that direction has developed which will sooner or later threaten our investments and as well our rights as citizens and taxpayers, as we hold them. If we concede that this condition exists, the most important answer to the questions submitted to the companies would seem to be that last cited, namely, "What is the best method of meeting and opposing this sentiment of municipal ownership?" and we cannot do better than to take for discussion in this report the suggestion embodied in the replies received from the members of the association, which, in brief, is covered by the term "education" or the phrase "public enlightenment upon the subject."

We may utter only a truism when we say that he who would ascertain the truth or falsity of a proposition or in the study of one that is complex accurately separate the true from the false, the material from the immaterial, must needs as a precedent to any permanent and safe result be furnished with an open mind, an honest purpose and a courageous resolve, but especially is such an attitude on our part absolutely essential in the present instance, for if we believe the discoverable truth as to this question of the municipal ownership of public and quasi-public utilities, such as transportation, both as to facts, methods and results, will lead to the safeguarding of the business interests, we represent and our own, as citizens and taxpayers, we ought heartily to urge our fellow citizens to join with us in a patient, comprehensive and honest study of the question and the conditions which have given it life and force. Invective and violent declamation will not prevail to stop its progress; its promoters cannot be frightened from their purpose by superficial criticism or political strategy. We must meet them in the field of open discussion and argument, prepared to reason together honestly and fairly as to the merits of the proposition.

When equilibrium is delicately poised a minute and perhaps an unobserved change of a few ounces of weight may precipitate an avalanche, so in a society like ours, moving with unprecedented rapidity, unintelligent conservatism is dangerous, and in these days we cannot afford to be superficial observers of the progress of this socialistic question, pregnant as it is for good or evil.

The proximate causes of this socialistic agitation in our land are conspicuous and easy to name—the underlying and more permanent reasons may possibly escape the notice of an unthoughtful observer. The former find their most clamorous exponent in the political demagogue or professional agitator who shouts, "Down with corporations," "Death to monopoly," "Smash the trusts." Of the same class and kind is the newspaper that in chromo type and with cartoon and caricature holds up to calumny and ridicule the fortunate and prosperous and declares that capital is the implacable foe of labor.

But state and municipal socialism also derive stimulus and support from a class of good citizens, sane and conservative, who in this land of equal political rights view with alarm the inequality of social conditions and note with resentment and dissatisfaction the open abuses of great wealth and corporate power, so that without a clear idea of the true reasons for the prevalence of these conditions or of proper methods for the amelioration of the evils of our complex society, they are well disposed to change in governmental relations as a panacea for all these ills. To these proponents of the socialistic movement must be added the taxpayer who

*Abstract of report presented at Columbus, O., on October 13, 1906.

believes under municipal or state ownership his taxes would be lowered and his outgo for service would be cheapened, and also the laborer who imagines that state or municipal ownership of public utilities will provide more opportunities for the sale of his labor, and that, too, at a higher rate measured by wage or hours of work.

Modern industrialism, despite its sins and mistakes, was the crowning glory of the last century, and properly guided and controlled will extend its blessings and repeat its triumphs in this one. To estop individual initiative and stimulus to genius and industrial development is to call a halt in state or municipal progress, and we contend rather that to multiply the opportunities for individual effort and to safeguard the results of same should be an important work of government and society.

We believe, then, that a safe and defensible position for us to take in the discussion of this question is that so clearly put by President Eliot of Harvard, who declares: "If the government enters a field which individuals or a voluntary association of individuals could till, it diminishes by so much the range or reach of the great school of self-governing free men, namely, the school of creative and constructive industry under liberty and with responsibility."

The more popular and usual reasons, aside from the general statement that corporations are acquiring too great control and political power, given by political orators and socialistic propagandists in support of the extension of municipal functions to cover water, light and transportation, are that these public utilities are natural monopolies, and as such belong to all the people for their use and convenience. The sanest and clearest statement made on this point we have seen is that of Samuel Chisholm, lord provost of Glasgow. He says: "In my opinion there are three conditions which should meet, or at least two of which should meet, before a municipal corporation should be authorized to take over any public enterprise: (1) That it is more or less practically a necessity. (2) That it is practically a monopoly. (3) That it requires the use of the streets."

As to the element of necessity, is light or transportation any more a necessity to the people of a city than bread, clothes or boots? Why should the supplying of the latter be given over to private enterprise and the former be taken in hand by the city?

But these public utilities are natural monopolies and use the public streets. Is it true that our rights under charter in the cities of this country have protected us from competition? Do not the major portion of our franchises distinctly state they are not exclusive? Appeals to courts on the question of exclusive franchises have resulted in decisions to the effect that it is "ultra vires" for a common council to grant an exclusive privilege in a public street. Our critics argue, however, that our occupancy of a city street with our tracks prevents of necessity the incoming of a competing line. If one consults the maps of the cities of the United States, he will find that there are but few in which a competing line of street railroad could not find unoccupied streets upon which, from the centers of the business section to the residential quarters, a line might be laid with some fair degree of prospective profit. But a few years have elapsed since the present apostle of municipal ownership, Mayor Johnson of Cleveland, was granted a franchise in the streets of Buffalo for approximately 100 miles of track, and was only prevented from construction by the railroad commissioners of the state, who, after a careful investigation of the matter, refused Mr. Johnson such a right on the ground that the new road was uncalled for, as the local company was already giving all the service and facilities the city's needs required. Evidence of the presence of competition is to be seen in not a few of our cities today where applications are before the councils for new and competing lines.

But if we are monopolizing the surface of the streets we cannot lay claim to the space above or below such streets, and neither in New York nor Chicago did the averred occupancy of the streets prevent the competition of elevated or subway lines, a kind of competition that is not far distant in many other cities.

Last of all we are exposed to the threatening competition of the cities themselves engaging in the business by the building of municipal lines, and with the strong arm of legislation compelling "joint user" clauses in any new extensions granted, giving them the right to run their cars over parts, at least, of our lines already built.

But distrust of so-called exclusive proprietorship of public utilities lies, we are often told, in the belief that they are immensely profitable, and, therefore, that the state or municipality, in granting charters for the private ownership and conduct of public utilities, have improperly parted with a valuable asset which they should in some way recover. This statement is notably the favorite allegation of agitators and demagogues, but it is as well a part of the faith of many

people who have never taken the time to study the matter with any degree of care or accuracy.

From the United States census bureau's special report on street and electric railways for 1902, some interesting and instructive statistics bearing on this matter of the value of our franchises may be obtained. By the report in question it appears that the total amount of dividends and interest actually going to stockholders and bondholders of the street and electric railways in the country, as a whole represents less than the current rate of interest on an amount equal to the face value of their outstanding securities. Of \$17 operating companies in 1902 with 22,576 miles of track, and 60,290 cars carrying 4,774,211,904 fare passengers, but 286 paid any dividend on any or all classes of stock securities. The total ratio of dividends paid to total capital stock was 2.6 per cent; the ratio of total dividends to total dividend bearing stock was 5.1 per cent. The full amount of dividends paid during the year was \$33,039,171, and the same year the companies distributed in interest to bondholders and creditors \$46,462,470, paid to wage earners, \$80,770,449, and to the commonwealths in taxes \$13,366,335. If to this latter item be added the personal taxes assessed against the individual holders of street railway securities, on the low basis of three-fourths of 1 per cent on the face value of their securities, the item of taxes turned into the state and municipal treasury during the year amounts to approximately \$20,562,516. The rate of net return to stockholders would not indicate any especially great profit at present being derived from the chartered rights the companies possess, and the rate of return, considering the menaces and hazards of the business, surely cannot be regarded as excessive. It is notable as indicating the estimate of value placed upon street railroad securities that the stock issues of a comparatively few of the companies represented in this association sell at par. The bonds of our companies are not permitted as investments by savings banks, and in the list of investments by banks, trust companies and insurance companies few if any street railroad securities are to be found.

To a statement of our dividend paying results, our municipal ownership friends may reply that our security issue is inflated, and thus good, divisible earnings are precluded. Meeting this allegation, we point to the facts as they appear in Massachusetts, an old and populous commonwealth and one in which, by law, the security issue of a company must not exceed the actual cash invested. Everett W. Burdett in his admirable recent address on "Municipal Ownership," points out that "The state of Massachusetts has 98 electric railways, operating 2,688 miles of track, transporting over 500,000,000 passengers by the use of 7,341 cars, and that only about one-third of them paid a dividend in 1905. Sixty-three paid no dividends at all, while the other 35 paid from 2 to 10 per cent with an average dividend of $4\frac{1}{2}$ per cent, which, if applied to the capital of all the companies in operation, would have yielded an average dividend of less than $2\frac{1}{2}$ per cent. At the same time these companies paid into the public treasury in the form of taxes nearly \$2,000,000. It thus appears the tax gatherer, the employe and the general public have each and all reaped rewards much greater than have been realized by the stockholders in these enterprises." Verily the monopoly we enjoy is neither to be feared nor greatly to be envied.

Giving further consideration of this monopoly cry, we may point out that the great danger of monopoly is the absence of the stimulating and controlling power of competition. In the granting of our franchises, both the state and city authorities seemed to have this fear, for not only in these charters, but by ordinances of constant and regular sequence we are required to do this or that, or refrain from sundry and imaginary actions, with elaborate legal refinement. We are directed as to opening the streets, the kind of rails and crossings which shall be employed, the style of overhead construction we shall use, the kind of cars we may provide and how they shall be run, the signals to be used, the time to put on vestibules, when to take them off, where we shall stop to take on or let off passengers, the fare we may charge and the transfers we must give; how we must adapt our business to other users of the street; these and a hundred other regulations are duly set forth for our guidance. No other public utility is regulated and controlled to a similar extent. Nor do we complain of this careful and watchful supervision—a supervision the penal clause of which reads nullification of privileges or severe fines.

To turn over such a regulated and controlled monopoly to an uncontrolled one, as would be the case were the city to assume the ownership and operation of its street railroads, would, to put it mildly, be open to great question. All the evils laid at the doors of monopoly of indifference to public wishes and comfort and the like, would surely be heightened and aggravated by such a transfer, and a little study of the usual conduct of public and municipal affairs would, we think,

evoke a decided negative to the proposition, unless, we are sometimes promised, vital changes are made in the usual make-up of municipal responsibility.

As to the point that as our roads in using the public streets thus trench on the proper sphere of municipal functions, we answer that as we construct our lines and operate them in accordance with and under the rule of the city's agents, the municipality could do no better.

Evidently back of a programme of municipal activity stands the question of taxes and their equalization in such way as that they shall bear justly upon the rich and the poor, the capitalist and the laborer, the professional man and the tradesman, with such equal weight that none may complain of his apportionment.

If the city, therefore, engages in a business for the service of which charge is to be made to users, and further, if this city business is instituted in the face of offers on the part of private corporations to assume all risk and under regulation by the proper authorities to give the service for a specific charge, justice to taxpayers and respect for fair business conditions demand that from the income of said business all charges should be paid. In other words, such business should be self-supporting, and this is manifestly true in consideration of the advantage which is claimed by the proponents of municipal ownership, that no dividends should be distributed by a municipally-owned enterprise of any sort.

That such should be the basis of the financing of a city's remunerative public utilities is becoming generally recognized and has been adopted in the case of municipal waterworks. The mayor of Chicago, in his scheme for the municipal ownership of the street railroads of that city, proposes to issue bonds or certificates of indebtedness against the properties and their earnings and against these alone. The citizens of Seattle, Wash., were recently called upon to vote upon a scheme for the construction of a system of municipal street roads in that city. The financial basis of the proposition is set forth in the ordinance authorizing the same, as follows: "To ratify or reject the proposition of incurring a general bond indebtedness bearing interest not exceeding 4 per cent per annum in the sum of \$1,272,000, together with the proposition of incurring a special bond indebtedness bearing interest not exceeding 5 per cent per annum in the sum of \$3,000,000, to be an obligation against not to exceed 20 per cent of the gross revenue or proceeds to be derived from the plan or system." This rather unique financial scheme, while it smacks very strongly of a municipality trading on margins, evidently recognizes the injustice, in part at least, of loading the general taxpayer of a city with the burden of a municipal public utility.

A city, therefore, establishing a business on such a basis has no advantage over that of a private corporation in the matter of securing capital, and public service utility bonds and certificates of indebtedness secured by mortgage on the property and its revenues will not sell in the open market at any higher prices than those of a private corporation. In fact, we believe it can be demonstrated that capitalists, by reason of having less confidence in the progressiveness, accurate accounting and the skill of municipal management, would regard less favorably such a security of a city road than they would that of a corporation.

As to the partnership of the people in the enterprise, it is but fair to say that the average man desires the liberty to choose for himself as to the investment of his money and business associates, and for every taxpayer in the city, whether he will or no, to be compelled to take shares in a business over which he has no control, and especially managed by men of whose capacity he has no proof, is a proposition which, while it may from a sentimental point of view have some force, surely from a business one, is of no weight.

As it is a notorious fact that private enterprise is ambitions and progressive, ever seeking extension for its efforts and multiplying its activities, while business interests in the hands of the government are quite the reverse in their policy, the suggestion that the municipalization of our street railroad systems would in the long run increase the opportunities for the working classes, is evidently untrue.

It is hardly necessary for us to take time to discuss the claim of the municipal ownership promoters that the city-owned road could be managed cheaper than is that of the private corporation; so universally is it acknowledged that public work of all kinds is less economically handled than that of corporations where responsibility is directly traceable and the directors or managers of which can be readily brought to book for negligence or incapacity.

As we have before stated in this report a considerable number of those advocating the municipal ownership of public utilities have been led to do so by their distrust and disgust at the relations which have existed between legislators having in their power the granting of public franchises, and the officials and promoters, or political bosses, who have

acted as the henchmen of public service corporations. Your committee hold no brief for the defense of corporations who have debauched councils, and by the use of bribes in the shape of securities or of cash have secured privileges, even though the request for such privileges in and of itself was often entirely proper. But we aver that graft is confined to no department, no locality, no party, no corporation or no individual. In the public revelations which have been made of late of the existence of this evil in this country, it appears in the federal government, in the city governments, in the postoffice department at home and in the consular service abroad, in public and private business circles; and wherever it is seen it is revolting to honest business enterprise, and injurious in the extreme to all our interests and desires. It is an evil which must be extirpated, or reduced at least to its lowest terms, and we believe we may say that no class of business men or business interests would be more pleased to see this evil uprooted than would the street railroad companies, their managers and directors. If the inner history of the companies represented by this association could be accurately written and spread in full upon the public books, it would cover a list of refusals to purchase privileges, or rather, in many instances, permission to do that which was altogether advantageous to the city in which the company operated and to the people whom it desired to serve, even at the risk of attack, misunderstanding and unpopularity, that would be surprising in number, and well-nigh continuous. We go farther and aver that the street railroad companies of the country, as a body, are honestly conducting their enterprises. They have no reason to be ashamed of the business in which they are engaged, or of the service which they give. They have played no unimportant part in the wonderful growth of urban life and what opportunities in this country during the past 25 years, and what they have accomplished in the introduction of electricity and its uses for public transportation is a source of pride and of self-congratulation. The use of improper or underhanded methods in the securing of rights or the enforcement of privileges already granted is as distasteful to the street railroad manager as it is to any citizen or business man; and we are sure that we will join hands most gladly in every movement looking toward the extirpation of such a practice of evil.

PROVISIONS OF NEW PHILADELPHIA ORDINANCE.

The new ordinance for the Philadelphia Rapid Transit Company, which was framed by the Retail Merchants' Association of Philadelphia, was presented to city councils on May 2. The main provisions of the ordinance are as follows:

Fifty-year profit-sharing contract, to take effect on July 1, 1907, between city and Rapid Transit company, superseding and canceling all existing contracts, agreements and bonds between them or between the city and the subsidiary companies.

Company to establish a sinking fund to extinguish its present capital stock of \$30,000,000 at the end of 50 years.

Company to call in within 30 days its unpaid capital stock by \$5.00 instalments so that the whole shall be paid up by December 31, 1908. Proceeds to be expended upon completion of present transportation projects, and upon additional improvements and betterments.

City reserves right to purchase all the property of the company, subject to all indebtedness now existing or hereafter lawfully created, upon July 1, 1907, or upon any July 1 thereafter by serving six months' notice and paying an amount equal to par for the capital stock of \$30,000,000, plus any additional capital stock which may be issued with the consent of the city.

Nothing in the contract is to make the city liable for any of the debts, obligations or liabilities of the company.

Broad street subway franchise is canceled. Frankford elevated franchise confirmed and time for construction extended for three years from June 1, 1907.

Underground trolley and other regulating ordinances repealed, but the city retains the right to make all rules and regulations for operation and management of the lines necessary for public health and safety.

When the sinking fund reaches \$5,000,000 the company is required to pay the money to the city treasury, and it is to become the property of the city.

In lieu of car licenses, the company is to pay a fixed amount to the city annually; and is also to pay a fixed sum per square yard of streets occupied by track in lieu of paving and repairing such streets.

The company is prohibited from assuming further leases, obligations or guarantees, or parting with any of its stocks, leaseholds or franchises without consent of the city.

Councils may determine upon routes of new surface,

elevated or subway lines, and if the company fails to accept them within 90 days the city may offer the franchises to any who will undertake their fulfillment.

The mayor, the president of the board of city trusts and the president of the board of education, without incurring any liability as directors, are to be members of the company's board of directors.

City to receive an amount equal to one-half of all dividends paid by the company in excess of 6 per cent per annum on the actual amount of capital paid into the company's treasury.

City comptroller to have access to the company's books, accounts and vouchers in order to verify its financial statements by examination and report the result to councils.

The company is to be prohibited from further increasing its capital stock or funded indebtedness without the consent of councils.

All certificates of stock and leases held by the company to be stamped across the face that they are held subject to the terms of the contract.

Morris L. Clothier, president of the association, said in a letter which accompanied the draft of the ordinance: "We are assured of its acceptance by the company."

Mayor Reyburn will hear the opinions of citizens representing various interests on the bill.

PRODUCER GAS ENGINES.*

BY G. W. BISSELL.†

Attention is invited to certain tests made by the United States geological survey during the period of the Louisiana Purchase Exposition and at the government testing plant established there.

Table I.

Samples—	British thermal units per pound dry coal.		Average k.w. hours at switchboard.		Dry coal per k.w. hour.		Rates of economy.

Averages	13,037	13,192			5.71	2.29	2.49

In Table I is shown the principal results of steam and producer gas engine tests of certain soft coals, some of which are comparable with Iowa coals. Fourteen tests are here quoted. The favorable showing of the producer gas engine in these tests is significant. While it is true that the steam engine used was a simple non-condensing engine having a water-rate of 23.6 pounds, it is also true that the gas engine in the large sizes is still in an experimental stage, especially in those features of its design and operation which affect its utility in plants where only ordinary skill can be expected to be exercised.

Of the coals listed in Table I, Missouri No. 2 resembles most closely the Iowa coals—its principal properties being:

	Missouri No. 2.	Average of Iowa coals.
Moisture	11.60	13.16
Carbon, volatile	35.28	33.36
Carbon, fixed	38.28	39.69
Ash	14.84	13.76
Sulphur	4.56	4.65
Calorific value	11,500 to 11,882	10,019 to 11,027

The lack of correspondence between the relative values of the several coals in Table I for steam and producer tests indicates that a given producer may be better adapted for handling a wide variety of coals than is a given boiler furnace.

*Abstract of a paper read before the Iowa Electrical Association, Clinton, Ia., on April 19, 1907.

†Professor of Mechanical Engineering, Iowa State College, Ames, Ia.

The table also shows that for these tests and conditions the percentage of saving in fuel of the producer over the steam plant is greater for the poorer coals, and this is an entirely reasonable view because the volatile constituents of the coal in the producer escape only through the engine cylinder in which their combustion is completely effected; whereas, with steam generation with volatile fuels under a boiler, various and large proportions of the volatile matter escape to the chimney unburned.

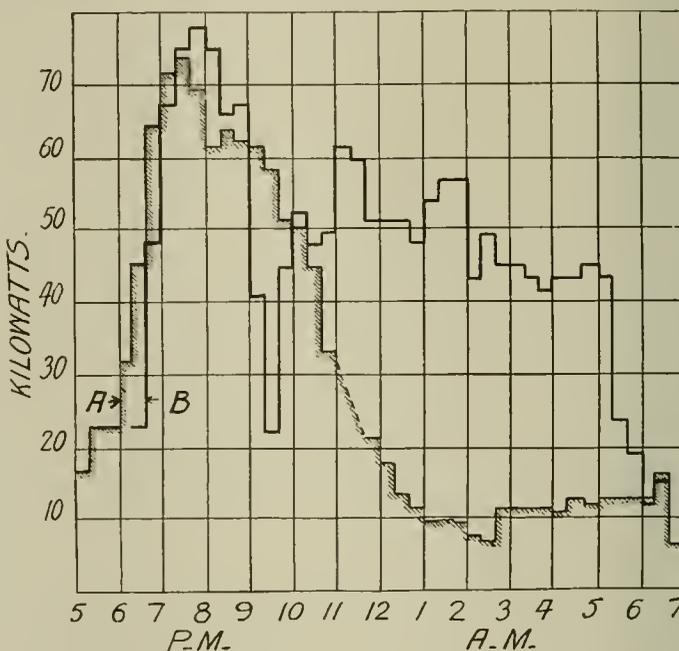

The tests above quoted were largely in the nature of preliminary tests and considerable difficulties were met with in obtaining reliable results.

In the year following the exposition, viz., 1905, better arrangements were available for the tests, and the matter was again entered into much more thoroughly. A notable change in the conditions surrounding the second series of tests was in their length. It was possible to secure continuous periods of operation for each test of from 40 to 60 hours, which was not possible in the earlier tests.

Table II.

Samples—	British thermal units per pound dry coal.	Ash.	Sulphur.	Dry coal per k.w. hour, steam producer.		Ratio.
Illinois, No. 9.....	12,438	11.5	4.92	7.00	2.38	2.94
Illinois, No. 19.....	13,000	9.4	0.53	5.65	1.79	3.16
Indiana, No. 5.....	12,600	11.50	5.00	6.41	2.20	2.92
Wyoming	10,518	15.3	7.36	7.96	2.40	3.31
Brazil	9,900	23.4	2.94	8.85	3.12	2.84
Average						2.92

Table II gives a comparative summary of a number of soft coals tested in 1905, both on the steam plant and the

Curve Showing Day Load on Steam and Producer Gas Plants.

producer plant. The results are very interesting and confirm in a general way the advantages of the producer plant indicated by the earlier tests. In the earlier tests, as shown in Table I, the ratio of economy of the producer to the steam plant was 2.49. In the tests of 1905, the average ratio for the Illinois coals was 2.92, and for sundry other coals used, 2.99, and for the 19 coals, as shown in Table II, the average was 2.93.

As it was found that purifiers are useless when the sulphur in the coal exceeds about 1 per cent, purifiers were discarded. In spite of the fact that some of the coal contained over 8 per cent of sulphur, it has been found after several months' operation that no ill effects were discernible in the engine cylinders.

Additional data are herewith presented, being the principal results of a test of a hard coal producer gas engine made under the direction of the writer in the spring of 1906. The engine was a 3-cylinder, vertical, Fairbanks-Morse engine, using gas generated from anthracite pea coal in a suction gas producer, also manufactured by Fairbanks, Morse & Co. The unit is rated at 150 brake horsepower at 250 revolutions per minute, and was guaranteed to give one brake horsepower-

hour for not to exceed 1½ pounds of anthracite pea coal for all loads above 75 brake horsepower.

Table III.

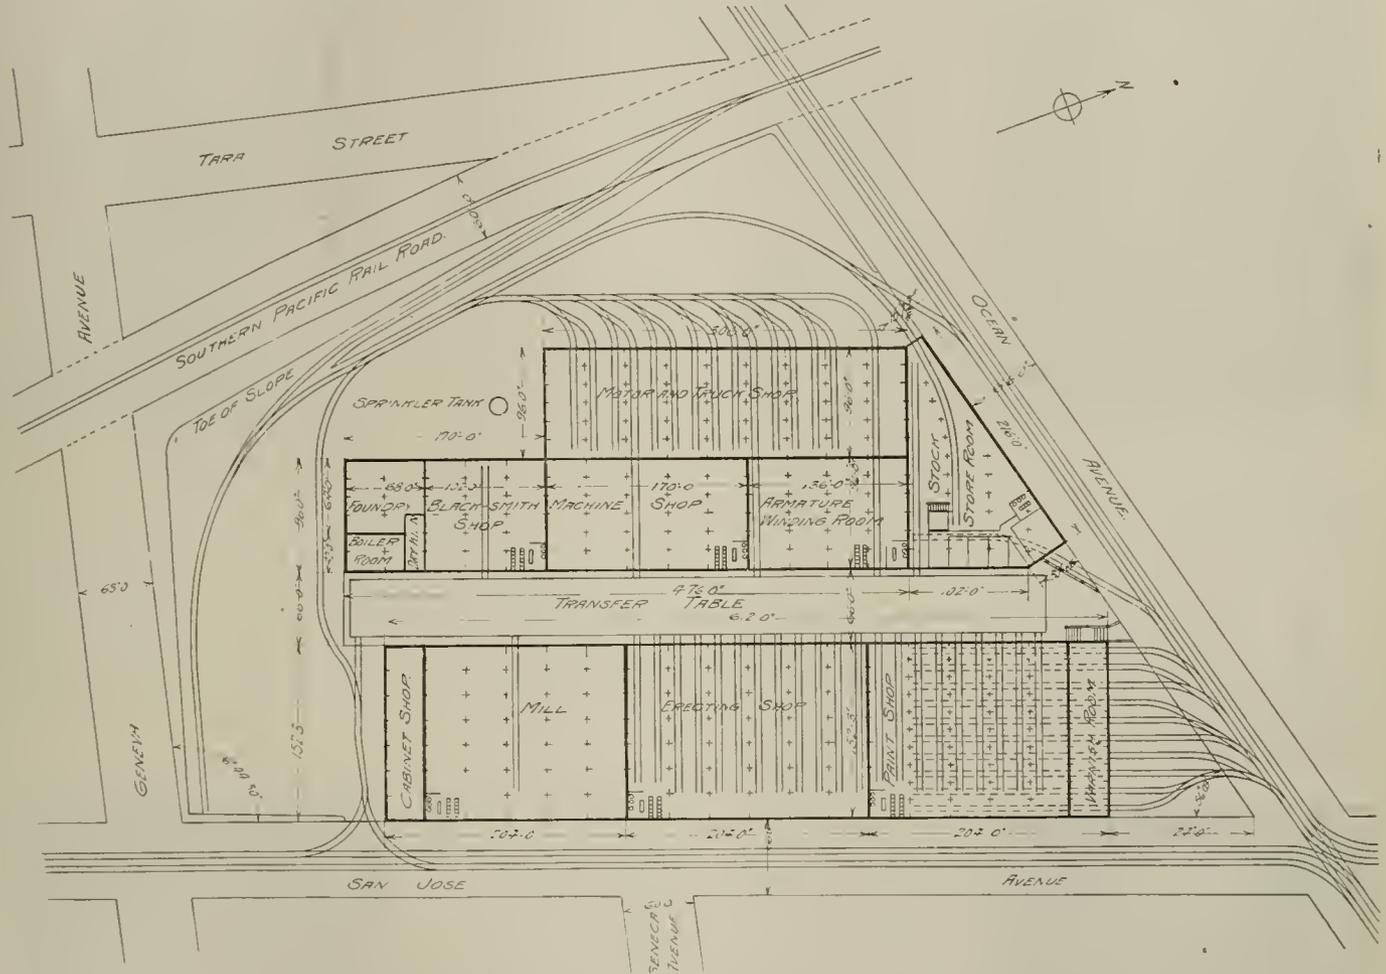

Revolutions per minute.....	250	250	250
Brake-load horsepower	40.1	82.7	156.9
Pounds coal (as fired) per brake horsepower per hour	1.511	1.157	0.999
Cost per brake horsepower-hour at \$6.00 per ton.....	\$0.00453	\$0.00347	\$0.00299

Two tests were also made on this engine under service conditions, viz., belted to a 75-kilowatt alternating current generator. In addition to the lighting load, electrically driven pumping machinery can be operated from this generator.

Figure 1 shows the load curve (A) during a service run with lighting load only, and the load curve (B) for the com-

type of prime mover is destined to be a formidable rival of the steam engine, and as the price of fuel increases the field for the producer gas engine will enlarge. At present there is a question whether it will pay to install a producer gas engine where coal is cheap. The only advantage would be the compliance with the smoke regulation, but as a financial proposition it may be stated that owing to the fact that a producer gas engine installation costs probably from 50 per cent to 60 per cent more than a steam engine plant, which would be its alternate, it will not pay to consider the installation of the gas producer plant with coal costing \$1.50 or less per ton.

The question of the mechanical and operative advantages and disadvantages of the gas engine will not be discussed here except to say that there is no reason why the gas engine

United Railroads of San Francisco—General Layout of New Shops.

bined load, the usual operating conditions, stand-by losses included.

At \$6.00 per ton the cost of fuel per kilowatt-hour at the switchboard for the load A was \$0.01207, including fuel for banking and starting, and for the load B was \$0.00639, including also the stand-by losses.

Soft coal from Illinois, which was used for a Corliss engine unit in the same plant, cost \$3.40 per ton.

A.—Load curve of Algona producer gas engine, on March 15-16, 1906. Fourteen-hour test. Output, 409 kilowatt-hours. Anthracite pea coal per kilowatt-hour=4.10 pounds. Fuel cost per kilowatt-hour=\$0.0123. Load factor, 18 per cent.

B.—Load curve of Algona producer gas engine, on March 16-17, 1906. Twelve-hour test. Output, 589 kilowatt-hours. Anthracite pea coal per kilowatt-hour=2.23 pounds. Fuel cost per kilowatt-hour=\$0.00699. Load factor, 27 per cent.

For the purpose of comparison with this test, we may consider the case of a simple Corliss engine similar to that used in the government tests at St. Louis. The average coal consumption of that engine, according to Table I, was 5.71 pounds per kilowatt-hour. If this coal cost \$3.00 per ton the cost of the coal per kilowatt-hour would be \$0.008565, which can be compared directly with the values given in connection with the Algona test.

It is difficult at this time to predict the immediate future of the producer gas engine, but the writer believes that this

cannot be used satisfactorily for the generation of electrical current for light and power.

NEW SHOPS FOR SAN FRANCISCO.

The United Railroads of San Francisco have recently completed the general designs for an extensive shop layout. By reference to the accompanying general arrangement drawing it will be noted that the buildings will comprise two groups with a transfer table track between them. The drawing also exhibits the horizontal dimensions of the various shops. As yet the construction details for the entire shops and their equipment are not complete. At first some of the buildings will be of temporary construction, but as fast as conditions warrant permanent structures of either concrete or mill construction will be erected. The present demand for shop facilities necessitates the immediate erection of some of the buildings, this being a result of the losses to shops and equipment resulting from the earthquake and fire of April, 1906.

A mono-rail car holding a vertical position by two gyroscopes has been invented by L. Brennan.

BOARD OF SUPERVISING ENGINEERS, CHICAGO
RAILWAYS.

Charles V. Weston was appointed by Mayor Busse on May 6 as the third member of the board of supervising engineers which will have charge of the rehabilitation of the traction properties in Chicago. The board comprises, in addition to Mr. Weston, Bion J. Arnold, who was named in the ordinances as chairman, and Harvey B. Fleming, who was appointed to represent the Chicago City Railway Company.

Bion J. Arnold.

ing and living expenses while away from home and engaged upon the work, the total compensation to be not less than \$3,600 nor more than \$10,000 a year.

Bion J. Arnold.

Bion J. Arnold, president of The Arnold Company and well-known authority on engineering and traction matters, was born in Casnovia, Mich., on August 14, 1861. In 1880 he entered Hillsdale (Mich.) College, where he graduated in 1884 with the degree of bachelor of science, and later, after a post-graduate course, with the degree of master of science and master of philosophy.

Charles V. Weston.

the civil engineering department of the Chicago Great Western Railway, and later, as mechanical engineer of this company, he redesigned some of its locomotives and prepared drawings for new equipment.

At this juncture, recognizing the rapid growth of electricity and its ultimate destiny as the probable solution to many problems, Mr. Arnold entered Cornell University for the purpose of specializing in this particular line of work, remaining there for one year. Immediately upon leaving college he

The ordinances provide that the chairman shall receive \$15,000 per annum compensation and shall also act as chief engineer of the work of rehabilitation, for which he shall receive an additional compensation of \$15,000 per annum. Each of the other two members of the board, according to the ordinances, shall attend monthly meetings and such other meetings as may be called by the chairman, and shall be paid for his services at the rate of \$100 per day, and travel-

accepted a position as manager of the Thomson-Houston Electric Company's St. Louis office, and for three years acted as consulting engineer for this company. During this time he also acted as consulting engineer for the elevated road constructed at the Columbian exposition in Chicago in 1893. In 1893 he opened an office as an independent consulting engineer and in 1894 built the St. Charles Street Railway, New Orleans, La. One of his earlier successes in electric railway work was the equipment in 1897-98 of the Chicago & Milwaukee Electric Railroad. Since 1901 Mr. Arnold has served upon the electric transit commission of the New York Central & Hudson River Railroad. In 1902 Mr. Arnold was commissioned by the city of Chicago to make an exhaustive study and report upon the traction system of the city. His recommendations have been followed and form the basis of a comprehensive system of surface, elevated and underground railways now being developed.

Aside from his extensive work on electric railway problems Mr. Arnold is the inventor of a number of valuable devices in connection with the magnetic clutch and storage battery for electric railway work. He also has achieved some highly satisfactory results from a series of experiments conducted at Lansing, Mich., from 1900 to 1904, upon an electro-pneumatic system of his own invention. These experiments have given an impetus to the development of the single-phase motor and have resulted, by reason of a material reduction in the cost of building electric railways, in its successful application to electric railway operation.

The Arnold Company, of which Mr. Arnold is the president, does a large engineering and construction business with both steam and electric railways throughout the United States. This company built the recently completed Elgin & Belvidere Electric Railway, described in the Electric Railway Review of March 9, 1907. Mr. Arnold is the principal owner of this road and is the vice-president and half owner of the Kentucky Valley road. He is a consulting engineer for many steam railroads and is now acting in a similar capacity for the Wisconsin state railroad commission and for the city of Toronto, Can., both of which are engaged in the readjustment of municipal arrangements with street railway companies.

Mr. Arnold is a member of the American Society of Civil Engineers, the American Society for the Promotion of Engineering Education, the American Institute of Electrical Engineers and the Western Society of Engineers. In 1903 and 1904 he was president of the American Institute of

Harvey B. Fleming.

George Weston.

Electrical Engineers, as well as first vice-president and chairman of the executive committee of the International Electrical Congress of St. Louis.

Charles V. Weston.

Charles V. Weston is chief engineer of the South Side Elevated Railroad of Chicago, a position which he has held since 1903. Mr. Weston is 50 years old and has been a civil engineer throughout his business career. Early in the eighties he was chief engineer of various railroads in Texas and Kansas, and came to Chicago later as engineer for the Chicago & Northwestern road. Shortly after coming to this city he constructed the Lake View intake crib and water tunnel. In 1894 he completed the Van Buren street tunnel for the West Chicago Street Railroad, and later became, in turn, chief engineer for the Northwestern and the Lake Street Elevated roads and the Union Loop. Mr. Weston is a member of the American Society of Civil Engineers, the Western Society of Engineers and the American Railway Engineering and Maintenance of Way Association.

Harvey B. Fleming.

Harvey B. Fleming, who has been appointed as representative of the Chicago City Railway Company on the board of supervising engineers, is chief engineer of that road. Mr. Fleming was born in Newburgh, N. Y., in 1873, and received his early education in New York state. He received a bachelor's degree in engineering from Washington University in 1896 and an honorary degree in engineering from the same university in 1903. He was assistant engineer in the United States government testing laboratory in St. Louis under J. B. Johnson, and was also assistant engineer in the water department in St. Louis. During the time Mr. Fleming was in St. Louis he was engineer for the National Railway Company and the St. Louis Transit Company of that city. In 1900 he came to Chicago to accept the position of superintendent of ways and structures of the Chicago City Railway Company. Mr. Fleming is a member of the Western Society of Engineers and the executive and the standardization committees of the American Street and Interurban Railway Association.

George Weston.

George Weston has been appointed assistant chief engineer of reconstruction and will have general charge of rehabilitating the tracks and properties and will report to Mr. Arnold. All other engineers will report to Mr. Weston.

George Weston was born in Kalamazoo, Mich., on January 30, 1861. After finishing the high school course in Kalamazoo he took special courses in chemistry, higher mathematics and mechanical drawing. In 1880 he joined the engineering corps of the Missouri Kansas & Texas road as rodman, and assisted in the work of construction on the line extending south from Ft. Worth, Tex. Between 1882 and 1885 he was engaged in mercantile business, but in the fall of the latter year he entered the employment of the Gulf Colorado & Santa Fe Railway as rodman with the engineering corps. While with this company he was advanced to instrument man and assistant engineer in charge of construction, remaining in the employment of the company until the spring of 1887, when he resigned to come to Chicago, where he entered the service of Charles T. Yerkes, who had then begun the work of constructing the north side cable lines. Mr. Weston had entire charge of the construction of the Clybourn avenue, the Milwaukee avenue, the Blue Island avenue and the Halsted street cable lines. Under his supervision, 75 miles of horse-car lines of the West Chicago Street Railway were rebuilt into electric lines.

Mr. Weston retired from the street railway company in July, 1896, and took a position as manager of the construction department of Naugle, Holcomb & Co., promoters and builders of electric and steam railroads. While he was associated with this firm in 1896 and 1897 he had charge of construction of the Suburban Railroad. This work involved the

electrical equipment of several miles of steam road, besides a long line of heavy electric road of street railway type. Mr. Weston also had charge of the operation of this road, and while engaged in its construction he had charge of the suburban passenger service to Oak Park and Harlem of the old Chicago Terminal Transfer Railway, the greater part of which was changed at that time from steam to an electric road. In 1898 Mr. Weston was given the general management for Naugle, Holcomb & Co. of all construction work of the Tennessee Central Railway, which was completed in Monterey, Tenn., in October, 1900. Since completing that work he has been engaged principally as a consulting engineer, and for the last two years has been continuously identified with Mr. Arnold's work. Mr. Weston was engineer in charge during the work of the traction valuation commission, which made a report to the committee on local transportation of the Chicago city council on the values of properties of the Chicago City Railway Company and the Chicago Union Traction Company. This commission was composed of Bion J. Arnold, Mortimer E. Cooley and A. B. du Pont. He is chief electrical inspector of the Wisconsin state board of assessment, which is now engaged in valuing the properties of the Milwaukee Electric Railway & Light Company and the Milwaukee Light Heat & Traction Company.

Work of the Board.

Various departments will be created by the board in order to carry out the work planned. Separate divisions will be formed to take charge of the subjects of track, cars, operation, power, power house construction and accounting.

Robert W. Hunt & Co. have been engaged as inspectors of the first 5,000 tons of rails to be used in the reconstruction.

F. K. Parke has been appointed accountant to formulate the new system of accounting, and Marwick, Mitchell & Co. are the general auditors.

The Chicago City Railway Company will keep in a separate bank account the funds which are to be used in rehabilitation of the property. The company has already placed \$5,000 to the credit of the board, which will be used for the immediate needs of the organization. Headquarters have been established on the tenth and eleventh floors of the Board building.

New Equipment Ordered.

During the past week the Chicago Union Traction Company has secured options for considerable new equipment for the rehabilitation of its lines representing an expenditure of approximately \$2,000,000. These include an option with the General Electric Company on 1,600 motors of 40 horsepower each, to be used in equipping 400 new cars, options upon which have been secured from the St. Louis Car Company. The contract with the Lorain Steel Company for 10,000 tons of grooved steel rails provides for delivery early next fall. The additional electric power necessary will be purchased from the Chicago Edison Company at the rate of 6,000 kilowatts per day.

Types of Track Approved.

One of the first acts of the board was to approve the different types of track which had previously been prepared by Mr. Arnold in order to facilitate the work of rehabilitation. The three types which were approved are as follows:

1. With steel ties four feet center to center in concrete.
2. With wood ties four feet center to center in concrete.
3. With wood ties two feet center to center on broken stone.

The first two types will be used for permanent roadway, the location of the respective types to be determined by local conditions. The third type is intended for use as a form of semi-temporary track where permanent improvements beneath the surface of the street have not yet been made. The structure of the track has been divided into two parts, the lower part to be permanent and the upper renew-

able. With the steel type construction, in order to permit the relaying of rails without disturbing the permanent foundation, clips and tieplates, which have been specially designed, will be used.

With the wood tie construction flat tieplates will be used and will be held in place by small lag screws, while the rails will be fastened by screw spikes.

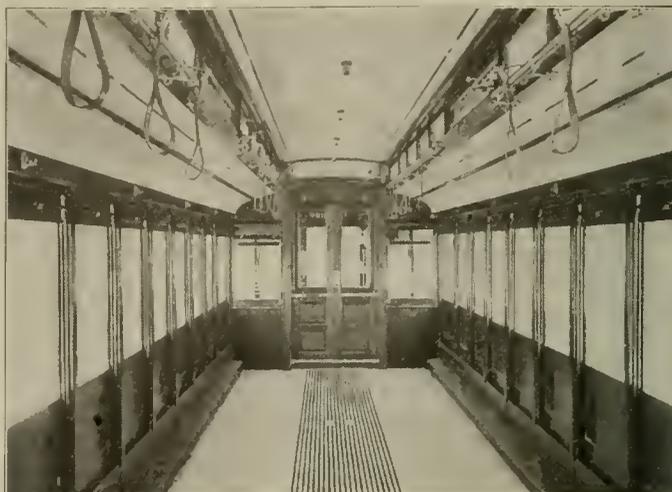

NEW ALL-STEEL CAR FOR BROOKLYN.

The Brooklyn Rapid Transit Company has just received from the Pressed Steel Car Company, for use on the surface lines, the first all-steel car to be purchased by the company. This car is of the same type as the especially designed semi-convertible wood and steel car adopted by the company as a standard. The steel car has a total weight of 50,800 pounds, or considerably less than wooden cars, designed for conditions of traffic similar to those in Brooklyn. The car is 42 feet 6 inches long over all and the car body is 31 feet 5 1/4 inches long. The length inside is 30 feet 7 1/4 inches and the car has a total width of 8 feet. The seats were manufactured by Heywood Brothers & Wakefield. The car has a seating capacity for 48 persons.

In adopting a standard for rolling stock the congestion of traffic and the limited headway made it necessary to design cars with as great capacity as could be operated on the city streets in Brooklyn, while at the same time providing comfort. The cars were designed on the basis of rush-hour conditions and are therefore larger and more costly to operate than is required by the traffic during the greater part of the time. The cross seat and center aisle arrangement was adopted with a view to the comfort of passengers riding considerable distances. For summer use the car does not unload so quickly as the ordinary open car, but this disadvantage is offset by the greater safety and comfort of the new car for use under congested traffic. The determination of the maximum practical size of car also required a great deal of engineering investigation on account of the extent

horsepower capacity, and Westinghouse multiple-unit control. The car also has the Westinghouse traction brake with cylinders 8 by 12 inches in diameter. The equipment of the car includes the Dressel headlight, Empire fender, Consolidated 192-W heaters and Pantasote curtains. The car is lighted with 27 incandescent lamps.

The car is painted in accordance with the Brooklyn Rapid Transit practice for standard cars. In order to avoid so far as possible the interior appearance resulting from the use of steel, the interior has been finished in mahogany effect in accordance with the company's standard practice. The

All-Steel Surface Car, Brooklyn—Interior, Without Seats.

ceiling is finished a light color, which presents an attractive appearance.

The Brooklyn Rapid Transit Company will give the new all-steel car a thorough trial on the surface lines and will also have an all-steel car built for test purposes on the elevated lines.

All-Steel Surface Car, Brooklyn—Exterior.

of the system, the presence of elevated structures, short radius curves and intricate interconnections of lines, etc.

These dimensions have been followed in constructing the steel car, for which no elaborate plans have been made, as the car is more or less an experiment. The car is framed with cross framing of 5-inch standard channel beams with steel side plates 18 inches by 5-16 inch, fastened to the channel beams with 3 1/2 by 7-16 inch angles. The flooring consists of steel plates fastened to the cross framing and these in turn are covered by 5/8-inch wooden flooring with the customary center aisle rack. The car is mounted on standard M. C. B. trucks with 33-inch rolled steel wheels on 4 3/4-inch axles, having journals 3 3/4 by 7 inches. The motor equipment includes four Westinghouse 101-B2 motors, each of 40

ANNUAL REPORTS OF RAILWAYS.

United Railways Investment Company.

The principal announcement in the annual report of this holding company for 1906 is the statement that an issue of \$5,000,000 of first preferred stock has been authorized by the United Railroads of San Francisco. This stock will bear dividends at the rate of not less than 6 per cent per annum, and \$1,500,000 of the issue will be taken by the United Railways Investment Company. The latter company owns all the stock of the United Railroads of San Francisco and a controlling interest in the Philadelphia Company of Pittsburgh.

The income account of the United Railroads of San Francisco for the year, with a comparison, makes the following showing:

	1906.	1905.	1904.
Gross earnings	\$5,955,786	\$7,066,892	\$6,652,630
Operating expenses and taxes...	3,114,590	3,617,821	3,676,438
Net earnings	\$2,841,196	\$3,449,071	\$2,976,192
Other income	89,360	43,757	30,670
Total income	\$2,930,556	\$3,492,828	\$3,006,862
Charges, etc.	1,617,933	1,805,348	1,790,467
Net earnings	\$1,312,623	\$1,687,480	\$1,216,395
Improvements, betterments, sinking fund requirements, etc..	435,478	353,345	249,339
Surplus	\$ 877,145	\$1,334,135	\$ 967,056
Operating expenses and taxes—percentage of gross earnings.	52.2	51.1	55.2

The president, Ernst Thalmann, discusses the great loss which the United Railroads of San Francisco suffered in the earthquake, which caused the destruction of the cable power houses and severe injury to the cable conduits. The balance sheets of the United Railroads of San Francisco

show that between December 31, 1905, and March 1, 1907, there had been expended in the restoration and reconstruction of its lines and plant, including improvements and betterments and the physical loss resulting from the earthquake and fire, a total of over \$4,000,000. Over 91 per cent of the mileage of the company is now in operation, and the officers of the company expect to place the balance of 9 per cent in operation as rapidly as the city completes certain necessary street improvements. All expenditures for betterments and improvements made to March 1, 1907, had been financed by that company, and its current liabilities did not on that date, Mr. Thalmann says, exceed the amount usually carried. The strike of the employes of the United Railroads occasioned, both directly and indirectly, considerable financial loss to the company.

The annual report of the Philadelphia Company, covering the operations for the year ended March 31, 1907, gives the income account of the Pittsburg Railways Company for that year, as follows:

Gross earnings from operations.....	\$10,232,619.88
Operating expenses—	
General expenses	\$ 851,908.59
Conducting transportation	3,243,327.51
Maintenance of way and structures	511,037.46
Maintenance of equipment	632,981.99
Park expenses	132,237.96
Total operating expenses	\$5,371,513.51
Bridge tolls	108,732.98
Taxes	291,711.11
Total operating expenses and taxes	5,771,957.60
Net earnings	\$ 4,460,662.28
Other income—	
Rent of buildings and real estate...\$	47,875.88
Interest and discount	5,013.68
Miscellaneous	31,013.36
Total other income.....	83,902.92
Total income	\$ 4,544,565.20
Deductions—	
Rentals of leased properties.....\$	2,178,252.86
Miscellaneous interest and discount	278,514.60
Tenement expenses	2,693.37
Total deductions	2,459,460.83
Balance	\$ 2,085,104.37
Fixed charges	1,734,199.71
Balance	\$ 350,904.66
Extraordinary maintenance expenditures	\$ 300,131.26
Car trust notes issued December 1, 1905, retired	40,000.00
.....	340,131.26
Surplus	\$ 10,773.40
Passengers carried	203,411,809
Car-miles	36,125,014
Earnings per car-mile.....	\$0.2791
Expenses per car-mile (including taxes).....	0.1552
Net earnings per car-mile.....	0.1239
Operating expenses—percentage of gross earnings.....	52.4

J. H. Reed, president of the Philadelphia Company, states in the report of that company that there were sold during the fiscal year 230 second mortgage bonds and 64,800 shares of the common capital stock. The proceeds were applied in retiring the one-year collateral gold notes, issued on October 1, 1906, in payment for the Beaver Valley Traction Company capital stock, the purchase of the Washington & Canonsburg Railway Company capital stock, and in advances to the underlying companies to be used for improvements and extensions.

The income account of the Philadelphia Company and affiliated operating companies for the year ended March 31, 1906, shows gross earnings of \$18,538,606. Operating expenses and taxes were \$9,340,325, leaving net earnings of \$9,198,281.

The combined statement of earnings of the United Railroads of San Francisco and the Philadelphia Company for the calendar year 1906, which is the period covered in the report of the United Railways Investment Company, shows

gross earnings of \$23,785,596. The net earnings were \$11,404,529, and the balance after the payment of fixed charges and other deductions, including \$1,595,627 for sinking funds, improvements and betterments, and after the payment of dividends on the preferred stock of the Philadelphia Company, was \$3,548,615. Of this sum \$877,145 represented earnings of the United Railroads of San Francisco, and \$2,671,469 earnings of the Philadelphia Company. The proportion of earnings applicable to the Investment company on the basis of its present holdings of Philadelphia Company stock was \$2,821,975.

In his report as president of the Investment company Mr. Thalmann speaks of the purchase of \$24,200,000 par value of the common stock of the Philadelphia Company, or approximately 72.8 per cent of the amount outstanding. Of this stock \$21,000,000 was deposited by stockholders in the Philadelphia Company under the plan ratified on April 5, 1906. These shares were then deposited under the agreement securing the 5 per cent prior lien collateral trust bonds of the Investment company. The remaining stock, amounting to \$3,200,000, was acquired later in the year. Before the end of the year \$2,690,000 of this latter amount had been paid for, and the balance was paid for in January, 1907. The money required for the purchase of this stock was derived in part from the sale of \$2,400,000 of the 5 per cent bonds of the Investment company at 90, and the balance was paid from earnings and other available cash assets. This change accounts for an increase in funded debt to \$18,150,000, as compared with \$15,750,000 in the previous year.

According to the report the floating debt amounted at the close of the year to \$2,090,000, but this has since been repaid, and the floating debt when the report was presented amounted to approximately \$135,000, which will be increased presently, as the directors have arranged to provide funds which will enable the United Railroads of San Francisco to continue the reconstruction and improvement work.

The book value of the investments of the Investment company amounted at the end of the year to \$53,126,482, of which approximately one-half represented the company's interest in the United Railroads of San Francisco and the other half the holdings of Philadelphia Company stock.

Of the prospects for stockholders of the Investment company in the future Mr. Thalmann said:

When it is considered that in the course of the year 1906 the earnings of the United Railroads of San Francisco have been subjected to the earthquake, the resulting conflagration and all its consequences, the strike of its employes, and the consequent general demoralization, they offer a most encouraging promise for the future, and justify the hope that at no distant date payment of cash dividends may be resumed.

Some Interesting Facts.

It is estimated that about six billion passengers were carried by the trolleys of the country last year, about four or five billion more than traveled by steam. This means that at this rate every man, woman and child, white, black, yellow and brown, might have had three rides or more each during the year. An average of something like 17 millions of people were carried daily. Nearly a third of a million people have their names on the payrolls of the trolley companies of the country. In spite of the rapid development of the electric street railways, there are still operated in this country 260 miles of horse car lines and 240 miles of cable lines.

In view of the talk prevalent today about the dangers incident to travel, it is interesting to note that statistics show that on the street railways but one person is killed in 26,000,000, and but one person is hurt in 900,000 of those carried.—Trolley Talks.

The Los Angeles-Pacific Company, operating electric railways to several beach resorts near Los Angeles, Cal., has imported 60,000 ties from Formosa. These are of hardwood, most of them being of narra, a wood much used in the orient for interior work. The cost of the ties at Los Angeles after tariff duty is paid is reported to be but slightly in excess of Oregon pine.

CAR INSPECTION AT WHEATON (ILL.) SHOPS OF THE AURORA ELGIN & CHICAGO RAILWAY.

James Doyle, master mechanic of the Aurora Elgin & Chicago Railway, has developed several unique practices in car inspection and in keeping records of the same. The shops in which the car inspection and repair work are done are located at Wheaton, Ill.

The Aurora Elgin & Chicago Railway Company has an equipment of 47 cars, which are used in maintaining the schedule on its third-rail system. About 30 of the cars are in regular service and are operated on an average about 300 miles daily. Each car is given a thorough inspection every other night.

The master mechanic keeps a complete record of the miles traveled by each car. Every night cards are posted in the shop designating the cars that should be placed over the pits. One of these cards is reproduced herewith. It contains the date, the car number, the date and time the car was taken from its run, and the respective heads under which the various car equipments are grouped. After an inspector has thoroughly inspected and repaired the equipments for which he is responsible, he signs his name in the blank space provided on the card opposite the general head under which his work is classed. He is then held responsible for the work.

The cards are gathered up each morning and sent to the master mechanic's office, where they are recorded. If for any reason a car is not inspected after having run 600 miles, the card bearing its number is filled out in red ink, which indicates that the equipment should be inspected more thoroughly than usual.

This company has found it profitable to overhaul the triple, engineer's and feed valves of its cars every 60 days. The journal boxes are thoroughly cleaned and repacked every 45 days. When the valves or journals have been in service the allotted time a cross is placed on the inspection card in the square opposite the respective parts, which indicates to the repairman that the part of the equipment thus marked should be overhauled or replaced by new parts. After the work has been done the employe places a circle around the cross.

The inspectors are divided into six classes. The men of each class have their duties definitely arranged according to a bulletin of instruction that is posted in the shop. The substance of the bulletins is as follows:

Whenever it is necessary to adjust or change triple valves, engineer's valves and feed valves, a cross will be marked on the card in the square opposite the name of the respective part. Should a valve be reported as defective on the trainmen's daily car report or by an inspector, the valve so reported may be changed by an employe, who must indicate the same by marking a circle in the space provided on the card. At no other time are the valves to be changed.

The employe who inspects and repairs controllers, controller circuit wires, switches and fuses, light circuits, switches and fuses, heaters, heater circuits, switches and fuses, com-

pressor governors, air gauges, signal bells, emergency valves, train line and bus line sockets, motor and bus line fuses, and who looks after all carpenter and trimming work, must sign his name in the space allotted on the inspection card provided for each car. This will indicate that he has completed the necessary inspection and repairs to each of the above car parts.

The employe who inspects the contactors and reversers must sign his name in the proper space on the card provided for each car. This will indicate that he has done the necessary work on the parts coming under his supervision.

The employe who inspects and repairs motors, commutators, brush holders, motor leads, grid and control rheostats, gear cases, brakes and brake rigging, air hose and piping, reservoirs, drawbars, trucks, wheels and safety chains, will sign his name in the allotted space on the card provided for each car, thus signifying that he has thoroughly inspected and adjusted the respective parts.

The employe who inspects and repairs air compressors, trolley stands, poles and wheels, third-rail shoes, fuses and brake release springs, will sign his name in the space allotted therefor on the inspection card provided for each car, thus indicating that he has done the necessary work.

The employe who inspects and oils armature, axle and journal bearings, sector bars, chafing plates and gearing will when he has completed his work on each car, sign his name in the allotted space on the card provided for each car. When the bearings are to be repacked, the inspection card will be marked with a cross in the square opposite the name of the bearing requiring attention. No bearing will be repacked otherwise unless in bad order. Armature clearance will be taken whenever bearings are to be replaced.

HOW TO INSULATE ARMATURE COILS.*

Armature coils are made in so many different varieties that several different methods of varnishing are necessary in order to secure the best results with each different kind. For the insulation of direct-current motor and dynamo armature coils, it is advisable to use what is known as the "double-dipping" method, as all coils of this kind are usually form-wound and are, therefore, readily adapted for this treatment.

The treatment is as follows:

After the coils are formed, they are clipped together at the corners, and dipped right into the varnish compound, and then allowed to dry. When the coils are thoroughly dry, they should then be taped and again dipped in the varnish compound—and dried. To get the best results on this class of work, particularly when handled in quantities, the varnish must have great plasticity, and good insulating and quick-drying properties.

The varnish should also be a combined baking and air-drying varnish, as quick-drying varnish is often an absolutely necessary factor—in many cases, the varnish must be thoroughly dry from one to two hours after baking.

The varnish which has great plasticity is also of vital importance on this class of work, because in making up the standard types of machines, it is often desirable and economical to make up at one time enough coils to provide for the entire output of each size machine for a long while ahead—in many cases, for six months or even a whole year.

Great plasticity is, in this way, of great value to the coil manufacturer, as it enables him to make up a big lot of coils and stock them, without any fear that the coils will harden, or that the insulation will break when the coils are finally assembled in an armature later on, as so often happens when a hard-drying varnish is used on the coils.

On armature coils of street railway motors, the great essential is durability and water-proofing qualities. The test of time has shown that the varnish which best accomplishes the desired results is a varnish of hydrocarbon base, which dries quickly and remains indefinitely soft and plastic. This quality enables a varnish to withstand the contraction and expansion always present in a street railway motor, and prevents the breaking of the insulating film from vibration and heat, thus absolutely and indefinitely repelling moisture, which, in a majority of cases, is the direct cause of short circuits and burn-outs. The "double-dipping" method described above is absolutely essential in the treatment of street railway motor armature coils.

In street railway work it is also essential that a finishing coat of varnish be given the armature after the coils are assembled, as very often injury to the insulating film results from placing the coils into the slots. This coat of varnish not only serves to remedy any defects of this nature, but also

provides an additional waterproof coating to the whole armature. A varnish of this nature to be successful should have in a great degree the qualities of dipping varnish, such as ability to withstand long continued heat and vibration without becoming brittle and absolute water-proofing qualities.

TESTS OF A 500-KILOWATT TURBO-ALTERNATOR.

As the results of comparatively few tests of turbo-generator units have been published, those recently conducted by H. L. Rice, general manager, and W. M. Willett, electrical engineer of the Western United Gas & Electric Company of a standard 500-kilowatt turbine and generator in the company's plant at Aurora, Ill., will no doubt be of interest.

Description of the Unit.

The steam end of the unit is an Allis-Chalmers-Parsons horizontal turbine, designed to operate with dry saturated steam at 140 pounds pressure per square inch, gauge, at the turbine throttle, and a vacuum of 28 inches of mercury, referred to a 30-inch barometer, at the exhaust nozzle. With steam under these conditions the unit is designed to carry an overload of 50 per cent, the power factor being 100 per

tioned. The lower barrels were connected with each other by a large horizontal pipe near their bottoms, and the suction pipe of the feed pump was brought into one of the barrels.

Two Stirling boilers of 250 boiler horsepower each supplied steam to the turbine during the test. Each of the six drums of the two boilers was provided with a gauge glass and readings of the water levels in all six drums were taken at the commencement and end of the test, and also during the test. The blow-off pipes were blanked off, as were also the feed connections to the other two boilers in the station.

The auxiliary steam header for the feed pumps, etc., was disconnected from the main header. That portion of the main header receiving steam from the two boilers not used during the test was separated from the portion receiving steam from the two boilers which furnished steam to the turbine during the test by means of a gate valve, which was closed tightly during the test. In order that there might be no leakage of steam through this valve, the pressure on all boilers was maintained about the same throughout the test, so that both sides of the valve were under approximately the same pressure.

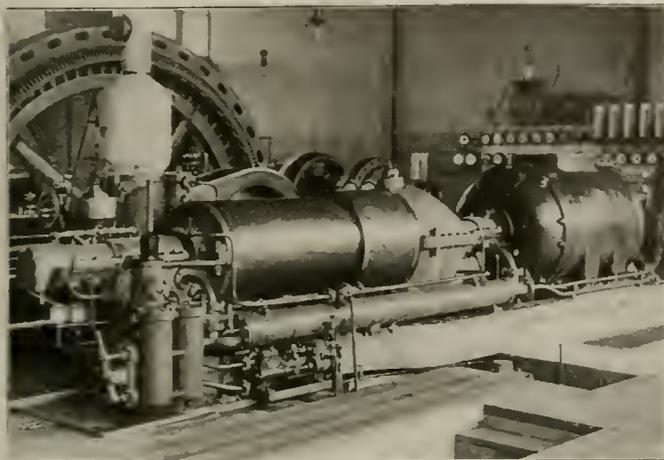

The condensed steam from the steam header, and also that from the steam separator near the turbine throttle, was discharged into barrels filled with a weighed quantity of cold water. As the water accumulated it was taken out and weighed, and when the water in the barrel became sufficiently hot to vaporize, a weighed quantity of cold water was added. At the end of each test the water in the barrel was brought back to its original quantity. The feed pump for supplying the measured feedwater to the boilers was a duplex outside-packed plunger pump. The leakage from this pump was caught and returned to the lower feedwater supply barrels. It was not necessary, therefore, to keep records of this leakage.

The steam gauges were checked by an inspector's test gauge, which had been verified shortly before. The quality of the steam during the test was determined by a throttling calorimeter introduced into the steam pipe just below the separator at the turbine. A water rheostat was used for loading the turbo-unit. Electrical readings were taken from the regular switchboard instruments in the station, and also from a set of calibrated instruments.

Between the overload and three-fourth load tests, the boilers were tested for leakage. To determine this, all valves were closed after the boilers had been filled to marks on the gauge glasses, and the boilers were kept under a steam pressure of 150 pounds per square inch for four hours. A measured quantity of water was then put into the boilers to bring the water level back to the original marks.

Results of Tests—	Underload.	Overload.
Average load, kilowatts	385.8	570.8
Per cent of rated load.....	77.5	114
Duration of test, hours.....	4	4
Steam pressure at turbine throttle, gauge.....	142.4	143.3
Steam pressure at turbine inlet, gauge.....	87.0	123.02
Vacuum turbine exhaust, inches.....	27.57	26.77
Barometer, inches	29.45	29.5
Vacuum at turbine referred to 30-inch barometer, inches	25.08	27.22
Revolutions per minute.....	3,600	3,600
Total water used, corrected for temperature, degrees F.	34,552.0	78.8
Drips from steam header, pounds.....	397.0	485.44
Drips from separator, pounds.....	91.5	318.75
Temperature of feed water, degrees F.....	83.16	68.25
Boiler leakage, pounds	1,927	1,927
Moisture in steam by calorimeter, per cent....	4.48	5.12
Actual weight of water chargeable to turbine, pounds	30,612.01	43,878.23
Actual consumption dry steam per kilowatt per hour, pounds	19.83	19.21

At the annual meeting of the National Association of Cotton Manufacturers, held on April 24 at the Massachusetts Institute of Technology, the association medal was presented to Mr. Charles B. Burleigh in acknowledgement of the merits of a paper read before the association at its fall meeting on September 13, 1906, entitled "The Curtis Vertical Steam Turbine."

Turbo-Alternator Tested at Aurora.

cent. The turbine and generator operate at 3,600 revolutions per minute, the generator being of the 2-pole, 2-phase turbo type, generating 60-cycle current at 2,200 volts. The normal current per phase is 114 amperes. The turbine is served by a standard Allis-Chalmers turbo jet condenser.

Conditions of the Test.

The time during which the turbine could be spared for test was limited from midnight Saturday to midnight Sunday; it was therefore decided to run only two tests, viz., one at 10 to 15 per cent overload, and one at three-fourths full load. As the turbine is provided with a jet condenser, the steam consumption had to be determined by weighing the feedwater, and to correct this it was necessary to make a boiler leakage test during the time available for test purposes.

To determine the amount of feedwater used, two barrels were placed on a platform and connected with each other by a short horizontal pipe introduced into the sides of the barrels near their tops. A water supply pipe with valves was brought over these barrels for the purpose of filling them alternately. Each barrel was provided with a large plug cock in its bottom. The barrels were carefully calibrated, and when filled so that the water would just enter the connecting pipe above mentioned, they were found to contain 413 pounds and 391.25 pounds of water respectively at 58 degrees F. As the feedwater during the test was at a higher temperature, a correction was made for the difference. Under the platform two receiving barrels were placed; into these the upper barrels emptied through the plug cocks men-

RECOMMENDATIONS OF WISCONSIN RAILROAD COMMISSION.

The first biennial report of the railroad commission of Wisconsin, reviewing its operations from the organization of the commission to June 30, 1906, and opinions to December 1, 1906, has been issued. The commission recommends a number of changes in the laws. In the list of recommendations is the following:

The jurisdiction of the commission over street railways should be either increased or diminished. Under the construction placed upon the law by the attorney-general and by the commission, it confers jurisdiction upon the commission to regulate any street railway company whose lines pass beyond the limits of the city in which it is operating. This right of regulation extends to the urban business of the company as well as to the business of the company outside of the limits of the city. As a result the commission appears to have a right to regulate the entire business of a street railway company where any of its lines extend beyond the city limits, but it has no right to regulate the business of a street railway company whose lines are entirely within the limits of the city in which it is operating. It would appear to the commission that it should either have power to regulate the urban business of all street railway companies operating in the state or that such power should not extend to any of them.

The commission also recommends that every corporation doing business in the state should be required to furnish a verified list of its stockholders upon demand from the commission.

The report gives figures of operations of the street and interurban railways in Wisconsin for the calendar years 1904 and 1905. In the year 1905 the total gross receipts from the railway business of 20 companies reporting were \$4,321,876, as compared with \$4,144,267 in the previous year. The total amount applied for "depreciation or reserve" was \$409,133 in 1905 and \$373,932 in 1904. Other items of expense in the two years were as follows:

	1905.	1904.
Conducting transportation	\$1,272,132	\$1,273,783
Maintenance of way and structures.....	172,054	192,073
Maintenance of rolling stock.....	207,889	206,989

THE CLEVELAND SITUATION.

Both the Cleveland Electric Railway and the low-fare interests are making preparations for extensive publicity campaigns to secure the favor of the citizens for their respective sides of the controversy. In the meantime the Cleveland Electric Railway has nearly completed the work of removing its property on the Central-Quincy lines and has so far been successful in preventing operation over those lines by its rivals.

Judge Chapman of the common pleas court on May 4 granted two temporary injunctions applied for by the Cleveland Electric Railway, one restraining the Forest City Railway and the Municipal Traction Company from interfering with the property of the Cleveland Electric in Central avenue and Quincy street, and the other enjoining further progress in those streets under the grant of the Forest City Railway, on the ground that the mayor's alleged financial interest in the company has invalidated the franchise.

At the council meeting on Monday night Councilman Felton attempted to have some action taken on his ordinance granting to the Cleveland Electric Railway a 6-year franchise on Central avenue and Quincy street on the basis of seven tickets for a quarter, but the ordinance was tabled. The Cleveland Electric filed with the city clerk several hundred revocations of consents to the Forest City Railway for the Central-Quincy lines, which are intended to operate against the pending ordinances to the Low Fare Railway. Three ordinances were passed giving the Low Fare Railway franchises on all of the lines now occupied by the Cleveland Electric Railway, whose franchises expire in February next, according to the city's claim. Fifteen ordinances were also introduced giving the Low Fare company franchise extension

rights over 15 cross streets between Central avenue and Quincy street. The manifest object is to keep the Cleveland Electric guessing as to which street the company intends to use so that it cannot block the work by preventing the securing of consents. A resolution was also passed directing the Cleveland Electric to repair its St. Clair avenue tracks by June 15 under penalty of forfeiture of its franchise. The company has refused to lay new groove rails and to pave between the tracks on its Detroit avenue line, where the city is repaving the street, because of the city's claim that the franchise on that street expires next February. A resolution was introduced requiring the company to proceed with the work at once, under the same penalty as provided in the previous resolution. It was referred to the committee on street railways.

The suit of the Cleveland Electric Railway to enjoin the Low Fare company from laying track or operating on the Central-Quincy lines, on account of the lack of a sufficient number of consents, has been given several hearings before Judge Phillips and is expected to be decided the latter part of this week. In the meantime the Low Fare company is temporarily restrained from doing any work under its permit from the board of public service.

Municipal Ownership Commission Preparing Report.

At a meeting of the Municipal Ownership Commission of the National Civic Federation, held in New York City on May 6, a number of subcommittee reports were received and a special committee consisting of Walton Clark, Edward E. Bemis, Milo R. Maltbie and J. W. Sullivan, was appointed to undertake the work of assembling and compiling the mass of material and of incorporating therewith the special contributions of an economic character made by recognized authorities. This committee will prepare two reports for publication, one being a synopsis of the more important matter for use by the press and the other a pretentious volume containing all of the statistics, records and contributions which have resulted from the committee's extensive investigation of municipal ownership at home and abroad. It is expected that the former report will be ready for distribution about June 10.

Rules and Regulations of the Operating Department of the Denver City Tramway Company.

The 1907 edition of the rules of the Denver City Tramway Company, revised to March 15, 1907, has just been received. The rules are remarkably complete and show the attitude of the company, not only to its employes but to its patrons as well, to be that of co-operation and a desire to do all within its power to give its passengers the best service possible and a foresight for the welfare of its employes. Throughout the little book useful hints are given to the motorman and conductor, and city ordinances, relating to the operation of electric cars and conduct of employes of electric railway companies, are inserted to aid the conductors and motormen to understand the rules and to improve the service.

London Underground Railways.

It is stated on good authority that the greater part of the tube railways, the construction of which has been undertaken by the Underground Electric Railways Company of London—about 22 miles in all—will be open for operation before July 1, 1907. The construction of these lines has been delayed much beyond the expectation of the promoters, so that at the present time there are only about 12 miles open for traffic, namely, about 3¾ miles of the Baker Street & Waterloo Railway, opened in March, 1906, and about 8 miles of the Great Northern Piccadilly & Brompton Railway, opened in December, 1906. The earnings of the uncompleted system scarcely enable the formation of a final opinion as to the possibilities, but the Wall Street Journal is informed that the portions which have been opened are showing weekly increases at the present time. The American expert and practical street railway man, who recently visited the city to look over the whole London situation and the properties of the Underground Electric Railways, is stated to have expressed the belief that the enterprise will in due time work out with good results.—Wall Street Journal.

PIPING AND POWER STATION SYSTEMS—XXXIX.

BY W. L. MORRIS, M. E.

Condensation Main and Branches—Class (J6-7-8 and 9).

This class of service pertains to surface condensers only. The condensation alone or with the air contained in it may be delivered to an open heater by the pump running continuously at a fixed speed, or the pump may be regulated by a float if the pump handles the condensation only. If the condensation pump is governed by a float it cannot handle air mixed with condensation. In this case the water of condensation may be delivered directly to the boilers, as shown in Figure (G1-2), through a closed heater, the condensation pump in this case being that employed for feeding the boiler. With this arrangement, though extremely simple, it is necessary that the pump be located at a sufficient distance below the condenser discharge, so that the weight of the column of water in the pump suction pipe will be sufficient to raise the valves of the pump and completely fill the pump cylinder without the necessity of maintaining a greater vacuum in the pump cylinder than in the condenser.

The details shown in Figure 276 would not be suitable for high pressure such as would be required in boiler feeding, though as a matter of fact this detail could not be employed, as the diameter of the pump necessary for boiler feeding would be far less than is necessary for the type of valve construction there shown. For high pressures the outside packed plunger pump is better suited, as it is at all times possible to ascertain exactly what the leakage is and the condition of the packing. In Figure 277 (J2-7) is shown an

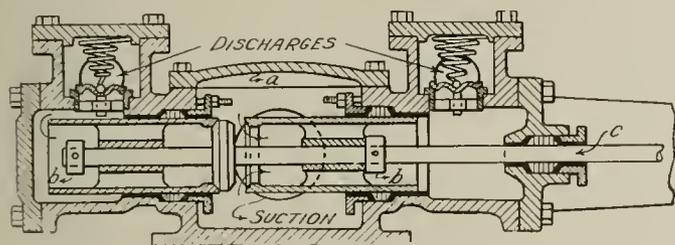

Figure 277—(J2-7).

outside packed plunger pump, which is packed by removing the cover plate over the suction chamber, a. The suction valves in this pump, as will be seen from an examination of the drawing, are mechanically operated by the movement of the plunger rod, upon which the valves are mounted. The discharge valves are of the usual heavy type employed for boiler feed pumps. The two brass plungers, which are free to slip on the rod within the limit set by the collars, bb, have valve seats turned on them at their outside ends. In operation the motion of the pump rod is transmitted to the plunger through the suction valve, which causes the valve to be firmly seated and kept tight by the pressure against the end of the hollow rams, and being mechanically opened, give free access for the water through the suction end. A feature which will be evident from an examination of the drawing is the large suction valve area presented by this type of construction. This type of pump is especially suited for direct steam drive with the steam cylinder at the other end of the piston rod. From its construction it will be easily seen that this pump is well adapted to handle air and water, together, but is not suitable for use as a dry vacuum pump on account of the large clearances.

To insure a high efficiency the design of a dry vacuum pump should be of the crank and flywheel type, so that the clearances may be reduced to the least possible amount, as shown in Figures (J2-5 and 6). This type of pump shown in Figure (J2-7) would be more efficient for handling air and water combined if the valves on the piston rod closed against the other end of the ram, closing against the ram from the

same side as shown, the valves being located inside of the ram. The air pump shown in Figure (J2-5-6 or 7) cannot be used if located a considerable distance below the condenser, as shown in Figure (G1-2). For these types of pump the suction lines should be carried from the bottom of the condenser to the suction chamber of the pump along practically a level line, giving the air a free path to the air pump over the surface of the water in the suction line. If it is necessary to place a wet vacuum pump a considerable distance below the condenser, owing to the use of spring loaded suction valves, it is then necessary to keep all the water pumped out of the suction pipe in order to permit the air to flow freely to the pump cylinder. This necessitates the pump being run at a higher speed, and by keeping the water out of the pump its capacity for handling air is decreased as the water is not present to fill the clearance spaces. The greatest capacity for handling air is obtained when the water taken at each stroke is just sufficient to fill the clearance spaces.

The condensation pump is oftentimes located in an out of the way place owing to the position of the condenser, and, in fact, it is sometimes necessary to set other pumps in positions where it is impossible to provide ready means for observing their operation. The most necessary operating condition to be observed is the speed at which the pump is running. This can be easily ascertained by arranging an indicator at a point readily observed by the operator.

A simple detail for such an indicator and one which permits the indicator to be placed in almost any location is shown in Figure 278 (J2-8). The indicator piping is attached to one end of the steam cylinder or water cylinder and the change of pressure is noted by the rise and fall of the water in the gauge glass, there being one movement for each stroke. The upper valve, a, is kept closed while in operation, the lower one being open. The quantity of air in the glass can be increased by manipulating the different valves, closing c, opening b, closing b, opening a, and drawing of the water through e. To raise the water line have c open, draw air at d and close b, open a and discharge contents of glass as much as required through e. The operation of this device is due to the air confined in the upper part of the gauge glass, the volume changing as the pressure on it changes. Not only can the speed be observed with this gauge, but also the regularity of motion. The liquid in the glass may be colored, but for continuous service it is better to use clear water, as nearly all colored liquids mark the glass where the liquid and air come in contact. It will be better to use galvanized iron or brass pipe and fittings, as they would reduce the danger of the glass becoming soiled and therefore make it possible to observe the motion of the water more easily.

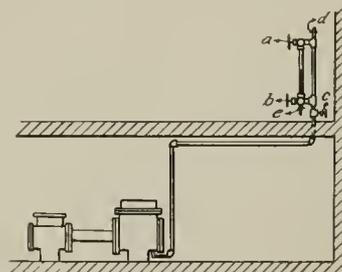

Figure 278—(J2-8).

City Water Main—Class K 1.

Plants that are provided with their own water supply soon become very careful in the distribution and use of city water. It is only a plant in which no other than city water is obtainable in which the employes of the plant become wasteful in its use. The operator becomes so accustomed to seeing large quantities of water used in regular work that what he wastes appears quite immeasurable.

In laying out the piping system of the plant which is to be operated entirely with city water many different methods can be introduced which will reduce or avoid the use of water. For example, instead of using hydraulic turbine tube cleaners, power cleaners should be employed, as they are successful in any plant and especially so in plants which use only city water. Instead of using furnaces having water

cooled parts some other type should be used to save the continuous loss of water. Instead of the bearings being water cooled they should be made sufficiently large to run cool without water. Instead of ashes being dropped into metal hoppers or other receptacles which necessitates their being wetted they should discharge into a masonry hopper, allowing air to the grate to carry off the heat.

If the water contains a considerable quantity of scale-forming salts it should be treated chemically in a purifier in order to reduce to a minimum the quantity of water wasted in blowing off. Little has been accomplished in the design of an exhaust condenser, a device which would save practically all the water fed to the boilers by condensing. Such a condenser would in all probability be constructed on the same general principles as an ejector, the ejector, however, having the greatest amount of work to perform, as it takes water from a state of rest and at a lower pressure.

An exhaust ejector would take air at practically the same pressure as the air it would discharge against. One cubic foot of air requires 0.0686 heat units to increase its temperature 1 degree F., or, if air is taken at 65 degrees and delivered at 205 degrees, the increase in temperature would be 140 degrees, which would require 9.6 heat units per cubic foot. Exhaust steam would have 965.7 latent heat units per pound, and as the volume at atmospheric pressure is 26.36 cubic feet per pound the exhaust steam would contain 36.6 latent heat units per cubic foot. To condense 1 cubic foot of steam therefore would require 3.8 cubic feet of air.

(To Be Continued.)

BRIDGE-DECKING RECORD USED ON WINONA INTER-URBAN RAILWAY.

In the Electric Railway Review for March 30, 1907, page 434, there was reproduced a record blank which was used

<u>BRIDGE DECKING RECORD.</u>

Bridge Decking Record, Winona Interurban Railway.

by the Winona Interurban Railway, Winona Lake, Ind., in recording the progress of pile driving on the Peru division. Accompanying this record is a bridge-decking record blank which has been compiled by R. M. Murray, chief engineer. It is shown herewith. This blank is intended to serve as a permanent record of the material used in the construction of the deck of the bridge.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL.B., OF THE CHICAGO BAR.

May Require Taking Out Permit to Do Work.

An ordinance of a city which requires street railway companies and other corporations holding franchises to use the streets of the city to file an application for a permit before entering upon and obstructing the streets, and which requires the applicant to file specifications of the manner in which the work is to be constructed and to fix the location thereof, and requires it to give bond to hold the city harmless for damages caused by the proposed work, and which gives the city council power to grant or refuse such permit, the supreme court of Nebraska holds, State, on the relation of the Lincoln Traction Company, v. Frost, 110 Northwestern Reporter, 986, is not invalid, as interfering with or violating the franchise rights of the company in the streets. The court will not presume that under such an ordinance the city authorities will act arbitrarily or abuse their discretion, but will presume that the ordinance will be construed according to its legal effect, and that if the proper conditions are met the permit will not be refused.

Duty Created by "Run Slow" Sign.

In an action against a street railway company for injuries received by a foot passenger struck by a car of the defendant while crossing a public street, it was established that when and where the accident occurred there was a sign, placed over the tracks by the defendant corporation, requiring cars to "run slow." The court of errors and appeals of New Jersey holds, Hayward v. North Jersey Street Railway Company, 65 Atlantic Reporter, 737, that this requirement, adopted by the defendant corporation previous to the accident, for the guidance of its servants in matters relating to the safety of the public, and made public, created a duty as to such persons as would be likely to be injured by a failure to observe the precautions prescribed. Proof of a violation of such requirement by the motorman, directly resulting in injury to the plaintiff, is evidence, although not conclusive, from which the jury would be warranted in finding the motorman negligent and the defendant therefore liable.

Company Entitled to Have Bill of Particulars.

In the case of Ferris v. Brooklyn Heights Railroad Company, 102 New York Supplement, 463, an action for an alleged assault by the defendant's servants upon the plaintiff when a passenger on one of its cars, the second appellate division of the supreme court of New York approves of an order for a bill of particulars. It says that it thinks a bill of particulars proper in this case to reach justice and to afford the defendant fair opportunity for preparation to meet the issue. The defendant is a corporation which works many cars and employs a large number of men. An allegation that on or about a certain day, when the plaintiff was a passenger on a car on a specified line on a specified street, he was assaulted by the defendant, its conductor, agents, servants and employes in charge of said car, is indefinite to the extent that it leaves the defendant in the dark as to the day, the time of day, the car, or the servants, and requires a minute, searching and laborious investigation by the defendant before it can throw any light upon the alleged occurrence.

There is nothing unreasonable, the court says, in requiring the plaintiff to name "the place and exact time of day that the accident (sic) happened, and also the direction the car was going." The information not only serves to locate and specify the occurrence, but also the car, and consequently those in charge of it, as it is common knowledge that the defendant keeps a record of its cars, their trips, and the particular servants in charge of each of them.

With regard to the bill requiring the number of the car, line and badge number of the motorman and conductor, the

court says that this was but to specify the car among the many worked by the defendant, and to identify the servants out of the many employed by it. If the plaintiff knew the names of the servants he could be required to give them. Of course, it was not essential to complaint or recovery that the plaintiff should give the numbers of the servants, or their names; but that was not the question. If he knew the numbers there was no good reason why he should not furnish the information.

The requirements of a setting forth of the length of time the plaintiff was confined to bed and house, the amounts paid for doctor's bills and medicines, the nature of his business, average earnings, and the time of his detention from work, were proper. But the court thinks that the plaintiff should not be required to give the "exact statement of injuries claimed to have been sustained" by him, or "the nature, extent and effects of same"; there being no allegation of permanent injuries.

Valid Ordinance as to Railroad Crossing by Cars.

A city ordinance intended to regulate the manner of crossing steam railroads by street cars in the city, provided that it should be unlawful for any conductor, in charge of any street car using the streets of said city for the purpose of carrying passengers or freight, to permit such cars to cross or enter upon the track or tracks of any steam railroad in said city until such conductor should have first fully crossed on foot to the opposite side of the farthest track of said steam railroad from his car, and it should be unlawful for any motorman, gripman or engineer, in charge of such car, to run into or upon the track or tracks of any such steam railroad until the conductor in charge of such car had first crossed on foot to the opposite side of the farthest track of said steam railroad from said car, and from said point had signaled such motorman, gripman or engineer to proceed with his car. The appellate court of Indiana, division No. 2, while not basing its decision upon the validity of the ordinance, states, *Indianapolis Traction & Terminal Company v. Romans*, 79 *Northeastern Reporter*, 1068, that it deems the ordinance valid. The court says that it was not necessary to pass upon the question of the validity of the ordinance, because the uncontradicted evidence, without reference to the ordinance, showed the company's negligence, the evidence showing that the car in question was run upon the track of a steam railroad, directly in front of an approaching train, without any effort to stop the car, and without any attempt by the conductor to ascertain whether the way was clear.

Right to Transfer from Short to Long Service Car.

A passenger on a car bearing in a conspicuous place the sign, "Fourth street only," was ordered off when the car reached that street, the conductor stating that the car did not go any farther. The passenger demanded a transfer entitling him to a continuation of his trip to his place of destination, which was refused.

It appeared that the company, in regulating its traffic, provided, over the route this passenger desired to travel, two classes of cars upon the same tracks, viz., long and short service cars. What he demanded was a transfer from a short-service car to a long-service car upon the same line.

The appellate term of the supreme court of New York holds, *Baron v. New York City Railway Company*, 102 *New York Supplement*, 746, that the refusal of a transfer was a violation by the company of section 104 of the New York railroad law, which provides that upon the refusal of a street car company to issue a transfer to a passenger, entitling the passenger to a continuous trip from the point of embarkation to another point on the railroad operated by such company, the company shall forfeit \$50 to the aggrieved party.

The court does not agree with the contention that the plaintiff failed to establish a cause of action on the ground that there was no proof that the transfer demanded by him was to a leased line. It says that the legislature never

intended that the obligation imposed by said section should be limited to leased roads.

Nor does the court consider that it was an excuse for a refusal of a transfer to the plaintiff to say that the giving of a transfer would confer upon him the privilege of stopping over. This argument could be urged against all transfers.

The court says that it may properly take notice of the fact that the region of the city through which the car under consideration passed was largely a congested business section, where the traffic was much heavier than in the extreme northerly or southerly parts of the city. The running of short-service cars between the long-service cars through crowded avenues is a reasonable regulation, well within the powers of the company in the management of its railroads, when, as in this case, reasonable notice is given of the conditions of operation. However, the company cannot lawfully refuse a transfer to a passenger whose continuous trip carries him beyond the terminal point of the short line. The court concedes to the company the right to establish lines of short-service cars, but it can find no authority that permits the company, no matter how conspicuous and complete the notice, to arbitrarily require passengers desiring to make a continuous trip beyond the place of destination of the short-service car to board only a long-service car. If the company possessed such authority it might avoid the giving of many transfers by establishing numerous short routes in various parts of the city and by operating thereon mainly short-service cars.

Right to Transfers Not Limited to One Direction.

A passenger boarded a southbound car, paid his fare, and asked for and received a transfer. He then left the car and boarded a westbound one on an intersecting street. On a car going northerly from this latter street he was refused a transfer, and was obliged to pay another fare to enable him to reach his destination. The appellate term of the supreme court of New York holds, *Kelly v. New York City Railway Company*, 102 *New York Supplement*, 742, that he was entitled to recover the statutory penalty for refusal of transfer.

Section 104 of the New York railroad law provides that "every such corporation entering into such contract," referring to one of lease, shall carry "between any two points," and "shall upon demand, and without extra charge, give to each passenger paying one single fare a transfer entitling such passenger to one continuous trip to any point or portion of any railroad embraced in such contract." The court says that when the passenger pays for the right to ride it is upon an agreement between the parties that he shall have a continuous ride for the one fare to his point of destination. Such a ride under the circumstances disclosed in this case was guaranteed to the plaintiff by the statute.

The court is unable to find legal support for the defendant's claim that it has the right to impose a limitation upon the giving of transfers by refusing them to passengers desiring to continue their journey upon lines not running in the same longitudinal direction. It was the contention of the defendant that "when a trip becomes southerly it shall not thereafter become northerly, and vice versa, without the payment of an additional fare."

The court thinks such a rule is a violation of the statute. It is not an excuse to show that such a rule is necessary to prevent a fraudulent use and abuse of the defendant's transfer system. The question of the reasonableness of such a rule and its effect upon the defendant's earnings affords no support for said contention. The reasonableness of the rule is not involved here. The statute gives to the public specifically and in unmistakable language the right to "one continuous trip to any point or portion" of the roads. The application of ordinary intelligence to the consideration of this question indicates at once to an impartial mind an unobscured and definite meaning in the words of the statute. The court has no right, under the claim of construction, to add to or take from that meaning. It can see no relief for the defendant except in additional legislation.

News of the Week

Legislation Affecting Electric Railways.

Florida.—The senate has passed a bill requiring both steam and electric railways to provide separate accommodations for the white and negro races.

Missouri.—The senate on May 3 concurred in a house amendment to Senator Cooper's bill enabling cities to regulate the charges of public utility companies by ordinance, and the bill has gone to the governor, who is expected to sign it without delay, as it is along lines recommended by him. The bill contains a court review provision and cities are empowered to provide for commissions to ascertain facts in regard to public utilities.

Pennsylvania.—The Fabey bill, requiring electric railway companies to secure local franchises before applying for state charters, was passed by the house on May 1, by a vote of 129 to 52.—The Homsher eminent domain bill was reported favorably by the house committee on city passenger railways on May 1.—The house has defeated a bill permitting railroads with less than 40 miles of track to charge 5 cents a mile passenger fare.

New York.—President E. W. Winters and Vice-President T. S. Williams of the Brooklyn Rapid Transit Company appeared before the senate railroad committee on May 7 and asked that before the committee acts upon the Wagner 5-cent fare bill a subcommittee be appointed to investigate the conditions. The bill, which was recently passed by the house, provides that no more than 5 cents shall be charged for a continuous ride within the limits of a municipality over the lines operated or controlled by one company, and would compel the Brooklyn Rapid Transit Company to reduce its fare to Coney Island, which is now 10 cents. The officials declare that the passage of the law would work a serious injustice.

Commission Report on Woodlawn Wreck.

The New York state board of railroad commissioners on May 6 made public its findings in regard to the New York Central wreck near Woodlawn on February 16, in which 24 persons were killed and 143 injured. The commission eliminated from the list of probable causes obstruction on the track, broken parts of equipment and defects inherent in the locomotives, limiting the probable causes to two—character of track and high speed. The commission finds:

"That the accident was caused by a condition of weak track, which was discovered and reported by the engineer of train 5, which left the Grand Central station on the morning of February 16 at 9:03 a. m. Also that this bad spot became worse by reason of the pounding it received from numerous passing engines, holding, however, until subjected to the unusual and abnormal pressure exerted by the impact of the two powerful electric locomotives running at a very high rate of speed striking it in quick succession, shearing the spikes and causing the rail to spread. The accident, therefore, was the result of a track condition, plus speed, plus again the neglect to locate and remedy conditions that had been reported on the morning of the accident.

"The board is further of the opinion that on the day of the accident in question no trains should have been allowed to run over the Harlem division on track 3, even at the schedule rate, until the track supervisor on that division had reported affirmatively to the superintendent or the general manager even that the track in question was right in every respect. The testimony adduced by the board fails to show that any such affirmative report was made, and the officials of the railroad when given an opportunity to offer evidence on this subject likewise failed to produce any testimony to that effect."

The commission also recommends extra strong tie plates and double-spiking on curves, close inspection of track and train equipment and a change in the rules of the company to enable a more ready location of responsibility.

Rapid Transit Affairs in New York.

The rapid transit commission at its meeting on May 2, after a hearing on the application of the Interborough-Metropolitan Company for permission to build a third track on the Second and Third avenue elevated lines for express trains, adopted a resolution introduced by John H. Starin to the effect that the board would negotiate with the company for the granting of a franchise for the additional elevated trackage, provided that company will enter into a contract with the city to construct and operate those portions of the Seventh and Eighth avenue and Lexington avenue roads, referred to in Mr. Shonts' letter to the board on April 25, using entirely its own capital in construction and equipment, and provided, further, that it will also agree to arrange for a system of universal transfers between subways, elevated structures and surface lines on all its lines in the boroughs of Manhattan and the Bronx. President Shonts, after reading the resolution, stated that it would be impossible under present conditions for the company to construct the subways with its own money, and that it would not at present consider any system of universal transfers.

George L. Rives, counsel to the commission, submitted a report, dealing with the objections made by Mr. Shonts to the form of contract drawn for the new subways. The substance of Mr. Rives' report was that the stipulations complained of by Mr. Shonts were not due to any arbitrary action by the commission, but to the obligations placed on the commission by the changes in the rapid transit act in 1905, and by the Elsborg bill, which was passed last year.

The commission gave a hearing on the application of F. B. Behr for a franchise to build a monorail line from the foot of Atlantic avenue to Coney Island. Mr. Behr stated that the plan of construction contemplates a double-track road on elevated pillars

16 feet above the street surface. The speed will be 80 miles an hour, exclusive of stops.

It is probable that the commission will take no further action until the fate of the public utilities bill is decided. It has been suggested that the city might build the subways in sections, as its borrowing powers will not permit of its building them outright.

American Railway Insurance Company.

The inspection and survey bureau of the American Railway Insurance Company of Cleveland, O., which was organized on January 10 at Cleveland, as noted in the Electric Railway Review of January 12, page 57, by 27 leading traction and power companies, for the purpose of carrying their own fire insurance, has sent out a book of 55 pages describing the work the company proposes to do and offering many helpful suggestions for the adequate protection of electric railway properties against fire.

The object of the company, as previously stated in the Review, is to carry the companies' insurance at actual cost. The plan was worked out principally by Henry N. Staats of Cleveland, who is manager of the company, and was outlined in the report of the "Insurance" committee of the American Street and Interurban Railway Association at Columbus last fall. The company is now ready to carry a part at least of the insurance of the companies represented, and is the first of a series of companies to be organized, including the Traction Mutual Insurance Company, the Electric Railway Insurance Company and the Associated Railways Insurance Company, which will carry both sprinkled and un-sprinkled risks. The idea of the formation of the several companies is to scatter the risks, the aim being to bring the various companies eventually to a position where they can carry all of the insurance of any electric railway company. Horace E. Andrews, president of the Cleveland Electric Railway, who was largely instrumental in the formation of the American Railway Insurance Company, is its president.

The book just issued, besides outlining the plan to obtain insurance at actual cost, contains the report of the "Insurance" committee, submitted at the Columbus convention and the discussion on and approval of that report, which were published in the Daily Electric Railway Review of October 18, 1906, and two chapters devoted to automatic sprinkling of electric railway properties. It also contains a large number of halftone illustrations of the buildings of the Cleveland Electric Railway, which are equipped with automatic sprinklers, and of several tests of sprinklers.

Chicago-New York Air Line Called to Account.

The Chicago-New York Electric Air Line Railroad, the much advertised company which proposes to build an electric railroad from Chicago to New York, and promises to carry passengers over its 750-mile air line in 10 hours for \$10, will probably be called into court to account for its expenditure of the amounts derived from its large sales of stock. Theodore Nemoyer, a former employe of the company, has filed a suit in the circuit court of Cook county, Illinois, asking for an injunction restraining the company from doing business in Illinois, for a thorough accounting and for the appointment of a receiver in case in the progress of the hearing it should be demonstrated that the company can be more economically administered by officers of the court.

After giving a history of the development of the concern and the acts of its officers the plaintiff asks the court to enter an order nullifying a number of contracts. President Alexander C. Miller and other officers of the company are charged with mismanagement and with wasting securities of the company, with misrepresenting facts concerning the company's assets and hazarding its treasury through depositing funds in weak depositories. The petitioner further avers that the charter is liable to forfeiture because the capital stock of the Air Line was increased without authority of the stockholders and that the officials are giving away two shares of stock to every one they sell. He charges the officials, headed by the president, with voting themselves excessive salaries. He states that the entire proceeds from the sale of the capital stock is turned over to the Co-operative Construction Company of Chicago, of which Jonathan D. Price is president, and that both Miller and Price receive \$25,000 a year salary in addition to large blocks of stock. He also states that the officers have no knowledge of the cost of constructing the line, as no surveys have been made east of the eastern part of Ohio and no profiles have been made between there and Tolleston, Ind.

President Miller has issued a statement denying the claims of Nemoyer, who, he says, is a disgruntled employe, and stating that contracts have been let and deliveries of materials partly made for the first 20 miles of the line from Laporte, Ind., toward Chicago. Work is now in progress at Laporte and a 3-mile spur track has been built from Laporte to the construction camp.

Wage Increases.

The Twin City Rapid Transit Company of Minneapolis, Minn., operating in Minneapolis, St. Paul, Stillwater and vicinity, has announced that the wages of all its trainmen will be increased on June 1. This is a voluntary action on the part of the company and comes as a complete surprise to the men. At present the men receive 22 cents an hour after the first six months of service; under the new scale they will receive 21, 22 and 23 cents an hour for the first, second and third years, respectively, 24 cents for the fourth and fifth years, and 25 cents thereafter. All trainmen appointed during the past year will receive the 22-cent rate during the second six months of service. This means that a large percentage of the company's employes will immediately receive the maximum rate of 25 cents an hour.

The Omaha & Council Bluffs Street Railway of Omaha, Neb., on May 1 put into effect a new scale of wages, as follows: For the first year of service, 21 cents an hour; for each succeeding year, including the fifth, an increase of 1 cent an hour; fifth to ninth

years, 25 cents an hour, and after the ninth year, 26 cents. This is an increase of 1 and 2 cents for the 800 employes affected.

The Tacoma Railway & Power Company, Tacoma, Wash., has announced a new scale, effective at once, which amounts to an increase of 2 and 3 cents an hour. The new rates for conductors and motormen are: First six months, 23 cents; second six months, 24 cents; second, third and fourth years, 25 cents; fifth, sixth and seventh years, 26 cents; eighth, ninth and tenth years, 27 cents; eleventh and twelfth years, 28 cents; thirteenth, fourteenth and fifteenth years, 29 cents, and after fifteenth year, 30 cents. Gripmen will receive 1 cent an hour above this scale.

The Duluth Street Railway, Duluth, Minn., has announced a new scale, effective on June 1, of 21 cents an hour for the first year, with an increase of 1 cent an hour for each year, including the fifth.

The St. Thomas (Ont.) Street Railway, owned and operated by the city, has announced a new schedule of wages for its trainmen as follows: For the first six months, 15 cents an hour, for the next 2½ years, 17 cents an hour, and thereafter 18 cents an hour.

Congress of Manufacturers.—The twelfth annual congress of the National Association of Manufacturers of the United States will be held at the Waldorf-Astoria, New York, on May 20, 21 and 22.

Extension of Time in Which to Comply with Safety Appliance Law.—The Indiana railroad commission has granted the Angola Railway & Power Company, Angola, Ind., which operates a three-mile electric line from Angola to Angola lake, an extension of time until May 1, 1908, to equip its line according to the provisions of the safety appliance law.

Express Deal Completed.—It is reported that the deal has finally been completed whereby the Pacific Express Company has arranged to take over the express business between Toledo and Dayton, O., now handled by the Toledo Urban & Interurban Railway, the Western Ohio Railway and the Dayton & Troy Electric Railway. It is expected that the new service will go into effect about June 1.

Hospital Annex for Railway Employes.—The Georgia Railway & Electric Company of Atlanta, Ga., and the Southern Railway have proposed to build and equip an annex to the Grady Hospital in Atlanta for the accommodation of employes of the company. The facilities of the hospital are often overtaxed and the companies desire a separate ward for their patients, where they may receive immediate attention, under the control of the companies' physicians.

Ft. Wayne & Wabash Valley Adopts Merit System.—The Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind., has announced that it has adopted the merit system of disciplining employes, beginning on May 1. Under this system an employe will receive a certain number of demerit marks for each violation of the rules and merit marks for efficient service. Efficient service for a certain period will cancel the demerits. Cash prizes are to be given all employes who have a clean record up to July 1. The operation of the system will be in charge of J. B. Crawford, superintendent of transportation.

Joliet Strike Averted.—A strike of the 119 conductors and motormen employed by the Chicago & Joliet Electric Railway, Joliet, Ill., which was threatened last week, was averted on May 3, when an agreement was reached between the men and the company on the basis of an increase of two cents an hour, extra pay for overtime, recognition of the union and a plan for arbitration of future differences. The men held a meeting on April 30 and voted to strike if their demands were not granted. The men employed on the Joliet city lines have been paid 20 and 21 cents an hour, while those on the Joliet-Chicago run were paid 24 cents. They demanded 25 and 27 cents for the city lines and 30 cents for the Chicago run.

Convention of the Southwestern Electrical and Gas Association.—President H. S. Cooper of Galveston, Tex., announces that the third annual convention of the Southwestern Electrical and Gas Association will be held at San Antonio, Tex., on May 14, 15 and 16. It is earnestly desired to make this the banner convention of the association, and every effort is being made by the officers and executive committee to make it such. An excellent list of practical papers on live subjects for every branch of the association will be presented, and an interesting question box has been prepared. San Antonio is an interesting and hospitable city and ample accommodations, both for guests and for exhibits, have been arranged. Special entertainments will be given by the San Antonio Traction Company and the San Antonio Gas and Electric Company.

New England Street Railway Guide.—Robert H. Derrah of Boston, Mass., formerly general passenger agent of the Boston & Northern and Old Colony Street Railway companies, has issued the 1907 edition of Derrah's Official Street Railway Guide to New England. This, the eleventh edition of this well-known guide, contains 128 pages of useful and interesting information about the electric railway systems of New England, in a suitable size for the pocket, 5 by 7 inches. This year a new arrangement has been adopted and all towns reached by electric railways are placed in three classifications, giving in alphabetical order all towns reached from Boston, Providence and Worcester. The mileage, fare, running time, route and points of change are given for each town. The book contains several good maps and descriptions of trips to the many points of interest which are reached by the New England lines. Besides being exceedingly useful to the traveler this guide is of special interest to any one interested in electric railways as illustrating the remarkable development of the electric railways in Massachusetts, Rhode Island, Connecticut and New Hampshire.

Construction News

FRANCHISES.

Baker City, Ore.—A 30-year franchise has been granted to William Pollman and associates of Baker City to build and operate an electric line in this city. It is stated that rails and cars have been ordered and that work will be started as soon as the materials arrive. The promoters promise to have 1½ miles of line in operation by the end of the year and later to extend it to points outside of the city.

Bennettsville, S. C.—J. J. Matheson, Warren Moore and Vann Livingston, Bennettsville, S. C., have applied for a franchise to build and operate a street car system in Bennettsville, which will connect with interurban lines to be built in Marlboro county. One of these will run from Bennettsville to Blenheim and another from McColl to Gibson and Laurinsburg, S. C. It is stated that arrangements for financing the project are about completed.

Champaign, Ill.—The Corn Belt Traction Company has been granted a franchise to build its interurban line over Walnut street from the north city limits to Main street. Cars are to be in operation within one year from the granting of the franchise.

Dubuque, Ia.—The Eastern Iowa Traction Company has applied for a franchise to enter Dubuque with its interurban road.

Gary, Ind.—A petition, signed by 150 of the 5,000 residents of Gary, has been filed with the board of that village, asking that it pass franchise ordinances, granting to subsidiary companies of the United States Steel Corporation the exclusive right to supply light, water, heat, power, telephone and traction service inside the corporate limits.

Hanover, Pa.—The Hanover & York Street Railway Company has applied for a franchise to enter Hanover with its 18-mile double-track line between Hanover and York. In exchange for the franchise the company agrees to pay the borough 3 per cent of the gross receipts, based on the pro rata length of the line, and to pave between the rails and keep same in repair.

Silver Creek, N. Y.—The Buffalo & Lake Erie Traction Company has been granted a franchise to enter Silver Creek with its interurban line. The road will enter from the east over private right of way and leave at the southwestern limits by way of Main street. The road is to be completed within 18 months from the date of the franchise.

Westfield, N. Y.—A 99-year franchise has been granted to the Buffalo & Lake Erie Traction Company to build a double-track line through Westfield from the eastern limits to Portage and Main streets and on Main street. The franchise also provides for the construction of a viaduct over the creek at the western end of the village of sufficient width to accommodate a roadway and sidewalk in addition to the trolley tracks. The cost is estimated to be between \$90,000 and \$100,000, of which the village will pay \$35,000. A special election will be held to ratify this portion of the franchise. It is stated that the line will be in operation within 18 months from the date of the franchise.

RECENT INCORPORATIONS.

Bahia Tramway Light & Power Company.—This company has been incorporated in Maine with \$3,500,000 capital stock to build a system of electric railways in Bahia, Brazil, South America. The company has an authorized issue of \$7,500,000 50-year 5 per cent bonds, of which \$3,500,000 have been offered in London and Brussels at 90½. Some of the financing, it is said, will be undertaken in New York, and among the New Yorkers mentioned as interested in the enterprise is W. L. Bull, who has already large interests in South America.

Columbus Kenton & Lima Railway.—It is reported that this company will soon file incorporation papers as a consolidation of the Columbus Urbana & Western Electric Railway of Columbus, O., the Lima Kenton & Marion Traction Company and the Delaware Magnetic Springs & Northern Traction Company, which are controlled by J. A. Vandegrift of New York and W. H. Ogan of Columbus.

Kansas City & Olathe Electric Railroad.—Incorporated in Kansas to build an electric railroad 20 miles long from Rosedale southwest to Olathe, through Wyandotte and Johnson counties, in Kansas. Capital stock, \$175,000. Incorporators: D. E. Johnson, R. O. Larsen, George Holsinger, J. A. Stewart, F. P. Dickson and R. W. Hoken.

Lake View Traction Company.—Incorporated in Mississippi to build and operate an electric railway between Memphis, Tenn., and Clarksdale, Miss. Principal office, Clarksdale; capital stock, \$500,000. Incorporators: G. W. Agee, R. F. Tate, Anthony Walsh, W. A. Percy, H. E. Craft and others.

Syracuse & Chittenango Railway.—Incorporated in New York to build an electric line from Syracuse to Chittenango, Madison county, about 10 miles. Capital stock, \$500,000. Incorporators: W. H. Dowe, G. S. Terry, New York City; C. G. Everson, Syracuse, N. Y.

Twin City & Lake Superior Railway, Minneapolis, Minn.—Incorporated in Maine to build a double-track high-speed line for freight and passenger service from Minneapolis and St. Paul to Duluth and Superior, Minn., 129 miles. It is proposed to operate

the line by steam at first, but later to use the Farnham inverted protected third-rail system. Seventy-pound rails are to be laid. Two surveying crews are at work at present locating the line and it is expected to begin construction in a short time from both ends. Capital stock, \$7,000,000. Officers: President, E. W. Farnham, Chicago; vice-president, W. H. Crossland, Minneapolis; treasurer, F. B. Kidder, Minneapolis; secretary, S. A. Carlisle, Wyoming, Minn.

Wagner Lake Shore & Armour Railway.—Incorporated in South Dakota to build an electric line from Wagner to Mitchell, S. D., 65 miles, with a branch to the shore of Lake Andes. The road will conduct a general freight and passenger business and also will furnish electric power for commercial purposes along its route. Capital stock, \$1,000,000. Incorporators: A. H. Pease, John Steransky and John Absher, Wagner; Albert Amundson, Lake Andes; E. P. Wanzer, Armour.

West Point (Va.) Traction Company.—Incorporated in Virginia to build an electric line in West Point. Capital stock, \$10,000. Incorporators: J. W. Marshall, president; J. W. Owens, secretary and treasurer, and W. C. Dunham, all of West Point, Va.

TRACK AND ROADWAY.

Albany, N. Y.—The New York railroad commission has authorized the construction of the following electric railways: Canandaigua Southern Railway, running from Canandaigua, Ontario county, to Atlanta, Steuben county, a distance of 33 1-3 miles; Utica Southern Railway, from Clinton through Deansboro, Waterville, Oriskany Falls and Madison to Hamilton, in the counties of Oneida and Madison, a distance of 26 miles; One Hundred and Forty-fifth Street Railway, starting at the corner of One Hundred and Forty-fifth street and Lenox avenue, and running along One Hundred and Forty-fifth street to Broadway, in New York City; Queens Borough Street Railway, from the junction of Franklin and Van Alst avenues, along Van Alst avenue to Winthrop avenue, in the first ward of the borough of Queens.

Atlantic Shore Line Railway, Kennebunkport, Me.—Work was started last week on the connection between York Beach and Kennebunkport, Me., 15 miles, which is expected to be opened some time in June, and which will connect the eastern and western divisions of the company's system. Rails and other materials are on hand for the construction of the first three miles and the remainder is being delivered. W. G. Meloon, general manager, Portsmouth, Me.

Bay City, Mich.—It is reported that E. W. Mills of Detroit is the promoter of a new company that proposes to connect Bay City and Port Huron, Mich., through Caro, Vassar, Memphis, Richmond, Sanilac and Capac. Mayor Johnson of Cleveland is reported as interested in the project.

Bay Counties Electric Railroad.—It is reported that this company will in a few weeks break ground for a new line from Belvidere to Lakeport, Cal., via Corte Madera, Greenbrae, Point San Pedro and Novato. Representatives of an eastern syndicate have gone over the route of the proposed line and are said to have reported favorably on a proposition to underwrite the bonds. Richard Hotelling is president.

Broadway, Va.—The United States Leather Company of Philadelphia, which owns several tanneries in this region, is making surveys for an electric line from Broadway to Lost City, Va., 30 miles.

Chillicothe, Mo.—A. W. Carpenter of Columbus, O., J. T. Carpenter of Toledo, O., and J. W. Andrews of Fairfield, Ia., are promoting an electric railway from Chillicothe, Mo., to Newton and Marshalltown, Ia., and are seeking to raise subscriptions for the preliminary work.

Corinth & Shiloh Electric Railway, Corinth, Miss.—It is reported that this company will soon let contracts for its line from Corinth to Shiloh, Miss., 22 miles. Right of way has been secured and a survey has been made. Abe Rubel is president.

Gallatin, Mo.—It is reported that C. F. Alt of Warren, Pa., is interested in a project to build an electric railway from Gallatin to Excelsior Springs, Mo., about 40 miles.

Grand Junction, Colo.—Surveys are being made for an electric railway to connect several towns in the fruit belt, including Fruita, Grand Junction, Palisades and Plateau City.

Grand Rapids (Mich.) Electric Railway.—President J. W. Boynton is sending out a prospectus and personal letters in the interest of the company's extensive plans for construction of new lines radiating from Grand Rapids. The company has planned about 500 miles of new railways, including six different lines, as follows: 1. From Grand Rapids to or near Rockford, thence to Greenville, Langston, Edmore, Clare, Gladwin, West Branch, Rose City, and thence to Alpena on Luke Huron. 2. From Grand Rapids to Belding, thence to Palo, Hubbardston, Maple Rapids, and other towns to Saginaw. 3. From Grand Rapids to Battle Creek, Coldwater, Coldwater Lake, California, Montgomery and Camden in Michigan, thence to southern state line, thence to Pioneer and Montpelier, thence to Napoleon, Weston, Bowling Green and other cities to Fostoria, O. 4. From Grand Rapids to Freeport, Grand Ledge, and thence to Lansing. 5. From Grand Rapids to Kalamazoo. 6. From Grand Rapids to Grand Haven harbor on Lake Michigan. All of these routes have been fully surveyed and located except the line from Belding to Saginaw, and the engineers are surveying that. Of these different lines 40 miles of right of way 100 feet wide through private lands has been conveyed by deed or contract to the company. Two hundred miles is graded and ready for cross ties and rails.

Illinois Traction Company, Champaign, Ill.—General Manager L. E. Fischer of Danville, Ill., announced recently to a delegation of Fairmount citizens that the company would build an extension of the line out of Danville, from Catlin to Fairmount. Preparations are being made for double-tracking the line from East St. Louis to Staunton.

Kansas City & Olathe Electric Railroad.—This company has begun construction at South Park, Kan., on its proposed line to Shawnee, Kan. Tracklaying was completed several years ago between Rosedale and South Park, three miles.

Knoxville (Tenn.) Railway & Light Company.—This company is now building a 3,000-foot extension of the Lonsdale line.

Kokomo, Ind.—It is reported that a company is being organized to build an electric line from Terre Haute to Kokomo, Ind., through Crawfordsville and Frankfort.

Lake Erie & Youngstown Railroad.—An official report from J. H. Ruhlman, president, Youngstown, O., states that this company is now making surveys for its proposed electric line from Conneaut to Youngstown, O., 60 miles. Contracts are to be let July 15 and grading is to begin this summer. George Tod, Jr., chief engineer.

Lewiston Augusta & Waterville Street Railway, Lewiston, Me.—Fred S. Gore writes that the Fred S. & A. D. Gore Corporation of Boston, Mass., has the contract for building this company's proposed lines from Auburn to Mechanic Falls, Me., nine miles; from Sabattus to Gardiner, 20 miles, and from Augusta to Waterville, 21 miles. Construction is to begin at once. The overhead work will be of the bracket type. There will be three 125-foot steel bridges on the line with concrete abutments. John R. Graham, Bangor, Me., is president; E. D. Reed, Lewiston, Me., general manager.

Lima & Toledo Traction Company, Lima, O.—A contract has been awarded to the National Bridge Company of Indianapolis, Ind., for the construction of a 1,400-foot reinforced concrete bridge over the Maumee river at Roche de Boeuf, O., on its line from Leipsic to Toledo.

Little Rock & Hot Springs Electric Railway, Little Rock, Ark.—The Electrical Installation Company of Chicago has the contract for building this line from Little Rock to Hot Springs, Ark., 56 miles, including several bridges. Surveys have been made and most of the right of way secured. C. J. Kramer, president; J. R. Van Franks, chief engineer.

Madison & Interurban Traction Company, Madison, Wis.—President F. W. Montgomery of New York, N. Y., states that surveys have been made for an extension from Madison to Janesville, Wis., but that it has not yet been decided whether the line will be built this year, on account of the high price of materials.

Marion, O.—F. M. Ohl of Toledo and associates, who are interested in a project for an electric line from Marion to Tiffin, O., via Wyandot, Nevada and Sycamore, recently went over the route of the proposed line, securing data. They stated that financial arrangements have been made for building the line this summer.

Maryland Electric Railways, Baltimore, Md.—J. G. White & Co. of New York are now engaged in the work of converting the Baltimore & Annapolis Short Line, which has been absorbed by the Maryland Electric Railways Company, for electrical operation between Baltimore and Annapolis. The wire for the overhead work has been ordered and is expected within a few weeks. Power will be obtained from the Westport power house of the Consolidated Gas Electric Light & Power Company. Between Cliffords and Camden the Baltimore & Ohio tracks are used. Negotiations are pending for a lease of one of the tracks for the exclusive use of the electric road, and the line is being straightened so as to reduce the distance between Cliffords and Camden from 6 to 4 miles, thus reducing the distance between Baltimore and Annapolis from 28 to 26 miles. J. W. Brown, president.

Nazareth, Pa.—It is reported that a company has been organized to build an electric road between Nazareth and Bath, Pa., for the accommodation of employes of the cement companies, and that seven-eighths of the right of way has been secured. Conrad Miller of Nazareth is president.

New Castle & New Wilmington Street Railway, New Castle, Pa.—G. B. Zahniser, chief engineer, states that surveys have been made and a private right of way acquired for this company's proposed line from New Castle to New Wilmington, Pa., 10 miles, and that contracts for construction will probably be let this summer.

Newell (W. Va.) Street Railway.—This company is said to be contemplating the extension of its lines to New Cumberland, W. Va. Frederick Lawrence, general manager.

Northern Electric Railway, Chico, Cal.—H. A. Butters, president, San Francisco, is quoted as saying that the line from Marysville to Sacramento, Cal., will be completed by August 1. Cars are now running regularly between Chico and Yuba City and Marysville.

Northern Ohio Traction & Light Company, Akron, O.—It is announced that this company will build an extension from West Brookfield to East Greenfield, O., this summer. Charles Currie, general manager.

Ogden (Utah) Rapid Transit Company.—The double-tracking of the line from Washington avenue to Glenwood Park, in Ogden, has been completed.

Ohio & Southern Railroad, Columbus, O.—Rapid progress is now

being made on this line from South Columbus, O., south to the Hartman stock farm, 7 miles. It is reported that the line will be extended farther south to Washington Court House.

Omaha & Nebraska Central Railroad.—It is announced that the contract for grading this line between Omaha and Hastings, Neb., has been let to C. D. Conover of Omaha and that actual construction work will be started within a few days. Contracts for grading the remainder of the line are now in hand and will be let within the next few weeks. W. H. Fuller, chief engineer. J. C. Knisler of Omaha is interested.

Peninsula Railway, Barstow, Fla.—E. C. Stuart, president, writes that contracts are to be let this week for the grading of this line from Barstow to Tampa, Fla., 50 miles, via Mulberry, Nichols, Plant City, Collinstown and Thonotosassa, and that construction is to begin on June 1. The Evers Engineering Company of Cleveland, O., has charge of the engineering work. Sixty-pound rails will be laid.

Peoples Street Railway, Nanticoke, Pa.—It is reported that this company will extend its line to Benton, Columbia county, Pennsylvania, via Shickshinny and Huntington Mills. K. M. Smith, president, Alden, Pa.

Philadelphia & Garrettford Street Railway, Philadelphia.—A contract has been let for the extension of this line from Alden to Collingdale, Pa. The road is controlled by the Philadelphia & Westchester Traction Company and passengers will have access over the latter's lines to Philadelphia, connecting with the Philadelphia Rapid Transit Company's elevated line at Sixty-third and Market streets. W. A. Hall, chief engineer, Llanerch, Pa.

Philadelphia Rapid Transit Company.—This company has opened a new extension in Philadelphia from Sixty-fifth street and Kingessing avenue to Fortieth and Market streets, connecting at the latter point with the new Market street elevated line.

Portland, Ore.—The United Railways Company, which has built about two miles of track on Front street, under the franchise of the Oregon Traction Company, is applying for an extension of time in which to complete the work. It states that the Front street belt line will be completed in 30 days, and that the line will be extended to Hillsboro. The company has been delayed by the non-arrival of construction material. The application is contested by the Oregon Electric Railway, which claims a prior right to the Front street franchise, and which is building a line to Salem.

Rochester Corning & Elmira Traction Company, Rochester, N. Y.—This company, which is seeking a certificate of necessity for its line from Rochester to Corning and Elmira, N. Y., will be given a hearing on May 20 on its application for permission to issue \$8,000,000 of bonds. The commission was enjoined last week from granting the permission, at the instance of the Erie Railroad. The application of the company for a certificate of necessity was opposed before the board of railroad commissioners by the Lehigh Valley Railroad, Delaware Lackawanna & Western Railroad, Erie Railroad, Elmira Corning & Waverly Railway, Elmira City Railway and Corning & Painted Post Street Railway. The board of railroad commissioners refused to grant the certificate, it being shown among other things that the road would be unprofitable, and that there was not sufficient business for the lines now existing. The appellate division reversed the decision, and directed the board to grant the certificate of necessity. An appeal was taken to the court of appeals, and an undertaking filed, which had the effect of staying proceedings on the part of the board and on the part of the applicant. The board, however, through a misunderstanding, issued the certificate of necessity, and the railroads which appeared in opposition obtained a writ of certiorari to review the action of the board in so doing, and obtained an order from the court staying the proceedings of the applicant railroad company. Until the matter is finally disposed of by the court of appeals the proceedings of the company are stayed.

Rumford Falls & Bethel Street Railway, Rumford Falls, Me.—The Maine railroad commission has given this company its approval of location of its line connecting Mexico, Rumford, Hanover, Newry and Bethel, Me., 30 miles. Elliott W. Howe, O. J. Gonya, E. K. Day, William H. Rae and Dennis J. McCoy of Rumford Falls are the directors.

St. Joseph Valley Traction Company, Elkhart, Ind.—The first car was operated over this company's new line from Lagrange as far as Orland, Ind., on April 29. H. E. Bucklen, Chicago, president.

San Diego (Cal.) Electric Railway.—It is stated that this company will this year place contracts for several extensions as follows: Adams avenue line, about three miles; University line, two miles; Third street line, three miles, and Ocean Beach lines, about 35 miles. Charles McLagan, chief engineer, Coronado, Cal.

Snohomish Valley Railroad.—The Snohomish Construction Company has been incorporated for the purpose of building the first 15-mile section of this road, projected to extend from Snohomish to Seattle and Tacoma, Wash. Work is to begin in a few weeks on the construction of the first section, which extends from Snohomish to a point in Cherry valley, seven miles beyond Monroe. The officers of the company are: President, Edward Wright; vice-president, Charles H. Lamprey; secretary and treasurer, J. F. Taylor, all of Snohomish.

Sioux Falls (S. D.) Traction System.—F. M. Mills, formerly treasurer of the Benton Harbor-St. Joe Railway & Light Company, Benton Harbor, Mich., has issued a circular stating that he has been granted a franchise for a street railway system for Sioux Falls, S. D., and that he proposes to organize a company to build lines in the streets of that city, to be extended as fast as the patronage will justify. The franchise requires that five miles of

track shall be constructed by July 1, 1908, and includes a provision for the use of the line by interurban railways. Mr. Mills states that he expects to begin construction in the spring of 1908 and that he will be pleased to receive estimates on all material necessary for electric railway, light and power purposes.

Southwest Missouri Railroad, Webb City, Mo.—Surveyors are now locating an extension of this line from Webb City to Columbus, Kan., where connection will be made with the line of the Pittsburg Railway & Light Company. E. J. Pratt, engineer.

Springfield (Ill.) Consolidated Railway.—This company is planning to begin work at an early date on the construction of an extension of the North Eighth street line to the Zoo park, north of the city, at a cost of about \$20,000.

Titusville (Pa.) Electric Traction Company.—The directors have decided to extend the company's lines to Cambridge Springs and Oil City via Cherrytree. E. J. Robertson, chief engineer.

Washington Frederick & Gettysburg Electric Railway, Frederick, Md.—This company has filed a trust deed to the Baltimore Trust & Guarantee Company to secure an issue of \$400,000 of bonds for the construction and equipment of its line from Frederick to Emmitsburg, Md., via Thurmont, about 25 miles. The section between Frederick and Thurmont, 17 miles, is now under construction, with six miles graded. It is expected to have the line between Frederick and Lewistown in operation by August 1.

Washington, N. C.—The Washington Investment Company of this city has engaged the James D. Lalor Company of Washington, D. C., to build an electric railway system in Washington, N. C., and to Washington Heights, a suburb. Surveyors are now at work.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia.—Chief Engineer M. L. Newton is preparing plans and specifications for an extension of the Commercial street line to the site of the proposed driving park, about two miles.

POWER HOUSES AND SUBSTATIONS.

Atlantic Shore Line Railway, Kennebunkport, Me.—This company has awarded a contract for the erection of a new rotary substations at Ogunquit, Me. The contract was awarded to the firm of Jones & Clark of Kennebunk.

Chicago Lake Shore & South Bend Railway, South Bend, Ind.—This company has just closed a \$2,500,000 contract for electrical equipment with the Westinghouse Electric & Manufacturing Company of East Pittsburg, Pa., for the equipment of its power house, substations and line. The Westinghouse single-phase alternating current system will be installed. The power house at Michigan City, Ind., will contain three 3,000-horsepower Westinghouse steam turbines and generators and a switchboard of similar capacity. Thirty-one cars will each be equipped with four 100-horsepower single-phase motors. The Chicago terminus of the road will be at Kensington, where connections for downtown parts of the city will be made with the trains of the Illinois Central Railroad. J. B. Hanna, South Bend, president.

Georgia Railway & Light Company, Atlanta, Ga.—This company has just completed the erection of a new substation at East Point, Ga., which, with the property on which it stands, costs about \$25,000. The new station will be used to furnish current for the district from East Point to College Park and to furnish the power for the trolley line to Hapeville. The building, which is externally designed similar to the Carnegie Library at Atlanta, Ga., faces a small park, and from external appearances it is impossible to tell that it is a substation. It is a 2-story building and is equipped with the most modern electrical machinery.

Northern Texas Traction Company, Ft. Worth, Tex.—It has been announced that this company is introducing a novel method of preventing delays caused by breakdowns in its substations. A small substation has been mounted on wheels and left at a siding between Arlington and Grand Prairie, and is connected by telephone to the other substations, so that, in case of a breakdown or accident to the machinery, it can be rushed to any of the substations. When not needed for emergency service it is not left idle, however, but is connected to the line and helps to take the load from the regular stations.

Tacoma (Wash.) Railway & Power Company.—This company has announced that it will build a new substation at the northern end of the city of Tacoma, near the terminus of the Point Defiance line. This additional substation was necessitated by plans which have been made for giving a one-minute service on this line.

Tri-City Railway & Light Company, Davenport, Ia.—It is stated that the tests made of the Cheatham electric switch, which has been installed at Second and Grady streets, has given perfect satisfaction, and if further trial proves equally satisfactory it will be adopted over the entire railway systems of the three cities. The working parts of the switch consist of an overhead contact on the trolley wire, which is connected to a solenoid magnet, the plunger of which operates the switch. The switch is set for straight ahead or to take the siding, according as the motorman does or does not leave the power turned on while passing under the overhead contact.

West Jersey & Seashore Railroad.—Owing to the great increase in traffic this company has found it necessary to install a 6,600-volt Curtis steam turbo-generator and increase the boiler capacity of its plant at Westville, N. J. A small horizontal Curtis turbo-generator of 76-kilowatt capacity has also been ordered. Six 1,000-kilowatt rotary converters and 13 air-blast transformers will be installed in the substations at South Camden, Glassboro, Newfield, Mizpah, Atlantic City and Westville.

Personal Mention

Mr. J. H. White, general manager of the Winona (Minn.) Railway & Light Company, has resigned, effective on July 1.

Mr. D. D. Price of Frostburg, Md., has been appointed master mechanic of the Cumberland & Westernport Electric Railway, Cumberland, Md., succeeding Mr. C. K. Definbaugh, resigned.

Mr. Alva Reynolds, heretofore roadmaster of the Hoosac Valley Street Railway, North Adams, Mass., has accepted a similar position with the Pittsfield Electric Street Railway, Pittsfield, Mass.

Mr. Frank M. Welch has been promoted from assistant claim agent to claim agent of the electric railway lines controlled by the New York New Haven & Hartford Railway, with office at New Haven, Conn.

Mr. C. F. Bryant has resigned as auditor of the Connecticut Railway & Lighting Company, Bridgeport, Conn., on account of the consolidation of that company with the Consolidated Railway of New Haven, Conn.

Mr. V. R. Hughes, recently chief engineer of the Pueblo & Suburban Traction & Lighting Company, Pueblo, Colo., has resigned to take a similar position with the Northern Colorado Power Company at Lafayette, Colo.

Mr. A. R. Whaley, heretofore division superintendent of the New York New Haven & Hartford at New York, has been appointed manager of the Grand Central station and general superintendent

of the electric zone of the New York Central railroad, effective on May 1. Mr. Whaley was born in 1861 at Coventry, R. I., and received his early education in the common schools. He entered railway service in 1877 as a freight brakeman on the Providence & Worcester Railroad. On this road he performed almost every duty, from freight and passenger brakeman to conductor, baggageman, station master and general yard master; in 1891 he was appointed assistant trainmaster. On the consolidation of the New York Providence & Boston with the New Haven and the leasing of the Old Colony system, thus bringing together five roads, Mr. Whaley was given charge of all crews on three divisions, with headquarters at Providence.

In 1898 he was made general agent of terminals at Providence and in 1899, upon the death of the superintendent of the Worcester division, that division was added to his territory and he received the title of superintendent. About the same time all docks and coal piers of the New England Navigation Company were placed in his charge and in 1900 the central division was abolished and added to his territory. It was due largely to the efforts of Mr. Whaley that the Providence Warren & Bristol, which was formerly a steam road, became an efficiently operated high-speed electric line. In December, 1904, Mr. Whaley was appointed superintendent of the New York division of the New York New Haven & Hartford, with headquarters at New York City, and he has been the responsible official in charge of this division during the electrification of this line between Woodlawn and Stamford and has had charge of all of the operating difficulties which would naturally arise in handling a heavy traffic during the progress of the electrification and erection of the catenary construction by the Westinghouse company, as well as the added difficulties involved in maintaining schedules while the New York Central electrification was in progress at the Grand Central station. Mr. Whaley is recognized as a good disciplinarian, who takes pleasure in solving difficult operating problems. His experience with electric operation and electrification work makes him especially fitted to fill the position to which has now been appointed.

Mr. W. W. Griest has resigned as president of the Lancaster County Railway & Light Company, Lancaster, Pa. Mr. Griest has been president of this company since it was first organized to take over all of the electric lines and lighting systems of the county, comprising about 200 miles of railway and several electric and gas plants. Mr. Griest will be succeeded by Mr. George Bullock, president of the United Gas & Electric Company, New York. Another change in the personnel of the company, due to its recent purchase by the Bertron Storrs & Griscom banking firm of New York, is the election of Mr. R. E. Griscom of Philadelphia as vice-president, to succeed Mr. Charles B. Keller, who also has resigned the vice-presidency of the subsidiary companies. Mr. M. E. Dodge of New York has been chosen treasurer. Mr. Edgar C. Titzel, formerly

superintendent of the Conestoga Traction Company, a subsidiary of the Lancaster County Traction & Light Company, has been chosen general manager of all of the electric lines and lighting systems. Mr. Griest will retain the presidency of this company; Mr. George Bullock has been elected vice-president, and Mr. John S. Graybill, Jr., has been re-elected secretary and treasurer.

Mr. William A. House, whose formal election as president of the United Railways & Electric Company, Baltimore, Md., was announced in an earlier issue of the Electric Railway Review, has been associated with the company in various capacities for about 28 years.

In 1879 he entered the accounting department of the old People's Passenger Railway Company, serving in this and other departments until 1883, when the road was reorganized with Mr. T. E. Hambleton as president and Mr. House as secretary and general superintendent. In 1889 this company was taken over by the Baltimore Traction Company and Mr. House became general manager of the combined properties. Under his management the lines of the company in 1892 were converted for electrical operation and other noticeable improvements made. In 1895 he was elected vice-president in addition to his duties as general manager, and one year later succeeded ex-Governor Frank Brown as president. In 1897, when a second consolidation of the properties was effected, including the merging of the City & Suburban and the Baltimore Traction companies into the Baltimore Consolidated Railway Company, Mr. House again became vice-president and general manager, with Mr. Nelson Perin as president. Two years later there occurred the merging of all the traction properties in Baltimore into the United Railways & Electric Company, with Gen. J. M. Hood as president and Mr. House as second vice-president and general manager. Upon the death of Mr. Hood Mr. House became acting president, and in April last, as earlier announced, was formally elected president of the company.

Mr. Charles H. Clark, for the past four years engineer of maintenance of way with the Cleveland Electric Railway at Cleveland, O., has resigned to accept a similar position with the International Railway Company at Buffalo, N. Y., effective on June 1. He was born in Rochester, N. Y., in 1869, and received his education in the public schools of Canastota, where he graduated in 1887. His appointment as time-keeper for T. William Harris in 1888, at that time engaged in street railway construction work in Syracuse, N. Y., marks the beginning of his extensive experience in this branch of street railway work. He later entered Cornell University, where he graduated as civil engineer in the class of 1892. After leaving college he entered the draughting department of William Wharton, Jr., & Co. of Philadelphia, where he remained until it was decided to change the old Gray's Ferry road from

horse power to electricity, when he was appointed superintendent of construction of this undertaking. At the completion of this work he again became associated with T. William Harris in the building and reconstruction of street railways in Syracuse, Oswego, Troy and Oneonta, N. Y.; Norristown and Scranton, Pa., and Washington, D. C., later being given charge of the construction of a 60-foot dam, which was built at Trenton Falls, N. Y. From 1901 to 1903, as chief engineer of the Utica & Mohawk Valley Railway, which is controlled by the Andrews-Stanley interests, Mr. Clark had entire charge of its various improvements and extensions in and around Utica. In 1903 he was transferred to the Cleveland property of this syndicate, with the position of engineer of maintenance of way, where he has remained until his present appointment.

Mr. R. E. Danforth, who was recently appointed general manager of the street railway department of the Public Service Corporation of New Jersey, at Newark, N. J., succeeding Mr. A. H.

William A. House.

A. R. Whaley.

Charles H. Clark.

Stanley, assumed his new duties on May 1. Mr. Danforth will divide his time between Rochester and Newark for the present, until his successor has been appointed as general manager of the Rochester Railway.

Mr. Burton B. Pierce has resigned as superintendent and chief engineer of the Mansfield Railway Light & Power Company, Mansfield, O., to become chief engineer of the Washington Portland Cement Company, Concrete, Wash.

Mr. Clarence P. Hayden, superintendent of the eastern division of the New Hampshire Electric Railways, Haverhill, Mass., has been appointed superintendent of the Haverhill and Salem divisions, succeeding Mr. Robert Dunbar, resigned.

Mr. John G. Phillips, heretofore purchasing agent and superintendent of rolling stock of the Hudson Valley Railway, Glens Falls, N. Y., has been appointed assistant general manager, effective on May 1. He succeeds Mr. John H. Cain, who has been appointed superintendent in place of Mr. F. W. Kinnonth, resigned.

Mr. William Gettys, for several years master car builder of the Tacoma (Wash.) Railway & Power Company, has resigned his position and the car building department will hereafter be in charge of Mr. W. G. Denny, who was recently appointed master mechanic of the company in place of Mr. William Glenn, resigned.

Mr. Walter A. Draper has been elected secretary of the Cincinnati Traction Company, succeeding Mr. S. C. Cooper, resigned on account of ill health. Mr. Cooper has held his present position for about six years and had previously been connected with various Schoepf properties in Washington and Baltimore for about 15 years.

Mr. C. M. Bange, whose photograph is presented herewith, was recently appointed superintendent of motive power of the Northern Ohio Traction & Light Company, with headquarters at Canton, O., succeeding Mr. William E. Ralston, resigned, as previously reported in the Electric Railway Review.

To accept his present position Mr. Bange resigned as master mechanic of the Detroit Jackson & Chicago Railway, formerly the Detroit Ypsilanti Ann Arbor & Jackson Railway of Detroit, Mich., which was recently absorbed by the Detroit United Railway. Mr. Bange, who is 39 years of age, was born in Pontiac, Mich., and has been engaged in electrical work for the past 22 years. For 12 years he was employed in the telephone field and later in electric light construction. He has been connected with electric railway work for about 10 years, first as master mechanic of the old Detroit Rochester Rome & Lake Orion Railway, which is now a part of the Detroit United Railway system, and later in a similar position with the Detroit Ypsilanti Ann Arbor & Jackson Railway.

C. M. Bange.

Mr. F. W. McAssey, heretofore auditor of the Rockford & Interurban Railway, Rockford, Ill., has been appointed general superintendent. Mr. C. C. Lines, heretofore superintendent of track and lines, has been appointed superintendent of construction of the Beloit (Wis.) Traction Company, controlled by the officers of the Rockford & Interurban. Mr. E. Main has been appointed to succeed Mr. Lines at Rockford.

Mr. C. M. Clark, chairman of the executive committee of the Portland (Ore.) Railway Light & Power Company, which is a consolidation of the Portland Railway, the Portland General Electric and the Oregon Water Power & Railway companies, has been elected president, to succeed the late Henry W. Goode, formerly of Portland, Ore. It is stated that according to present plans Mr. Clark will administer his new duties from the Philadelphia office of the company.

Reduced Rate for G. A. R. Encampment.—Official announcement is made by Frank D. Norvick, general passenger agent of the Terre Haute Indianapolis & Eastern Traction Company, comprising the merged lines in Indiana, that a round-trip rate of \$3.00 has been granted from Indianapolis to Ft. Wayne because of the state G. A. R. encampment, to be held in Ft. Wayne on May 21, 22 and 23. Tickets bought on any day of the encampment will be accepted on any local or limited car without the payment of excess fare and will be good returning up to and including May 25. The tickets will be routed by way of the Indiana Union Traction Company from Indianapolis to Peru and by way of the Ft. Wayne & Wabash Valley from Peru to Ft. Wayne, with no change of cars throughout the trip. When the steam roads of Indiana refused, in retaliation for the 2-cent law, to grant their usual 1-cent-a-mile rate for the state encampment, the G. A. R. sought to obtain a 1-cent rate from the tractions. This was refused, but the \$3.00 rate from Indianapolis to Ft. Wayne was conceded. As the distance is 136 miles, the \$3.00 fare is practically one cent a mile, plus 25 cents.

Financial News

Boston Elevated Railway Company.—The following particulars regarding the company's probable cash requirements, as stated during the hearing before the Massachusetts railroad commission on April 18, when approval was requested for the issue of \$3,000,000 additional stock and \$3,800,000 bonds, are published by the Boston News Bureau:

Probable cost of East Cambridge extension and subway, \$12,900,000, as follows:

Elevated railway, Union station to Lechmere square.....	\$4,450,000
Cambridge subway	6,000,000
Connection in Boston.....	450,000
Cars for Cambridge subway.....	1,000,000
Power and fenders.....	1,000,000

Expenditures from organization to February 1, 1907, and requirements for construction and equipment:

Construction and Equipment Expenditures—	Expended to February 1, 1907.	Estimated balance needed.	Total.
Deposited with state.....	\$ 500,000	\$ 500,000
Engineers and general expenses...	832,008	\$ 858,300	1,690,308
Structures	4,822,268	778,350	5,600,618
Construction and equipment of power houses	1,616,444	1,852,000	3,468,444
Terminals and other stations, exclusive of land	1,496,795	1,070,000	2,566,795
Equipment of subway.....	165,463	165,463
Real estate	8,885,835	2,698,700	11,584,535
Rolling stock	1,810,904	1,822,000	3,632,904
Machinery and tools	114,465	50,000	164,465
Equipment of tunnel	243,712	170,000	413,712
Totals	\$20,487,894	\$9,299,350	\$29,787,244

An additional statement shows that \$6,895,344 cash would be required for the above outlay, even if the \$2,091,900 premium received from the sale of stocks and bonds and held on deposit were applied thereto. This estimate is made on the assumption that the elevated structure does not go beyond Forest Hills square. If it does, \$1,500,000 would have to be added to the above, making a total of \$8,395,344 new cash required, plus the use of all premium funds on deposit.

California Midland Electric Railroad, San Francisco.—The stockholders of this company have authorized the issue of \$3,000,000 of 5 per cent 40-year bonds.

Coney Island & Brooklyn Railroad Company.—This company has passed the dividend due on May 1. In 1903 and 1904 the company paid 16 per cent in dividends, in 1905 it paid 10 per cent, and in 1906 the dividends aggregated 8 per cent. The earnings will be applied to improvements if the \$1,500,000 of new stock which has been authorized and is to be offered to stockholders at par does not provide enough money to meet the cost of the improvements which are considered necessary.

Consolidated Railway Company, New Haven, Conn.—The report for the eight months ended February 28, 1907, makes the following showing:

Total gross earnings from operation	\$4,027,135
Less operating expenses	2,516,371

Net earnings	\$1,510,764
Add income from other sources.....	682,828

Total income	\$2,193,592
Charges, taxes, etc.	1,966,534

Net income

Against this net income there was charged \$200,000 for the six months' dividend, paid on December 31, 1906, and \$66,666 for the accrued dividend for January and February, 1907.

Electric Properties Company.—Directors of the Electric Properties Company have declared a dividend of 2 per cent on the common stock for the year ending April 30, payable on June 10. They also declared a dividend on the preferred stock at the rate of 6 per cent per annum to April 30, 1907, from the date of the last dividend on January 31, and from the date subsequent payments were received, payable on May 10 to preferred stockholders and subscription receipt holders of record on May 4. The company, which was organized in May, 1906, for the purpose of acquiring, financing and developing properties, especially those in which electricity plays the principal part, and which also acquired the ownership of Westinghouse, Church, Kerr & Co., through which it conducts a general engineering and construction business, completed its first fiscal year on April 30, 1907. The company has paid dividends for the first fiscal year on the preferred stock at the rate of 6 per cent per annum.

Gainesville (Tex.) Electric Railway & Light Company.—This corporation has changed its name to the Gainesville Traction Company.

Hammond (Ind.) Whiting & East Chicago Electric Railway Company.—At the annual meeting of stockholders on May 7 H. C. Saitonstall was elected a director to succeed V. Shaw Kennedy. The other directors were re-elected. The following officers were re-elected: President, D. F. Cameron; vice-president, D. M. Cummings; secretary and treasurer, O. S. Gaither.

Havana Central Railroad Company.—Speyer & Co. of New York announce that they will receive deposits of the common stock and the first mortgage 5 per cent bonds of this company in accordance with the plan announced by J. Henry Schroder & Co. of London for the sale of the property to the United Railways of the Havana and Regla Warehouses, Ltd.

Interstate Railways Company, Philadelphia.—Charles W. Welsh, of Robert Glendinning & Co. of Philadelphia, has been elected a director to succeed Joseph L. Caven.

Maryland Electric Railways Company, Baltimore.—This company has sold \$750,000 Baltimore & Annapolis Short Line 5 per cent bonds to New York bankers. Prior to the absorption of the Baltimore & Annapolis Short Line's property by the Maryland Electric Railways the Short Line had authorized the issue of \$1,000,000 bonds to meet the cost of electrifying the road.

New Orleans Railway & Light Company.—Earnings for the three months ended March 31, 1907, with a comparison, were as follows:

Quarter ended March 31—	1907.	1906.
Gross earnings, all sources.....	\$1,595,713.39	\$1,491,331.60
Operating expenses	767,294.79	765,759.14
Net earnings	\$ 828,418.60	\$ 725,572.46
Fixed charges	489,717.92	447,348.30
Net income	\$ 338,700.68	\$ 278,224.16
Other deductions	9,723.74	8,809.01
Surplus	\$ 328,976.94	\$ 269,415.15

New York City Interborough Railway Company.—Theodore P. Shonts, president of the Interborough-Metropolitan Company, has been elected a director, to succeed Arthur Turnbull.

Rochester (N. Y.) Railway Company.—Earnings for the quarter ended March 31, with comparisons, were as follows:

Quarter ended March 31—	1907.	1906.	1905.
Gross earnings	\$561,758	\$487,281	\$416,198
Expenses	358,486	289,573	250,101
Net earnings	\$203,272	\$197,708	\$166,097
Other income	\$,640	3,229	1,325
Total income	\$211,912	\$200,937	\$167,422
Charges	106,003	93,746	89,541
Surplus	\$105,909	\$107,191	\$ 77,881

South Chicago City Railway Company, Chicago.—H. C. Saltonstall was elected a director at the annual meeting of stockholders on May 7 to succeed V. Shaw Kennedy. The other directors were re-elected. The following officers were re-elected: President, D. F. Cameron; vice-president, D. M. Cummings; secretary and treasurer, O. S. Gaither.

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis.—The board of public works of Indianapolis has approved the lease by this company of the Indianapolis & Northwestern Traction Company and the Indianapolis & Martinsville Rapid Transit Company and its purchase of the Indianapolis & Eastern Railway and the Indianapolis & Western Railway. The consent was necessary in order that the new company might operate in Indianapolis.

Western Massachusetts Street Railway Company, Westfield, Mass.—The Massachusetts railroad commission has approved the purchase by this company of the property of the Woronoco Street Railway Company, and has authorized for that purpose the issue of \$250,000 additional capital stock in exchange at par for the stock of the Woronoco company. The Western Massachusetts company operates 12 miles of track from Westfield to Huntington. The Woronoco company operates 17 miles of track from Westfield to Holyoke and West Springfield. The entire capital stock of the Western Massachusetts company is owned by the New England Investment & Security Company.

Western Railways & Light Company.—It is reported that a company has been formed with the above title to consolidate the Illinois Traction Company of Champaign, Ill., which is controlled by W. B. McKinley of Champaign, and interests associated with the Sun Life Insurance Company of Montreal, Can., with the Galesburg Railway & Light Company of Galesburg, Ill., the Illinois Valley Railway of La Salle, Ill., and the Quincy Horse Railway & Carrying Company of Quincy, Ill., which are controlled by Mr. McKinley and Portland, Me., capitalists, represented by G. F. Duncan. Mr. McKinley is to be at the head of the new company.

Dividends Declared.

Rochester Railway Company, common, quarterly, 1 per cent.

Accident on the Toledo Urban & Interurban Railway.—A serious accident on the Toledo Urban & Interurban Railway occurred on the night of May 5, when the southbound Dayton-Toledo limited car met in a head-on collision with the northbound local car from Findlay, about a mile south of Bowling Green, O. Both cars were late and were running at a high speed. It is stated that from 30 to 50 persons were injured, three of them fatally. The cars were telescoped and were totally wrecked. The accident seems to have been caused by a misunderstanding of orders. The company has appointed a committee of superintendents of other lines to make an investigation.

Manufactures and Supplies

ROLLING STOCK.

New York & Queens County Railway, Long Island City, N. Y., has placed an order with the American Car & Foundry Company for 40 all-steel cars.

Interborough Rapid Transit Company, New York, has ordered 40 motor trucks, class 84-30, and 60 trailer trucks, class 66-30 T, from the Baldwin Locomotive Works.

Chicago Union Traction Company, Chicago, has secured an option from the St. Louis Car Company on 600 new cars. These will be equipped with four General Electric Company motors each.

United Railways Company of St. Louis, St. Louis, Mo., is reported to have ordered the building of 100 new cars at its own shops. These will be equipped with four 50-horsepower motors each and will be built at the rate of three cars a week.

Texas Traction Company, Dallas, Tex., has placed an order for 15 interurban cars, 58 feet in length, with passenger and smoking compartments and a seating capacity of 60 passengers. The cars are for delivery on December 1. We understand the order was placed with The J. G. Brill Company.

Pennsylvania Railroad has ordered for the West Jersey & Seashore Electric Line 10 motor coaches from the American Car & Foundry Company and 7 motor coaches, 2 combination passenger and baggage cars and 2 baggage cars from the Wason Manufacturing Company. The coaches will have a seating capacity of 58 passengers and the combination cars a seating capacity of 38 passengers, with a baggage compartment 15 feet 7 3/4 inches in length. All of the cars are 55 1/2 feet in length and are for delivery on June 1.

Baton Rouge Electric & Gas Company, Baton Rouge, La., as reported in the Electric Railway Review of May 4, has purchased nine semi-convertible cars from the St. Louis Car Company for delivery about May 13. The specifications call for the following details:

Seating capacity...32 passengers	Wheel base.....7 ft. 6 in.
Length of body.....21 ft.	Width, over all.....8 ft. 8 in.
Over all.....31 ft.	Body and underframe....Wood

Special Equipment.

Brakeshoes	Diamond	Interior finish	Mahogany
Couplers	Journal bearings	Motors	2 GE-80
.....St. Louis radial draw barsMonitor full length	Roofs	Sanders
Curtain fixtures	Pantasote	Seats	Rattan—cross, type L-3
Curtain material.....	12-inch steel	Trucks.....	Dupont No. 46
Gongs	Kranshaar		
Headlights			

SHOPS AND BUILDINGS.

Atlantic Shore Line Railway, Kennebunkport, Me.—This company has let a contract to Jones & Clark of Kennebunk for the construction of a car barn at Ogunquit, Me.

Illinois Traction Company.—It has been decided to build a passenger station, containing business offices, ticket rooms and dispatcher's office at Granite City, Ill., on the corner of Twenty-second and Niedringhaus avenues.

Ft. Dodge Des Moines & Southern Electric Railway, Boone, Ia.—This company and the Newton & Northwestern Railroad have let a contract to S. J. Webster of Boone for the erection of an \$18,000 joint passenger station and office building at Boone.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has acquired title to a tract of ground between Tenth and Eleventh streets, south of Arbor street, Omaha, and proposes to build a large new car house for the Farnam, Dodge and Harney lines.

Willamette Valley Traction Company, Portland, Ore.—This company is reported to have purchased land at Springfield, Ore., for car houses, repair shops, yards and a passenger station.

TRADE NOTES.

Borne Scrymser Company has removed its New York offices from 135 Front street to 80 South street.

Rossiter, MacGovern & Co. have removed their New York offices from 17 Battery place to 90 West street.

Niles-Bemont-Pond Company has declared its regular quarterly dividend of 1 1/2 per cent on the preferred stock, payable on May 15.

Pratt & Whitney Company has declared its regular quarterly dividend of 1 1/2 per cent on the preferred stock, payable on May 15.

Electric Service Supplies Company, Philadelphia, announces the removal of its New York office from 85 Liberty street to the United States Express building, 2 Rector street.

Buell & Mitchell, New York, contractors and experts in steel for building and bridge construction and for manufacturing purposes, announce the opening of a branch office at 70 Kilby street, Boston, in charge of Henry W. Nutt as manager. The company

has appointed as its New England representative the Rogers Shear Company of Warren, Pa., for the exclusive sale of its output of high elastic limit round, square and twisted concrete steel bars.

McClintic-Marshall Construction Company, Pittsburg, has opened an office in Room 923, Columbus Savings and Trust building, Columbus, O., in charge of F. C. Lewis.

Gould Storage Battery Company announces that on June 1 it will remove its New York offices from 1 West Thirty-fourth street to 341-347 Fifth avenue, corner of Thirty-fourth street.

B. F. Sturtevant Company, Boston, has removed its New York offices from 131 Liberty street to the Engineering building, 114 Liberty street, where larger quarters have been secured.

Northern Engineering Works, Detroit, has received an order from the International railway at Buffalo, N. Y., for four 3-motor electric northern traveling cranes of 10 tons capacity; also one overhead electric track and trolley.

Barrett Manufacturing Company, 17 Battery place, New York, is having plans prepared by Ballinger & Perrot, engineers, for a new plant to be erected at Thirty-sixth and Wharton streets, New York. The building will be 78 by 124 feet, two stories in height and of reinforced concrete construction.

F. I. Cordo has been appointed purchasing agent of the Griffin Wheel Company, Chicago, to fill the vacancy caused by the death of P. J. Geraghty. S. L. Prest, formerly comptroller of the company, has been elected treasurer and G. F. Griffin, manager of the review department, has been made secretary.

Joseph W. Lowry, purchasing agent of the Westinghouse Air Brake Company, died on Monday, May 6, at his residence in Pittsburg of heart failure, following an illness of five months. He was born in Pittsburg in 1866. He was also president of the Duquesne Manufacturing Company, of which he was one of the organizers.

Lupfer & Remick is the name of a recently formed co-partnership to do a general engineering business. Edward P. Lupfer, a member of the American Society of Mechanical Engineers, has resigned as constructing engineer between Wellsville and Buffalo on the Buffalo & Susquehanna Railway, to devote his time to this business. Frederick N. Remick was also formerly connected with the Buffalo & Susquehanna Railway. The offices of the company are located at 590 Ellicott square, Buffalo, N. Y.

Under-Feed Stoker Company of America, Marquette building, Chicago, has recently received a fourth order from the Georgia Railway & Electric Company of Atlanta, Ga., for Jones stokers. The first order received from this railway was for four stokers in July, 1904, which has been added to at intervals until the fourth order now in hand makes a total of 36 Jones stokers in its Butler street station, and providing for the equipment of 7,200 horsepower of Babcock & Wilcox boilers. The installation of 18 stokers under the third order given in May, 1906, necessitated the removal of another type of stoker heretofore installed in that plant.

F. V. L. Smith has been appointed representative in the south of the Sprague Electric Company, New York, with headquarters at New Orleans, La. Mr. Smith has had a wide experience in the electrical field, having been electrical inspector of the Pan-American exposition in 1901 and afterward electrical inspector for the National Board of Fire Underwriters in New York City until December, 1904, when he became chief electrical inspector for the Louisiana fire prevention bureau, with headquarters in New Orleans. Owing to his extensive knowledge of electrical work and his acquaintance in the south, Mr. Smith is well fitted to represent the Sprague Electric Company in that section.

Allis-Chalmers Company, Milwaukee, has received an order from the Bristol Tramways & Carriage Company, Limited, of London, Eng., for an Allis-Chalmers vertical cross-compound Reynolds Corliss engine, with cylinders 26 and 56 by 48 inches. This unit will be installed in the central power station at Bristol to drive a 1,000-kilowatt direct-coupled, direct-current generator. The engine, operating under 140 pounds steam pressure, will develop approximately 1,700 indicated horsepower. The Bristol station now contains four Allis-Chalmers vertical cross-compound engines, which are somewhat smaller than the new unit just purchased. They have cylinders 22 and 44 by 42 inches and are used to drive 550-kilowatt generators. The engines now in this station have been in continuous operation for eight years. It was doubtless due largely to their good record that the purchase of the new American-built unit was made.

General Fireproofing Company announces, coincident with establishing a branch office at 82 Second street, San Francisco, the appointment of W. W. Thurston as district manager in that territory. The company is well and favorably known on the coast through large sales in the past of herringbone expanded steel lath and expanded metal. Mr. Thurston will devote especial attention to exploiting pin-connected girder frames and cold twisted lug bars, two advanced types of reinforcement in which engineers recognize unique points of merit. Another recent acquisition by the General Fireproofing Company is W. E. Ramsey, engineer, a graduate of the University of Illinois, and formerly with the Expanded Metal Fireproofing Company at Chicago. Mr. Ramsey is at present with the home office at Youngstown. Jesse Briegel has been engaged by the Chicago office as salesman. Through his previous connections as adjuster with liability insurance companies, most recently with the accident liability department of the Aetna Life Insurance Company of Hartford, Conn., Mr. Briegel has formed an extensive acquaintance among contractors, factory owners and employers, which should be of advantage in introducing the General Fireproof-

ing Company's system of reinforced concrete. The main offices of the company are at Youngstown, O.

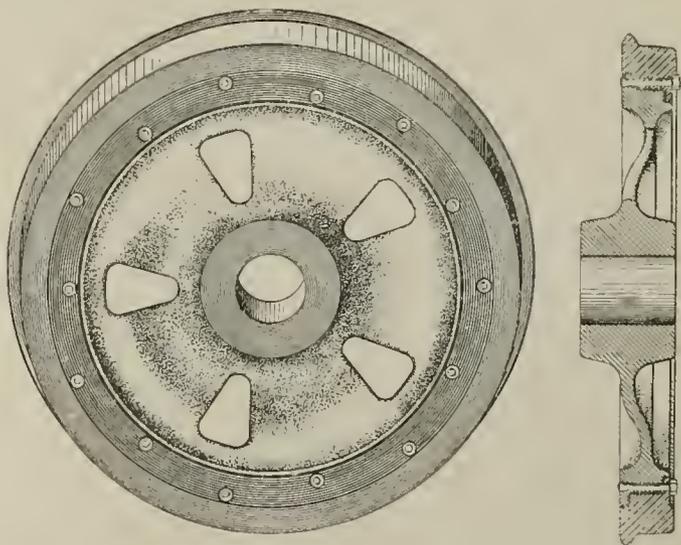

ADVERTISING LITERATURE.

John Ruscoe & Co., Limited, Albion Works, Hyde, Manchester, Eng.—This company is circulating a pamphlet in the interests of its one-horse drum carriage, designed for the handling and laying of electric cables.

Western Electric Company, Hawthorne, Ill.—This company is about to issue its 1907 supply catalogue. The publication will be a large volume of 700 pages, listing a very complete line of electrical supplies. The previous catalogues which have been issued by this company in recent years have been in great demand by dealers and those interested in electrical supplies because in addition to furnishing a complete list of all material handled by the Western Electric Company, they have embodied many features of general interest to the electrical trade. The edition for this year, which is now in the press, we are advised, will be more complete and instructive than anything issued heretofore by this company. The advertising department of the Western Electric Company, as previously mentioned in these columns, has been reorganized and placed under the charge of Howard M. Post, who at one time successfully handled the advertising for the Kellogg Switchboard & Supply Company, manufacturers of telephone apparatus, and the Quincy-Manchester-Sargent Company, manufacturers of railway supplies. Mr. Post was also associated with the Lord & Thomas Company for a period.

Noiseless Car Wheels.

One of the continuous annoyances which confront the management of electric railways operating in cities or through residential districts is the constant list of complaints which are charged against the companies because of the noise made by cars operated

Noiseless Car Wheel.

at high speed. Further, a source of loss which is experienced by railway companies is that caused by the great cost of renewing and turning down car wheels which have developed flats, and renewing wheels with broken flanges. With standard solid cast wheels or those fitted with rolled steel tires, considerable delay is caused in the shops because it is necessary to remove wheels and axles in order to turn down the wheels or to replace steel tires. This consequently increases the number of cars which are out of service because of repairs being made, thus adding greatly to the cost of operating cars. A further element in the cost of replacing worn or damaged wheels is that with the solid wheel or those fitted with steel tires it is necessary to put them in a press and force the tires on the wheel centers or the wheels on to the axles. Hence there is a chance that the gauge of the wheels may not be correct and undue strain and excessive wear are the inevitable results.

In order to obviate these difficulties, the "Noiseless" wheel, shown in the accompanying engraving, was designed. Though it is called a noiseless wheel, the name is not intended by the manufacturers to convey the idea that it absolutely prevents all noise, as that is an impossibility, but it is claimed that its construction reduces the amount of noise very materially, especially in rounding curves.

As will be seen from the illustration the wheel consists of a cast-iron center, on which a chilled cast-iron or rolled-steel tire is forced, the latter, however, being separated from the cast-iron center by heavy cloth cardboard packing. The tire is securely held in position on the cast-iron center by numerous countersunk bolts. It is claimed that the cardboard packing reduces the shock on the wheel and by dampening the vibration reduces the noise.

An advantage of the sectional wheel is that, the cast-iron center not having to be chilled, the metal is of more uniform structure, and, the different parts of the casting being more nearly of equal thickness, they can be cast entirely free from strain, which distorts and locally weakens the metal in solid cast-iron wheels. By making the wheels in this manner it is possible to easily replace a rim without taking the wheels and axles from the car, thus

greatly reducing the time that a car is out of commission for the turning down of wheels or replacements.

As it is unnecessary to disturb the center and unnecessary to use a wheel press the tires can be put in place while the wheel is on the car and gauging is unnecessary, as the tires are held in a definite position by the flanges on the cast-iron centers. It is stated that the cloth cardboard packing can be used continuously without having to be replaced.

The cost of the cast-iron centers and cast-iron tires of the noiseless wheel is about three times that of an ordinary cast-iron wheel and the cost of those fitted with rolled steel tires is a trifle less than built-up wheels with steel tires. The results of actual tests which have been made on these wheels have shown the mileage to be approximately 200,000 to 250,000 for the cast-iron tires and 250,000 to 300,000 for the rolled steel tires, whereas the mileage of the ordinary cast-iron wheel will not greatly exceed 25,000. It follows, therefore, that since the cost is three times as great, and the mileage seven or eight times as great as that of the cast-iron wheels, they actually cost but half as much when the mileage is considered.

The wheel is manufactured and sold by the Noiseless Car Wheel Company, whose incorporation with a capital of \$1,000,000 was recently noticed in these columns. The headquarters of the company are now located in Detroit, but it is intended to establish the general sales office in Chicago. The company is now represented at the latter point by George H. Bryant, president, 1055 Old Colony building. The other officers are: Vice-president, August Ziesing, president of the American Bridge Company; treasurer, Bethune Duffield, Detroit, and secretary, W. F. McCorkle, Detroit. The directors are: George H. Bryant, western representative of Thomas Prosser & Son, August Ziesing, Bethune Duffield, J. L. Carleton and Fred M. Delano.

The Acheson Effect.

BY ORRIN E. DUNLAP.

E. G. Acheson of Niagara Falls, N. Y., has invented a process for suspending graphite in water or oil, where it remains permanently suspended, thus adding largely to the possibilities of graphite as a lubricant, and, strange to say, when so suspended in water the graphite possesses the remarkable power of preventing rust or corrosion of iron or steel. This latest process will be known to the scientific world as the "Acheson Effect," and when suspended the product is called deflocculated graphite. In the deflocculated condition produced by Mr. Acheson graphite has a condition of fineness far beyond that attainable by mechanical means. In fact its condition resembles, if not wholly approaches, the molecular state. The "effect," for such it must be termed, is produced with water and a comparatively small quantity of gallotannic acid, and when thus treated the graphite remains suspended in the water, showing not the slightest disposition to settle. The black liquid passes with ease through the finest filter paper. Severe tests have demonstrated that it is an admirable lubricant, and there is every reason to believe that deflocculated graphite with and without oil will succeed oil as a popular agent for all classes of lubrication.

Graphite has been known for years to be an excellent lubricating body, not especially in a dry state, but when associated with a liquid, oil, fats or water. Strenuous efforts, extending over a long period, have been made to suspend graphite in a liquid to be used as a lubricant but all these efforts have been unsuccessful. It is well recognized that plain water has many advantages as a lubricant if it had sufficient body to withstand the pressures brought to bear and to which lubricants are subjected. Its very high specific heat would be of great advantage to keep down the temperatures of bearings, while its low viscosity would reduce friction, but unfortunately it has not sufficient body to withstand the pressure of an ordinary bearing. It also has the fatal quality of rusting and corroding metals. The "Acheson Effect" makes it possible not only to reduce graphite to practically the molecular state and to cause it to remain suspended in water for an indefinite period of time, but it, as stated, prevents rust or corrosion while associated with water, thus enabling the taking advantage of water as to its high specific heat and low viscosity, making of the new product a lubricant seemingly quite superior to any heretofore used.

About six years ago Mr. Acheson engaged in a series of experiments having as their object the production of crucibles from artificial graphite. This led him to a study of clay, and he learned that American manufacturers of graphite crucibles import from Germany the clay used by them as a binder of the graphite entering into the crucibles; also that the German clays are more plastic and have a greater tensile strength than American clays of very similar chemical constitution, while residual clays—those found at or near the point at which the parent felds pathic rock was decomposed—are not in any sense as plastic or as strong as the same clays when found as sedimentary clays at a distance from their place of origin. Chemical analysis failed to account for these decided differences.

It was under these conditions that Mr. Acheson reasoned that the greater plasticity and tensile strength were developed during the period of transportation from the place of their formation to their final bed, thinking possibly it might be due to the presence of extracts from vegetation being in the waters which carried them. He made several experiments on clay with vegetable extracts, tannin being one of them, and found a moderately plastic, weak clay, when treated with a dilute solution of gallotannic acid or extract of straw, was increased in plasticity. Being acquainted

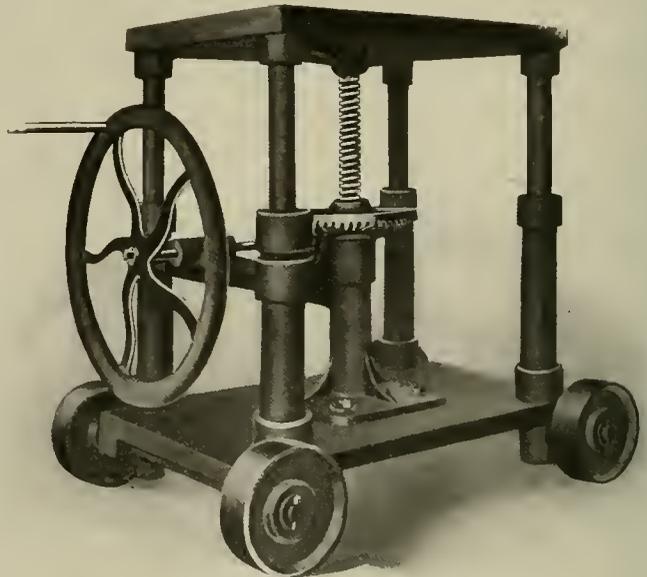

with the record of how the Egyptians had the children of Israel use straw in the making of bricks, and believing it was used not for any benefits derivable from the weak fibers, but for the extract, he calls clay so treated Egyptianized clay.

Last year Mr. Acheson discovered a process for producing a fine, pure, unctuous graphite, and undertook to work out the details of its application as a lubricant. In the dry form, or mixed with grease or oil, it was easy to handle, but he wished it to enter the entire field of lubrication as occupied by oil. In his early efforts to suspend it in oil, he met the same troubles encountered by his predecessors in this line of work. It would quickly settle out of the oil. His unctuous graphite was just plain, simple graphite, and obeyed the same laws governing the natural product. Such was the condition of things in the latter part of 1906, when the thought occurred to Mr. Acheson that tannin might have the same effect on graphite that it did on clay. He tried it with satisfactory results. The writer has seen most interesting and successful experiments made with unctuous graphite of Mr. Acheson's manufacture, which might properly be termed disintegrated unctuous graphite. It may be added that Mr. Acheson has obtained his "effect" with amorphous bodies generally, alumina, lampblack, clay, graphite and siloxicon, the only exception being magnesia, which needs further tests.

Mr. Acheson's success in deflocculating graphite and causing it to remain suspended in water was most gratifying. However, he realized that the people of the world had been educated to the use of oil as a lubricant, and that it might be difficult to re-educate them to the use of water and graphite for a similar purpose until they better understood what he has accomplished. It was with such convictions that he undertook to solve the problem of replacing the water used as a conveyor of the deflocculated graphite with petroleum. His first experiment, and probably the simplest and most rational, was to diminish the quantity of water by evaporation, leaving the graphite in a dry state, to be rubbed up later in oil. While this method produced what seemed to be an ideal result, it was soon discovered that in a comparatively short time the graphite had settled out of the oil, having lost its deflocculated condition and returned to its original flocculated state. Consequently it was not in condition to remain suspended in oil, nor indeed was it possible to again suspend it in water. Notwithstanding this apparent failure, the desired result eventually was accomplished, and it may be accepted as fact that the "Acheson Effect" permits the suspension of graphite in water or oil at will, there to remain permanently suspended.

Patten Motor Lift.

Considerable time and money can often be saved by providing proper means for handling heavy weights in the repair pit. Owing to the cramped space in which men are compelled to work much

The Patten Motor Lift.

time is lost if proper facilities for handling motors, armatures, etc., are not provided. Realizing the convenience and the demand for an efficient motor lift which can easily be operated by hand, Mr. Paul B. Patten, 78 Lafayette street, Salem, Mass., has designed and placed upon the market a compact, well-made motor lift.

As will be seen by examining the accompanying illustration the lift comprises a solid cast-iron base, mounted on wheels. Supported upon this base are four telescoping legs, which act as guides to a platform, 3 feet 5½ inches by 24 inches. The platform is moved up and down by a 2½-inch square-threaded steel screw of ½-inch pitch. The nut, which is circular and has a bevel gear cut upon it, is turned upon seventy-two ½-inch steel balls by a hand wheel and gear. The gear ratio is 3½ to 1. It will thus be seen that the heaviest load can easily be handled by one man with the aid of this lift. The height of the machine when closed is 32½ inches and when open it is 56 inches high. The weight of the complete machine is about 1,000 pounds.

The statement which was made public on May 9 by E. H. Harriman, president of the Southern Pacific Company, shows that of the floating debt of that corporation, for which provision is to be made through the issue of stock, \$16,234,336 was incurred in the purchase of electric railways, principally around Los Angeles, Cal., and Salt Lake City, Utah. This figure illustrates the extent of the recent investments of this company in electric railways. In the last year steam railroad companies have been large purchasers of electric roads, both urban and interurban, and by these investments have acquired valuable feeders and protected their own properties. That these investments will increase steadily seems to be an undoubted tendency of the times.

There are many good reasons for housing high-potential transformers in individual compartments. It is also desirable that provision be made for handling them easily when repairs are necessary. In the large substation of the Portland Railway Light & Power Company, described in this issue, the transformers are single-phase water-cooled units, each of 850 kilowatts capacity, lowering the potential from that of the transmission line, 33,000 volts, to 11,000 volts, the distribution pressure for this and other substations in the city. There are six such transformers, each placed in a fireproof room having no connection with the main part of the station. There is only one entrance to each transformer room and that is normally closed by a steel door. Under operating conditions the units are positively independent of each other, except through the electrical connections, and each is in a compartment of such construction that it would hardly seem possible for fire or any electrical disturbance in one compartment to be transferred to its neighbors. To facilitate repairs the transformer cases are mounted on small trucks which permit of the units being rolled through the doors on to a large concrete platform built at the same

elevation as the floors in the transformer compartments. This type of construction should fully meet the requirements, both mechanical and electrical, for plants operating at high potential and for service demanding continuity of operation.

The subject for discussion at the coming meeting of the Central Electric Railway Association is "Modern Methods of Train Dispatching." This is a fertile topic and

The Telephone and Train Dispatching.

one that should be productive of interesting arguments. While the conditions on electric railways vary so greatly that it hardly would be wise to adopt, at the present time, a standard method for dispatching trains, nevertheless there are essential requirements for a good train-dispatching system that can wisely be considered for general adoption. With the rapid growth of interurban lines and the consequent shortening of the headway, it becomes more and more desirable to use a dispatching system which includes, as one of its essential factors, some method for permanently recording all train orders delivered to crews. Some roads have, for this and commercial reasons, entered into contracts with telegraph companies, employing operators as station agents and requiring them to handle the train dispatching by telegraph. It will not be questioned that the telegraphic order offers a high degree of accuracy; but, differing from the conditions on steam roads, electric trains run on such short headway that the element of the delay in running time required to ask for and receive orders by telegraph would seem to be a disadvantage that should be considered. Other high-speed lines have adopted a method which provides the security of the telegraph and yet saves a considerable amount of time in transmitting orders. This system includes a copying device which mechanically deposits in a locked receptacle an exact carbon copy of the order which is issued and received. There also is the commendable feature that this duplicate cannot be seen by the crew. This system also assures that there shall be available, for the use of the superintendent alone, carbon copies of every order issued by the dispatcher and received

by the crew, together with the proper marks to identify the man who transmitted the order over the telephone. The telephone is unquestionably the most satisfactory medium now available for transmitting train orders, but its use requires more than ordinary carefulness. For this reason all efforts are to be welcomed that tend toward the elimination of mistakes due to carelessness in giving or receiving train orders.

Improved operating conditions in the power plant have become so important within the last few years in the minds of street railway managers that in some quarters the attention given to this topic has been criticized as excessive. Doubtless it is true that on many roads the actual money cost of delays in the car service, of protracted rolling stock repairs, and of low standards of efficiency in platform work have not been properly appreciated, but in view of the sums expended on modern systems simply to keep the cars in motion it is clear that the power question was never a more lively issue than it is today. During the last year, for example, the street railways of Massachusetts expended nearly \$20,000,000 in operating expenses. Of this the cost of rolling stock repairs aggregated \$2,300,000; transportation wages came to \$7,500,000, and the cost of power was \$3,000,000. The magnitude of these figures proves their importance. Taken with repairs to roadbed and track, \$1,750,000, and damages for injuries, \$1,400,000, these five items comprise about 75 per cent of the cost of operation, and to decry the need of saving every possible dollar in each item is to talk without wisdom.

Although experience has demonstrated the practicability of using concrete for shop floors, there appears to be a doubt as to the advisability of using this material in the wheel room, where the wheel presses, boring mill and wheel lathes are installed. The handling of wheels over the concrete floor soon chips the surface of the concrete, with the result that the floor not only becomes uneven and thus unsatisfactory for handling the work, but presents a very bad appearance. The question of the thickness of the concrete or of reinforcement does not enter into the problem or present any means of overcoming the difficulty. In the case of the new Camden shops of the Public Service Corporation it has been decided to use creosoted wood blocks placed on a concrete bed and the experience of this company at its main plant, the new Plank Road shops, has been such that it has even been decided to replace the concrete floor of the wheel room there with the creosote blocks. The cost of blocks on a concrete bed is about 45 cents a square foot, as compared with about 15 cents a foot for plain concrete, but the space to be paved in any wheel room is so small in comparison with the general floor area that the question of cost does not present itself for serious consideration.

Many technical students receive their first experience in handling tools and machinery in the engineering college laboratories. It is thought that one of the most important factors in the education of an engineer is practical experience with the handling of apparatus similar to that which he will be called upon to take in charge after his graduation. Believing this, strong efforts are now being made by the faculties of our prominent engineering schools to enlarge the capacities of their mechanical departments so that students may become better acquainted with the handling of machinery and the details of its manufacture. An experiment which was performed in the laboratory of the University of Illinois on a recent visit of the Western Society of Engineers serves to illustrate the method pursued by the technical instructors with a view to familiarizing young engineers with operating machinery. This experiment was performed to show a method of synchronizing two

alternators without regard to their phase relation. It is accomplished by inserting in the circuit of the incoming machine a coil of wire without an iron core. The coil used experimentally in synchronizing a 45-kilowatt 2-phase generator with a 125-kilowatt unit, consisted of 30 pounds of No. 8 wire wound on a cylinder two feet in diameter. The cost of such a coil is about \$12, or, roughly, 1 per cent of the cost of the machine to be synchronized. The effect of the coil is like that of a spring, preventing any serious jar. It is connected in but one phase and is cut out of circuit when both phases are thrown together. The machines may be synchronized without waiting for them to be adjusted in step, and it is stated that the results are no more severe than with the best possible manipulation without the coil. While such experiments as these may or may not have an actual commercial value they do, however, afford a means for training a student so that he becomes well acquainted with the design, use and possibilities of machinery, and therefore can make better use of the excellent store of fundamental knowledge given him by his alma mater.

HANDLING CARS IN THE PAINT SHOP.

Improved methods of handling cars in the paint shop are desirable on many electric roads. The use of stub tracks in shops is largely responsible for the lack of flexibility in car movement within doors which at present hampers repair and storage work in so many instances. Local conditions often impose the necessity of a track layout which is far from satisfactory, but when a shop is built on cheap land unrestricted by adjoining buildings or streets, it is a mistake not to consider the possibilities in the way of through tracks and cross-overs, a transfer table, traveling crane or even a roundhouse design. The new shops of the Elgin & Belvidere Electric Railway at Marengo, Ill., which were described in an article in the Electric Railway Review of March 9, 1907, illustrate in an interesting way the flexibility of a through track arrangement in the repair and storage sections; not only can cars be moved in and out of the building with a minimum of obstruction to one another, but the enlargement of the shops in the future can be effected along symmetrical lines, which will permit the present ease of transfer to be enjoyed on a larger scale. The value of cross-overs in the paint shop was thoroughly appreciated in the construction of the new repair plant of the Union Street Railway Company of New Bedford, Mass.

A plain stub track layout in the paint shop opens the door to no little confusion and extra expense in handling the cars if the road is not large enough to be relatively independent in the time required for repairs. In the work of painting, the first car entering any one of the tracks would be the first one to leave the shop ready for service; and, in order to accomplish this, the cars in front of it, in case the track is fully occupied, would have to be moved out into the yard and hauled out of the way. Otherwise the first car in must be held idle after it is ready for service, causing a loss in earnings, which is liable to amount to a good many hundred dollars a year.

It often happens that one or more cars will be wet with varnish or paint at the time, and will be in no condition to be hauled into the dust and blowing dirt of the yard or street. In case the paint shop doors lead directly into the open, the cars which are being painted on parallel tracks are liable to be exposed to dusty drafts every time a car is moved, and actual instances have occurred where the wet varnish was ruined by these conditions. Additional time and expense are also entailed when car bodies are jacked up without trucks if these have to be moved out of the way before work upon them is completed.

Liberal shop areas with cross-overs will be found very helpful in reducing the amount of idle movement. The provision of through tracks and doors at each end of the shop

enables the work to be passed through progressively, and the cost of the necessary extra special track work is a small matter in relation to the convenience afforded. At the Marengo shops the first car in becomes the first car out. The shop in such a case is a way station instead of a terminal. On account of the relatively infrequent movements of cars in paint shops it seldom pays to install elaborate hoisting facilities. When the land is limited in area by surrounding buildings the roundhouse scheme of tracks can sometimes be used effectively. The transfer table also has its place in large shops, but in general the use of either cross-overs or through tracks is the least expensive method, all points considered, of facilitating the movement of rolling stock in the paint shop. Incidentally the location of this department with reference to the carpenter and machine shops is worth studying carefully. The woodworking and painting departments are in such close relation that their separation is a great disadvantage because of time and labor lost.

PERMANENT TROLLEY POLES.

The increasing scarcity of timber and the necessity for frequent replacement of wooden poles have encouraged experimental work on the construction of poles of a permanent character. A type of reinforced concrete pole which promises long life is used for supporting the overhead construction along one mile of track of the Lafayette & Logansport Traction Company. The constructional details of these concrete poles were illustrated and described by R. M. Feustel, assistant engineer of the Ft. Wayne & Wabash Valley Traction Company, in the *Electric Railway Review* of May 4, 1907, page 589. The new poles are 32 and 42 feet long, each length being set 8 feet in the ground. The shorter pole is 10 inches square in section at a point 8 feet from the bottom, and tapers to a section at the top 6 inches square. It is reinforced by eight $\frac{3}{8}$ -inch twisted square bars, 32 feet long, placed close to the surface. The 42-foot pole is 12 inches square in section at a point 8 feet from the base and is reinforced with $\frac{1}{2}$ -inch bars. The shorter poles carry the trolley bracket and a single cross-arm for supporting telephone and direct-current feed wires. The 42-foot poles are similarly fitted and in addition carry a 7-foot cross-arm and the pole-top pin, thus affording supports for the three wires of a high-tension line. Wrought-iron steps are embedded in the longer poles at a height affording a lineman a convenient footing when it is necessary for him to work on the high-tension wires at the top of the pole. The concrete mixture used comprised one part cement, three parts sand and three parts gravel or fine crushed stone. The materials were mixed wet. All poles have a facing of one part cement to three parts sand. The approximate weight of the 32-foot pole, which has a volume of 22.5 cubic feet and contains 122 pounds of steel, is 3,286 pounds. The 42-foot pole has a volume of 29 cubic feet and contains 242 pounds of reinforcing steel and 21 pounds of wrought iron in the steps, giving a total weight of 4,323 pounds. The design of the longer pole is considered sufficiently safe to support the high-tension wires in spans of 200 feet. For this reason an economy in first cost was obtained by alternating a short and a long pole with a spacing between adjacent poles of 100 feet. Thus the trolley wire is supported, as usual, on flexible brackets 100 feet apart, and the high-tension wires hang in spans of 200 feet.

Experimenting with a more permanent type of pole probably is brought about not so much by the growing scarcity of wooden poles as the desire to obtain a type of overhead structure which will require less expense for maintenance in good operating condition. With untreated or even treated wooden poles replacement becomes necessary after a very few years of service; and, other than the cost for new poles, these replacements result in delays to traffic, which undoubtedly appear in the net financial results of operation. It is

stated that the cost of the concrete poles is not excessive, and, if actual service shows that they are not mechanically weak, the total cost when considered for a number of years should demonstrate their economy.

POOLING MOTORS ON CITY SYSTEMS.

The practice of pooling locomotives on steam railroads has shown such satisfactory results under modern specialized operating organizations that it is important for electric railways operating a large number of cars in city service to consider how far it may be profitable to pursue the same policy in the use of motors. Closely allied with this problem is that of interchanging cars for service on different divisions, but here the practice of companies with regard to painting rolling stock settles the question without much delay. If all the cars of a system are painted the same color, with detachable signs, there need be little difficulty in satisfactorily pooling them, provided the attempt is not made to force small single-truck cars to do the work of large ones, and vice versa. When the policy of the management and the demands of the public require the use of separate colors as an aid to route classification, the question of pooling at large drops out of sight in the cost of repainting, including, of course, time lost in earning nothing while each car is in the shops.

On roads operating but a few cars each it is a simple matter to interchange motors or to draw upon reserves as the occasion dictates. Many small roads are today using several types and makes of motors, but there is little real necessity for the use of more than two sizes. It is safe to say that in the majority of cases a single type of motor can be found which will be capable of handling all the business on a small road, and if 4-motor equipments of this type are used on double-truck cars for the faster and heavier runs, the results ought to be thoroughly satisfactory on the score of flexibility, economy of operation and reduced investment in spare parts.

As the size of the system increases, however, the requirements of motive power become more complex. In proportion to the track mileage, the street railways operate many more routes than is the case in steam railroad practice, and only in cities exceptionally favored geographically are these routes to any great extent alike in physical characteristics. The traffic conditions vary on almost all routes, and with these the number and duration of stops, which are such vital factors in motor performance. Different sizes of motors become necessary for different classes of service, the smaller motors going to the easier runs with the smaller cars.

In such systems it is possible to set aside a certain number of motors for use in each division, holding a few in reserve at each car house where a division superintendent has headquarters. Special hoisting facilities are then required in order to rapidly substitute for a burned out motor one in good condition; storage space must be charged off; one or more mechanics maintained at the car house, and probably several thousands of dollars' worth of motors held against time of need. It may often pay to do this, especially in car houses located far from the shops, but the full advantages of pooling all the motors at a common center and drawing upon that stock as occasion arises ought to be realized before the other policy is settled upon. The whole problem is rather one of fitting motors to given routes rather than of assorting them by divisions, on most large systems. It is usually the case that a car traverses several divisions in part as it covers its route, and it is as probable that a breakdown will occur near a centralized shop as in close proximity to the division car house where the car is stored in times of light traffic. Motors cannot be transferred from route to route in a large city without discrimination, and the maintenance of the reserves at the central shops insures a minimum extra investment. When a division includes several complete routes of distinguished physical and traffic characteristics in compari-

son with the balance of the system it may well pay to hold a few motors in reserve at the central car house of that division, but in general the pooling of motors at a central shop with special regard to routes and service is the better plan. Motors can be ordered as needed, by telephone, installed at the division car house, or, if the management prefers, the car can be run to the central shops for the change-over. Local conditions will determine the best place for changing motors, but most car house foremen should be capable of overseeing such work. Free interchange of motors, trucks and cars is desirable on similar route conditions, but it is certain to lead to inefficient operating results if practiced on a large system in the way which is usually feasible on a small one.

ANNUAL REPORTS OF RAILWAYS.

Ohio River Electric Railway & Power Company.

In the annual report for 1906 of Percy M. Chandler, president of the Ohio River Electric Railway & Power Company, Pomeroy, O., many details of the operation of the property are discussed. The results for the year, with comparisons, were as follows:

	1906.	1905.	1904.
Gross earnings	\$58,981.10	\$53,196.61	\$45,591.67
Operating expenses	36,224.77	30,125.57	29,362.10
Net earnings	\$22,756.33	\$23,071.04	\$17,229.57
Fixed charges and taxes.....	17,808.97	17,790.18	16,377.43
Net income	\$ 4,947.36	\$ 5,280.86	\$ 852.14
Operating expenses—percentage			
of gross earnings	61.4	56.6	64.4
Motor car-miles	290,557	285,633	277,743
Freight car-miles	12,702	12,956	9,447

An abstract of the statement of John Blair MacAfee, the vice-president and general manager, contained in the report, follows:

The company continues to have more coal freights offered than can be accommodated by reason of the impossibility of obtaining sufficient car equipment from the Hocking Valley Railway.

Owing to the increased cost of operation, cost per car-mile has increased as well as the operating ratio. Your company's track and roadway has reached an age at which considerable renewal is required.

During the year 1905 the sum charged to this item was...\$1,481.43
Whereas during the year just past there has been charged... 4,584.07

Being an increase of\$3,102.64

In the item of maintenance of equipment an increase is shown of \$1,100.96. Under the headings of operation of power plant, operation of cars and general expenses, a total increase is shown of \$1,895.60.

During the past year we have abandoned the contract for carrying United States mail. An arbitrary ruling of the government imposed conditions which made the contract unprofitable. The government paid us \$200 per year for seven deliveries per day. Under a new arrangement, recently made by the government with an individual carrier, certain of these deliveries have been abandoned and the department pays \$240 per year to the individual.

We are still able to report no unsettled accident claims against your company. The total amount of damages paid on account of accidents for the past year was \$139.05.

Certain paving has been done in the different towns along the line of your road during the year 1906. The total charge against your company incident to this paving is \$3,852.82. By arrangement, however, with the civic authorities, your company will pay for that paving in the following manner: There will be paid \$994.25 during the year 1907, and the balance will be liquidated by semi-annual payments, the final payment being due on June 20, 1916.

During the year two new Brill semi-convertible cars have been purchased and delivered to the company. These cars are equipped with General Electric motors and air brakes, the total cost of the cars being \$8,818.95. Of this sum there has been paid \$4,974.51. The balance is being liquidated in deferred payments.

I. L. Oppenheimer, the superintendent, furnishes further details in the report. Of the gross receipts \$46,516 was received from passenger business, while freight receipts were \$6,012.57, divided as follows: Sale of parcel tags, \$1,202.95; delivery local freight Hocking Valley Railway, \$463.92; car-

load freight to and from Hocking Valley Railway, \$4,345.70. An abstract of Mr. Oppenheimer's statement follows:

In my last year's report I ventured the statement that this year would be the largest the company ever had. While the increase has been substantial it would have been still larger except for a diphtheria epidemic, which caused the closing of schools, churches and all places of public gathering in Pomeroy and Middleport. During September, when we expected to reap unusually large returns by reason of a varied number of amusements planned, the epidemic was at its worst, a portion of the amusements were suppressed, and those that were allowed to take place were failures, causing a loss in our passenger receipts of fully \$1,000. In the freight department we have suffered a loss in the carload business by reason of the car famine, which was considerably worse this year than last. With ample car supply this business should have shown a splendid gain, as our local way freight and parcel tag receipts will partially testify by showing a gain of 24.7 per cent. With the increase of our receipts has come an unusually heavy operating expense and maintenance cost, due to the increased price of all the materials and the heavy repairs necessary to the roadbed, which, I regret to say, is not in as good condition as I would like to report, and considerable money will have to be spent in maintaining this part of the property, and if the cost is within reason a better ballast should be used than has been employed heretofore. Four thousand three hundred and eighty-eight new ties were used, being 2,600 less than my recommendation of last year. The rapid advance in the price of ties has made this work expensive.

The overhead line is in good condition, and has involved no expensive maintenance cost; 78 pole renewals were made, all of first-class Michigan white cedar.

Rolling stock is all in the best condition. The cars have been kept well painted, seven repainted and two retouched in the past year; their electrical equipment has been carefully and well maintained, and with the acquisition of the two splendid new cars we are well prepared to meet all traffic requirements.

TRACTION MERGERS AND FEDERAL CONTROL.

Fourteen of the larger cities of Indiana connected by interurban traction lines are involved in an extensive merger project. The controlling interests have been concentrated in the hands of five syndicates which own all but two interurban lines of the state. Their holdings are such as to admit of almost immediate consolidation.

The completion of the merger thus proposed would connect the extreme southern towns of Indiana with those on Lake Michigan in Indiana and Illinois, and also with some of the towns of Ohio. Holders of interurban lines in Ohio seem to be working with those in Indiana, so that consolidation in the eastward direction is likely. It is also not improbable that developments in the direction of St. Louis may soon be made. In fact, the whole territory north of the Ohio, east of the Mississippi and south of the lakes, seems to be destined sooner or later, from present indications, to pass under one gigantic system of traction control.

Traction unification in the central states has already passed far beyond state limits, and must in due time receive attention as interstate commerce. The federal commission has in a few cases reminded western traction companies that they are subject to its jurisdiction. Within the scope of this territory there are probably 70,000 miles of steam railways. The adjustment of traction with steam business is a widening problem. As traction business develops it must add enormously to the amount of work which will fall to the federal commission to take care of, and must render the rate problem still more complex.

The first decision of the interstate commerce commission on express company rates has just been handed down, requiring a considerable reduction in charges on powers to New York City. This opens still another field of rate regulation over which federal control has hitherto had no authority.—Wall Street Journal.

It is estimated that about 200,000 people visited Coney Island last Sunday, May 12, most of them traveling over the lines of the Brooklyn Rapid Transit Company. Luna Park opened Saturday night and Dreamland, the other big park, was expected to be opened the latter part of this week.

NEW SUBSTATION OF THE PORTLAND RAILWAY LIGHT & POWER COMPANY.

The power supply for the Portland Railway Light & Power Company of Portland, Ore., is obtained from three steam-driven plants and three water power plants. The most recently built hydro-electric plant, known as the Cazadero station, was described and illustrated in the Electric Railway Review of May 11, page 608. This station is about 40 miles from the city of Portland. The power is transmitted over two 33,000-volt transmission lines, which have as their terminus the large modern substation described in this article. The machine equipment of this station includes two 1,000-kilowatt railway rotary converters, one 1,000-kilowatt phase-changing set, and eleven 44-kilowatt magnetic arc rectifier sets, together with transformers and auxiliary apparatus of the most recent design.

Building.

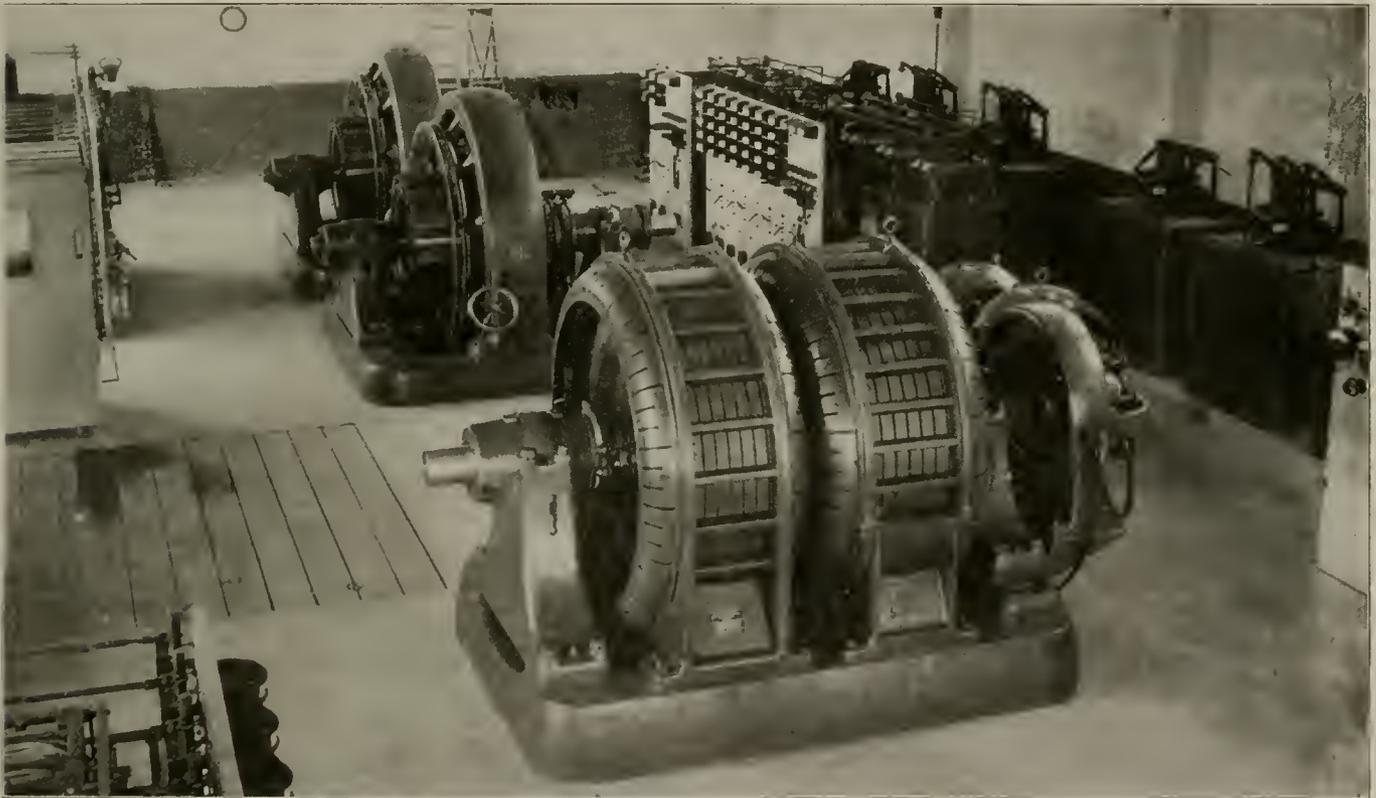

The substation building of brick with stone trimmings is located near the load-center of the city and forms a structure of pleasing design. The floor area of the building is 41 by 136 feet in dimensions. All the foundations, floors and interior divisions are of concrete. The roof is supported by structural steel girders and interior pilasters support runways for a 20-ton Pawling & Harnischfeger motor-operated crane. Accompanying engravings illustrate the interior arrangement of the building and disposition of the apparatus. It will be noted that at the end of the machine room is an independent portion of the building 16 feet wide. This part of the struc-

ture is three stories high and houses the high-tension transformers and all 33,000-volt switches and buses. The lead from the other switch passes through and under the floor of the third story to connect with a current transformer supported in a saddle below this floor. From the transformer the line passes to the terminal of a type F 60,000-volt remote-control oil switch of General Electric manufacture. From the opposite terminal of this switch which stands over a hole in the third floor, the 33,000-volt current is taken through a disconnecting switch to connect with four 33,000-volt bus wires

Portland Railway—Substation. Showing Outside Entrance to Transformer Compartment.

ture is three stories high and houses the high-tension transformers and all 33,000-volt switches and buses. The lead from the other switch passes through and under the floor of the third story to connect with a current transformer supported in a saddle below this floor. From the transformer the line passes to the terminal of a type F 60,000-volt remote-control oil switch of General Electric manufacture. From the opposite terminal of this switch which stands over a hole in the third floor, the 33,000-volt current is taken through a disconnecting switch to connect with four 33,000-volt bus wires

Portland Railway—Interior of New Substation, Showing 1,000-Kilowatt Rotaries and Phase-Changing Set.

ture is three stories high and houses the high-tension transformers and all 33,000-volt switches and buses.

High-Tension Tower.

The two incoming 33,000-volt 3-phase transmission lines enter the third story of the wire tower through 24-inch vitrified tiles. The bare wire of each phase takes the following course through the tower to the main bus: The incoming wire is dead-ended on a line insulator, whose pin is embedded

directly below it and in the second story of the tower. The lead from the other switch passes through and under the floor of the third story to connect with a current transformer supported in a saddle below this floor. From the transformer the line passes to the terminal of a type F 60,000-volt remote-control oil switch of General Electric manufacture. From the opposite terminal of this switch which stands over a hole in the third floor, the 33,000-volt current is taken through a disconnecting switch to connect with four 33,000-volt bus wires

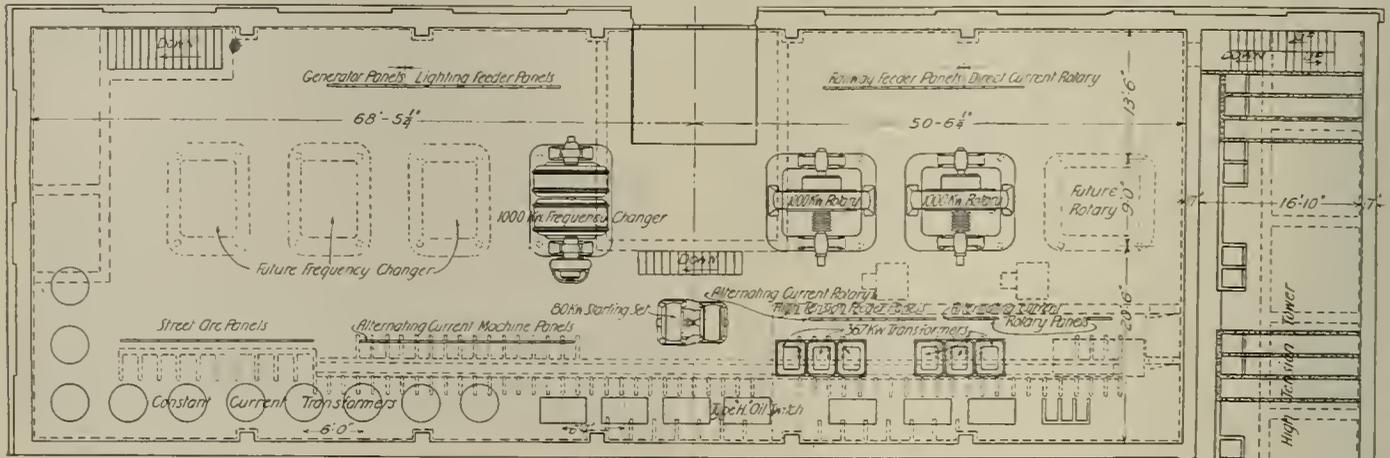

mounted horizontally in concrete septums opposite the second story of the wire tower. The lower bus is neutral.

The common bus wires afford a means for interconnecting in various ways the incoming transmission lines with the transformer equipment. The leads from the buses to the trans-

formers are also bare wire, mounted on line insulators and protected by concrete barriers. From each phase in the bus compartments connections are made through hand-operated disconnecting switches with 850-kilowatt single-phase transformers, which lower the potential from 33,000 volts to 11,000 volts.

The center and leads are taken from both ends and carried through the basement of the substation to feed the phase changing set and the rotary converters.

The 11,000-volt distribution buses are supported on line insulators in concrete septums and the circuit is so looped

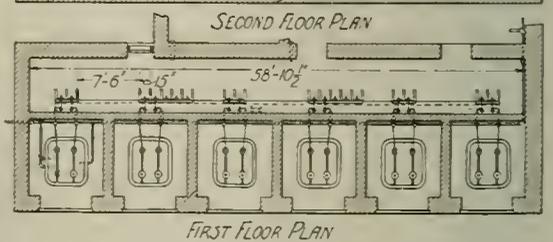

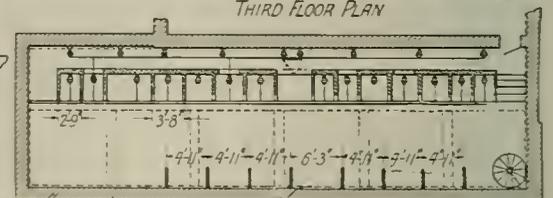

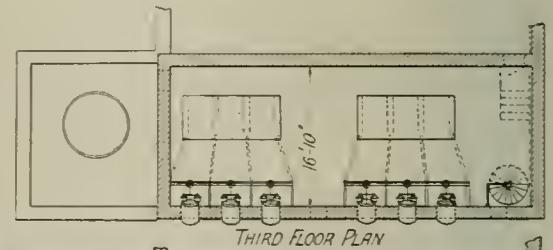

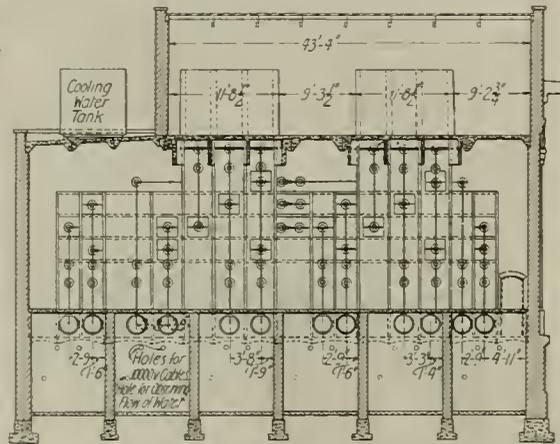

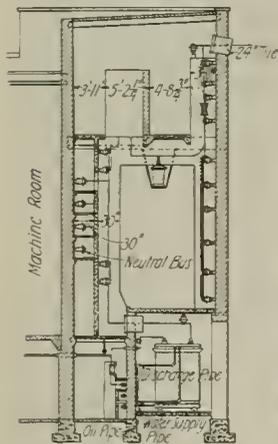

Portland Railway—General Machine Floor Plan, Showing Disposition of Units.

formers are also bare wire, mounted on line insulators and protected by concrete barriers. From each phase in the bus compartments connections are made through hand-operated disconnecting switches with 850-kilowatt single-phase transformers, which lower the potential from 33,000 volts to 11,000 volts.

Transformer Arrangements.

By reference to the sectional views of the wire tower the special arrangement of the transformers may be noted. Each

with disconnecting switches that either half may be dead and the transformers and phase-changing set still have their current supply uninterrupted. As the switchboards stand on

Portland Railway—Sections and Plans of High-Tension Tower, Showing Transformer Sections and Connections.

transformer unit is housed in a brick and concrete compartment which can only be entered through steel fire doors opening on to a concrete platform at the rear of the substation, as shown in the exterior view of the building. The six step-down transformers are of the oil-insulated water-cooled type, mounted on trucks so that they may easily be drawn on to the platform outside the building for repairs.

From the secondary side of the step-down transformers current is taken by wires leading through a partition wall and connecting through knife switches with an 11,000-volt, 3-phase set of buses extending parallel with the row of transformers. These buses are provided with knife switches at

the machine floor directly above the bus lines the wiring connections are comparatively simple for such a large station.

Switchboard and Machines.

The switch equipment includes seven Form H 300-ampere General Electric switches, six of which control the input to six air-cooled step-down transformers of 367 kilowatts capacity each. These transformers lower the potential from 1,000 volts to 430 volts for the operation of two 1,000-kilowatt capacity, 33-cycle, 600-volt General Electric rotary converters. The rotaries have starting motors

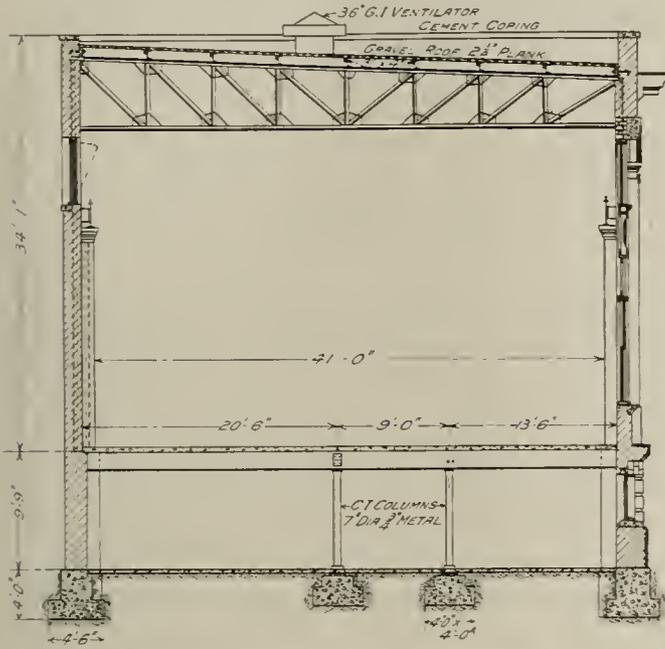

mounted on the common shaft. Current for starting is furnished by a starting set comprising a 125-volt, 640-ampere generator, driven by a 100-horsepower, 220-volt, 33-cycle induction motor.

Through the seventh of the oil switches, earlier men-

There are five switchboards for controlling the various classes of apparatus, including the lighting transformers and mercury arc rectifiers. This well-designed substation is of ample dimensions to accommodate three additional phase-changing sets and one additional rotary converter of the capacities now used.

NEW CAMDEN SHOPS OF THE PUBLIC SERVICE CORPORATION.

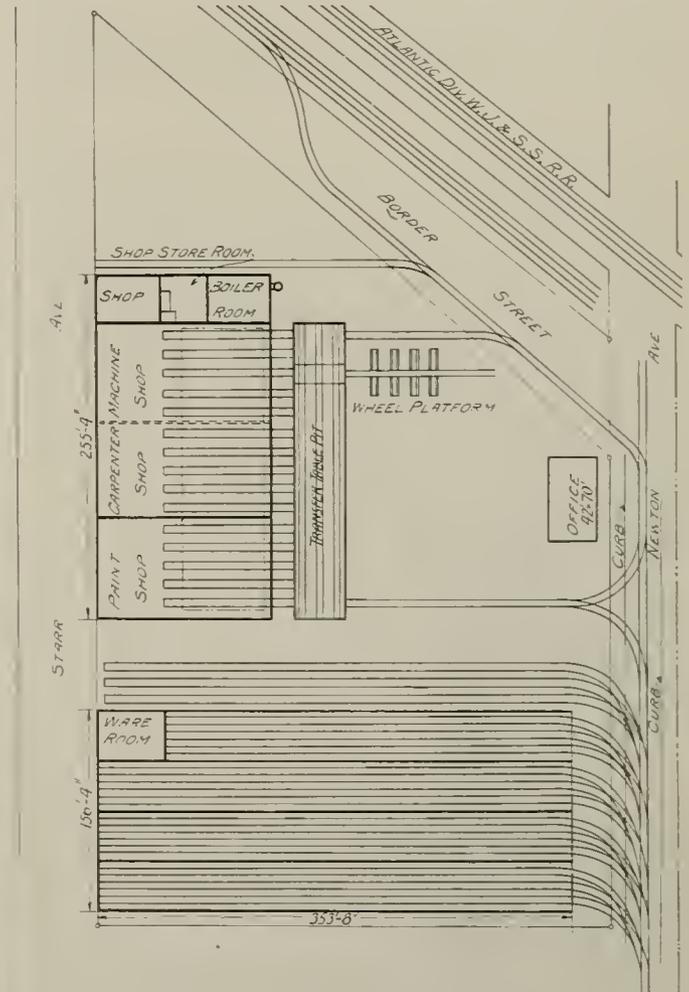

A new shop plant for the South Jersey division of the Public Service Corporation is now under construction at Camden, N. J. The shop site is at the corner of Border street and Newton avenue, and is of the shape indicated in the accompanying engraving showing the layout of the buildings. The main building, which is now completed, so far as

Portland Railway—Cross Section of Machine Room and Basement.

Portland Railway—Transformer Compartment with Entrance from Outside of Building.

Camden Shops, Public Service Corporation—Layout of Buildings and Tracks.

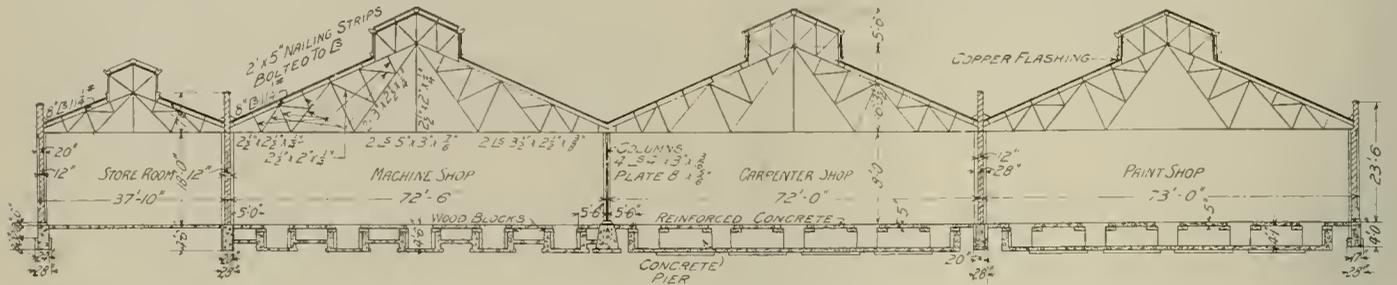

the external structure is concerned, is arranged, as shown, for a machine shop, carpenter shop and paint shop, with the boiler room and shop storeroom at one end. The building is 255 feet 4 inches long and 130 feet 8 inches wide, and the space devoted to the machine shop, carpenter shop and paint shop respectively is 72 feet in each case. There are five pit tracks allotted to each section, all tracks being served by the transfer table. The length of each pit is about 74 feet, or long enough to accommodate a car body and provide space for running out two pairs of trucks.

The paint shop is separated from the carpenter shop by a fire wall having one 5-foot opening on the side opposite the pits. A similar fire wall divides the machine shop from the boiler room shop, storeroom and wheelroom, each with openings into the machine shop. Between the machine shop and carpenter shop are placed steel columns on concrete founda-

tioned, 11,000-volt current is fed direct to a 1,400-horsepower synchronous motor, driving a 2,300-volt, 60-cycle generator, these two units forming the phase-changing set.

tions, spaced 16 feet apart on centers. These serve instead of a wall to support two sections of the steel truss roof. The roof stresses are calculated independently for each section of the building, thus constituting three main bays. The roof has a pitch of one in five. The building is of brick, the walls 12 inches thick with pilasters placed 16 feet apart on centers. All foundations, including the pits, are of concrete. Fully 40 per cent of the exterior wall space is devoted to windows, affording excellent lighting in the shops. The window allot-

23, 1907, page 380. There will be five jib cranes and one wall crane with air hoists, similar to those illustrated and described in the Electric Railway Review of March 23. The air pressure used on the shop tools will be supplied by a compressor plant, consisting of a Westinghouse twin electrically driven set. The five pits in the machine shop will be fitted with car hoists, similar to those in the Plank Road shops, each set made up of four jack screws, driven by a motor in the forward end of the pit. One pit will be fitted

Camden Shops, Public Service Corporation—Section Across Shops.

ment is shown clearly in the accompanying engraving from a photograph of the exterior of a building. The entire interior of the building will be finished above the window sills in white, in order to give the best possible reflection of light. The roof on each of the four bays is capped with a louvre of galvanized iron and glass running the entire length of the bay.

The complement of tools in the machine bay is very complete, including jib cranes in front of the machine pits. The small shoproom in the corner of the building at the end of the small section or bay devoted to the boiler room will

up with the wheel grinder designed by the company and previously described. The toolroom will be located in the carpenter shop bay near the compressor plant. The toolroom will be of structural steel frame, covered with wire netting of 2-inch mesh, and the office will be located above it. The latter will have a concrete floor between beams finished with $\frac{3}{8}$ -inch yellow pine. The ceiling of the office will be on a level with the bottom cord of the roof truss, and will be built of iron, supporting adamant block.

It will be noted that the tracks in the paint shop are of sufficient length to hold two cars on each track, thus giving

Camden Shops, Public Service Corporation—General View of Buildings.

be equipped with a wheel press, boring mill and wheel lathe. This room is separated from the machine shop by a fire wall with a 5-foot passageway and has a 9-foot exit to the outside, where a wheel platform is to be built. The equipment of the machine shop consists of two Buffalo down-draft forges, one small babbitting forge, Bradley power hammer, bolt cutter, three drills, shaper, milling machine and two lathes. The machinery will be driven from line shafting.

In the armature section will be installed two winding machines and an armature bander. These will be similar to the machines designed by the company for the Plank Road shops, described in the Electric Railway Review of March

the shop a capacity of 10 cars. This bay will be arranged with a washstand, so that the cars may be washed for painting. It is the ultimate purpose, if the growth of the system demands it, to build a new plant shop on the opposite side of the transfer table, in which event more space could be devoted in the present building to the machine shop. The boiler house will be served by a steam road track to enable the company to deliver coal cars so that coal can readily be unloaded. The power house chimney is a circular brick structure on an octagonal base, and is 85 feet in height and 48 inches in diameter.

The boiler room equipment will consist of two return

tubular boilers of 250 horsepower capacity. The general storeroom and offices will be heated from the boiler room, the pressure from the boiler being reduced by valves in the feed line near the heaters, so as to give about five pounds of pressure to the coils and radiators. Condensation will be cared for by the vacuum system. The shop building, except where painting is done, will be heated by the fan system, and air will be distributed through galvanized iron pipes hung from roof trusses. The paint shop is to be heated to 80 degrees F in zero weather by direct radiation, placed on the floor near the windows.

The operating barns shown in the general layout plan will be built in four bays, each separated by a fire wall with space in one bay for a ware room. The building is 156 feet 4 inches wide and 353 feet 8 inches long. Each bay has three tracks and in addition there are three storage tracks outside the building. The building will have concrete foundations and brick walls and will have a roof of heavy mill construction. Each track, for a distance of 100 feet in the forward part of the building, will have inspection pits of open construction, consisting of piers placed 8 feet apart on centers and supporting 7-inch Trilby rails. Angle-bar cover braces will be riveted between the tracks every four feet to support a cast-iron walk 36 inches wide and $\frac{3}{8}$ inch thick. The building will be painted white on the inside and will be ventilated with 36-inch ventilators placed 50 feet apart in the skylights.

On Newton avenue a 2-story brick office building 70 feet by 42 feet will be erected. The first floor will be devoted to the office of the general superintendent, chief dispatcher, superintendent of tracks, starters and receivers, men's room, storeroom and locker and toilet accommodations. The second floor will be left as a hall and will be utilized as a club room, library and entertainment center for employes of the South Jersey division. It is intended to build a general storeroom building, line stable and an oil house as a part of the general layout.

As was noted in the description of the Plank Road shops, the Public Service Corporation fully appreciates the necessity of providing an adequate fire protection, and the Camden shops will be provided with a dry pipe automatic sprinkling system with a steel tank and tower to supply water reserve and an electric motor-driven centrifugal pump to supply the proper pressure, similar to the system installed at the Plank Road shops. The Camden shops will also have an auxiliary fire alarm system and will be equipped with chemical fire extinguishers and other paraphernalia for fighting fire in an effectual manner. The work on the new plant began under the direction of A. H. Stanley, then general manager of the street railway department of the Public Service Corporation, and the designs are in charge of Martin Schreiber, engineer maintenance of way. The contract for the shop building was let to J. S. Rogers Company of Stanwick, N. J.

A NEW TYPE OF TRACKLAYING MACHINE.

The machine illustrated herewith is being used for laying the track of the Pacific Traction Company between Tacoma and American Lake, Wash. This new line will be 12 miles long and a considerable portion of the track is being laid on an abandoned steam railroad embankment. The tracklayer was recently designed and patented by C. O. Wescott, Puyallup, Wash. The equipment necessary for laying track comprises a light locomotive, which pushes four flat cars.

On the forward car is a structural steel bridge which extends in front of the car for a distance of about 18 feet, or enough to allow a rail supported by tongs in the center to be lowered from the end of the bridge. On the framework of the bridge, as shown in the illustration, are four air cylinders, the pistons of which operate steel cables, which in turn control the handling of the steel rails. A conveyor by which ties are brought from the rear car to the front end of the bridge extends along the floor of all the cars. The conveyor

is operated by a donkey engine carried on the floor of the car next to the locomotive. This car also carries a supply of miscellaneous tools and extra equipment, such as may be needed in the progress of the work. The second car in front of the engine carries 500 standard ties and the angle plates necessary to lay 1,000 feet of track. The car immediately in the rear of the tracklayer is loaded with a sufficient number of 33-foot rails to lay 1,000 feet of track. These rails are carried on skids elevated above the car floor so that they can be dropped on to a conveyor, which will carry them along the middle of the cars and directly over the tie conveyor, from where they are slid to opposite sides of the car.

While the rails for one rail length of track are being placed, the tie conveyor is operated by the donkey engine in the rear, and ties are brought forward to be placed ahead of the tracklayer. Meanwhile two rails from the rail storage car are slid to a point under the bridge of the tracklayer and directly over the car wheels below. The rails are then lifted by tongs connected through cables with the air cylinders and carried ahead to the extremity of the bridge, as shown in the illustration. Then by the releasing of the air

Wescott Track-Layer in Operation.

in the operating cylinders, which movements are controlled by a man standing on the elevated bridge, the two rails are lowered directly in front of those already spiked in place. Temporary clamps are next placed to hold the rails to gauge so that the entire tracklaying equipment may move forward and the spiking be postponed until after the engine has passed the rails already laid. In this way the process is continuous, the ties being brought ahead and placed, the rails being lowered directly in line and gauge and the spiking gang following the locomotive, which pushes the train from the rear. When the several incomplete details in the preliminary design of the tracklayer have been perfected, it is anticipated that the work of placing the ties and rails can be carried on with a crew of seven men other than the necessary spikers which will follow the train.

According to the figures compiled by the forest service of the United States Department of Agriculture in Circular 97, which has just been issued, this country as a whole consumes every year between three and four times more wood than all the forests of the United States grow in the meantime. The average acre of forest lays up a store of only 10 cubic feet annually, whereas it ought to be laying up at least 30 cubic feet in order to furnish the products taken out of it. Since 1880 more than 700,000,000,000 feet of timber have been cut for lumber alone.

STANDARD M. C. B. COUPLERS FOR INTERURBAN CARS.

It is very desirable that a large interurban system handling freight in foreign cars as well as operating its passenger equipment in trains, have all its rolling stock provided with a coupler designed according to the master car builders' standard contour lines and capable of intercoupling with all

burn Steel Castings & Coupler Company, Minneapolis, and delivered to the St. Louis Car Company for the new equipment. The coupler as now perfected and adopted for the extensive system of the Pacific Electric Railway Company has a standard M. C. B. contour for the head which will intercouple with any similar equipment as used on the Pacific Electric or the foreign freight cars handled over its line.

M. C. B. Couplers—Train of 18 Cars En Route from St. Louis to Los Angeles.

M. C. B. Couplers—Train Moving Around 50-Foot Radius Yard Curve.

rolling stock of that or any other system. These conditions so impressed the management of the Pacific Electric Railway, Los Angeles, Cal., that some time ago steps were taken to provide a type of coupler that would fulfill the desired requirements.

The type of coupler shown under various conditions in the accompanying illustrations is the result of a considerable amount of careful designing and experimental work carried on by the Pacific Electric Railway and Edwin C. Washburn. The couplers were manufactured by the Wash-

burn Steel Castings & Coupler Company, Minneapolis, and delivered to the St. Louis Car Company for the new equipment. The coupler as now perfected and adopted for the extensive system of the Pacific Electric Railway Company has a standard M. C. B. contour for the head which will intercouple with any similar equipment as used on the Pacific Electric or the foreign freight cars handled over its line.

It will be noted from the illustrations that the coupler and draft rigging are mounted so that they can swing radially about a pin connecting them to a standard radial drawbar anchor bolted to the center sills of the car by $\frac{3}{4}$ -inch bolts. The drawbar is provided with a spring yoke draft box and a spring sufficient for handling five or six large interurban cars. To prepare the bumpers of the cars for the accommodation of the radial couplers it was necessary to bolt on the timber extension as shown in the line drawings. Other than increasing the rigidity of the framing of the car this extension pro-

FREIGHT HANDLING AT BIRMINGHAM.

In the development of a freight service between Birmingham, Ala., and the suburban districts of that city, the Birmingham Railway Light & Power Company has adopted some interesting billing and other forms necessary to facilitate the handling of shipments.

During the past five years this company has given much attention to the building up of its freight traffic, which now produces receipts of practically \$5,500 gross per month. The operating expense of this department is about 60 per cent of the receipts.

In the Street Railway Review of April, 1904, and of May, 1905, were published data on the freight handling methods of this company. Since these articles appeared the service has been extended to better accommodate the suburban towns and a very thorough system of records has been adopted.

Two regular daily freight trains leave the First avenue station at Birmingham en route for the suburbs. The first two trains in the morning, known as the "Meat Specials," are

usually laden with meats, fruits and other perishable goods. One of these trains departs for Bessemer at 6:15 a. m. and the other leaves at 6:30 a. m. for Ensley, Pratt City, Thomas and way stations. So well do these trains serve the rural districts that cold storage houses have been abandoned and the residents now depend on the electric road for their day's supply of meats and provisions. The other regular freight trains leave Birmingham for Bessemer at 10:30 a. m. and 2:30 p. m.; for Ensley at 10:00 a. m. and 3:30 p. m.; for points on the North Birmingham, Gates City and East Lake divisions at 8:30 and 11 a. m. and at 3 p. m., and for Boyles, North Birmingham, at 2 p. m. Each freight train is composed of from one to six 35-foot box cars hauled by one of the company's standard express motor cars.

The motor car is utilized in carrying freight to be distributed at way stations. The box cars, so far as possible, are loaded with carload shipments for one of the 13 established agency stations. In the latter case the car is locked and set in on a siding and left to be unloaded at pleasure. The freight traffic has been so uniformly developed that it is seldom necessary to haul empty cars in any direction.

The company's freight equipment consists of, besides the motor cars, 18 box and 7 flat cars. Other equipment is now being built at the company's shops.

Track connections are made at Bessemer with the Louisville & Nashville, Alabama Great Southern, Southern, Frisco, Birmingham Southern, and with the Seaboard Air Line; at East Birmingham with the Union Track and Birmingham Belt; at Pratt City with the Birmingham Southern; and at Woodlawn with the Louisville & Nashville. Cars carrying freight to be delivered at points on the electric lines are picked up at the connecting points and set out on the siding nearest the delivery point. The company has also an inter-

change agreement with the Southern Express Company whereby express is carried between Birmingham and the suburban points where express offices are not maintained.

As a usual thing all freight and express shipments are delivered to the consignee at the station. At Woodlawn, a town located three miles distant from Birmingham, however, a free city delivery is maintained. This free delivery was found advisable on account of the wagon competition by means of which goods hauled from Birmingham were delivered at the doors of the consignees. The free delivery of goods costs the company an average of about 2 cents per 100

pounds, but as the practice attracts a large amount of extra business, it produces satisfactory results.

The freight rates as established by this company are based on the Southern classification and with but few exceptions the tariffs adopted by the steam railways for the Birmingham district are used. A minimum charge of 10 cents is made for packages weighing 50 pounds or less and 15 cents for packages from 50 to 150 pounds. Special rates are made on commodities essential for household purposes.

The forms used in billing, checking and forwarding freight have been perfected with a view to simplifying the office work necessary for properly recording the business done. When goods are received for shipment, three carbon copies are made of the freight bill. The original goes to

the consignee, the duplicate is signed by the consignee and kept as an office receipt, the triplicate is sent to the auditor and the fourth copy is kept in the billing station as an office file. This system relieves the agent at destination of the arduous duty of making his freight bills from the waybills

take is made in billing the shipment. In order that such mistakes may be rectified at once a waybill correction notice blank is provided for furnishing notice of such discrepancy to the freight traffic manager. When the error is traced to its source the agent is advised that the correction is approved.

Freight Handling at Birmingham—Statement of Proceeds and of Way Bills Received.

per, which, if desired, may be exchanged for a regular bill of lading. The freight traffic officials, however, consider the dray-ticket equally as binding as the regularly printed form. The ticket is 5½ by 8½ inches in size and is printed at a nominal expense.

Freight received at any station up to 15 minutes before the arrival of any train is dispatched on the first train. In hastening the departure of freight it is often that some mis-

ported to the manager of the freight traffic. The concise form used in making these reports contains headings for the car number, the time out, time in, cars transferred and contents of the same, waybill number, origin and destination of car, time it is picked up and time set out. These reports are made by the conductors from the train-books with which each is supplied.

The method adopted for keeping station records of busi-

ness done at the several agencies has been carefully developed. The agents make daily statements to the freight traffic manager of all waybills and money received and forward an abstract of the same to the auditor of the company. On the 7th, 14th, 21st and last day of each month a recapitulation and settlement sheet, which is a verification of the daily reports and a general statement of the condition of the agencies, is forwarded to the auditor. Records of all freight and moneys received are kept in station books from which the reports are compiled.

The tonnage moved daily by this department is upwards of 275,000 pounds and at closing time at night no freight is

REHABILITATION OF THE BROOKLYN RAPID TRANSIT COMPANY.

In 1902, when Mr. Winter undertook the rehabilitation of the Brooklyn Rapid Transit Company, he faced a trying and complex situation. The citizens were hostile, the municipal government was antagonistic, and the property was a wreck. The first undertaking was to provide money for the extensive improvements which were absolutely and immediately necessary. This was done through a new refunding mortgage for \$150,000,000, the proceeds to be used in retiring the securities of some of the constituent companies, and the remainder as required for improvements. The next work was to effect a complete reorganization and consolidation of the personnel and duties of the subordinate officers. Having the money and the men to carry out his plans, Mr. Winter began the far-reaching reconstruction whose progress thus far is outlined in these two articles.

Depending on results rather than on promises and smooth words, Mr. Winter has been content for the most part to let the people form their own conclusions as to whether or not the company was making a conscientious effort to remedy the evils so long suffered by the community and to provide a modern and efficient transit system. Shortly after he was made president a contract was made with the city for disposing of ashes in Brooklyn, and over \$600,000 was invested in plant and equipment for removing the refuse. At that time the company was openly accused in some quarters of using unfair means in obtaining the contract. There have since been complaints that the collecting stations and incinerator plants constituted a public nuisance, and that the ash cars caused delays to cars carrying passengers. The contract is soon to expire, and, more because it has aroused public hostility than because it has not been profitable, the company has notified the city that it will not again bid on the job. It will give up the business and write off on its books the investment of \$692,000. There is some question as to when the contract expires. The company claims that it expires in 1907, but in spite of all the clamor about its having obtained the contract on unduly favorable terms, the company has been threatened with mandamus proceedings if it does not continue the collection of refuse until November, 1908.

Results of the improvement policy were not apparent at first, and the new administration came in for quite as much condemnation as the old, but the attitude of the public has been gradually changing. The innumerable civic organizations in Brooklyn no longer hold frequent meetings to denounce the company; only occasionally is an attempt made to make political capital out of it; the newspapers are ready and willing to give praise where praise is due. From a financial and operating standpoint the results of the improvements have been even more clearly marked. For the year ended June 30, 1902, the gross earnings were \$12,510,622, net earnings \$4,301,225, and net income after fixed charges \$103,321. For the year ended June 30, 1906, gross earnings were \$18,473,328, net earnings \$8,031,951, and net income \$2,742,952. With an increase of 48 per cent in gross earnings, net earnings increased 86 per cent and net income 2,450 per cent. The 1902 surplus, after deducting \$84,428 for improvements, was only \$18,893. In 1906, after deducting \$1,652,113 for betterments and special appropriations, the surplus was \$2,075,563. The operating ratio in 1902 was 65.5 per cent, and in 1906 had been reduced to 56.5 per cent.

The value of these improvements to the company is perhaps more strikingly illustrated in other ways, less important in the aggregate, but more vital as really typifying the changes which have been wrought. Five years ago the insurance rate on the property of the Brooklyn Rapid Transit Company, including shops, stations, car barns, power houses and rolling stock, averaged \$1.65 per \$1,000. Today it is \$0.85, and this in spite of the fact that three years ago an arbitrary advance of 20 per cent was made in the basis rate on all Brooklyn risks. The saving in yearly premiums, large as it is, is nowhere nearly so important as the reduction in the risk of destruction by fire of some important element of the transportation machine, which it indicates.

In the year ended June 30, 1901, 8.28 per cent of the gross earnings was paid out in settlement of such claims. This percentage has been steadily lowered until for the year ended June 30, 1906, it was 3.71 per cent; this notwithstanding the big increase in number of passengers carried. In 1906 the damages paid were over \$300,000 less than in 1901, and less than in any year in the history of the Brooklyn Rapid Transit Company since it took over the lines which it now operates.—The Railroad Gazette.

on hand at stations to be forwarded except that which has been received after the last train has departed.

The character of the freight movement is aptly expressed in the advertising motto used in all advertisements of this department: "Express service at freight rates."

The traffic managers of steam and interurban railroads in Indiana have declined to grant reduced rates to the public for public occasions during the present summer. The steam line men say that in view of the recent adverse legislation and the 2-cent law, concessions of this kind are to be withheld. On the other hand, the traction men say it is unnecessary for them to reduce rates because their equipment is inadequate to handle the large crowds that desire to be carried on these various special occasions. They argue that it is inadvisable to offer additional inducements for travel when they know they must leave large crowds at the stations along the lines on such occasions because of the lack of cars to carry them.

BOOK TABLE.

Roadmasters and Maintenance of Way Association of America.—Proceedings of the Twenty-fourth Annual Convention. Published by the association, Walter E. Emory, Chicago & Northwestern Railway, Chicago, Ill., secretary. Paper, 136 pages, 5¾ by 8½ inches.

This volume comprises the verbatim report of the annual convention held at Chicago on November 13-15, 1906.

American Street and Interurban Railway Claim Agents' Association.—Proceedings of the third annual convention. Published by the association, B. B. Davis, secretary, Columbus, O. Paper, 253 pages, 6 by 9 inches.

This book contains a complete report of the proceedings of the convention held at Columbus, O., on October 15, 16 and 17, 1906.

American Society for Testing Materials. Proceedings of the ninth annual meeting. Published by the society. Philadelphia, 1906. Cloth, 712 pages, 6 by 9 inches.

This volume contains the report of the annual meeting of the society, which was held at Atlantic City on June 21 to 23, 1906, and in addition to the committee reports and discussions there are included in this volume memoirs of a number of deceased American investigators who have contributed largely to the advance of the testing of materials. These memoirs were prepared by Gautano Lanza.

Locomotives: Simple, Compound and Electric. By H. C. Reagan, New York, 1907. John Wiley & Sons. Cloth, 494 pages, 5¾ by 8 inches. Price, \$3.50.

The fifth edition of this popular treatise on locomotives is revised, enlarged and brought up to date, by including an account of the recent developments of the compound locomotive, the electric locomotive and the motor car. The number of pages is increased from 617 to 946. The book is almost entirely descriptive and has little to do with principles or design. It is dedicated to locomotive engineers and firemen and should prove to be a satisfactory volume for their entertainment and instruction.

The Peabody Atlas of Coal Mines and Coal Railways. By A. Bement, C. E. Published by the Peabody Coal Company, Chicago, 1906. Cloth, 149 pp., 16¾x18 in. Price, \$5.00.

This publication contains colored maps showing the location of the coal fields of Illinois, Indiana, Ohio, Michigan, western Kentucky, Iowa and Missouri. The text gives much technical information in regard to coal, including a brief description of the geology of each coal field; names and number of the various coal seams, with their relative importance, and chemical analyses, showing the relative composition of fuel from the different states. Information is given in regard to the economical use of coal, with hints as to the manipulation and management of fires so as to render the combustion of bituminous coal smokeless, and there are various illustrations of the latest types of smokeless boiler furnaces.

Hamlin's Index-Digest of the Interstate Commerce Acts.—By Charles S. Hamlin. Boston, 1907. Little, Brown & Co. Buckram, 480 pages, 6¼ by 9½ inches. Price, \$3.50 net.

Mr. Hamlin, who is corporation counsel of the Boston chamber of commerce, and a member of the law committee of the National Board of Trade, has given to the public in this book a work of much importance. The volume contains the text of the important laws of the United States relating to railways, shippers, etc., as officially printed by the interstate commerce commission, including the original interstate commerce act, approved on February 4, 1887, and amendments; the Hepburn act, approved on June 29, 1906; the acts in relation to testimony before the commission; the acts concerning the immunity of witnesses; the act to expedite hearings; the so-called Elkins act; the act approved on August 7, 1888, as to government-aided railroad and telegraph lines; the safety appliance laws; the resolutions providing for the investigation of block signal systems and of railway discriminations and alleged monopolies of the coal and oil businesses; the act approved on June 1, 1898, providing for arbitration

between carriers and their employees; the Sherman anti-trust act; the un repealed provisions of the Wilson tariff act, relating to trusts in import trade, and the act approved on June 3, 1906, relating to the liability of railways to their employees. To these are added an index of the principal words and phrases used in these laws, a concise digest of the laws and citations of all uses of the same words and phrases in the different acts. Changes in the earlier laws are indicated on the margin of the text. The work will be of special value to lawyers, shippers, railway officials and students of railway subjects.

Boiler-Waters—Scale, Corrosion, Foaming. By William Wallace Christy. New York, 1906, D. Van Nostrand Company, 23 Murray street. Cloth, 235 pages, 6 by 9 inches. Price, \$3.00.

This is a good general treatise on boiler waters, although the portion relating to water softening occupies only one chapter of 40 pages. The book contains little that is new or original, but is a good collection of recent articles from technical papers, contains a great deal relating to quality and purification of feed waters for locomotives and is probably one of the best books of the kind for the use of the railway master mechanic. The practice of publishing an almost complete catalogue of scientific books at the end of a volume of this kind is a reprehensible one and should be avoided by publishers who have any regard for space in office libraries.

Encyclopedia of Engineering. Treatise on boilers, steam engines, locomotives, electricity, automobile motors, refrigeration, etc. Published by Calvin F. Swingle with the co-operation of mechanical and electrical engineers. New York and Chicago, 1907. Cree Publishing Company. Seven volumes, cloth, 3,500 pages, 5½ by 8¾ inches. Price, \$24.

This Encyclopedia consists of seven large volumes each 2½ inches thick. It has been compiled from the papers of the International School of Engineering and is intended to furnish practical instruction for those who are not in position to take up the correspondence course or to attend a school of engineering. A number of practical examples are given in each volume, which help to bring out the fundamental principles involved and also to fix the essential points in the reader's mind. This Encyclopedia will be of special benefit to those who are not in a position to obtain a regular technical education at a school or university.

The Engineering Index, Volume IV—Five Years, 1901-1905. Edited by Henry Harrison Supplee and J. H. Cuntz in co-operation with Charles Buxton Going. New York, 1906, The Engineering Magazine. Cloth, 1,234 pages, 6¼ by 9¼ inches. Price, \$7.50.

The fourth volume of The Engineering Index is a continuation of the work originally begun by the late Professor J. B. Johnson in the Journal of the Association of Engineering Societies in 1884 and turned over by that association to The Engineering Magazine at the close of 1895. The previous volumes published respectively in 1892, 1896 and 1901 cover very thoroughly the field of technical periodical literature, and in the present volume care has been taken to maintain and advance the high standard already adopted. The classification used is the same as that introduced in Volume III. It includes all branches of engineering and contains more than 50,000 entries as compared with 40,000 in the previous volume. The list of periodicals indexed includes 250 technical engineering journals in six different languages, about one-fourth of these being in languages other than English. In every case a brief extract is given showing the scope and purpose of the article sufficient for the investigation without further reference. It can be used as a convenient guide to the vast mass of information buried in the files of engineering publications in reference libraries, and the index thus becomes the master key by which this information is made available. The volume is especially valuable at the present time as it can be used by the engineer in the new Engineering building in New York City, where the invaluable technical libraries of the mining, mechanical and electrical engineers' societies are now collected. Catch

words and cross references as here used are probably the result of a long experience, but in glancing over the volume it would seem that there is a too frequent use of large capitals in the text for cross references which tend rather to confuse than to assist in the rapid use of the book. This is simply a suggestion and it may be there is good reason for the practice indicated.

Handbook of Timber Preservation. By Samuel W. Rowe. Chicago, 1906. Pettibone, Sawtell & Co. Leather, 202 pages, 3¾ by 6 inches.

The handbook on "Timber Preservation," by Mr. Rowe, was first issued in 1900, and the increased demand for information on the practical side of this subject has justified another edition, which has been revised and somewhat extended in its scope. The primary purpose of the book is to furnish information as to the practical workings of timber preserving plants, so as to enable the operator to fully understand the philosophy and principles involved and to serve as a guide during the construction of the works and their operation. In a general way the book is an epitome of the experience and observation of the author and gives the results of much labor and study. It contains an account of the various methods of treating timber and the results obtained and is quite fully illustrated with drawings of the apparatus used in timber treating plants, much of it in detail. This hand book will be found of great convenience and much interest to all those connected with the operation of timber treating plants, and it will also be found a convenient reference book by the railroad superintendent and other officers who have charge of such plants.

Graphical Handbook for Reinforced Concrete Design. By John Hawkesworth. New York, 1906, D. Van Nostrand. Cloth, 64 pages, 8¾ by 11 inches. Price, \$2.50.

This book is intended for the use of architects and engineers whose work in reinforced concrete design does not warrant the steady employment of a concrete engineer. The use of such a graphical handbook should render it unnecessary to call in expert assistance to solve most of the problems ordinarily presented in the design of reinforced concrete structures. The book contains a series of plates, showing graphically by means of plotted curves the required design for slabs, beams and columns, under various conditions of external loading, together with practical examples explaining the methods of using each plate. The design of most of the common forms of concrete construction may be ascertained directly from these plates, without performing any of the computations ordinarily required. While an inspection of the plates is all that is needed to select the design for the given conditions, nothing is sacrificed in the way of flexibility by the graphical method, but a wide range of choice is afforded to the relative proportions of steel and concrete to be used. The plates are drawn to a large scale and have plain figures, so that they can be easily read for comparatively small values, and although the page is large, where necessary the plates occupy a full double sheet. They are printed on heavy paper. The unit stresses described by the building code of New York city have been adopted throughout as a standard, and the methods are those sanctioned by the best practice at the present time.

Combustion and Smokeless Furnaces. By Joseph W. Hays. New York, 1906, Hill Publishing Company. Cloth, 104 pages, 5¼ by 9½ inches; price, \$1.50.

This volume has special reference to the smoke nuisance, and as such it is a welcome addition to the literature of combustion and smokeless furnaces. The subject is treated in a popular manner and is intended largely for the owners of boilers in cities and the engineers in charge of them, with a view of giving them intelligent advice as to the best methods of arranging boilers in order to prevent smoke and to comply with the smoke ordinances of large cities. The author has obtained much information from the standard authorities, and it will be of use in presenting sound advice to the general

reader on a subject which is thoroughly understood only by the skilled engineers. One of the most valuable parts of the volume is that relating to steam jets, where it is shown that this is the favorite method of attempting to prevent smoke and 75 per cent of the patents issued in the last 17 years on smoke consuming appliances have been founded on modifications of the steam jet. The author states that it is not possible to give any views favorable to the use of the steam jet and quotes a number of authorities who are in agreement with respect to its undesirability. The steam jet has probably done more than anything else to prevent the radical changes in boiler settings which are necessary for the proper suppression of smoke, and this explosion of the fallacy and uselessness of the steam jet we regard as the most important protest against its further use to be found in technical literature. In the conclusion the author points out some other undesirable features which are continually being presented under the guise of smokeless furnaces and shows that by the use of the most of them damage will result to the boiler and no improvement made in the matter of smoke.

Concrete Factories. Compiled by Rob't W. Wesley. Published for the Cement Age Company, by Bruce & Banning, No. 1 Madison avenue. New York. Boards. 152 pages, 6¾ by 10 inches. Price, \$1.00.

This contribution to the literature of cement comprises a series of papers descriptive of the use of cement and concrete is applied to construction at industrial plants. It offers in condensed form what is believed to be the most complete review of the principles underlying reinforced concrete construction. The method of the treatment was intended to present the matter in such form that it would be understood by the layman as well as the engineer. The book contains the report of the United States advisory board on "Fuels and Structural Materials," the report of the sub-committee on "Tests," the only translation of the French rules on reinforced concrete, which have just been issued by the ministry of public works in France, and a number of profusely illustrated articles showing the methods of reinforced concrete construction including all the well known reinforcing systems. "Reinforced Concrete Construction," a chapter by Walter Mueller, is a concise description of the many concrete reinforcing systems now in the market, and "Concrete in Factory Construction," by E. A. Trego, reviews the work that has been done with concrete in the construction of industrial plants during the past few years. This book also contains "A Surface Finish for Concrete," by Henry H. Quimby, and a symposium of articles on the use of concrete in constructional work by eminent authorities on this subject.

Street Railroad Accident Law. By Andrew J. Nellis. Albany, N. Y., 1904. Matthew Bender. 350 pp., 6 by 9 inches. Price, law sheep, \$6.00.

In this publication the author has given a complete treatise on the principles and rules of law by the courts of the states and territories of the United States and Canada in determining the liability of street railroads for injuries to the person and property by accidents to passengers, employes and travelers on the public streets and highways, and on the pleading and practice in the various jurisdictions in street railroad accident litigation.

Street railway law itself has been recognized as a subject for separate text-book treatment but a comparatively short time. That a single branch of it, namely, street railroad accident law, should now be so treated indicates the sudden prodigious development of the latter through the enormous amount of litigation relative to it, and it is to be borne in mind that the cases which reach the courts of last resort are but a small fraction of those occurring, for it is the boast of the claim departments that they settle out of court most of the accident cases arising; yet 102 pages are here required for the table of cases alone.

The author does not venture far into the domain of

theory, but confines himself almost altogether to succinctly stating and orderly arranging the principles he has found laid down in the cases cited. Comparatively little space specifically is given to matters purely electrical or designated as being peculiar to electric railways, but the rules developed are for the most part as applicable to electric railways as if that term had been used instead of "street railroads," with which, in most cases, it may be said to be practically interchangeable.

The book is clearly written and thoroughly practical and unquestionably is one that will prove valuable to street railway attorneys and claim agents alike, while many points of value to the financial and other departments of a street railway are discussed in its pages.

SELECTING AND LOCATING TROLLEY FROGS.

In the selection of trolley frogs proper importance is seldom given to the divergence angles. It is not generally recognized that divergence angles and other details, when particularly suited to the operating conditions, will not only increase the reliability of overhead construction but will add greatly to its life. For this reason the General Electric Company has issued a pamphlet which contains instructions for the proper choice of trolley frogs.

For ordinary city service, with turnout radii not exceeding about 50 feet, the 20-degree frogs are suitable, but with the longer radii introduced by suburban and interurban work smaller divergence angles are necessary. The introduction of higher speeds has necessitated the use of longer pans to overcome the inertia of the trolley wheel in passing between the inner ends of tongues.

The following table gives the range of distance from track switch point to track frog with which each set of trolley frogs may be most satisfactorily used:

Track Frog Distance	Divergence Angle of Trolley Frog
Up to 22 feet	20 degrees
From 20 to 30 feet	15 degrees
Above 28 feet	8 degrees

The minimum frog distance given in the table with which the 15-degree frogs may be used to best advantage corre-

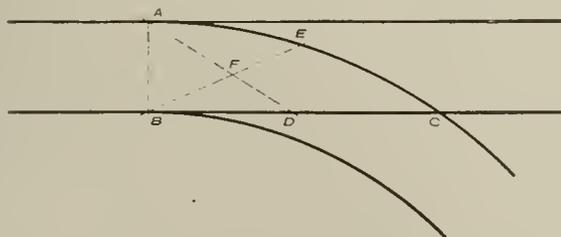

Diagram to Assist in Locating Trolley Frogs.

sponds to a turnout radius of 40 feet, but when suburban cars using high-speed trolley wheels run over city tracks it is advisable to use 15-degree rather than 20-degree frogs throughout the city construction, even where the minimum frog distance is less than 20 feet. The 20-degree frogs are especially designed for use with No. 0 and 00 wire, but will admit the use of No. 000 round or grooved wire.

The 15-degree and 8-degree frogs are designed for wire up to and including No. 0000 round or grooved.

The accompanying diagram shows an excellent method of properly placing the frogs on the line, and while certain variables, such as superelevation of the outer rail on the curve, length of wheel base and projection of trolley pole rearward from center of car may necessitate slight variation of setting, this location will be found so nearly correct that a very small alteration, which must be determined by experiment, will compensate for the variable conditions. The diagram may be used as follows:

From switch point A draw a line to center point, D, of track frog distance, BC. From switch point B draw a line to center point, E, of arc AEC. The intersection of these two lines at F will be the proper location of the frog.

THE CLEVELAND SITUATION.

The principal interest in the Cleveland controversy during the past week has centered in the suit of Edward L. Isom, a property holder, backed by the Cleveland Electric Railway, to enjoin the Low Fare Railway from proceeding with construction work on the Central-Quincy route, which is being heard before Judge Phillips of the common pleas court. The matters at issue are the legality of property owners' consents to the low-fare lines, later revoked by agreements with the Cleveland Electric, the legality of the revocations and the validity of the unrevoked consents as applying to the particular construction contemplated by the Low Fare Railway. The original consents were obtained by the Forest City company, under an ordinance which the Cleveland Electric attorneys declare grants only the right to construct an extension of an existing line. The greater part of last week was taken up by the attorneys of both sides in the effort to agree on a statement of facts, and the real hearing began on Friday morning, May 10. It was continued on Monday and Tuesday of this week and no decision is expected before the end of next week.

President W. B. Colver of the Low Fare Railway has begun negotiations with the Cleveland Electric Railway for the use of the latter's tracks, power, etc., in the streets in which the former holds franchises, as provided in the ordinances. As the Cleveland Electric has practically removed its property in Central avenue and Quincy street, the only street by the Cleveland Electric Railway, and to operate cars East Fifty-fifth street. President H. E. Andrews of the Cleveland Electric Railway left for the east on Saturday afternoon, promising to give the Low Fare company an answer on his return.

At the meeting of the council on Monday night, May 13, the Low Fare Railway presented a communication in which it offered to restore immediately at its own cost all tracks, poles and wires removed from Central avenue and Quincy street by the Cleveland Electric Railway, and to operate cars on those lines, paying to the city the balance after deducting from gross receipts operating expenses and 6 per cent on the investment. Or, the company offered to restore the tracks, etc., and to permit the use of the restored tracks by the Cleveland Electric Railway free of charge, with no stipulation as to rate of fare, until a final settlement shall be had in the courts, and to accept transfers of the Cleveland Electric Railway whether that company accepts transfers from the Low Fare company or not.

An ordinance granting a franchise to the Cleveland Electric Railway for the Central-Quincy route was introduced.

The Cleveland Electric Railway has begun a campaign for popular approval of its offer of seven tickets for a quarter in return for a franchise, by circulating throughout the city an endless chain letter signed by President Andrews. The letter requests the recipient to write or call upon the councilman from his ward and the editor of his newspaper, urging an immediate acceptance of the company's proposition, and also to write to ten of his friends and acquaintances, asking them to do likewise.

THE LAFAYETTE & LOGANSFORT RAILWAY.

In the article on the construction of the Lafayette & Logansport railway in the Electric Railway Review of May 4, 1907, page 588, it was stated that the Lafayette & Logansport Traction Company was organized for the purpose of constructing a road between Lafayette and Logansport. The general counsel of the company, Messrs. Barrett and Morris, desire to have it stated that the Lafayette & Logansport Traction Company is a corporation organized under the laws of the state of Indiana for the purpose of owning, constructing, operating and maintaining an electric interurban railway between the terminal cities of Lafayette and Logansport; the railway to be operated in conjunction with the Ft. Wayne & Wabash Valley company's line from Ft. Wayne to Logansport.

ELECTRICAL EQUIPMENT OF THE DETROIT RIVER TUNNEL.

A tunnel is being built under the Detroit river for the transference of both the freight and passenger trains of the Michigan Central Railroad. The tunnel will replace the present ferry service between Detroit on the American shore and Windsor on the Canadian side of the river. Two tracks will be laid in separate iron tubes 65 feet beneath the surface of the river. These iron tubes will rest on beds of concrete and will be flanked by concrete walls. The electrified zone will be 4.6 miles in length and will comprise with the yards some 15 miles of single track.

Electric locomotives for operating through the tunnel were decided upon because they would not only permit of greater celerity in handling traffic but also afford a complete solution of the ventilation problem. Six 100-ton direct-current locomotives of the swivel truck type, with geared motors, will comprise the initial equipment for hauling both freight and passenger trains. Each locomotive will be capable of hauling a 900-ton train up a 2 per cent grade at a speed of 10 miles per hour. Four 280-horsepower motors will be mounted on each locomotive, two motors being placed on each of the two swivel trucks. The Sprague-General Electric multiple unit control system will be furnished, enabling the locomotives to be operated singly or in train. Current for operating the motors will be taken from a third rail by means of contact shoes. Automatic, high-speed air brakes will form a necessary part of the equipment. The electrical equipment for the locomotives as well as for the tunnel in general will be furnished by the General Electric Company.

Current for operating the system will be purchased from the Detroit Edison Company and will be delivered to a substation at Detroit at a potential of 4,400 volts, and at a frequency of 60 cycles. At the substation two 1,000-kilowatt synchronous motor-generator sets will be installed for supplying direct current to the third rail at 650 volts. A 15-kilowatt, 125-volt exciter for the synchronous motor will be mounted on a shaft extension of each of the motor-generator sets.

A very complete electric lighting and electric pumping equipment forms a part of the project. The yards and approaches to the tunnel will be lighted by arc lamps, while the tunnel itself will be illuminated by incandescent lamps arranged on duplicate circuits. Alternating current from the main power supply, at a frequency of 60 cycles, will be used on the lighting circuits. To insure an uninterrupted lighting service the lighting circuits in the tunnels are so arranged that half the lamps in both tunnels will burn if, by chance, either of the lighting circuits in the tunnels should be broken. A single 3-phase distributing circuit will run through each tunnel and from these circuits suitable connections will be made to step-down transformers. The secondaries of the step-down transformers will be interconnected with duplicate circuits for half the lamps in each of the tunnels.

For keeping the tunnel dry five sumps will be provided, each sump drained by induction motor centrifugal pumps arranged in duplicate. The motors on the pumps will operate directly at 4,400 volts and the controlling circuits with compensators will be centralized in the substation. For indicating the amount of water in each sump, a float system will be provided having both visible and audible indicating devices in the substation.

At the substation a regulating storage battery will be provided to carry the fluctuations of the load. If the main power supply from the Detroit Edison mains should be interrupted this storage battery will have sufficient capacity to operate the entire system for half an hour. In such an emergency the lighting and pumping alternating current equipment will be energized by 60 cycle, alternating current from a 50-kilowatt motor-generator set, the driving motor being supplied with current from the storage battery. Flexible switching arrangements will be installed to enable this interchange of power supply to be easily and quickly made.

NEW STYLE OF TRANSFER FOR MONTREAL.

The Montreal Street Railway Company has adopted a new style of transfer, as shown in the accompanying illustration,

Montreal Street R'y

→

CONDITIONS

This Transfer is NOT A STOP-OVER, and is NOT TRANSFERABLE, and only good if passenger takes first car leaving junction where transfer is made. Passengers must see that transfer bears proper date and that the TIME and DIRECTION are correctly punched, otherwise it is void. In case of dispute passengers are requested to pay fare and refer to Superintendent.

4 inches in size and are printed in various colors on standard transfer paper.

which is much less complicated than the old form and is expected to simplify considerably the work of the conductor as well as to avoid possible inconvenience to passengers. The transfer is punched with the direction from which the passenger started and with the time at which he is due at the transfer point. Passengers are required to ask for transfers at the time of paying their fare and to see that they are properly punched.

The transfer slips are 1 3/8 by

CONSTRUCTION OF THE MILWAUKEE NORTHERN RAILWAY.

Such excellent progress has been made during the fall and winter months on the construction work of the Milwaukee Northern Railway, which will open up communication between the eastern Wisconsin towns of Sheboygan, Port Washington, Fond du Lac, West Bend and numerous others in this populous district and Milwaukee, that it will probably be ready for operation on at least one division by early summer.

Except for short distances in the centers of some of the larger towns, the Milwaukee Northern roadbed is located on its own right of way, and in almost a straight line. The entire absence of grade crossings is a feature which will permit of a high speed schedule. Where the road crosses twice both the Northwestern and St. Paul tracks, subways of steel bridging and masonry abutments or viaducts are used. At Grafton the line passes over a steel viaduct 765 feet long over the St. Paul tracks and again over a viaduct of similar construction 454 feet long at Mequon.

The complete power equipment was purchased from and built by the Allis-Chalmers Company of Milwaukee. Three-phase alternating current will be generated at 405 volts by three direct-connected alternators, each of 1,000 kilowatts normal capacity, driven at 107 revolutions per minute by Allis-Chalmers twin tandem gas engines, each with a rated capacity of 1,500 horsepower. It is stated that this equipment when in operation will enjoy the distinction of being the largest installation in America of gas engine driven electric generating units used exclusively for traction purposes.

The main power house is located at Port Washington, and eight sites for substations have been provided.

W. A. Comstock, Alpena, Mich., is president of the company, and F. W. Walker of Port Washington is vice-president and chief engineer.

PIPING AND POWER STATION SYSTEMS—XL.

BY W. L. MORRIS, M. E.

A system for condensing the exhaust steam by means of atmospheric air is shown in Figure 279 (K 1-1). The exhaust pipe is shown in the center of the air flue, the object being to increase the temperature of the air to create a draught. The air would, however, be drawn through the flue by the flow of steam through the ejector flights. The upper section is shown as a water and air separator.

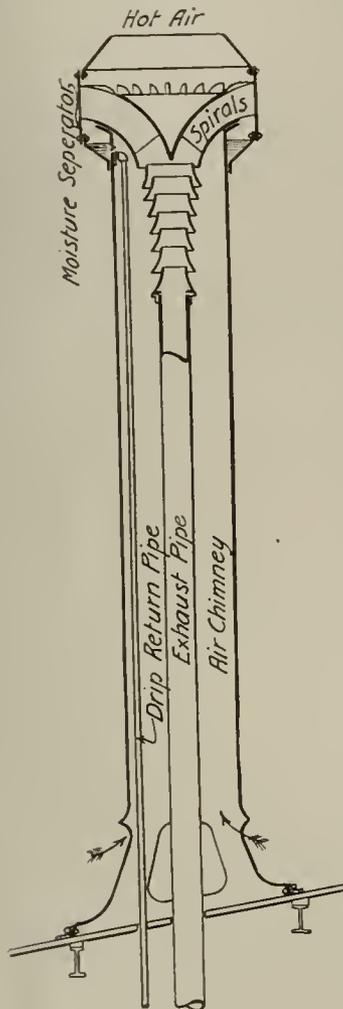

Figure 279 (K1-1).

ful if the saving in water expense would justify or equal the interest depreciation and operating cost of such an arrangement. A plant equipped with an exhaust condenser would not require an exhaust heater, as it is possible to feed the cold make-up water into the exhaust condensing chamber, thereby aiding the process of condensation and heating the water. To use more water for the purpose of condensing would be just so much water wasted, as there would be no use for it and it would therefore be discharged into the sewer. The amount of water added to take the place of that lost in the form of vapor would be close to 10 per cent of that fed into the boilers. To prevent an excess of air passing through the chimney, shown in Figure 279, it is possible to provide a thermostat in the return drip pipe, which could operate a damper or series of dampers, controlling the quantity of air passing through the chimney. This would be necessary to maintain the condensation at a high temperature for boiler feeding.

One objection to such a condenser is the increase of difficulties arising from cylinder oil, as all the oil is returned to the boiler feeding system, but it has the advantage of materially decreasing the amount of scale-forming salts ad-

In the arrangement of a condenser of this character, it must be noted that the exhaust travels at a high velocity, possibly 5,000 feet per minute, and the air at 1,000 per minute, which is quite rapid, about that obtainable by a high stack. To what extent the air would be accelerated by the exhaust ejector is quite problematical and to secure the greatest difference in weight of air in the chimney, and that without, it may be advisable to place the condenser at the base of the chimney, causing the entire column of air to be at the highest possible temperature. If the capacity of the chimney is less than the exhaust blower or ejector, then the increased length of stack would simply offer resistance to the flow of air, as is the case of a high smokestack placed over the fan of an induced draught plant. It is quite probable that the air chimney would have to be fully twenty times the area of the exhaust, or about four and one-half times the diameter of the exhaust pipe. The air can be supplied from a blower, but it is very doubt-

mitted to the boiler. A saving of fuel and water in electrical plants using city water can easily be obtained by using motor driven auxiliaries instead of steam driven auxiliaries. The greatest difficulty experienced with motors for this service has been that only one speed was obtainable, but there are now a large number of different types of variable speed motors on the market, which have a wide range of speed with nearly a constant efficiency. These motors are principally used to drive machine tools, some of them having a range of 5 to 1, that is, the speed is variable from full speed to one-fifth the full speed.

Plants which have their own water supply and are within reach of city waterworks should have a connection to the city main of sufficient size to supply the boilers. Invariably the city connection is so made that it is a source of loss to the waterworks. The most common method is to connect the city water to fire hydrants and install a meter at the point where the city water enters the building, as shown in Figure 280 (K 1-2). The system as shown is primarily laid out for

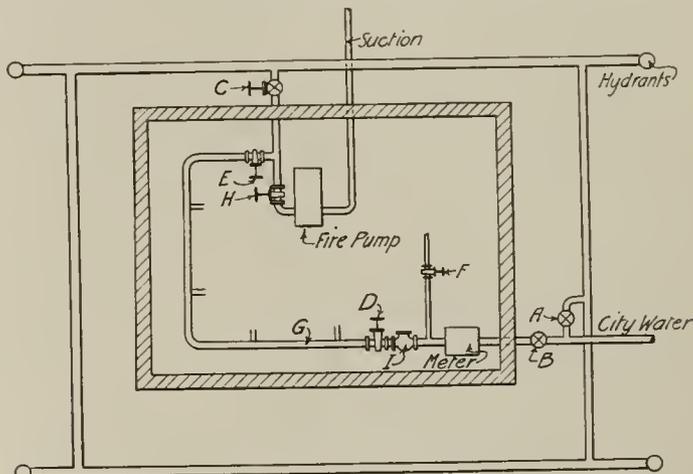

Figure 280 (K1-2).

station convenience and reliability. The fire hydrants are taken from a fire system located on the outside of the building, fitted with a valve a, which admits the city water to it. There is no meter placed between the city mains and the hydrants, partly on account of the liability of the meter becoming damaged under severe working speeds and thus shutting off the flow of water. As the hydrants are a protection against fire the city is expected to furnish water for this service. The valves b and c close all connections into the building to prevent loss of pressure in case of fire and damage to the inside piping. In regular operation it is assumed that the valve a is closed, b open, c open, d closed and h and f open. This places the outside fire lines and inside boiler and miscellaneous service line g on the station water system and its fire pump shown in the illustration, the only city water being that taken for drinking purposes and wash basins through the valve f. The assumption is that the city water would be used for fire service only, in case the fire pump is thrown out of service, or, if the water supply of the power plant fails, city water could be run into the lines through the valve d. The plan looks honest, and if used as stated it would be. The chief engineer of the plant knows how much water has been used, and if at any time it becomes necessary to stop the fire pump and use city water, the assistant is liable to be reprimanded and consequently to obviate this he would open valve a and cut off the pump at h, thus allowing the city water to flow around through the fire mains back to the general main to supply the boilers without registering on the meter. From the operator's standpoint there can be no objection to this plan except that it makes possible the presentation of an excessive water bill in case the waterworks inspector should find the valve a open. If the station operator is perfectly honest and

does not want to place a means of obtaining city water without passing through the meter in the hands of his employes, he can employ the following system: The valve a should be sealed to prevent its being moved without breaking the seal. The valve b should be open and valve d closed under ordinary conditions. The check valve i prevents station pressure from backing into the city lines. In this case it would be necessary to make arrangements with the waterworks regarding the valve a, some predetermined damage being agreed upon which can be collected in case the valve a is found open at any other time than immediately after a fire, the seal being the property of the waterworks. The valves a, b and c should be located sufficiently distant from the building to permit operating them in case of a fire, and if against a wall they should be a considerable distance from windows or door openings to permit access to them. An excellent arrangement for placing valves a and b would be to have a hose at the fire department house about 50 feet from the building with the valve posts inside, or along the side of the building. Fire service is seldom or never needed and to familiarize the employes with its location and operation it is generally a good plan to have the parts of the fire system exposed so that they are constantly in sight of the employes.

Ordinarily but one meter is placed in a station, one that is large enough for the ultimate emergency requirement, as shown in Figure 280. If the city waterworks is satisfied with this arrangement it should be satisfactory to the station operator. The small line f is oftentimes but $\frac{1}{2}$ or $\frac{3}{4}$ inch piping and the meter a 3 or a 4 inch, with nothing flowing through it except the water passing through the small line. The leakage past a large meter is sufficient to supply all or a large part of that used from the small line, and to get the correct reading a smaller meter should be installed for ordinary use and the large one for emergency service.

(To be continued.)

PROJECTED ELECTRIC LINE FROM MILAN TO GENOA.

United States Consul J. E. Dunning reports that an electric railroad 85 miles in length and to cost \$47,000,000 is to be built between Genoa and Milan, Italy.

The electrical current will be generated by water power by three engines of 24,000 horsepower. To complete the line 19 tunnels will have to be built, the most important being 12 miles long, which will require six years in its construction. The cost of the road will be about \$500,000 per mile, according to the estimate. The line will have a double track, the trains being hauled by electric locomotives. The latter will be combined with baggage cars, with two sets of trucks, having four motor axles, each axle of 300 horsepower, and will weigh 45 tons. With this force of 1,200 horsepower per locomotive they will be able to operate at a speed of about 54 miles an hour for parts of the line having a grade of 8 feet per thousand and at a speed of 80 miles an hour on the level. The trains will be run in three cars, each car carrying 50 persons—the whole train weighing 160 tons. These figures are for the express and local trains. The plan is to have them running from 4 o'clock in the morning till midnight. The express trains will run every two hours. The locals will run much oftener, and will collect passengers from the smaller towns and take them to the express station farther along the line, where passengers can transfer. All locals will, after leaving Milan, take all passengers collected from the smaller stations to the station of Tortona—the only express station—as well as those locals starting from Genoa. The express trains will take passengers from Milan to Genoa, or vice versa, in one and one-half hours, while the locals will require two and one-half hours. In this way there will be 20 trains per day, carrying an average of 6,000 persons.

The 70 to 100 freight trains to run each 24 hours will have combination locomotive and baggage cars of the same size and power as those of the passenger trains, and will pull 30 freight cars, each car weighing 22 tons, which includes 12 tons of goods on each car, so that the train will pull in all 700 tons. These trains will run at the speed of 20 miles an hour on the inclines, and about 35 miles an hour on the level.

To prevent accidents, there will be no grade crossings along the line, and 372 bridges must be built. The principal tunnel will be perforated from both ends at once, and at the same time in eight places along the lines, boring holes from above. In all, this tunnel will be constructed from 10 borings at the same time. By the time this tunnel is ready the whole line will be finished.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Motorman Must Know Whether Headlight is Burning.

It was urged in Indianapolis Street Railway Company v. Taylor, 80 Northeastern Reporter, 436, the appellate court of Indiana says, that there was no evidence to show that the motorman knew that his headlight was not burning. But the evidence was that he stood in the front vestibule of the car, where he could see in front of the car, and it followed from natural laws that, if there was no headlight on his car, he knew it.

Need Not Change \$10 Bills—Rule Upheld.

A man and his wife boarded a car, and, upon being approached by the conductor of the car for fare, tendered to him a \$10 bill, all the money the man had, for change and payment of their fare, which was five cents each. The conductor declined to accept the bill, upon the ground that he was unable to make the change, and required the two to leave the car; no other offer of payment being made. This action of the conductor was charged to have been unlawful, oppressive, and in violation of the right of the parties to be transported by the company upon its car to their destination. The company, in defense, relied upon a rule, theretofore made by it, requiring all conductors of cars to be provided with currency or fractional coins, or both, to the amount of \$5.00, and to change bills or coins of that denomination or less when tendered in payment of car fare, and, upon failure of passengers to tender bills or coins of that sum or less, to put them off the car. There was no publication of this rule, nor did it appear that these parties had actual notice of it.

The supreme court of Tennessee holds, Knoxville Traction Company v. Wilkerson, 99 Southwestern Reporter, 992, that the rule of the company invoked in this case was reasonable, one which it had a right to enforce, and that its conductor had the right to refuse to change the bill tendered him by the parties, and, upon his failure to otherwise pay the fare, to require them to leave the car. It also holds that it was immaterial that this rule was unknown to the parties. It was so reasonable in its terms and so necessary to the convenience of the company in the collection of fares that the public was charged with notice of it. Where the fare to be paid, as in this case, is so small, and the number of passengers so numerous, any one proposing to take passage upon one of the cars of the company is bound to know the necessity of providing himself with change reasonably near the amount of fare to be paid, and of the inconvenience and probable impossibility of the conductor furnishing change in large amounts.

The court does not think the company has the right to require the exact fare charged to be tendered, but it certainly may fix a limit upon the amount of change it will undertake to furnish its patrons.

Lack of Cars and Shortening Run on Public Occasions.

Where a franchise is sought and granted to operate a street railway, upon the condition that enough cars will be run to serve the public convenience, the court of appeals of Kentucky says, Frankfort & Versailles Traction Company v. Marshall, 98 Southwestern Reporter, 1035, an action brought by the latter party, that it may be doubted whether the grantee of the franchise can excuse its failure to comply with the condition upon the fact that it had not supplied itself with cars enough to meet the requirements of travel on public and festival occasions. The court is not prepared to say that they are not usual, customary, and reasonably to be expected, although at irregular intervals, though it does not mean to decide the question here, because unnecessary to do so.

In this case the traction company—which owned only four trolley cars and one trailer, and the regular schedule of

which was to run all of them, except the trailer, through the city of Frankfort, across the bridge, and through South Frankfort, as that part of the city south of the Kentucky river is called, and back again to the points of starting—on the occasion of a circus outside the city limits changed its schedule temporarily, because of the extraordinary demand made upon it by the great crowd at the circus grounds, and ran only one car to South Frankfort, stopping all the others after they had got well into the city, where there were pavements and street lights, where the passengers were disembarked, and the cars returned to the circus grounds for another load. The plaintiff, with his wife and brother-in-law were at the circus, and took passage on one of the cars, intending to go to their home in South Frankfort, which was on or near the company's line. The fares were paid. When the car reached the corner in North Frankfort where the company had been discharging its passengers, it was announced that all passengers should get off, as that car was going back to the circus grounds. It was then near 11 o'clock at night. The conductor in charge of the car told the plaintiff to get off, and declined to carry him and his party farther, informing him that he would have to walk home, or to wait for another car and pay his fare again. Thereupon the plaintiff refused to get off the car, when the conductor seized him, and jerked him from the car.

The court, in affirming a judgment for the plaintiff, says that, if he was a passenger the carrier was bound to fulfill its contract with him by carrying him to his destination, either upon that or some other car, and its failure and refusal to transfer him to another car, entitled him to complete his journey upon that one. That the carrier wanted to use the car in going back after other people, who had not yet become passengers was no excuse for not complying with its contract obligations to its passengers.

Company Liable as Partner in Amusement Enterprise.

A street railway company entered into a contract with parties who had leased a tract of land, reciting that it was the intention of said lessees to conduct upon said ground various amusements, in the conduct of which business it was presumed that certain benefits would accrue to the street railway, that, in order to procure funds for the establishment and conduct of said business, it was necessary that aid and assistance be extended said lessees by said company, and that it was agreed, among other things, that said amusements should be carried on under the name of "Electric Park," that when patrons walked to the park and paid 10 cents admission, said amount should accrue wholly to said lessees, but when patrons rode to the park and paid 15 cents for transportation and admission, 7 cents per passenger should go to said lessees and 8 cents to the company.

This contract was read by the contractor who constructed the park, under a contract with one of said lessees, and who thereafter sought to hold the company liable therefor as a partner. The appellate court of Indiana holds, *Breinig v. Sparrow*, 80 Northeastern Reporter, 37, that, under all of the circumstances of the case, it was so liable.

The court says that it holds without hesitation that one who causes a contract to be so prepared as that a person of ordinary understanding reading it is thereby induced to believe that a partnership exists, and whose conduct, extrinsic to the writing, accords with such conclusion, cannot subsequently, after a third party has parted with value upon the strength of the belief thus induced, be permitted to deny liability. The practical interpretation placed upon this contract by its officers justified the contractor in relying upon it as evidencing the responsibility of the railway company. During the entire transaction its president was treated by the corporation so as to indicate that such contract was subject to the interpretation which he might place upon it. Its board of directors, its officers, and the majority of its stock-

holders, participated in both the enterprise and interpretation of the contract. Having thus induced the contractor to incur the expense incident to the construction of the building in accordance with the contract which he was also thus caused to make, it was bound to him therefor.

Liability in Putting Child Off Car for Want of Fare.

A young woman put a small child six years of age, her cousin, on an electric car, in charge of the conductor, one cold January afternoon, telling the conductor to put the child on a connecting car in another city. It seemed that the young woman thought the child had a 5-cent piece, the amount which would be due as her fare; but, in point of fact, she did not have it.

On proceeding to the outskirts of the city in which this took place, where houses were few and none was occupied for the distance of a block or more, the conductor put the child off the car and left her by the side of the track. He said that after he started on he looked back and saw the child following after the car, instead of going back in the direction of where she was put aboard. He went on to a passing point, not a very great distance, for cars going in opposite directions, and there told the conductor of the car going back that if he saw her he had better pick her up and take her back. That car met her, and took her aboard. She seemed very cold and much frightened, and two woman passengers took her in charge.

The Kansas City court of appeals affirms a judgment for damages, *Harless v. Southwest Missouri Electric Railway Company*. It says that the instructions for the plaintiff permitted a recovery for fright, mental suffering and anguish. The defendant assailed the propriety of such instructions on the ground that, where there is no bodily hurt, mental anguish and fright are not elements of damage. That is the law in cases of mere negligence. But in cases where the wrongful act is accompanied by offensive, insulting and humiliating conduct, or where the act itself is wilful and inhuman, such elements enter into the damages which may be recovered.

The court holds that the conduct of the conductor must be considered inhuman in the circumstances developed by the evidence. It says that the first of these circumstances was that the plaintiff was not a passenger, and therefore was not entitled to consideration from the standpoint of a passenger.

But, being on the car wrongfully, and though, notwithstanding her tender years, the court charged her with responsibility for that wrong, yet, on considerations which arise outside the relations of carrier and passenger, she was entitled to humane treatment.

There are certain acts where circumstances must determine their character.

It would not have been inhuman, nor even improper to have put off a person of mature years at the place where the plaintiff was left, who was aboard the car wrongfully; but the plaintiff was not of an age to care for herself. She was tender in body as well as mind, and consequently easily made to suffer with cold, and to be distressed, confused and terrorized. To a little girl of that age, an unfamiliar house, even though no more than 300 or 400 feet away, was a long distance off; and who is it, with capacity sufficient to be a conductor, who should not have known that the strange place, the cold wind and bleak day would frighten and perhaps freeze so small a child? The court cannot, and does not, suppose that he affirmatively wanted to injure the plaintiff; but it must judge of the character of his act by the act itself, and, so judged, it showed him to have been so wholly indifferent to the result of his conduct as to characterize it as wilful and malicious as those terms are known to the law.

The court therefore holds that, notwithstanding no bodily harm was inflicted in putting the plaintiff off of the car, yet she was entitled to have her fright, mental suffering and anguish considered as elements of damage.

News of the Week

Central Electric Railway Association.

A regular meeting of the Central Electric Railway Association will be held at the Claypool hotel, Indianapolis, on Thursday, May 23. Several papers will be presented on the subject of "Modern Train Dispatching." As this topic is an important one it should induce the presence of a large attendance and an especially interesting discussion. At this meeting the Standardization committee and the Express committee will report on these subjects of much interest. H. A. Nicholl, president, and W. F. Milholland, secretary-treasurer, announce the following programme for the one day's session:

10:30 a. m.—Order of business.

11:30 a. m.—"Modern Train Dispatching," by J. K. Gray, trainmaster Western Ohio Railway, Lima, O.; M. C. Stern, General Systems Company, Dayton, O.; J. B. Crawford, superintendent of transportation, Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.

Demonstration, Chauncey P. Button, general manager Telegraph Signal Company, Rochester, N. Y.

12:30 p. m.—Adjourn for lunch.

2:00 p. m.—"Issuing of Supplies—How to Prevent Leaks," by S. R. Dunbar, purchasing agent Indiana Union Traction Company, Anderson, Ind.

3:00 p. m.—Report of committee on "Standardization"; report of committee on "Express Contracts."

Henry Clews on Municipal Ownership.

Henry Clews, in an address on "Individualism versus Socialism," in the Columbia theater, Brooklyn, on May 12 said:

"Let us take a lesson from England in this respect, where public ownership has been tried on a larger scale and under more favorable conditions than elsewhere. In a few instances the running of street railways or city lighting plants has been successful, but exceptions do not always prove the rule, and the conditions under which these enterprises have been operated there must be taken into consideration.

"Many of these enterprises in English cities have proved unprofitable. The accounts have been juggled, and expenses that should be charged against the plant were often transferred to city accounts. Not a few of the English cities have so run into debt as to injure their credit and impair the sale of their securities. Already the British taxpayer is beginning to complain about the costliness of these municipal ownership schemes, and a decided reaction against them is setting in. The London county council has launched heavily into these ventures, many of which have proved losing ventures, and some prominent experts have gone so far as to predict that London will be bankrupt before long, unless present tendencies are reversed. If municipal ownership has failed under the highly favorable conditions which exist in England, how can it succeed here?

"American railroads under private ownership perform the best and cheapest service in the world."

Purchase of Supplies Authorized in Chicago.

The Chicago City Railway has been granted permission by the board of supervising engineers to place contracts for Portland cement to be used in the work of reconstructing the company's lines. Options will be asked on 30,000 barrels of cement and at least 20,000 barrels will be ordered. The Chicago City Railway has also been authorized to purchase 2,400 new car wheels. For experimental purposes 400 of these wheels will be of solid steel and the remaining 2,000 will be cast-iron spoke wheels. A small quantity of new machinery to facilitate the handling of material in the storage yards of the company will also be purchased.

The board of supervising engineers, in charge of traction rehabilitation in Chicago, will have about 100 employees. Chairman Arnold has been authorized to appoint and to fix the salaries of all the employees except the six assistant engineers, who will have charge of separate divisions of the work and will be chosen by the board as a whole.

Track reconstruction by the Chicago City Railway Company will be begun at once at three points in the city. The board of supervising engineers decided that the reconstruction work should be begun at Wallace street, on the Root street line; at Grand Crossing, on the South Chicago avenue line, and at Indiana avenue and Fifty-first street.

A petition for the rehearing of the Mueller case has been filed with the supreme court of Illinois by the attorneys of the city of Chicago. The petition alleges that the issue of certificates would not constitute an indebtedness of the city, since the statute states that "under no circumstances shall the certificates become an obligation or liability of the city."

In the supreme court of the United States at Washington there has been docketed a petition for a writ of certiorari to bring before that tribunal the record of the case of the North and the West Chicago Street Railroad companies against the Chicago Union Traction Company, in which the petitioners seek the setting aside of the merger of the lines. The prayer was refused by the trial court, and the United States circuit court of appeals.

It is stated that the plan of reorganization of the Union Traction company has been about completed. The time limit for deposits of stock of the underlying companies has been extended until May 22.

W. W. Gurley, general counsel for the Union Traction company, said that 93,000 of the total 120,000 shares of Union Traction preferred stock had been deposited with the New York committee.

Only 50,000 were necessary. Of the 200,000 shares of common, 139,000 had been deposited, or 5,666 more than required. It is stated that with the stock which has been deposited and with the additional stock which has been pledged the interests controlling the underlying companies will have more than a majority when the negotiations with the Union Traction representatives are opened.

The San Francisco Strike.

The strike of the conductors and motormen of the United Railroads of San Francisco, which was declared on May 5, as reported in the Electric Railway Review of May 11, 1907, page 612, has continued throughout the past week without any immediate prospects of a settlement. Neither side shows any disposition to recede from its position and the company has issued statements that it would no longer recognize the union. The company has imported several hundred non-union men, who are quartered in the various car houses, where every preparation has been made both for caring for the men and for protection from attack. On May 11 the company operated cars for passenger traffic for the first time since the opening of the strike. Twenty-five cars were run on the Sutter and Eddy street lines late in the afternoon, carrying about 1,000 passengers, and on the following day 50 cars were operated, carrying about 20,000 passengers. The cars were protected by about 500 policemen and there was little disorder. On Tuesday the protection of the police was somewhat relaxed and there was considerable rioting throughout the day.

On Thursday of this week about 130 cars were operated on eight lines of the system. No important developments have taken place this week and the officers of the United Railroads have expressed themselves as entirely satisfied with the present situation.

The men are striking for a flat scale of \$3.00 per day for eight hours' work, in place of the present scale, which the company has offered to continue for a year, of \$3.10, \$3.20 and \$3.30 for the first, second, third and following years of service.

Legislation Affecting Electric Railways.

Illinois.—The legislature has passed a bill requiring elevated railroad companies to erect guard railings for the protection of passengers along the edges of the station platforms, with gates to correspond with the platform gates of the cars.

Massachusetts.—The house has passed a bill requiring fenders on street cars. The legislature last year appropriated money for an investigation of various fenders by the railroad commission, which has been in progress since January 17, and the companies have been directed to submit types of fenders for approval by May 15.

New York.—The assembly on May 15 passed the Page-Merritt public utilities bill, which has been advocated by Governor Hughes. An abstract of the provisions of the bill was given in the Electric Railway Review of April 6, 1907. The bill contemplates the abolition of the present state railroad commission and the rapid transit commission of the city of New York and the substitution therefor of two commissions, one for the city alone and one for the state outside of the city, to have jurisdiction over public utility corporations.—Assemblyman Hackett has introduced a bill prohibiting electric railways from putting strike-breakers on their cars.

Pennsylvania.—The senate on May 13 passed the Homsher bill, giving to electric railway companies the right of eminent domain. The bill now goes to the house for concurrence in the senate amendments. One of these provides that companies, before taking property for proposed lines, must file two separate bonds as surety for damages.—The senate on May 14 passed the bill requiring electric railway companies to file with the secretary of state the consents of the cities or towns through which a proposed line or extension is to run, at the time of application for a charter.—The Dunsmore commission bill was finally passed on May 15 and sent to the governor. The bill provides for the appointment by the governor of a commission of three members with complete power to investigate railroads, street railways and other public utilities, in such matters as rates, management, distribution of cars, crossings of one railroad by another, bond issues and facilities for transportation, but with no power to enforce their recommendations. If its recommendations are not carried out it may petition the secretary of internal affairs and the attorney-general to proceed against the corporation. The commission is empowered to examine the books of any railroad.—The senate on May 15 passed the Kennedy bill fixing five cents as the maximum street car fare within the limits of cities of the second class.

Texas.—The senate has passed the "gross receipts" bill, which imposes a tax of three-fourths of 1 per cent of the gross receipts of street and interurban railways operating in or connecting towns of over 20,000 population.

Rapid Transit Affairs in New York.

At the meeting of the rapid transit commission on May 9 Chief Engineer George S. Rice submitted a report recommending the construction by the city of a part at least of the so-called triborough subway route, in view of the fact that the Interborough-Metropolitan Company has refused to bid for the new subways. The report contained a full outline of the proposed route, beginning at Pelham Bay park, running through Westchester avenue, Southern boulevard and under the Harlem river, thence down Third avenue and the Bowery, across the new Manhattan bridge and then proceeding through the Flatbush avenue extension, Ashland place and Fourth avenue to Fortieth street, South Brooklyn, but recommended the present construction of only such portions as could be built for \$40,000,000, conceded to be available by the city for use in the extension of rapid facilities. The entire route would cost \$60,000,000. Mr. Rice estimated that

the essential portions of the subway could be built in three or four years. The line would be operated as an independent route and would provide a very complete transit system between the boroughs of the Bronx and Brooklyn, with connections to Manhattan. The matter was referred to the committee on plans and contracts.

At the same meeting the report of the plans and contracts committee on the application of F. B. Behr for permission to build a monorail system between Brooklyn and Coney Island was considered. A resolution was adopted that before the board should lay out a route and advertise for bids Mr. Behr should be required to give assurance that he would bid for the construction of the road and to deposit \$25,000 to guarantee the expenses of surveys, etc. It is said that Mr. Behr already has consents of three-fourths of the property owners along the proposed route.

On May 11 President Shonts of the Interborough-Metropolitan Company sent to the commission a communication in reply to the proposition of John H. Starin that the company be given franchises for third tracks on its elevated lines, provided it would build the Lexington and Seventh and Eighth avenue subways with its own money, as reported in the Electric Railway Review of May 11, page 628. Mr. Shonts said that it would be impossible for the company to build the subways under the conditions of the proposed contract, and repeated the offer contained in his letter of April 24, to complete the rapid transit system provided the terms of the contract are such as to cover interest, sinking fund and depreciation. As the company regards the Starin proposition as tantamount to a refusal of this offer it is evident that the transit situation is deadlocked until the fate of the public utilities bill is decided, unless some action is taken on Mr. Rice's triborough plan.

On May 13 Mr. Shonts addressed a communication to the Retail Dry Goods Association, which has interested itself in the subway question, inviting a thorough inspection of the company's books and accounts for the purpose of determining the cost of the present subway and of making an analysis of the company's estimates of the cost of the new subways.

Bids were received on May 14 for the construction of the second section of the bridge subway loop. The Cranford Company of Brooklyn bid \$2,150,000 for the subway and \$60,000 additional for the pipe galleries. The Degnon Contracting Company, which has the contract for the first section, bid \$2,800,000 and \$75,000 additional for the pipe galleries. Chief Engineer Rice said, after seeing the bids, that the system would cost \$8,000,000 or \$9,000,000, instead of \$6,500,000 as estimated.

Western Society of Engineers.—On May 11 about 100 members and guests of the Western Society of Engineers of Chicago visited the University of Illinois at Champaign. The day was spent in inspecting the university buildings and experimental laboratories.

Philadelphia Traction Situation.—The special committee of the Trades League of Philadelphia, which has been opposing the plan of the Retail Merchants' Association for settlement of the traction question, has been dissolved. Directors of the league were convinced that the opposition to the plan did not have the approval of the members of the league.

Chicago City Railway Refuses Wage Demand.—Representatives of the union of the motormen and conductors employed by the Chicago City Railway Company met with President Mitten on May 11 and presented their demand for 25 cents an hour for the first six months' service and 33-1-3 cents thereafter, with a 9-hour day, in place of the company's offer of 23 cents for the first three months, 25 cents for the ensuing nine months, and 27 cents thereafter, which was recently refused by the men. Later in the day President Mitten sent a letter to the officers of the union, stating that the company could not comply with the demands and repeating the former offer. A committee has been appointed to see Mr. Mitten again in the effort to secure a compromise.

Indiana Interurbans Not Affected by 2-Cent Fare Law.—Attorney-General James Bingham of Indiana, at the request of the state railroad commission, has rendered an opinion that the 2-cent fare law, passed at the last session of the legislature, does not apply to interurban railroads. The commission has received many inquiries on this point. The attorney-general states that steam and interurban railroads are regarded as two separate classes of transportation facilities; that the rates on the interurban roads were below 2 cents a mile at the time the law was passed, and that the history of the legislation shows that while the bill was before the legislature amendments were introduced seeking to extend the law to interurban roads, indicating that the law in its present form was not intended to apply to such roads.

Atlantic City Conventions.—George Keegan, secretary of the American Street and Interurban Railway Association, has issued a circular in regard to the October conventions. As announced in the circular issued on April 9, 1907, by the secretary of the American Street and Interurban Railway Association, the special committee consisting of members of the American association and the Manufacturers' association, appointed to decide on the location for the 1907 convention, has decided on Atlantic City, where the next convention will be held on October 14, 15, 16, 17 and 18, 1907. The many good features about Atlantic City for a convention city are too well known by all manufacturers to dwell upon. Contract has just been closed for the use of the steel pier for the exhibits, and, with the most excellent hotel facilities which Atlantic City provides, this convention is sure to be admirably taken care of. After the next meeting of the executive committee, which will take place on May 20, 1907, another circular containing more detailed information will be issued.

Construction News

FRANCHISES.

Adel, Ga.—A franchise has been granted to William Scandrett, J. Z. Jackson, J. J. Parish, Jr., and others, to build a street railway system in Adel. It is stated that preliminary work is well under way and that the company will soon be incorporated.

Astoria, Ore.—A franchise has been granted to E. B. McFarland and S. D. Adair for a street railway from the corner of Eleventh and Commercial streets to Young's Bay Bridge, to be part of an interurban line from this city to New Astoria. One thousand dollars will be forfeited by the company in case the road is not in operation within one year.

Aurora, Ind.—The Indiana Southern Railway, recently incorporated with a capital stock of \$10,000, is seeking a franchise to operate a freight and passenger line in Aurora. This is the revival of a project agitated several years ago for the building of an electric line between this city and Rising Sun, Ind., by a company organized and known as the Southern Indiana Railway. This project was abandoned when the Big Four was built through this section and it is now revived by Garry Hermann, J. R. Wymond, W. V. Webber, C. W. McMullen and E. W. Swarthout.

Bennettsville, S. C.—Application for a street railway franchise has been made to the town council by J. J. Matheson, Warren Moore and Vann Livingston.

Brazil, Ind.—The Terre Haute Indianapolis & Eastern Traction Company has secured a 50-year franchise from the board of county commissioners to operate its interurban line in Clay county and in Liberty street, Harmony, Ind., for a distance of 1,000 feet.

Canton, O.—The Canton-Akron Consolidated Railway Company has secured a franchise from the Stark county commissioners for an electric railway, to be known as the Dalton & Wooster line, through the western portion of the county from Mansfield to East Greenville, O. The line must be completed not later than December 1.

Detroit, Mich.—The Highland Park council has renewed the franchise of the Detroit United Railway on Woodward avenue for 21 years, making it coexistent with the life of the present franchise of the company. The grant includes the building of a loop on its 20-acre tract of land opposite the Ford Motor Company's new site; a "Y" at the power storage station at Woodward and Courtland avenues, and four sidetracks into the loop tract and to a freight shed. The company will extend the Oakland avenue line to a point near the Ford Motor Company's site and across to Woodward avenue. Also, it is provided that should the city fares in Detroit be readjusted the same schedule is to apply to the Highland Park territory when it is annexed to Detroit. It is stated that work on the Oakland avenue extension will be started as soon as the material can be assembled and that when completed the congestion of traffic on the Woodward avenue line during the state fair in the fall will be considerably relieved. The connecting point for the Oakland and Woodward avenue lines will be at the new car barn site.

Gary, Ind.—The United States Steel Corporation, which is building the town of Gary, has now secured 50-year franchises for all its public utilities, including a street railway system, gas, water and electric plants. The street railway franchise was granted to the Gary Electric Railway.

Goldfield, Nev.—The board of county commissioners has received a number of applications for franchises to build an electric street railway system in and to points outside of Goldfield. Offers of payment for these privileges range in price from \$2,000 to \$25,000. It is stated, however, that no action will be taken pending negotiations with the chamber of commerce which insists that the franchise shall be granted only to the company agreeing to give a portion of its earnings to the city and which will concede, among other demands, the right of the municipality to take over the system at the expiration of the franchise.

Oakland, Cal.—The Oakland Traction Company has applied for a franchise to operate its line in Lake Shore, Lake Park and Pleasant Valley avenues. This will be an extension of its present line now ending at Grand avenue.

Pana, Ill.—A franchise has been granted to the Springfield & Southeastern Traction Company, which is to build a line from Springfield to Pana by way of Assumption and Taylorville. Work must be begun within six months and completed within two years from the date of the franchise. J. J. Finn, Decatur, Ill., president.

Riverside, Cal.—The Crescent City Railroad has applied for a franchise to build an electric railway which will connect Riverside with the new cement plant now being built by the Southern California Cement Company at West Riverside.

Toledo, O.—The Lima & Toledo Traction Company, Lima, O., which is building an extension to Toledo, has applied for a franchise to enter the city at the southern limits, near the Miami & Erie canal, following the canal and crossing several of the streets at grade. The franchise provides for a terminal near the corner of Belmont and Michigan avenues, but it is stated that the company later will ask for permission to enter the business district of the city and erect an interurban station.

Waycross, Ga.—A franchise has been granted to Burdette

Loomis of Hartford, Conn., George W. Dean of Waycross, Ga., and F. H. Elmore of Jacksonville, Fla., to build and operate a street railway system in this city. The petitioners agree to commence work within six months and to have the line completed within three years from the date of acceptance.

Wichita, Kan.—An ordinance granting to the Wichita Railroad & Light Company the right to build and operate a single-track street railway in Waco avenue, from Ninth street north to the city limits, has been passed by the council. The ordinance calls for passenger service only and the line must be in operation from Ninth to Seventeenth streets within 15 months from date of acceptance of the franchise.

York, Pa.—The city council and the Hanover & York Street Railway Company have finally reached an agreement on the terms of a franchise for the use of the streets in York for the company's proposed line to Hanover, and after several ordinances had been introduced the council on May 12 granted the company a franchise, under which the company is to build a line on Market street, the main thoroughfare of the city.

RECENT INCORPORATIONS.

Chenango Valley Electric Railway.—Incorporated to build and operate electric railways in New Jersey. Capital stock, \$100,000. Incorporators: H. O. Coughlan, L. H. Gunther and John R. Turner.

Deodate & Hershey Street Railway.—Incorporated in Pennsylvania to construct an electric railway in the southern portion of Dauphin county. Capital stock, \$30,000. M. S. Hershey, Lancaster, Pa., president.

Duff & Eastern Railway, Duff, Tex.—Incorporated in Texas to construct an electric line in Duff. Capital stock, \$25,000. Incorporators: George W. Curry, Charles C. Curry, P. D. Hammett and William P. Mollette.

Eugene & Eastern Railway.—Incorporated in Oregon to build an electric railway from Eugene to Springfield and from the McKenzie river valley to Prineville, Ore. Frank W. Waters of Salem, Ore., vice-president of the company, is quoted as saying that surveys for both routes have been made and right of way acquired over the greater portion of the distance. The lines will develop rich timber and mineral districts in the east central part of the state and provide an outlet to the market for these products. It is the intention to complete the lines during the summer, provided rails and other materials can be procured. Capital stock, \$1,000,000. Incorporators: A. Welch, president, Portland; Frank W. Waters, vice-president, Salem; E. W. Hall, secretary-treasurer, Portland; James R. Thompson, constructing engineer, Portland; Charles A. Hardy, attorney, Eugene, Ore.

Fremont Street Railway.—Incorporated in Ohio to take over the present street railway system in Fremont and to extend and improve the property for interurban traffic. The present line, about two miles long, is owned by the Kerlin interests of Toledo. Incorporators: Hon. A. H. Jackson, Hon. James Hunt, J. M. Sherman, J. J. Anderson, Fremont; and R. G. Kerlin, Toledo, O.

Fremont Tiffin Marion & Southern Railroad.—Incorporated in Ohio to build an electric railway from Fremont through Sandusky to Tiffin and Marion, O., with such branches as may be needed. Capital stock, \$10,000. Incorporators: Donald McKenzie, William H. Kildon, Alexander Kiskadden, James D. Watson and W. W. Weller.

Garrettford & Delaware County Railway.—Incorporated in Pennsylvania to build an electric road from the Garrettford station of the Philadelphia & Westchester Traction Company to the crossing of the Philadelphia Wilmington & Baltimore Railroad on the public highway between Chester Heights and Llewellyn, about 10 miles. Capital stock, \$100,000. Incorporators: George K. Powell, Wilkesbarre, president; John M. Garman, A. H. Bloom, B. C. Allen, E. J. Doyle, Thomas W. Haines and L. E. Waller.

Inland Electric Railway.—Incorporated in Oregon to build an electric line from Klamath Falls to Bomaza, Yonna and Merrill, Ore. Capital stock, \$25,000. Incorporators: E. J. Murray and H. L. Colgate.

Jefferson City (Tenn.) Electric Railway Light & Power Company.—Incorporated in Tennessee with \$15,000 capital stock. Incorporators: W. T. Russell, J. B. Huff, A. A. Galbraith, J. T. Watkins and Frank Galbraith.

Mankato Electric Traction Company.—Incorporated in Minnesota to build an electric street railway in Mankato. Principal office, Mankato. Capital stock, \$200,000, of which \$2,003 is paid in. Incorporators: A. J. Whipple, Glenoe, Ill.; C. C. H. Fynee, A. M. Hewes, E. D. Adcock, M. J. Porter, Chicago.

Oklahoma City Electric Railway Terminal Association.—Incorporated in Oklahoma to build two electric lines in Oklahoma City. One of the lines will extend from the south side of Capital Hill north through the city; the other will start from the junction of the Chicago Rock Island & Pacific and the St. Louis & San Francisco railways, cross the city and terminate at a point near Main street and the North Canadian river. Capital stock, \$1,000,000. Incorporators: Guy V. McClure, Warren F. Moore, C. Combs, Fred S. Combs and J. J. Johnson, all of Oklahoma City.

Panhandle Electric Railway & Power Company.—Incorporated in Washington to build and operate an electric line with headquarters at Spokane, Wash. Capital stock, \$1,000,000. Incorporators: Amasa J. Smith, Harry W. Wallace, Spokane; John R. Jones, Hillyard, Wash.; W. Payne and Andrew Coolin.

Pittsburg, Pa.—It is announced that the promoters of two new electric lines to be built in Allegheny county, Pennsylvania, will, on May 28, apply for charters for this purpose. One will be known as the Crucible Street Railway and will operate in a number of streets and highways of West Elizabeth borough, beginning at State street and running to the Allegheny county boundary line, returning by the same route. The other is the Bellebridge Street Railway and will be built in Elizabeth borough, beginning at the Monongahela river road and ending at Short street, returning by the same route.

Rockford Oregon & Southern Railway.—Incorporated in Illinois to construct a line from Rockford through Winnebago, Ogle and Lee counties to Dixon, Ill. Principal office, Oregon, Ill. Capital stock, \$10,000. Incorporators: Frederick C. Jones, Charles D. Etnyre, Arthur F. Herbert, Oregon, Ill.; Louis C. Wachsmuth and Fred H. Wachsmuth, Chicago.

Terre Haute & Merom Traction Company.—Incorporated in Indiana to build an interurban line from Terre Haute to Merom, about 30 miles. It is stated that surveys have been completed and practically all the right of way has been secured. Work will be started in about two months. Capital stock, \$750,000. Incorporators: Lafayette Brown, H. L. Bartlett, J. F. Oldbuck, J. T. Barrett, Frank S. Lewis, A. E. Hays and Virgil Pounds. Headquarters, Indianapolis, Ind.

TRACK AND ROADWAY.

Amityville, L. I.—The village board has granted a 2-year extension to the franchise of the South Shore Traction Company.

Baltimore Frederick & Hagerstown Railway.—Westinghouse, Church, Kerr & Co. of New York have recently completed surveys for this proposed line from Baltimore to Frederick and Hagerstown, Md., 78 miles, and it is announced that construction will begin shortly. It is expected to enter Baltimore from the southwestern side, over the tracks of the United Railways & Electric Company. The company was chartered several years ago and has an authorized capital stock of \$15,000,000. James E. Ingram of Baltimore is president.

Boston & Eastern Railway, Boston, Mass.—This company, which is seeking the approval of the Massachusetts railroad commission for its line from Boston to Lowell, Mass., has filed a new set of plans through Chelsea, whereby the tracks will pass under the streets. The hearing before the commission has been postponed until June 3. John H. Bickford, chief engineer.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—This company, which is building from Dunkirk, N. Y., west along the shore of Lake Erie, is making rapid progress with the work and expects to have cars running as far as Westfield by the middle of the summer. The Dunkirk & Fredonia Railway, which has been acquired, has been rebuilt, and about a mile of track has been laid from Dunkirk east. J. C. Calisch, Buffalo, general manager.

Chattanooga (Tenn.) Railways Company.—It is reported that the directors have recently considered plans for building an electric line from Chattanooga to the summit of Lookout Mountain and have decided to build the line if the property owners will grant the right of way.

Columbia & Manor Electric Railway, Columbia, Pa.—This company, which proposes to build an electric railway from Millersville to Columbia, Pa., with several short branches, about 12 miles in all, has elected officers as follows: President, Henry Wertz, Washingtonboro, Pa.; vice-president, H. M. Herr, Lancaster, Pa.; secretary and treasurer, E. K. Hirshey, Creswell, Pa.

Columbia & Walla Walla Traction Company.—J. H. Morrow, general manager, Waitsburg, Wash., states that this company will in the near future begin surveys for an extension up the Snake river to Clarkston, Wash.

Columbus & Lake Michigan Railway, Lima, O.—Rapid progress is being made by the engineers in the employ of the Schoepf syndicate on the work preliminary to extending the line to Defiance for electrical operation between Lima and Defiance. Work is being pushed on several of the 13 concrete arches and bridges; 70,000 ties have been purchased and delivery is to begin this week; poles for the Defiance end of the line are to be delivered soon and rails have been ordered.

Columbus Marion & Bucyrus Railway, Delaware, O.—It is announced that grading on this extension of the Columbus Delaware & Marion Railway from Marion to Bucyrus, O., which was stopped last fall, will be resumed this week. George Whysall, general manager.

Consolidated Railway, New Haven, Conn.—This company has applied to the street board of Hartford, Conn., for permission to double-track its Trinity street line, from Pearl street to Capitol avenue.

Cortland & Auburn Railroad.—This company has been granted a certificate of necessity by the New York railroad commission for a line from Cortland to Auburn, N. Y. Surveys are in progress and contracts are to be let shortly. W. L. Webb of Philadelphia, chief engineer.

Dayton & Troy Electric Railway, Dayton, O.—This company has agreed to elevate its double track at Dayton between the corporation line and the old channel of the Miami river, at the request of the county commissioners.

Ft. Wayne & Toledo Traction Company.—Surveys have been started for this proposed road from Toledo, O., to Ft. Wayne, Ind.

The Eldenbell Construction Company of New York are the engineers and Francis B. Morgan of Cleveland and C. M. Pierce of New York are interested.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.—It is now announced that the Lafayette & Logansport extension, which was described in the Electric Railway Review of May 4, 1907, page 588, will be opened for traffic on June 1.

Galt (Ont.) Preston & Hespeler Street Railway.—It is announced that plans are practically completed for about \$100,000 worth of improvements to this company's system. These will include new car barns, the installation of a 750-horsepower engine, orders for new rolling stock and the double-tracking of the line. Martin N. Todd, Galt, Ont., is president and general manager.

Hummelstown & Campbelltown Street Railway, Hershey, Pa.—Thomas J. Humphreys, who has the contract for grading the remaining 2½ miles of this company's extension west of Campbelltown, now has a large force of men employed on the work. The present terminus of the line is at Palmyra. There still remain 1½ miles to be graded between Derry Church and Hershey, for which a separate contract will be let.

Illinois Traction Company, Champaign, Ill.—This company last week succeeded in laying the crossing over the tracks of the St. Louis Merchants' Bridge Terminal Railway at Venice, Ill., and laid the 150 feet of track necessary to complete the line to the Mississippi river at the site of the proposed bridge to St. Louis. The crossing was placed at night in spite of the opposition of the Terminal Railway men and an injunction was secured to prevent interfering with the work after it was finished.—Tuttle Brothers, who have the contract for grading the Lincoln-Mackinaw line, are making preparations for beginning work at once, and a large number of men will be put to work in the endeavor to complete the 28 miles by August 1. The Helm Contracting Company of Pontiac has been awarded a contract for six miles of the grading.—Tuttle Brothers have also announced that if the weather is favorable the Decatur-Champaign line will be completed this month.

Indianapolis & Louisville Traction Company, Louisville, Ky.—Master Mechanic W. H. Palmer has announced that with the exception of a small section of overhead work this line is now completed from Sellersburg to Scottsburg, Ind., and that this section will be put in operation as soon as the new cars arrive.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind.—It is reported that as soon as the extension from Columbus to Seymour is completed the line from Indianapolis to Greenwood, Ind., will be double-tracked. Right of way is now being secured.

Indianapolis Newcastle & Toledo Electric Railway, Newcastle, Ind.—This company has completed surveys during the past week for a branch line from Newcastle to Greenfield, Ind., and the right of way is now being secured.

International Railway, Buffalo, N. Y.—President Henry J. Pierce announces that he has placed an order for \$75,000 worth of steel rails to be laid in Chippewa, Pearl and Franklin streets.

Jefferson City, Tenn.—A company has been organized to build an electric railway from Jefferson City to Dandridge, for both freight and passenger service. James H. Bundren of Jefferson City is interested.

Kansas Traction Company, Coffeyville, Kan.—This company, recently incorporated to build an electric railway from Coffeyville to Lawrence, Topeka and Kansas City, Kan., is now securing stock subscriptions in the towns along the route for the preliminary work. A site for a power house has been donated at Coffeyville. F. B. Shirley, Coffeyville, president.

Lima, O.—It is reported that the Lucas Construction Company of Toledo, O., is reviving the old Bartholomew project to build an electric line between Lima and Bellefontaine, O., via Westminster, Roundhead and other villages. Bartholomew graded seven miles of the line before abandoning the plan about a year ago.

Little Rock & Hot Springs Electric Railway.—We are advised by the Electrical Installation Company of Chicago that the statement published in the Electric Railway Review of May 11 that that company has the contract for building the line from Little Rock to Hot Springs, Ark., is incorrect, as that company has no contract with the Little Rock & Hot Springs Electric Railway.

Marengo & Midland Railway, Marengo, Ia.—Surveys have been started for the line from Marengo to Midland, Ia., which is to be a branch of the proposed system of the Iowa & Missouri Traction & Power Company, which will extend from Fairfield to Cedar Rapids, Ia., 96 miles. H. H. Erimmer of Marengo, president; J. W. Andrews of Fairfield, chief engineer.

Minneapolis Kansas City & Gulf Electric Railway, Minneapolis, Minn.—This company has been organized by Minneapolis men and has issued a prospectus for an electric line from Minneapolis south through Albert Lea, Minn., to Des Moines, Ia., as the first section.

Mississippi Valley Electric Railway, Nauvoo, Ill.—W. A. Calhoun, consulting engineer, states that 80-pound steel rails have been ordered from the Lackawanna Steel Company for building the proposed lines from Nauvoo to Niota, Carthage and Hamilton, Ill., and that they are to be delivered in August and September. Contracts for grading are to be let about June 15. Franchises have been secured in Nauvoo and Carthage.

New York, N. Y.—It is reported that A. H. Stanley, who recently resigned as general manager of the Public Service Corpo-

ration of New Jersey to become general manager of the London Underground Electric Railways Company, is president of a company organized to build an electric railway from a point on the Hudson river, opposite Grant's tomb, in New York, to Nyack, N. Y., a distance of 28 miles. Detroit capitalists are said to be associated with him.

Northwestern Elevated Railroad, Chicago, Ill.—The Ravenswood elevated extension, from Clark street junction, in Lake View, to Ravenswood, 3½ miles, is to be opened for traffic on Sunday, May 19.

Okanogan Electric Railway, Spokane, Wash.—An official report from this company states that work is expected to begin about June 1 on the proposed electric line from a junction with the Victoria Vancouver & Eastern Railway near Nighthawk to Brewster, Wash., about 60 miles, via Loomis, Conconully, Okanogan and several mines. Surveys have been completed as far as Okanogan. Contracts have not been let. President, A. M. Dewey, Spokane; chief engineer, G. H. Wheeler, Conconully.

Owensboro (Ky.) City Railway.—It is reported that this company will expend \$50,000 this summer on improvements.

Parkersburg (W. Va.) Marietta & Interurban Railway.—J. F. Carr of Marietta, O., has been awarded the contract for the construction of the Muskingum extension to this company's line, and work is now under way. Five miles yet remain to be completed between Marietta and Lowell, O. C. H. Shattuck, Parkersburg, W. Va., is general manager.

Rochester Corning & Elmira Traction Company, Rochester, N. Y.—The most serious obstacle to the construction of this road from Rochester to Corning and Elmira, N. Y., has been withdrawn. General Manager George A. Engert of the Rochester & Southern Construction Company, which is to build the road, has received notice from the Erie Railroad that it has withdrawn its appeal to the court of appeals to stay proceedings under the certificate of necessity granted by the state railroad commission by direction of the appellate division.

Russell Fork Railway, Ashland, Ky.—This company has been organized for the purpose of constructing an interurban electric line in Dickinson and Buchanan counties, Kentucky, to the Kentucky state line. The road will tap valuable timber lands and mineral deposits of that section.

St. Louis St. Charles & Western Railroad, St. Louis, Mo.—It is stated that the work of laying new steel rails on this company's line between St. Charles and St. Louis, Mo., is now in progress. Robert McCulloch, general manager, St. Louis.

Seattle, Wash.—Jacob Furth, president of the Seattle Electric Company, owned by Stone & Webster of Boston, Mass., is quoted as saying that the surveys now being made for electric lines radiating from Bellingham, Wash., through Whatcom and Skagit counties, will be the nucleus of a line to be built by Stone & Webster from Bellingham to Seattle, via Sedro-Woolley, Mt. Vernon, Burlington, La Conner, Snohomish and Everett, about 100 miles. An extension north to Vancouver, B. C., is also said to be a possibility.

Seattle, Wash.—P. P. Carroll of Seattle represents a syndicate which, he says, proposes to expend \$40,000,000 in the construction of electric railways and power development in Washington. The electric railway projects include the Puyallup Valley Northern Transit Company of Puyallup, Wash., for which the Continental Engineering-Construction Company of New York has the contract to build from Seattle to Tacoma; the Snohomish Valley Railroad, which proposes to build from Snohomish to Cherry Valley and later to Seattle and Tacoma; and the Seattle-Chelan-Spokane Railway, which intends to build from Puget Sound to Renton and Spokane. The men who are backing these enterprises have decided they can build and profitably operate the lines in connection with numerous power plants to be operated by water power. The plants will be located at towns along the lines of railway, and will furnish power for commercial and municipal uses as well as for the operation of the railways.

South Dakota Gas Electric Company, Huron, S. D.—J. A. Cleaver, president, writes that contracts for grading are to be let soon for this proposed line from Huron to Spink county, South Dakota, 49 miles. Surveys have been completed to Irving and Carpenter, 40 miles. The road is to be for freight and passenger service. Sixty-pound rails will be used.

Spokane & Big Bend Railway, Spokane, Wash.—W. H. Plummer of Spokane has been re-elected president of this company, which proposes to build a line from Spokane to Crystal City, Wash., 70 miles. Work has recently been started at the Spokane end of the line. Entrance to the city will be had over the tracks of the Spokane & Inland Railway.

Spokane Pend d'Oreille Rapid Transit Company, Spokane, Wash.—A court decision has confirmed the claim of the Prairie Development Company, which consists of the backers of the railway project, to the ownership of 1,500 acres of land on the shores of Lake Pend d'Oreille, Idaho. J. Grier Long, who, together with M. F. Mendenhall, D. K. McDonald and R. A. Hutchinson, is interested in both companies, states that this decision paves the way for immediate construction of the proposed line from Spokane to the lake, 46 miles.

Springfield Wilmington & Cincinnati Traction Company, Springfield, O.—This company, which proposes to build from Springfield to Cincinnati, O., 72 miles, has filed a mortgage for \$4,000,000 with the county recorder. The Eldenbell Construction Company of New York has the contract and work is to begin at once.

Tampa & Sulphur Springs Traction Company, Tampa, Fla.—This company's new line from Lafayette street and Florida avenue, Tampa, to Sulphur Springs, about five miles northeast of Tampa, has been completed and an experimental trip was made on May 9. The power house and car sheds are located on the Hillsboro river. H. H. Kirkpatrick, general manager.

Texas Traction Company, Dallas, Tex.—It is now reported that approximately 30 miles of grading has been completed on the Sherman-Dallas interurban line, which will be 64 miles long. Seven grading camps are now located at different points along the route and another is soon to be established. The 80-pound rails will be delivered in monthly instalments, beginning in July. F. A. Jones, chief engineer.

Toledo Urban & Interurban Railway, Toledo, O.—This company has notified the city council of Toledo that it is ready to co-operate with the municipality in building a new bridge over the canal at South street, in place of the present wooden truss structure, which has been condemned. It is estimated that the bridge would cost \$22,500.

Twin City & Lake Superior Railway.—W. H. Crossland, vice-president, Minneapolis, writes that this company, whose incorporation was noted last week, will build a double-track third-rail electric line from Minneapolis and St. Paul, Minn., to Duluth, Minn., and Superior, Wis., 130 miles, of which 91 are in Minnesota and 39 in Wisconsin. The road will be practically an air line and will intersect no present towns or villages. Surveys have been made and grading is to begin on June 1. No general contracts are to be let. The road is to handle both freight and passengers. Maximum grade, 0.5 per cent; maximum curvature, 1½ degrees; weight of rail, 70 pounds. About 4,500 feet of steel will be required for the five principal bridges, although the company is not at present in the market for equipment. E. W. Farnham of Chicago, president; J. H. Thomas, Minneapolis, chief engineer. Headquarters, 345 Railway building, Minneapolis.

United Traction Company, Albany, N. Y.—The appellate division of the supreme court of New York has given a decision confirming the favorable report of a commission to determine the necessity of an extension of the Western avenue line from Madison avenue and Allen street to a point about 1,500 feet west and General Manager E. S. Fassett has announced that the work will begin at once. The material for the extension of the Broadway line is expected about June 1.

Wagner Lake Shore & Armour Railway, Wagner, S. D.—A. H. Pease writes that this company, recently incorporated, is now making surveys for its proposed line from Wagner to Mitchell, S. D., 75 miles, by way of the east shore of Lake Andes, Armour and Hillside. Contracts for grading are to be let and grading is to begin in 60 days. The company will operate electric lighting plants at the terminals and at several intermediate points. A tract of 106 acres of ground has been secured for a summer resort at Lake Andes. Fifty-six-pound rails will be used. The powerhouse will be located at Wagner and substations at Armour and Mitchell. The Minneapolis Steel & Machinery Company will furnish the power equipment. John Absher of Wagner is president.

West Jersey & Seashore Railroad, Philadelphia, Pa.—This company is now lowering its tracks on Atlantic avenue, Atlantic City, N. J., to the new paving grade. The work, which, it is estimated, will cost \$360,000, is expected to be completed by June 1. The company has paid to the city treasurer \$150,000 for the cost of paving on Atlantic avenue, under the terms of its perpetual franchise. This sum, together with \$5,000 per annum which the company is to pay for the next 10 years, will completely relieve the company thereafter from responsibility for the maintenance of the street.

Whatcom County Railway & Light Company, Bellingham, Wash.—Manager L. H. Bean has announced that construction work on the Bellingham-Skagit county line will begin in about a week. Materials have been ordered.

Winona Interurban Railway, Winona, Lake, Ind.—At elections held last week in five townships along the route of the proposed Warsaw-Ft. Wayne line subsidies were voted to the company in Columbia, Richland and Union amounting to \$50,370, and subsidies amounting to \$21,500 were defeated in Lake and Washington.

POWER HOUSES AND SUBSTATIONS

Georgia Railway & Electric Company, Atlanta, Ga.—It has been announced that a large gas engine is being installed in the Davis street plant of this company and will be ready for service as soon as the generator winding is finished. It will serve as an emergency power supply in case of a shutdown of the Bull Sluice powerhouse.

Long Acre Electric Light & Power Company.—It is announced that this company has purchased a plot of ground on which to build a power plant capable of developing 100,000 horsepower. It is stated that about \$500,000 was paid for the plot of land, which is located at One Hundred and Twentieth street and East river, New York City.

Mount Hood, Ore., Railway & Power Company.—It is stated that work on the 15,000-horsepower generating station of this company has been started. During the past week bids have been received by the company from electrical manufacturing companies for supplying and installing the electrical apparatus in the station. It has not been announced to whom the contract has been awarded. It is said that the present contract on which bids have been received will amount to about \$280,000.

Personal Mention

Mr. J. B. Livingstone, heretofore auditor of the Oregon Water Power & Railway Company at Portland, Ore., has resigned to become associated with the Jersey Central Traction Company at Keyport, N. J.

Mr. A. C. Murray, heretofore assistant to General Manager L. E. Fischer of the Illinois Traction Company, has been appointed assistant general superintendent of the southern division, with headquarters at Staunton, Ill.

Mr. E. W. Poole, formerly assistant treasurer of the Connecticut Railway & Lighting Company, Bridgeport, Conn., has resigned to become associated with the United Gas Improvement Company, with headquarters at Philadelphia.

Mr. William G. Evans, president of the Denver (Colo.) City Tramway Company, has moved his headquarters from Denver to New York City, where he will represent the Denver Northwestern & Pacific Railway and other interests with which he is identified. Mr. Evans is vice-president of the latter company.

Mr. Hector W. Mackay has resigned his position as division superintendent of the Boston & Worcester Street Railway, to accept a similar position with the northern division of the New Hampshire Electric Railways, with headquarters at Hampton, N. H. He will be succeeded by Mr. Edwin C. Whitney, whose headquarters will be at Marlboro, Mass.

Mr. C. Edgar Titzel, who, as announced in the Electric Railway Review of May 11, 1907, has been appointed manager of the Lancaster County Railway & Light Company, with office at Lancaster, Pa., was born at

C. Edgar Titzel.

Irwin Station, Westmoreland county, Pennsylvania, on May 4, 1875. His parents moved to Altoona in 1880, and from there to Lancaster in 1885. He was educated in the public schools of Altoona and Lancaster; later he attended Franklin and Marshall Academy for two years and Franklin and Marshall College for one year. He entered the employ of the Edison Electric Illuminating Company of Lancaster in 1892 and was made superintendent of this company in 1896. In 1901 he was appointed superintendent of the Lancaster Gas Light & Fuel Company, and the Columbia Electric Light Heat & Power Company. In 1903 he was appointed superintendent of the Conestoga Traction Company of Lancaster,

succeeding Mr. Frank S. Given. Since that time he has been superintendent of all the above companies, which are owned by the Lancaster County Railway & Light Company. On March 1, 1907, the controlling interest of the Lancaster County Railway & Light Company was sold to Bertron, Storrs & Griscom of 40 Wall street, New York City, and on May 1, 1907, Mr. Titzel was appointed manager of the above companies, being locally in charge of all the properties owned by the Lancaster County Railway & Light Company.

Mr. Frank Steinhart, United States consul-general at Havana, Cuba, and a director in the Havana Electric Railway, which was recently reorganized, as announced in the Electric Railway Review of March 16, 1907, has been appointed general manager of this company. His resignation as consul-general, which was tendered about three months ago, will be effective on June 1, at which time he will assume his new duties.

Mr. Edward Raver, heretofore superintendent of the Logansport division of the Ft. Wayne & Wabash Valley Traction Company, has been appointed superintendent of the local street railway lines in Ft. Wayne, Ind. Mr. Raver entered the service of the company in 1891 as motorman. Former Assistant Superintendent Rider of the Ft. Wayne local lines will be transferred to Logansport to succeed Mr. Raver as superintendent.

Mr. Walter A. Draper, who, as announced in last week's issue of the Electric Railway Review, has been elected secretary of the Cincinnati Traction Company, succeeding Mr. S. C. Cooper, resigned, was born at Portsmouth, O., and graduated from the Ohio Wesleyan University in 1883. For about five years he has been secretary and treasurer of the Cincinnati Zoological Garden Company, which is controlled by the Cincinnati Traction Company and allied interests.

Mr. A. S. Richey has been appointed professor of electric railway engineering at Worcester (Mass.) Polytechnic Institute. He was formerly in charge of the mechanical and electrical departments of the Citizens' Railway, Muncie, Ind., and more recently held the same position with the Marion (Ind.) City Railway. Prior

to going to Worcester he was chief engineer of the Indiana Union Traction Company at Muncie, Ind., resigning in 1905 to become an instructor in the electric railway engineering department of Worcester Polytechnic Institute, where he has remained as assistant professor until his present appointment. He will be succeeded by Dr. George Olshausen of St. Louis, Mo.

Mr. Charles M. Crawford, secretary and treasurer of the Hartford (Conn.) Paving & Construction Company, has been appointed chief engineer of the Cincinnati Northern Traction Company, Cincinnati, O., to succeed Mr. C. A. Alderman, who resigned some time ago to become associated with J. G. White & Co. of New York. Mr. Crawford has had a long experience in steam railroad engineering and was formerly assistant engineer of the Pennsylvania Railroad.

Mr. Benjamin F. Tilton of Newburgh, N. Y., has been appointed engineer of maintenance of way for the Cleveland Electric Railway, effective on May 20, succeeding Mr. Charles H. Clark, whose resignation to take a similar position with the International Railway at Buffalo, N. Y., was announced in our issue of last week. Until his present appointment Mr. Tilton was in charge of the elimination of grades for the Cleveland & Pittsburg division of the Pennsylvania Lines.

Mr. R. F. Kelker, Jr., has resigned as engineer of the Goldschmidt Thermit Company of New York to become connected with the board of supervising engineers in charge of the reconstruction of the Chicago street railway systems. Mr. Kelker is to have charge of the track work, a position for which his previous experience in the track departments of the Brooklyn Rapid Transit Company, the International Railway Company of Buffalo and the Baltimore & Ohio Railroad renders him especially fitted.

Mr. F. W. Johnson has resigned his position as claim agent of the Connecticut Railway & Lighting Company, Bridgeport, Conn., to become assistant general claim agent of the Philadelphia Rapid Transit Company. Mr. Johnson was formerly a member of the claim department of the old Boston & Lynn Street Railway. Shortly after the consolidation of this company with the Boston & Northern Railroad he accepted the position of claim agent with the Connecticut Railway & Lighting Company, where he has been for the past five years. He is a member of the executive committee of the American Street and Interurban Railway Claim Agents' Association.

Directory of Electric Railway Associations.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York. Annual meeting, Atlantic City, N. J., October 14-18.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.

American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.

Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.

Central Electric Railway Association. Secretary, W. F. Millholland, secretary and treasurer Indianapolis Traction & Terminal Company, Indianapolis, Ind. Next meeting, Indianapolis, Ind., May 23.

Colorado Electric Light Power & Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.

Oklahoma Electric Light, Railway and Gas Association. Secretary, Galen C. Crow, general manager Guthrie Electric Light & Power Company, Guthrie, Okla.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical and Gas Association. Secretary, R. B. Stichter.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y. Next meeting, Bluff Point, N. Y., June 25 and 26.

Wisconsin Electric and Interurban Railway Association. Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

Financial News

Atlantic City & Suburban Traction Company, Pleasantville, N. J.—On the application of Grey & Archer, attorneys, of Camden, N. J., Vice-Chancellor Leaming of the court of chancery in Camden appointed John L. Clawson of Philadelphia receiver for this company. The application was made on behalf of C. L. Leland and Robert Wetherill. Mr. Clawson tried as chairman of a reorganization committee to secure the acceptance by creditors of preferred stock for their claims.

Bennington & North Adams Street Railway.—The New York state railroad commission has approved the issue by this company of \$450,000 first mortgage bonds.

Chicago Lake Shore & South Bend Railway Company, South Bend, Ind.—This company has increased its capital stock from \$250,000 to \$6,000,000, of which \$1,000,000 will be preferred stock and \$5,000,000 common stock.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—The Commercial and Financial Chronicle contains the following statement of earnings of the roads which have been acquired by this new company:

	1906.	1905.	1904.
Gross earnings	\$645,849	\$543,226	\$475,361
Operating expenses	363,856	314,253	293,615
Net earnings	\$281,993	\$228,973	\$181,746
Interest, taxes, etc.	179,252	152,693	128,746
Net income	\$102,741	\$ 76,280	\$ 53,000

Consolidated Railway Company, New Haven, Conn.—The annual report of the United Gas Improvement Company of Philadelphia contains the following: "The property of the Connecticut Railway & Lighting Company has been leased for 999 years from August 1, 1906, and the capital stocks of the Housatonic and New Milford Water Power companies and of the Meriden Southington & Compounce Tramway Company have been sold to the Consolidated Railway Company, a corporation controlling all the important trolley properties of Connecticut. The New York New Haven & Hartford Railroad owns most of the stock of the Consolidated company and has guaranteed the fulfillment of the conditions of the lease and payment of the principal and interest of the debentures issued to buy the stocks of the water power companies and the Meriden Southington & Compounce Tramway Company. The rentals under the lease supplemented by the sum of \$10 per share on their stock paid by the owners of the common stock to the Colonial Trust Company of New York, as trustee, will be sufficient to pay interest and sinking fund charges, the cost of maintaining the corporate organization, and dividends at the rate of 4 per cent per annum on the preferred and common stock of the Connecticut Railway & Lighting Company. Simultaneously with the above transaction there were sold to the Providence Securities Company, which made payment in its 4 per cent 50-year debenture bonds, guaranteed as to principal and interest by the New York New Haven & Hartford Railroad, all of the bonds and floating debt and practically all of the capital stock of the Rhode Island Securities Company, and paid to the Providence Securities Company cash to the amount of \$10 per share of the stock so sold. By these transactions we have transferred the responsibility of managing and financing these properties to the New York New Haven & Hartford Railroad, and insured an income to the United Gas Improvement Company from its investments in Connecticut and Rhode Island of \$1,000,000 per annum, being 4 per cent on securities of the par value of \$25,000,000."

Denver City Tramway Company and Denver & Northwestern Railway.—The gross earnings of this system for the last eight years have been as follows:

1906.....	\$2,652,218.60	1903.....	\$1,977,854.78	1900.....	\$1,302,289.91
1905.....	2,412,129.30	1902.....	1,702,958.39	1899.....	1,230,161.57
1904.....	2,040,146.06	1901.....	1,507,752.17		

Delaware & Hudson.—J. Rogers Maxwell and Frank E. Smith were elected members of the board of managers, succeeding Frederic Cromwell and Alexander E. Orr, at the annual meeting of stockholders on May 14. Rufus B. Cowing criticized the purchase of electric railway properties by the company, especially that of the Hudson Valley Railway, which he said was not worth \$2,000,000, while the company had paid for it \$5,000,000. He also criticized the purchase of coal lands and said that the Delaware & Eastern, now under construction, would compete with the Delaware & Hudson. L. F. Loree, the president, answering these criticisms, said that he has recommended that \$1,500 be set aside each month for the purpose of examining coal lands south of Wilkesbarre, and that he thinks it is prudent for the company to purchase additional coal lands. Regarding the purchase of traction properties Mr. Loree spoke of the purchase of electric railways by the New York New Haven & Hartford and the New York Central & Hudson River. He believed that it remains to be seen whether the Delaware & Hudson made a mistake in buying the Hudson Valley property, and said it was his impression that the people from whom the road was purchased would take it back if such a step was found advisable. Mr. Loree said there was some doubt about the advisability of giving out detailed information about the Hudson Valley purchase until the transaction is closed. The Delaware & Hudson now holds between 80 and 90 per cent of the Hudson Valley stock. President Loree said that he had not made up his mind how much money the company will need and that another

meeting of stockholders will be necessary to approve a plan for financing. He said he believed the earnings would continue at a sufficient rate to meet present dividend payments.

Interborough Rapid Transit Company, New York.—At the annual meeting of the stockholders on May 8 the following directors were re-elected to serve for three years: Gardner M. Lane, John Peirce, George W. Young and Alfred Skitt.

Jackson Consolidated Traction Company, Jackson, Mich.—It is announced that control of this property has been purchased by the Michigan United Railways Company of Lansing. The latter company now operates local systems in Lansing, Kalamazoo and Battle Creek, and interurban roads between Lansing and St. Johns, between Jackson and Battle Creek, and between Kalamazoo and Battle Creek. The ownership of the Jackson road will add 30 miles of road to the 153 miles which had previously been operated by the Michigan company.

Marion Bluffton & Eastern Traction Company, Bluffton, Ind.—A mortgage securing an issue of \$850,000 first mortgage 5 per cent bonds has been recorded in Bluffton. Of this issue \$130,000 of the bonds will be reserved for future requirements.

Milwaukee Light Heat & Traction Company.—A trust deed to secure an issue of \$30,000,000 refunding and extension mortgage bonds has been recorded. The Metropolitan Trust Company of New York and Randolph Radman are trustees.

Norfolk & Portsmouth Traction Company, Norfolk, Va.—Earnings for March and for the three months ended March 31 compare as follows:

	1907.	1906.	Increase.
March—			
Gross earnings	\$163,135	\$123,173	\$39,962
Operating expenses	106,929	81,035	24,994
Net earnings	\$ 57,106	\$ 42,138	\$14,968
Three months—			
Gross earnings	\$447,204	\$366,966	\$80,238
Operating expenses	293,971	237,404	56,567
Net earnings	\$153,233	\$129,562	\$23,671

Scioto Valley Traction Company, Columbus, O.—At the annual meeting of the stockholders the following directors were elected: Frank A. Davis, E. R. Sharp, E. K. Stewart, W. S. Courtright and Theodore Rhoades of Columbus; George Eustis and A. B. Voorheis of Cincinnati; J. C. Hoover of Hamilton, O.; and H. B. Peters of Lancaster, O. Officers were re-elected as follows: President and manager, Frank A. Davis; vice-president, W. S. Courtright; secretary and treasurer, Edwin R. Sharp; superintendent, L. C. Bradley.

Trenton Lakewood & Atlantic Railway Company.—Peter Schlicher filed in the court of chancery, Trenton, N. J., on May 14, a petition for the appointment of a receiver for this company.

Washington Traction Company, South Charleston, O.—Stacy B. Rankin was appointed receiver of this road on May 7 by Judge A. H. Kunkle. The receiver was appointed at the request of the Guaranty Title & Trust Company of Pittsburg.

West Jersey & Seashore Railroad.—The annual report of this road for 1906 shows gross earnings of \$5,206,284, as compared with \$4,652,405 in 1905. Operating expenses were \$3,959,914 in 1906, and \$3,388,728 in 1905. The aggregate amount of construction, equipment and real estate expenditures during the year was as follows: Electrification, Camden (Haddon avenue) to Atlantic City

via Newfield and Newfield to Millville.....	\$4,460,296
Connection between Atlantic City division and Atlantic City Railroad at Winslow Junction.....	183,174
New lines, etc., in Camden, N. J.....	522,780
Double-track freight line, Westville to Haddonfield Junction.....	244,910
Miscellaneous	122,739
Electric railway and other equipment.....	559,719
Real estate	19,193

In his report the president, James McCrea, says: "You will note from the foregoing statement that the construction expenditure for the year was mainly in the electrification of your railroad from Camden to Atlantic City via Newfield Junction, and from the latter point to Millville. This required an independent terminal and various other changes and improvements in Camden. As the result of these expenditures the company has one of the most completely equipped long-distance electric lines in the country, but as the line could not be put in operation until September 18, 1906, the close of the season for heavy summer passenger traffic, and the complete service was not inaugurated until a month later, your company did not derive any material benefit from its earnings during the remaining portion of the year. Other important improvements, still under way, are the new freight line from Westville to Haddonfield Junction and the new overhead connecting line from Spruce street, on the Atlantic City division, to Van Hook street, on the Cape May division, in Camden. In connection with the electrification of the Somers' Point branch and its use under the contract by the Atlantic City & Shore Railroad Company, it was necessary to double-track that branch from Pleasantville to Somers' Point, for which we shall receive a satisfactory increase in the rental."

Dividends Declared.

Georgia Railway & Electric Company, Atlanta, common, quarterly, 1½ per cent.

Washington, D. C., Railway & Electric Company, preferred, 2½ per cent.

Manufactures and Supplies

ROLLING STOCK.

Houston Electric Company, Houston, Tex., has placed an order for 10 double-truck cars.

Puget Sound Electric Railway, Tacoma, Wash., has ordered five additional double-truck cars.

Public Service Corporation of New Jersey, Newark, N. J., has ordered 200 cars from Cincinnati Car Company.

Aurora Elgin & Chicago has ordered two interurban cars from the McGuire-Cummings Manufacturing Company.

San Diego Electric Railway, San Diego, Cal., will build during the present year 50 cars for city and interurban service.

Pittsburg & Westmoreland Railway, Pittsburg, Pa., expects to be in the market soon for four convertible double-truck cars.

Seattle Electric Company, Seattle, Wash., has ordered one sprinkler car from McGuire-Cummings Manufacturing Company.

Union Electric Company, Dubuque, Ia., has placed an order with the McGuire-Cummings Manufacturing Company for one sprinkler car.

Lacroze Tramway Company, Lacroze, Buenos Aires, S. A., has ordered 50 single-truck and 6 double-truck cars from The J. G. Brill Company.

Washington Railway & Electric Company, Washington, D. C., expects to purchase soon 25 closed cars with bodies 28 feet 3 inches in length, to be equipped with maximum traction truck and two motors of 60 horsepower each.

Virginia Passenger & Power Company, Richmond, Va., has recently purchased 20 semi-convertible cars from The J. G. Brill Company. These will have 38-foot bodies and will be equipped with Detroit type platforms, Brill trucks and General Electric motors.

Nashville Railway & Light Company, Nashville, Tenn., as reported in the Electric Railway Review of March 9, placed an order on March 4 with The J. G. Brill Company for 15 double-truck motor cars for August 10, 1907, delivery. The specifications include the following details:

Seating capacity.....	44 passengers	Height, inside.....	7 ft. 8 in.
Wheel base.....	4 ft. 6 in.	Sill to trolley base.....	8 ft. 8½ in.
Length of body.....	30 ft. 6 in.	Track to trolley base.....
Over vestibule.....	40 ft. 6 in.	11 ft. 4 in.
Over all.....	42 ft.	Body and underframe.....
Width, inside.....	7 ft. 7 in.	Wood and metal
Over all.....	8 ft. 1¼ in.

SHOPS AND BUILDINGS.

Indiana Columbus & Eastern Traction Company.—It is reported that this company has taken options on a site for a large new union station at Lima, O., to cost \$150,000.

Marion Bluffton & Eastern Traction Company, Bluffton, Ind.—This company has purchased a piece of land, 20 by 66 feet, in Warren, Ind., on which will be erected a concrete passenger station.

Minneapolis Rochester & Dubuque Traction Company, Minneapolis, Minn.—M. W. Savage, president, who is connected with the International Stock Food Company, has made arrangements to convert the ground floor of the exposition building owned by that company into a terminal station for the railway company, which expects to begin construction on its proposed line from Minneapolis to Rochester, Minn., and Dubuque, Ia. The building occupies 222,400 square feet of ground space, and is expected to contain, besides car storage space, a waiting room, ticket offices, restaurant and offices. The permanent survey for the line is being made and most of the right of way has been secured, according to the statements of its officers.

Pacific Traction Company, Tacoma, Wash.—A contract has been awarded to Miller & Bischo for the erection of a brick car house, 103 by 113 feet, at South Sixty-fourth street and Union avenue, in South Tacoma. A permit for the erection of the building has been secured and work has been started.

Puget Sound Electric Railway, Tacoma, Wash.—Work has been commenced on the construction of large freight sheds, yards and

a supply depot for the use of this company and the Tacoma Railway & Power Company on Puyallup avenue, Tacoma. The freight business is increasing rapidly and the present accommodations are inadequate. The freight warehouse will be 200 by 50 feet and will have tracks through the center of the building and on either side.

Spokane & Inland Empire Railroad, Spokane, Wash.—Work has been started on a passenger and freight station at Hayden architecture and will contain a waiting room, 30 by 30 feet, an Lake, Wash. The building will be of the Swiss chalet type of office, 12 by 12 feet, and a baggage room, 14 by 20 feet. The cost is estimated at \$20,000.

Susquehanna Railway Light & Power Company, Lancaster, Pa.—This company, which has acquired the Lancaster County Railway Light & Power Company, is planning extensive improvements to the system, including an addition to the car house at Lancaster, to cost \$35,000.

Willamette Valley Traction Company, Portland, Ore.—It is stated that work on the car shops and barns for this road will be started within the next 10 days. The company recently purchased 25 lots in North Springfield, Ore., on F street, between Third and Seventh, for this purpose.

TRADE NOTES.

Wolff Truck Frame Company, Chicago, has removed its office from Room 506 to Room 529 Railway Exchange building.

H. P. Walden has been appointed purchasing agent of the Pullman Company to succeed the late W. A. Hughes.

Taylor Electric Truck Company, Troy, N. Y., has moved its Chicago office from the eleventh floor of the Great Northern building to Room 1139 First National Bank building.

D. F. Holman Railway Tracklayer Company has moved its offices from the Railway Exchange to 1103 Ellsworth building, Chicago.

Pittsburg Pneumatic Company, Canton, O., manufacturer of pneumatic riveters, drills, etc., has opened an office in the Fidelity building, Pittsburg, in charge of Charles S. Rea.

Berthold & Jennings, St. Louis, Mo., dealers in timber, poles and ties, have moved their office from the Chemical building to Suite 1302-5 in the new Lumbermen's building.

Imperial Pneumatic Tool Company, Athens, Pa., has prepared plans for an addition to its plant, 54 by 144 feet, to provide additional floor space and manufacturing facilities to meet the demands of its rapidly increasing business.

Electric Automatic Railroad Safety Signal Company, New York, has been incorporated with an authorized capital of \$1,000,000. The directors of the company are Mark Birmingham, C. A. Reed and D. W. Birmingham, all of New York.

General Electric Company, Schenectady, N. Y., at the annual meeting of its stockholders on May 14 elected Marsden J. Perry to succeed the late Gen. Eugene Griffin as first vice-president and H. L. Henderson to succeed T. W. Henderson, resigned. All the old directors were re-elected.

Atha Steel Casting Company, Newark, N. J., announces the appointment of C. W. Owston, Jr., as sales agent, with headquarters at Newark. Mr. Owston was formerly manager of the Washington, Pa., and East St. Louis plants of the Railway Steel-Spring Company and chief inspector of the American Steel Foundries at St. Louis.

Sarco Company, 906 Sixth avenue, New York, has appointed Syles R. Fralick, 269 South Canal, Chicago, its representative in that territory. Mr. Fralick, who was formerly connected with the Benjamin Electric Company, of Chicago, has an extensive acquaintance in this field and will keep on hand a full supply of the products of the company.

American Machine & Manufacturing Company, Charlotte, N. C., has been incorporated with a capital stock of \$300,000 to manufacture and sell electric, hydraulic and steam power transmission machinery. The incorporators are: D. A. Tompkins, S. B. Sargent and J. W. Conway. Mr. Tompkins, a large manufacturer in the south, will be consulting engineer of the company.

American General Engineering Company, manufacturer of specialties such as self-contained armature heading and banding machines, Perfect armature and field coil winding machines, handy armature buggy, factory armature and field coil forms, car pit jacks, power coil taping machines, quick-break fuse boxes and oil cups, has removed its offices from 132 Liberty street to 253 Broadway, New York.

Omaha Mobile Sign Company, Omaha, Neb., has been incorporated with a capital stock of \$100,000, to manufacture and sell a device by which street car advertising will travel from one end of the car to the other, instead of remaining stationary. The incorporators are: G. H. Knowles, W. E. Morris, A. A. Patzman, P. C. Wreath, J. E. Dahlman, G. A. Floersch, William William, C. H. Griffith, A. L. Kelley and Theodore Kharas, the latter being the inventor of the device.

Wells Brothers Company, Greenfield, Mass., well-known manufacturer of "Little Giant" taps, dies, screw plates, gauges, etc., has just opened a store at 54 West Washington street, Chicago, in charge of Bordwell & Barton Company. The company will carry a complete line of taps, dies and screw plates, and later on will

add other tools. The New York store, which is in charge of A. Z. Boyd, has been removed from 56 Reade street to 126 Chamber street. The other store of the company is located at 149 Queen Victoria street, London, Eng. The company does a large business in all of these branch stores, and in each carries a complete stock of its products.

General Electric Company, Schenectady, N. Y., has issued its fiftenth annual report, covering the year ending January 31, 1917. The total earnings for the company amounted to \$61,608,831.73, or \$16,924,981 more than the previous year, an increase of about 40 per cent. The earnings and expenses of the company are as follows:

Earnings.	
Royalties, dividends, interest and dis-	\$60,071,882.99
counts	532,246.19
Profits on sales of stocks and bonds.....	329,702.55

Surplus	\$86,245,289.20

During the past year turbo-generators of an aggregate capacity of more than 350,000 horse-power have been sold. Sales of supplies and small apparatus, such as meters, direct and alternating motors, etc., have increased 35 per cent over the previous year. Stationary motors to the number of 40,365, and aggregating 565,000 horse-power, were sold. An average of 783 supply orders were received each working day throughout the entire year, as compared with 694 the previous year. The New York Central & Hudson River Railroad and the West Jersey & Sea Shore branch of the Pennsylvania Railroad were equipped electrically in the fall of 1916 with apparatus manufactured by the General Electric Company. Expenditures aggregating \$3,834,123.80 have been made during the year for real estate, erection of new factories, extensions, additional machinery, etc. The sales billed for the first two months of the present fiscal year are more than 50 per cent greater than at a corresponding time last year. President C. A. Coffin makes the statement that should this growth in business continue, additional capital will be required.

Crocker-Wheeler Company, Ampere, N. J., has received an order from the Tennessee Coal Iron & Railroad Company for the complete electrical equipment of its new steel rail mill at Birmingham, Ala. The order includes 15 Crocker-Wheeler form W rolling mill motors, aggregating about 575 horsepower. The line of form W motors is designed for the arduous service of rolling

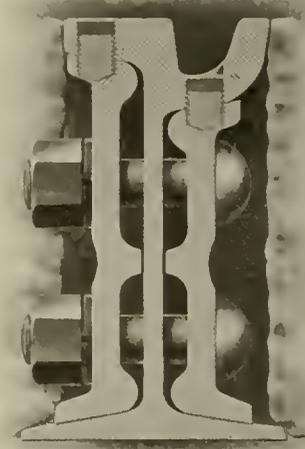

mills, and has attracted very favorable attention in the steel world for its ruggedness and simplicity of design. Among the other purchasers and users of the form W rolling mill motor are the following: Alliance Machine Company, Bethlehem Steel Company, Carnegie Steel Company, Illinois Steel Company, Lorain Steel Company, Mineral Point Zinc Company, Morgan Engineering Company,

PLASTIC RAIL BONDS.

Railway engineers now well recognize the absolute necessity of properly and amply bonding all rail joints, to reduce the current loss to a minimum. In many cases, however, rails are not properly bonded because of the expense involved in tearing up the streets

Brown Plastic Rail Bond—View Showing Method of Drilling Holes.

Brown Plastic Rail Bond—Sectional View Showing Position of Holes and Bonds.

National Tube Company, Pennsylvania Steel Company, Shelby Steel Tube Company, United Engineering & Foundry Company and Youngstown Sheet & Tube Company.

General Fireproofing Company, Youngstown, O., has about completed additions to its plant at Youngstown, which will double the capacity of the all-steel furniture factory and provide for the lug bar and girder frame departments, as complete an equipment as has been possessed for some years past by the herringbone expanded steel lath and expanded metal shops. For the manufacture of pin-connected girder frames a shop 85 by 200 feet has been erected, with a railroad spur running through the entire length of the building. Adjoining the girder frame shop is the steel yard, with stock lengths of cold-twisted lug bars and the square bars used in fabricating the girder frames. This bar yard is covered by an electric crane, having 100 feet span and 320 feet long, which has just been erected and which, because of its unusual size, creates great interest. To accommodate the steady growth of the all-steel furniture department a reinforced concrete building, 60 by 180 feet, and two stories high has been erected adjoining the old factory. The office building has been enlarged to accommodate the reinforced concrete department by the erection of a 2-story and basement addition, 36 by 36 feet. Cement plaster applied over the herringbone expanded steel lath is used for the exterior finish, and instead of woodwork in the addition, all-steel baseboards, moldings, window and door casings and doors, finished like mahogany, have been used.

ADVERTISING LITERATURE.

Concrete-Steel Retaining Wall Company, 805 Traction Building, Cincinnati, O.—The Bone system of retaining walls, bridge abutments, sea lock and area walls, in which this company is interested in the capacity of engineer, is described in a pamphlet which presents illustrations from photographs and from drawings.

Frank Ridlon Company, 200 Summer Street, Boston, Mass.—A pamphlet calls attention to the facilities of this company for handling electrical and mechanical work of all kinds, including the repair and rebuilding of dynamos and motors and the manufacture of spare parts. The pamphlet also includes a list of second-hand dynamos and motors which are on hand for sale.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletins Nos. 1059 and 1060 are devoted respectively to Allis-Chalmers generators for direct-current and Allis-Chalmers belted alternators, type "AB." The direct-current generators are designed for general lighting wherever machines suitable for direct connection to steam, gas or oil engines are required. The alternators described in Bulletin 1060 are suitable for lighting and power plants in small towns, factories, public and private institutions and offices.

Falk Company, Milwaukee, Wis.—This company has just issued a new general catalogue which is a publication finely illustrated from photographs. It shows a large number of castings turned out in the company's steel department, some of which are exceedingly large, one of them reaching 84,480 pounds in weight. The castings made by the company which are particularly applicable for electric railway use, include gears and pinions. The company is also interested in special track work and cast-welded rail joints. The publication is designated as Catalogue No. 9.

to get at the web of the rail, and, for some types of bonds, removing the fish plates. Further, in many cases, no doubt, engineers have been discouraged from installing new bonds because of the rapid depreciation in their conductivity. Engineers will therefore appreciate the great advantage in favor of a bond which can be installed

Brown Plastic Rail Bond—View Showing Clamp and Lamps for Night Work.

without disturbing the pavement or rail joints, and can be installed in nearly all kinds of weather, without interrupting traffic, and which is said to be equal in conductivity to five No. 0000 copper bonds and also to have shown a conductance depreciation of only 5 per cent in nine years.

We present herewith illustrations showing the process of installing bonds which fulfill the conditions previously enumerated

and a section of the rail joint showing the position of the bonds installed. The plastic rail bond shown in these illustrations is manufactured by Harold P. Brown, electrical engineer, 120 Liberty street, New York. As will be seen from the illustrations, these bonds cannot be sheared off, and, when placed in the tram of the rail, every wagon that passes over them tends to increase the conductivity of the joint. Bonds installed in exposed T-rails are placed in a hole bored through the flange of the angle plate and into, but not through, the base of the rail.

A special magnetic clamp with shoes to fit any standard rail has been designed to facilitate the drilling of the holes required without removing the pavement. The magnet coils of the clamp are fully protected against moisture and injury, and the whole is mounted on wheels, so that it may easily be moved from one joint to another. Lamps are mounted on the clamp to permit work being carried on at night. Current for energizing the clamp magnet coils, operating the drill motor and electric lamps is taken from the trolley wire or contact rails by means of a contact arm readily removed upon the approach of a car. Special tungsten steel drills are provided for boring the required holes, which are capable of drilling 1,000 holes without the use of a lubricant and without regrinding.

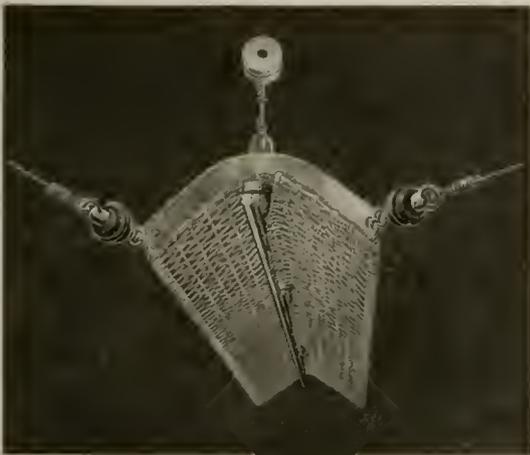

After the holes have been drilled it is only necessary to insert the amalgam composition, which comes put up in convenient, hermetically sealed packages, put the protective cap in place and the work is finished. One mechanic and two laborers can, it is stated, install from 70 to 100 of these bonds per day, which indicates the small cost of installation.

THE NATIONAL TROLLEY GUARD.

The number of accidents which have taken place at railroad crossings because of the trolley leaving the wire has caused the legislatures of several states to enact laws advising the installation of some device which will effectually prevent the loss of power when the trolley wheel leaves the wire. Many home-made devices have been installed for this purpose, but most of them have serious faults which make them useless in times of emergency. A simple guard which effectually prevents cars becoming stalled from loss of power on railroad crossings has therefore been introduced by The National Railroad Trolley Guard Company, 11 Pine street, New York.

One of the guards manufactured by this company is presented in the accompanying illustration, which shows it to consist of a wire mesh shaped in the form of an inverted V, extending over and along the trolley wire. An advantageous feature of this guard is its extreme lightness, those of aluminum weighing 13 ounces and those of copper and galvanized iron weighing but 18 ounces per running foot. On account of this low weight it is unnecessary to provide extra heavy poles and guys to support the guards. To insure perfect contact and durability the meshes are made of No. 10 galvanized and copper wire and No. 9 aluminum wire. They are fitted with substantial hangers spaced five feet apart. This protection can easily be installed without changes to the present overhead equipment.

The construction of the National guard affords ample strength

The National Trolley Guard.

and high electrical conductivity. The use of the wire net reduces the wind resistance to a minimum and effectually prevents the accumulation of ice, which otherwise might weigh down the wire and cause the poles or guys to fail. The width of the single guard for one wire is 10 inches and the depth of the trough 5 inches. Provision has been made in the design to accommodate two trolley wires. Such guards are made 15 inches wide, and space the trolley wires 6 inches between centers, the depth of the guard being 5 inches. The hangers provided with this guard are drilled and tapped to take any standard ear, thus maintaining standardization of the overhead work.

The National trolley guard, consisting simply of wire net with suitable hangers, is easily installed and shipped, a guard consisting simply of a roll of patent wire netting cut to the proper length and a set of hangers for each five feet of length. Therefore this guard can easily be installed by a regular line force.

PORTABLE AIR COMPRESSORS AND THEIR USES.

The introduction of compressed air has had a great influence in changing methods of manufacture. Some of the operations for which compressed air may be used are, for operating pneumatic riveters, hammers, chipping and calking tools, lifts, and also for the cleaning of cars, blowing out armatures, generator fields and switchboards. Besides these operations, which are mostly confined to the engine room or car shops, compressed air finds a large sphere of usefulness in mines for operating drills, hoisting engines, pumping engines, etc. Compressed air may further be advantageously used for raising water from artesian wells. For many of these uses, however, if stationary air compressors are employed, long pipe lines are required, which are costly to install and maintain in an air-tight condition, and further, the loss in transmission through long pipe lines is considerable. Therefore, for many purposes which require only a small amount of air, from 10 to 50 cubic feet of free air per minute, it is much less expensive to have a small portable compressor operated by electricity, which can easily be brought to the point where the air is required.

Small portable air compressors having these advantages are built in capacities of 11, 16, 20 and 50 cubic feet per minute, arranged as shown in the accompanying illustration. The Christensen air compressor herewith presented is manufactured by the Allis-Chalmers Company of Milwaukee, and from the general ap-

Christensen Portable Air Compressor.

pearance the reader will at once recognize the design to be identical with that of the compressors of Christensen air brake equipments, which have given such satisfactory and reliable service under the most unfavorable conditions.

The Compressor.

The compressor is of the single-acting 2-cylinder trunk piston enclosed type, with splash lubrication of all the moving parts. The cranks are set at an angle which gives the best balance of the moving parts. The connecting rods are of drop-forged steel, the wrist-pin end being solid, bushed with bronze, and the crank-pin end is of the marine type, split diagonally, thus relieving the connecting-rod bolts of the greater part of the strain, and also facilitating easy access to the nuts for adjustment and for tightening them. The nuts are prevented from backing off by split pins, which are inserted in the ends of all bolts.

The crank shaft is of forged steel, ground to the exact diameter, and carries a double helical gear attached to it by means of two feather keys set at right angles to each other and by a nut and split pin. The helical gear, which is built up of two separate wheels accurately machined, is mounted on the crank shaft by a taper fit which permits it to be easily removed. The use of two keys at right angles permits turning the gear through 90 degrees and thus causes the gear to wear evenly all around, whereas, were this provision not made, the gear would become worn at two points 180 degrees apart, corresponding to the end of the compression stroke when the pressure between the teeth of the gear and pinion is a maximum. These gears operate noiselessly and with a minimum of wear. The valves are made of solid drawn steel tubing, ground accurately to a perfect fit, and will operate continuously without the use of oil and will remain tight indefinitely. These are easily examined or replaced by removing the small screw plugs covering the valve chambers should replacement become necessary. The compressor case forms a convenient and substantial base for the motor, which is located directly above it.

The Electric Motor.

The electric motor is of the series type with form-wound armature and field coils with insulation of the highest quality ob-

tainable. The motor frame, which also forms the cover of the air compressor crank chamber, is made of low-carbon steel of high magnetic permeability. The field magnet is of the 2-coil 4-pole type, having two consequent poles, as is usual in motors for this class of service. The field coils are held firmly in position by two hook bolts, which pass through the field magnet frame. The armature is built up of varnished mild steel laminations, keyed on the shaft between two end plates. The form-wound coils are held firmly in their respective slots by means of insulating wedges driven into the slots and by three sets of band wires.

The commutator is of ample size with mica insulation. The armature winding is of the 4-pole cross-connected type, requiring only two sets of brush holders. The brush holders are provided with an adjustment for the brushes in the form of square blocks arranged so that the tension can be increased or decreased while the motor is running. The double helical gear pinion is fastened to the armature shaft with a taper fit and nut. A special tool is provided for removing the pinions from the armature shaft, thus preventing them from being damaged by the use of hammers or wedges in attempting to remove them.

The bearings for the armature shaft are of the ring oiling type, constructed in such a manner that no oil is wasted or leaks over the joints between the motor frame and the cap. Special oil guards are also fitted on the armature shaft, which prevents oil from reaching the commutator or armature. These motors are designed so that they can be started without the use of resistance, it being simply necessary to close the motor circuit.

The Automatic Pressure Governor.

The governor used in connection with the Christensen air compressor for controlling the pressure within very narrow limits consists of a Bourdon pressure gauge, the indicating needle of which is carefully insulated from the remainder of the gauge. One end of this needle is electrically connected by a flexible cord to the source of current. Two adjustable contacts connected with the solenoids which operate the motor circuit switch are mounted on the gauge dial.

Its method of operation is as follows: Should the pressure increase beyond the predetermined limit the indicating needle of the gauge comes in contact with the upper contact point; the current thus passes through one of the solenoids pulling the plunger forward and opening the motor circuit. Should the pressure decrease the indicating pointer comes in contact with the lower contact point, sending the current through the other solenoid, pulling the plunger back, thus closing the motor circuit. All of these parts are accessible for inspection and a magnetic blow-out is provided which effectually prevents the burning of the contact points.

Reservoir.

The reservoir is seamless, cold-drawn steel, made in one piece, with the bottom pressed in, and the end of the reservoir shell beaded over to form a joint, which is afterwards made solid and tight by brazing and tinning. These reservoirs are tested at 300 pounds hydraulic pressure.

USEFUL TOOLS FOR OVERHEAD CONSTRUCTION.

In the construction of an overhead line many of the seemingly simple steps in the process of stringing and fastening up the wires

saving of time that may be accomplished with these simple tools is surprising, and to the saving of time is to be added the saving in "wear and tear" on the lineman's nerves and the reduction in the number of lacerated knuckles, which tend materially to lessen the efficiency of the crew.

One of the most useful devices mentioned is the throw-in hanger wrench shown in Figure 1, for placing trolley wire hangers in position on the span or suspension wire. The hanger is first placed on the span wire, the span wire passing through the lip of one of the suspension arms and around one side of the hanger. The wrench is then placed over the hanger, as shown, two lugs on the under side pressing on opposite sides of the suspension arms. The handles of the wrench are then twisted around parallel to the span wire, bringing the other lip of the hanger near to the wire. The throw-in lever, which is shown projecting downward in the cut, is then thrown forward, bringing the span wire forward and upward into the lip. The process is simple and is accomplished in less time than is necessary to describe it. The wrench is made in various styles adapted to the different types of hangers manufactured by the Ohio Brass Company.

Figure 2 illustrates the cap and cone hanger wrench, for tightening caps on hangers of the cap and cone form when installing them on the line. The wrench consists of a pair of tongs with jaws adapted to fit over the hanger and hold it against turning while the trolley ear or clamp is being screwed into place.

The type D hanger wrench, shown in Figure 3, is of the alligator type, made of drop-forged steel. It will fit interchangeably the hexagonal nuts on the various types of insulated bolts, hanger caps, etc.

For dead-ending or anchoring trolley wires and for temporary splicing the trolley wire screw clamp, illustrated in Figure 4, will be found effective. The two halves of the clamp are brought together by two screws and it may be used interchangeably with round, figure 8 and grooved wires, from Nos. 0 to 4-0, Brown & Sharp wire gauge.

Splicing of trolley wires may be greatly facilitated by the use of the trolley wire tightener shown in Figure 5, which, like the screw clamp, may be used interchangeably with Nos. 0 to 4-0 round, figure 8 and grooved wires. The jaws of the tightener hold the two ends of the wire securely, and as the two turnbuckles on the sides are screwed up, the ends of the wires are brought together, so that the splice may be readily made.

More or less difficulty is encountered in removing ears from the trolley wire if a proper instrument is not used to pry open the lips of the ear. This operation may be quickly and easily performed by the aid of the stripping tool shown in Figure 6, which is adapted to various forms of clinch ears for round wire. The pointed end of the tool is placed between the lips of the ear and the trolley wire, after which a few blows of a hammer on the end of the tool will open the lips sufficiently to strip the ear from the wire.

A trolley terminal clamp for round or grooved wires is shown in Figure 7. It is made of bronze, in halves, which are clamped together by steel screws. The inside of the clamp and the outer edge of one end are grooved for the reception of the trolley wire.

A "come-along" clamp of more than ordinary strength and compactness is illustrated in Figure 8. This wedge clamp may be used with round, figure 8 and grooved wires. It secures a powerful grip on the wire, and the greater the stress the greater the gripping effect. A blow with a hammer releases the clamp when the wire has been fastened.

In stringing heavy feeder wires or cables, after the poles and cross arms are up, the friction of the wire may be greatly reduced

Figure 1.

Figure 2.

Figure 3.

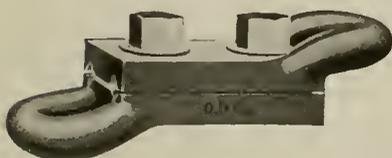

Figure 4.

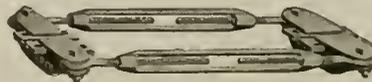

Figure 5.

Figure 6.

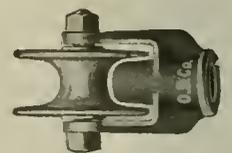

Figure 9.

become arduous tasks without the use of proper tools. A number of special devices which greatly lighten the lineman's work are being manufactured by the Ohio Brass Company of Mansfield, O. These devices were designed primarily for the installation of the company's own overhead equipment, but most of them may be used with equal success with any standard equipment. The actual

by using the Cook feeder wire sheave, shown in Figure 9. This sheave is slipped over an insulator pin and the wire passed over the pulley. By using one of these sheaves to each pole a heavy wire may be drawn over a number of cross arms at a time with ease. The groove in the pulley will take wires up to 1 1/2 inches in diameter.

With the gradual improvement of roadbed, leading to the adoption of steam road standards, it is not unnatural to find managers of interurban lines depending largely upon neighboring steam lines for trackmen, and especially for foremen. The possibilities of competing for this class of special labor have probably not been suggested in more interesting manner than in the words of the superintendent of a high-speed, rock-ballasted interurban line in the east, who was asked what particular steps he had taken to bring about the high operating efficiency of his line. He laid especial stress upon the track work, and said that the admirable track work of the line was due to the fact that the road had been able to secure its pick of the foremen from a parallel steam line by the simple plan of offering \$5.00 more each month than its steam competitor. He knew of no place where \$5.00 would go so far. He was of the opinion that many interurban lines, from short-sighted economy, merely drew the disgruntled and incompetent men from steam roads when a slight increase over the prevailing salaries paid to foremen would be productive of marked improvement in roadbed and hence in operating results.

The hearing before representatives of the interstate commerce commission in Chicago this week of the charges filed by the Chicago & Milwaukee Electric Railroad against the Illinois Central Railroad, which is reported on another page of this issue, disclosed some important facts. Charles W. Merrilies, traffic manager of the Chicago & Milwaukee Electric road, stated that satisfactory traffic arrangements are held with the Wisconsin Central Railway, under which freight is shipped in carload lots from Chicago to Minneapolis. Responding to the question why the road did not consign in its own cars the cabbage which it sought to have the Illinois Central road haul, Mr. Merrilies stated that his road, which owns three box cars, relied upon the arrangement that the railway having the long haul furnishes the cars. One of the principal points which was relied upon to strengthen

the case of the Chicago & Milwaukee Electric road was that the Illinois Central road promulgated the joint tariff, but almost immediately canceled it. Mr. Merrilies charged this cancellation to the influence of the Chicago & Northwestern Railway. There are now two cases of this character before the interstate commerce commission, in which the questions at issue are similar. The thorough manner in which the commission is proceeding in securing evidence in these cases indicates that electric railways will have every opportunity to demonstrate why they should be permitted under the law to exchange freight with steam railways.

The practice on the part of some conductors of holding or "knocking down" a part of the fares collected is a problem which practically every operating company has been called upon to face and one which has caused a great deal of trouble to the managements, as well as no small pecuniary loss to the companies. While it is believed

that most of the conductors are honest it is known that some of them are not, and, although the question of how to deal with the offenders has been given much careful thought, no method has yet been devised which has had the desired effect. Five cents is so small a sum that it is easy for a man to take a few nickels now and then, and, on account of the comparative security from detection, to let the habit grow on him before he fully realizes that he is a thief. Moreover, the general practice of simply discharging dishonest conductors when detected—which is probably due to the difficulty of securing evidence sufficient to convict—has not proved sufficiently severe to prevent others from following their example. The East St. Louis (Ill.) & Suburban Railroad has recently suffered from the dishonesty of some of its conductors and has found that the practice of discharging them when detected has not been sufficiently severe to eliminate the evil. Consequently the company resolved to adopt harsher measures for the sake of example, and, after securing evidence that a certain conductor had been holding back fares, had

him arrested and prosecuted him in the circuit court at Edwardsville, on the specific charge of embezzlement of \$1.20. The man was fined \$1.00 and costs, and given a nominal sentence of one day in the county jail. Although the penalty was a light one it is believed that the precedent thus established will have a salutary effect in preventing a recurrence of the act. Another company, the Cleveland Electric Railway, has recently announced its intention of adopting similar measures. Of course it is in most cases difficult to secure evidence sufficient to convict, but an occasional example could be made and the fear of a jail sentence should operate more strongly to keep men with dishonest tendencies in the right path than the simple prospect of losing a job.

In his annual report for 1906 Ralph Peters, president of the Long Island Railroad, says that a total of about 100 miles of single track is now operated by electric third rail. "Its workings during the year,"

**Electricity
on Long
Island Road.**

Mr. Peters says, "have been very successful, and the service has been reliable and efficient in every respect; and while it is

not yet economical, owing to the fact that your power is not fully employed, it has materially increased your passenger traffic." The company is continuing its heavy expenditures for improvements, and among the charges to capital account during the year were the following items: Electrification of lines, \$531,887, and Atlantic avenue trolley line, \$198,485. The statistics of traffic for the year show an increase of 18.8 per cent in the number of passengers carried, of 22 per cent in the passenger mileage and of 16.4 per cent in the passenger train mileage. Passenger earnings increased from \$5,076,103 in 1905 to \$5,831,453 in 1906, a gain of \$755,350. There was a slight decrease in the earnings per passenger per mile, due to a lowering of rates on commutation and excursion business; the average rate per mile was 1.522 cents, a decrease of 0.082 cent from the preceding year. The improvement which is set forth in the foregoing figures is of especial significance when it is recalled that in the previous annual report, covering the operations for 1905, it was stated that the decrease in the number of passengers carried in that year, as compared with 1904, was caused by a loss of local business due to competition from trolley lines.

The Master Car Builders' Association recommends that "axles be made of double-worked fagoted scrap, 16 per cent of new bar iron worked into the center of the axles being allowed if desired." The process of axle manufacture at the Los Angeles shops of the Pacific Electric Railway serves to illustrate how thoroughly some electric rail-

**Car Axles
from
Scrap Iron.**

ways are executing their shop work and meanwhile advantageously economizing in the purchase of raw materials by reworking scrap iron and steel. New axles are manufactured from scrap material in this company's repair shops, and a very serviceable product is obtained. When an old car is broken up the scrap wrought iron and steel are carefully sorted and turned into the company's storeroom, their value being credited to the destroyed car. The storekeeper receives this material at scrap value, and sells it on work-order requisitions to the blacksmith shop at an increase of 2 per cent in the cost for handling. Here the scrap wrought iron is cut into pieces about 16 inches long and bound into packs weighing 175 pounds each. These bundles of fagots are placed in an oil furnace and later worked under a power hammer until a homogeneous billet is formed from each. Three such billets of reworked wrought scrap are required in making a 4½-inch finished axle and seven bars for a 6-inch axle. The metal thus obtained is considered very desirable for use in axles. The large amount of working necessary to form the billets assures a very tough fiber and a high elastic limit. In this same way the scrap steel is fagoted and worked into shapes suitable for filler blocks, such as are used in building

special track work. While this economical practice is not new in steam railway shop work, its successful adoption by one large interurban road proves it at least to be worthy of thoughtful consideration by others.

The idea of using reinforced concrete arches instead of wooden or iron poles for catenary trolley suspension, as described and illustrated on another page of this issue of the Electric Railway Review, is an original one which should be productive of the best results. This system, which has been developed by E. Darrow, general manager and chief engineer of the Toledo & Indiana Railway, and which it is proposed to adopt on the company's extension from Bryan, O., to Waterloo, Ind., consists of arches 40 feet high, spaced 650 feet apart, supporting a ⅝-inch steel messenger cable, from which the trolley wire is suspended in the ordinary manner. On account of the long distance between points of suspension, the trolley wire is braced against swaying by bridle guys anchored to short concrete poles placed midway between the arches and by additional bridle guys and sway braces attached to the arches. The high-tension wires are arranged on insulators on the outside of the arch columns. Although the first cost of this form of construction is slightly higher than that of the ordinary wooden pole construction, the figures as given by Mr. Darrow being \$107 per section for the arches, ready for wires, as against \$90 for poles with brackets, the greatly increased length of life of concrete as compared with wooden poles is expected to result in a very large ultimate saving. The life of an ordinary wooden pole is only about 10 years, whereas concrete is supposed to last indefinitely. Another advantage of concrete arches is the comparative freedom from possibility of destruction by lightning.

**Concrete
Trolley
Arches.**

CARS WITHOUT MONITORS.

In the design of modern rolling stock there still remains at least one relic of stage-coach days—the monitor deck. In keeping with other advancements in car building consideration might well be given the problem of designing a car without the deck. It exists only as an unnecessary ornamental appendage, increasing the weight and decreasing the strength and cubical capacity of the car.

It is well known that the first requirement of good ventilation is a large cubical capacity per passenger, and it is equally well known that the monitors on cars furnish very little ventilation, as the air blows in one side and out the other without being properly mixed with the other air in the car. It is suggested, therefore, that the use of monitors be dispensed with, and the entire width of the car be carried up to the same height as the top of the monitors on cars now in use, thus materially increasing the volumetric capacity of the car per passenger. Besides furnishing better ventilation it would create a feeling of relief from congestion, for, though a car or hall may be actually crowded, a high ceiling has the psychological effect of eliminating the cramped feeling always present in places with low ceilings.

The most important gain from an economic standpoint is, however, the reduction in the weight of the car roof framing. This is made possible by the more advantageous disposition of the material, accompanied by an increase in the distance between the upper and lower members of the truss. Besides a slight saving in power and reduced wear on the wheels and rails in braking, there also appears a considerable saving in the cost of constructing cars in this manner. The lower cost of construction results from avoiding the expensive truss work on the monitor, and especially is this true of the all-steel construction, for, if made of steel, the fitting of so many small parts is very costly, and, if composite, the wooden parts soon rot and cause the iron work to corrode.

From the maintenance standpoint, there are a number of advantages in favor of abandoning the monitor. Among these are, that without the monitor the roofing is more easily constructed and maintained in a water-tight condition, the expense of replacing broken monitor lights is eliminated, and the trolley pole base can be more rigidly supported, thus greatly reducing the wear and tear on the roofing and the number of leaks.

An interesting example of reduction in weight is clearly presented in the trail cars of the Denver City Tramway, described and illustrated in the Electric Railway Review of May 4, 1907. The weight of these cars per unit of seating capacity is 285 pounds, compared with approximately twice this weight per unit of seating capacity of the old type trail cars of similar capacity. Another example of new construction which shows the good appearance obtained by omitting the monitor is illustrated by the gasoline motor car No. 8 of the Southern Pacific Railroad Company.

Ventilation of cars built without monitors can be easily furnished by ventilators fitted with deflectors placed in the turn of the roof at the front and the rear of the car, similar to those fitted on the cars of the Chicago City Railway.

Increasing the height of the side of the car should be of advantage in the design of semi-convertible cars, since it would permit the use of larger windows, thus making them practically as desirable as open cars. This would avoid, to a great extent at least, crowding of open cars by passengers who allow the closed cars to pass only partly filled because of the better ventilation of the open cars.

THE DOUBTFUL ADEQUACY OF URBAN FARES.

While the main encouragement for the 3-cent fare and analogous movements comes from persons of socialistic or other undesirable tendencies, it can scarcely be doubted that they have been aided in their campaigns by a showing of profits by some urban railways which are unreal and excessive because of improper accounting methods. Wide recognition of this fact is deserved, and it should lead, so far as possible, to a correction of previous error where mistakes have been made and to the adoption of clear accounting systems by managements which have not yet taken up important questions involved in issuing reports about the integrity of which, owing to plain provision for depreciation and renewals, there can be no justified criticism.

It should be borne in mind by those who have studied the situation that the public has never been taught, or had proved the fact that, except possibly in a few instances, the 5-cent fare in urban communities does not permit excessive profits if adequate provision for depreciation and amortization is continued through the life of a limited franchise. It behooves those who, after all, are really most concerned in the success or failure of these low-fare movements, which at times assume dangerous proportions in different parts of the country, to show that the true result of a radical low fare would be confiscation of the properties of the companies. Convincing evidence of the insufficiency of low fares can be produced only by conclusive figures compiled by the companies showing the true relation of operating expenses and depreciation and fixed charges to revenue.

To continue to operate without provision for depreciation or amortization is to prepare for a penalty that is as inevitable as the coming of night following day. Demonstration of the fact that after these just charges the earnings remaining for distribution to stockholders are normal, or less than normal, will constitute an argument against reduced fares which cannot seriously be denied.

The growth of the fallacy that 3-cent fares are adequate illustrates the vital need of educating the public on this important matter. Throughout the years when excessive dividends have been paid on some street railway properties there has been but slight recognition of the principle of

depreciation. Companies have assumed either that their franchise rights could not be questioned or that there would be no difficulty in procuring new ordinances.

The 5-cent fare has been the maximum rate of transportation per passenger for so long a time that custom and law now sanction it, and any advance at this late day would be difficult if not impossible to effect. Emphasis, however, should be laid on the urgent necessity for insisting that if the 5-cent fare is maintained as the maximum rate, it should be regarded also as the minimum rate.

While it is doubtful if any cure for the 3-cent fare mania would be so swift and certain as a sudden reduction to a 3-cent basis of urban street railway fares, with a corresponding decline in employes' wages, quality of equipment and appurtenances, and the inevitable resultant poor service, the bankruptcies that would follow would be so grave and serious that it is the plain duty of the companies to endeavor by all rightful means to maintain existing fares.

The low-fare injustice is generally founded on hatred of wealth, selfish political hopes or other unworthy motives. For its champions no policy is too radical, no course, even confiscation, improper. To discourage these movements, which, if successful, will strip street railway revenue to the point of despair, companies will undoubtedly be obliged to do more than explain patiently the inadequacy of 3-cent fares. It is no less sane and reasonable to advocate 7-cent fares than it is to urge 3-cent fares. In many communities there would be more merit in an argument for 6-cent fares than in the clamor for 4-cent fares. Is there not too little agitation on one side of this question as well as too much on the other?

The facts epitomizing the effect of the times on street railways may be stated as follows: Not only have labor and materials increased in cost, but taxes are continually growing larger. The length of ride for one fare is constantly increasing through the construction of extensions and through the transfer system. Because of the enlarged investments necessary in plant and equipment on account of the demands and needs of the public, fixed charges are increasing. At present, on account of the disturbance in the money markets and the difficulty of selling securities on advantageous terms, either increased interest rates or other concessions are essential in order to attract capital for improvements. Besides all these questions, there is now developing a recognition of the virtue of provision for depreciation of property and amortization of the investment.

The exactions of the public are insistent in these days. Companies must provide finer cars and must equip them with new, costly appliances designed to assure comfort, health and safety to passengers; seats are demanded for each person who chooses to board a car at any time of the day; motive power must be of modern type; cars must be kept clean and well heated and ventilated.

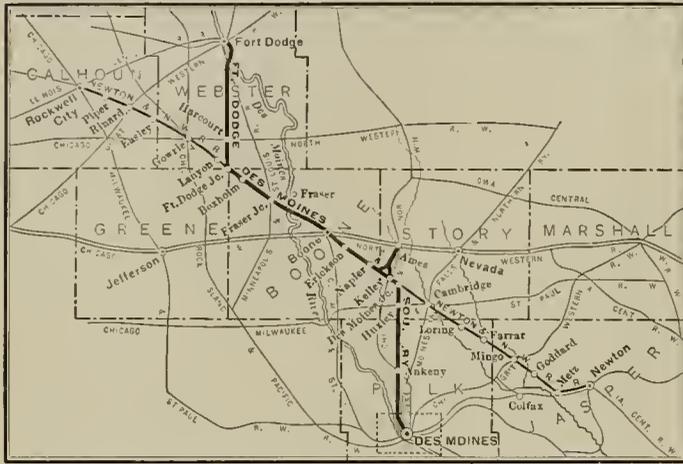

The street railway company is so completely helpless in the city in which its investment is made that periodical presentation of some of the foregoing facts should be made in those cities where the low-fare movement is rampant. The fact that every street railway can so readily be made the subject of abuse, public and political, is an additional reason why the company side of this vital fare question should be presented forcefully and ably in every large community whenever a good opportunity is offered.

If the task of providing for the transportation needs and whims of the populace of great cities is to remain thankless, there is no good reason why it should also be made unprofitable.

The Metropolitan West Side Elevated Railway on May 22 opened an extension of its Douglas Park branch from Fortieth avenue to Forty-sixth avenue and Twenty-second street. Local trains will be run every five minutes throughout the day and during the evening rush hours express trains will be run.

THE FT. DODGE DES MOINES & SOUTHERN RAILWAY.

The Newton & Northwestern Railway Company has been operating as a steam road between the terminal cities of Newton and Rockwell City, a distance of 101.7 miles, since 1903. In February, 1906, the officers decided to electrify a part of the existing line, purchase several small street railway

Ft. Dodge Des Moines & Southern Railway—Map.

systems, and construct branch lines. In accordance with this decision the Ft. Dodge Des Moines & Southern Railway Company was formed. Soon thereafter preliminary surveys for proposed lines were made, private right of way was secured and the work of electrifying the old line and constructing the new lines was begun. The first division of the electric line, from Des Moines to Ames, will be ready for

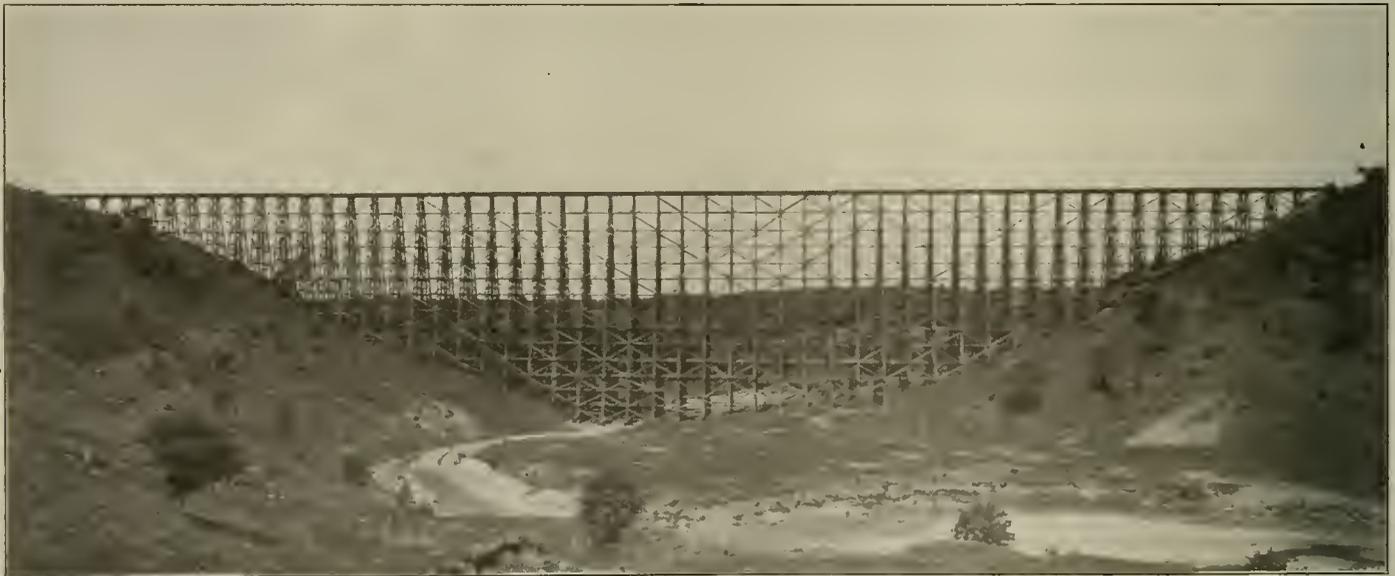

Des Moines Junction, a distance of about 25 miles, where connection is made with the main line of the Newton & Northwestern. From this junction point electric cars are to be run over the tracks of the steam railway to Ft. Dodge Junction, a distance of 37.7 miles. At Kelley, $3\frac{1}{2}$ miles west of Des Moines Junction, a branch line seven miles long has been built to Ames. The company has recently been granted a franchise to build a street railway on the principal streets of Ames and to electrify the existing steam railway that is now operating between Ames and the state college grounds near that city. From Ft. Dodge Junction, the point where the electric line leaves the right of way of the Newton & Northwestern, the tracks again run in a northerly direction to Ft. Dodge, a distance of 22.2 miles, where physical connection is made with the street railway system of that city, which is owned by the company. The distance from Des Moines to Ft. Dodge, exclusive of the Ames branch, is 85.5 miles, and from Des Moines to Ames is 35.9 miles.

Electrification of Steam Railway.

The work of electrifying the steam railway between Des Moines Junction and Ft. Dodge Junction has practically been completed. This consisted principally of bonding the rails, erecting a pole line and stringing the trolley and high-tension wires. However, in anticipation of the operation of the electric cars at high speed, it has been found advisable to ease many of the curves and to reduce the grades.

Track and Roadway.

The track, supported by an excellent roadbed, is laid with 70-pound rails. Between Des Moines and Des Moines Junction the track work is practically completed. The steel is now being laid between Kelley and Ames and between Ft. Dodge Junction and Ft. Dodge. The line from Des Moines to Kelley and from Kelley to Ames will probably be completed

Ft. Dodge Des Moines & Southern Railway—Timber Trestle 800 Feet Long and 165 Feet High.

operation by electricity on July 1, 1907, and the entire system, 85.5 miles in length, will be opened for traffic on September 1.

In the accompanying map the lines of the Newton & Northwestern and the Ft. Dodge Des Moines & Southern are shown. The electrified portion of the steam railway is between Des Moines Junction and Ft. Dodge Junction. The Ft. Dodge Des Moines & Southern has for its southern terminus Des Moines, the capital city of the state of Iowa. Entrance to this city is made over the tracks of the Des Moines City Railway Company.

From Des Moines the line extends almost due north to

before July 1 and the entire line completed before September 1. The steel on the Ft. Dodge division is now laid. On account of the proposed dual operation of steam and electric trains the trolley wire is being hung 21 feet 6 inches above the rails. Tubular iron brackets and No. 0000 trolley wire are being used.

One of the accompanying engravings, that of the deck steel truss bridge over the Des Moines river, five miles south of Ft. Dodge, illustrates the substantial character of the roadbed structures being erected. This bridge comprises two 70-foot deck spans 20 feet deep, designed for Cooper's E45 loading. The bridge abutments are of concrete con-

struction. The timber trestle approaches to the river spans have a total length of 760 feet. Another illustration shows the trestle spanning one of the canyons, west of Boone, on the electrified portion of the Newton & Northwestern. This

paratus. The generating equipment is in duplicate, either set of machines being of sufficient capacity to handle the load under normal conditions.

Coal is to be delivered to the boiler room by coal chutes

Ft. Dodge Des Moines & Southern Railway—Car Equipment.

trestle, 800 feet long, is 165 feet high over the ravine which it crosses.

Power Plant.

The generating station is situated on the bank of the Des Moines river at Fraser, which is practically the load center of the Ft. Dodge Des Moines & Southern Railway. In addition to being admirably located for obtaining feed and

from an elevated track. The coal will be hauled from the mines in bottom-dump cars and delivered to the boilers without rehandling. Along the front of the ash pits is a 12-inch spiral ash conveyor, which carries the ashes and cinders from the boiler room to a vertical bucket elevator, which loads them in cars.

The boiler equipment consists of three Aultman-Taylor

Ft. Dodge Des Moines & Southern Railway—Interior of Engine Room.

condensing water and for the economical distribution of electricity, the powerhouse is within 1,000 feet of a coal mine, from which the coal supply is received.

The building, which is of brick and steel construction throughout, is 90 feet square and 25 feet high to the roof trusses. It is divided longitudinally into two rooms, one of which is used for the boilers and auxiliaries and the other for the turbo-generators, transformers and other electrical ap-

horizontal water-tube boilers, equipped with extended furnaces, which allow them to burn slack coal, such as is mined in the vicinity of the station. Each boiler has a rated capacity of 400 horsepower and is worked under a steam pressure of 175 pounds. Space is provided for a fourth boiler. The stack is a concrete-steel structure 180 feet high and 8 feet in diameter. Boiler feedwater is supplied by two Epping-Carpenter duplex plunger pumps (7½ and 5 by 10)

which receive water by gravity from a Harrison open heater.

The generating equipment consists of two Westinghouse-Parsons 1,250-kilowatt, 3-phase, 2,300-volt, 25-cycle turbo-generators. The turbines are to be operated condensing and at a speed of 1,500 revolutions per minute. However, provision is made in the installation so that in case of accident to the condensing apparatus, which has a cooling surface of 2,000 square feet, or in case of low water, the turbines may be operated non-condensing. Circulating water for the condensers is drawn from the river through a 20-inch cast-iron pipe by Wheeler steam driven centrifugal pumps. The con-

Ft. Dodge Des Moines & Southern Railway—Timber Truss Bridge Across Des Moines River.

densation is returned from the turbines to the heater in the engine room by an Edwards steam-driven (6 by 14 inch) air pump.

Located in the engine room are two steam-driven 110-volt exciter sets, a 400-kilowatt 600-volt rotary converter, three 300-kilowatt and three 150-kilowatt water-cooled transformers and a 5-panel switchboard, which is equipped with necessary recording and measuring instruments. A general view of the interior of the powerhouse is shown in an accompanying engraving.

Substations.

It is planned to have six 400-kilowatt substations on the line, but for the present only five will be built. Other than the converter equipment at the powerhouse, similarly designed substations have been erected at Ankeny, Kelley, Ft. Dodge and Otho, and another will later be installed at Boone in connection with a general office building that is being planned.

Current is generated at the powerhouse at 2,300 volts, is stepped up to 22,000 and fed 3-phase east and west to the substations. The substations are each equipped with a Westinghouse 400-kilowatt rotary converter and three 150-kilowatt water-cooled transformers.

The car equipment which has already been received consists of ten 3-compartment single-end passenger cars. These cars are 53 feet 3 $\frac{5}{8}$ inches long over buffers and are 9 feet 4 inches wide over sill plates. Each car has 13 reversible seats upholstered in leather in the main compartment and 8 rattan-covered seats in the smoking compartment. The section at the front end of the car, set aside for baggage, is 10 feet 6 inches long and is provided with a 3 $\frac{1}{2}$ -foot sliding door on either side. The motorman's cab, 3 by 3 feet 6 inches, is located at the left-hand side of the forward end of the car.

The car body is mounted on Baldwin trucks, with 36-inch steel wheels. There are four Westinghouse No. 112 motors.

Entrance to the car is had through the sides of the rear

vestibule. In addition to the usual doors, single doors are provided at the ends for passage from one car to another when they are coupled into trains. In addition to the passenger cars an express car 47 feet 6 inches long over end sills has been received. The rolling stock was furnished by the Niles Car & Manufacturing Company.

In electrifying a section of the Newton & Northwestern Railroad care has been taken in the reconstruction work, so that the regular traffic of steam trains on this railway will not be interrupted by the electrical installation or later by the running of electric cars. It is proposed by Mr. J. L. Blake, general manager of both companies, to maintain without interruption the present schedule of passenger and freight trains over the entire length of the steam line. The steam railway passenger trains will be given the right of way over the electric cars.

Dispatching.

The running of the electric cars will be directed by telephone from the main office at Boone by a dispatcher who will also have charge of the operation of the steam trains over the track to be used jointly by the steam trains and the electric cars. The details of the operation have not yet been perfected. It is expected, however, that cars will be operated under 60-minute headway between Des Moines and Ames and under 90-minute on other parts of the system.

The general offices of the company and the car barns are

Ft. Dodge Des Moines & Southern Railway—Steel Deck Bridge.

at Boone. For the present the car equipment will be repaired in the shops of the Newton & Northwestern. A temporary building for the storage of the cars has been erected near the shops.

The organization of the Ft. Dodge Des Moines & Southern Railway is the same as that of the Newton & Northwestern. The officials are: President, Homer Loring, Boston; vice-president and treasurer, F. A. Farrar, Boston; secretary, C. A. Cushman, Boston; auditor, W. Chamberlain, Boone, Ia.; general manager, J. L. Blake, Boone, Ia.

The powerhouse construction and all electrical installations were made under the supervision of J. G. White & Co., engineers, of New York.

INDIANAPOLIS MEETING, CENTRAL ELECTRIC RAILWAY ASSOCIATION.

The last regular meeting before fall of the Central Electric Railway Association was held on Thursday of the present week at the Claypool hotel, Indianapolis, Ind., with President Nicholl in the chair. There were about 100 members present.

The president announced that the next meeting, after a summer recess, will be held at Columbus, O., on September 26. The finance committee reported a substantial balance to the credit of the association and that comparatively good progress was being made in collecting the dues from the members.

On motion of E. C. Spring the president was instructed to represent the association at the Atlantic City meeting of the American Street & Interurban Railway Association and to appoint one other member to accompany him.

J. K. Gray, trainmaster Western Ohio Railway Company, Lima, O., read a paper on "Modern Train Dispatching." (This paper appears in this issue on page 680.)

When questioned regarding the operation of work trains, Mr. Gray stated that the rules of his company require that such trains run as extras and must have orders for all movements. When they desire to run on the main line, having obtained orders, they must wait for a regular train and run as its second section. The regular is required to carry green signals for the work train as its second section, and not to remove these signals until sure that the work train is in the clear. The Western Ohio frequently operates as many as 10 or 12 extras at one time, including local freight, work and line cars.

Several members entered into discussion, regarding which one, the motorman or the conductor, should handle train orders. No definite conclusions were reached.

The matter of providing orders for operating cars if the company's telephone lines were disabled was considered. Mr. Gray stated that when there was trouble on all the railroad telephone lines, it was possible for station agents by means of properly located cut-out switches to sectionalize the telephone line and get into communication with some other agent who in all probability would be able to get the dispatcher on a long-distance telephone.

F. D. Norviel outlined the essential requirements of a train dispatching system. These comprise simple and brief rules and a well-made timetable. With these two requirements fulfilled the government of trains will be found more simple. In his estimation there is no department that needs standardization and uniform methods more than train dispatching, and there seemed to be no reason why train dispatching methods could not be standardized. In closing Mr. Norviel emphasized the great need for thorough organization in the train operating department and assurance of the execution of orders. With this last and greatest requirement fulfilled a large number of the delays and dangers sometimes incident to high-speed interurban operation disappear.

In relation to standardization, Mr. Spring stated that the books of rules adopted by the American Street and Interurban Railway Association and the Street Railway Association of the State of New York were formulated more especially by and for representatives of city railroads, and therefore are not wholly applicable to interurban operating conditions in the middle west. On motion of Mr. Spring the association instructed the chair to appoint a committee of five to report to the association recommending a set of rules for the "Operation of Trains." This is understood to mean not only rules for the conduct of employes connected with the operation of trains but also recommendations for a uniform method of train operation. The committee later appointed comprises F. D. Carpenter, general manager Western Ohio Railway Company, chairman; C. N. Wilcoxon, general manager Cleveland Southwestern & Columbus Railway Company; F. J. J. Sloat, general manager Cincinnati Northern Traction Company; C. D. Emmons, general manager Fort Wayne & Wabash

Valley Traction Company; C. A. Baldwin, superintendent of transportation Indiana Union Traction Company.

Mr. M. C. Stern, General Systems Company, Dayton, O., read a paper on "Train Dispatching by Modern Methods." (This paper appears in this issue on page 684.)

The association then adjourned for lunch and to inspect an exhibit of the Telegraph Signal Company, Rochester, N. Y. This demonstration of an entirely new method for controlling train movements and signals was in charge of Chauncy P. Button.

This very ingenious mechanism for attachment to telephone or telegraph systems, when installed at each station, automatically closes the circuit in from 15 to 20 seconds after a telegraph operator has allowed his key to remain open; it enables the dispatcher to quickly clear the wire of a "ground" at any station when an operator along the line has carelessly failed to remove the ground plug from switchboard; it enables the dispatcher to sound an alarm bell at any office or in the living apartments of any operator along the line and it also enables him to throw any semaphore signal on his district from a position of clear to danger in a period of from 25 seconds to two minutes, the operation for each station taking two seconds longer than the one preceding it. When the dispatcher has thrown the semaphore from clear to danger, there is automatically repeated to the dispatcher the number of signal that has been thus controlled.

If the dispatcher is in doubt as to whether an operator has thrown his semaphore signal to danger, he can quickly ascertain in less than two minutes by operating the device. He will receive an answer from that particular station, the same as though he had operated the semaphore signal himself. Then if the operator has failed to throw the signal the dispatcher, of course, by using the device, will throw the signal to danger.

Another marked feature is that by using this device, bridging the keys and also bridging the ground wires, it absolutely makes it impossible for an operator, who is so inclined, to interfere with the calling of an operator by an alarm bell or in placing a signal at danger, at any station, as the only method of interruption would be by cutting the wire.

This device works as successfully on telephone as telegraph lines, and when applied to a telephone circuit, permits a train dispatcher to throw any semaphore signal on his dispatching district to a stop position in a few seconds' time, the first signal operating in five seconds, the second in seven, and so on. The device was invented by S. R. Wright.

The first paper of the afternoon session was read by S. R. Dunbar, purchasing agent Indiana Union Traction Company, Anderson, Ind., and will be found in this issue on page 682.

There followed a general discussion on storekeeping with special regard to the handling of "scrap" accounts and maintaining the stores within predetermined maximum and minimum limits.

W. H. Evans, chairman of the "Standardization Committee," read his report as follows:

Report of Standardization Committee.

Your committee appointed to investigate the subject and recommend standards for adoption of this association, as they apply to traction railroads, held meetings at Indianapolis on April 25, 26 and 27, and investigated the subject of standards, principally on the line of the recommendations which were made by our association in convention assembled at Ft. Wayne on September 27, 1906, and with particular reference to the following subjects: Brakeshoes, axles, journals and journal boxes, tread and flange of wheels and rails for street and interurban railroads.

After carefully considering the various subjects, your committee would deem it advisable to make a partial report at this time, in order that this can come before the association for consideration at this meeting.

In the discussion of the advisability of standards it was evident that it would not be possible to arrive at any happy medium between the various types and classes of material now in use by the different traction companies serving the purpose for which we desire to adopt standards, but rather, it

would be necessary to arbitrarily select a standard and determine the dimensions which we consider advisable for these different parts. Any slight variation in the dimensions would necessarily interfere with the interchangeability of the parts and prevent, to a large extent, the object to be accomplished by standardization, that is, the selection of material and parts which would be of the same pattern and dimensions and common to the different roads forming this association.

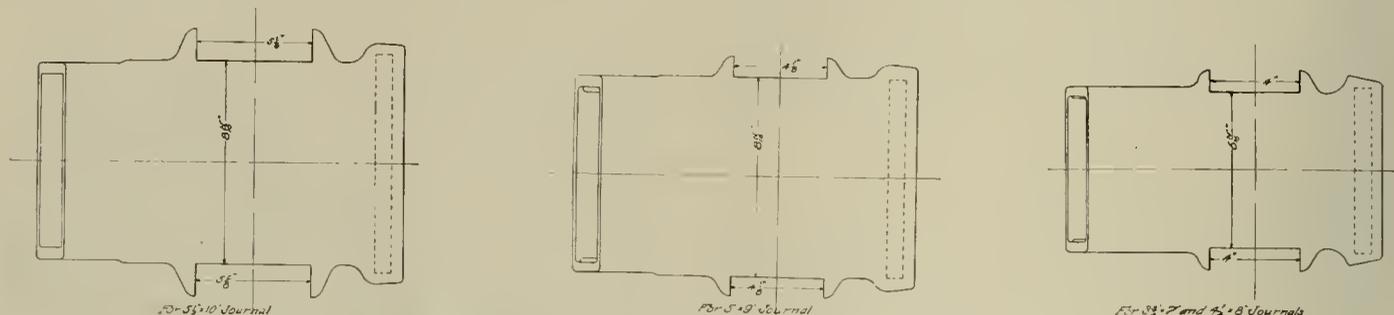

Brakeshoes.

It was decided to recommend the use of a brake head and shoe similar to the one which is now standard on the

capacity motors reducing the variety of axles to four sizes, as indicated by the axle journals, $3\frac{3}{4}$ by 7, $4\frac{1}{4}$ by 8, 5 by 9 and $5\frac{1}{2}$ by 10.

The various dimensions as given on these axles were the subject of considerable discussion by your committee, and while these dimensions very nearly approach those of axles already in service on the various types of motor trucks, it is the opinion of your committee that these dimensions can be faithfully followed to advantage in remodeling or rebuilding trucks already in service and to cover all future orders for equipment.

We would particularly recommend the advisability of re-

Standardization Committee Report—Controlling Dimensions for Pedestals and Pedestal Jaws.

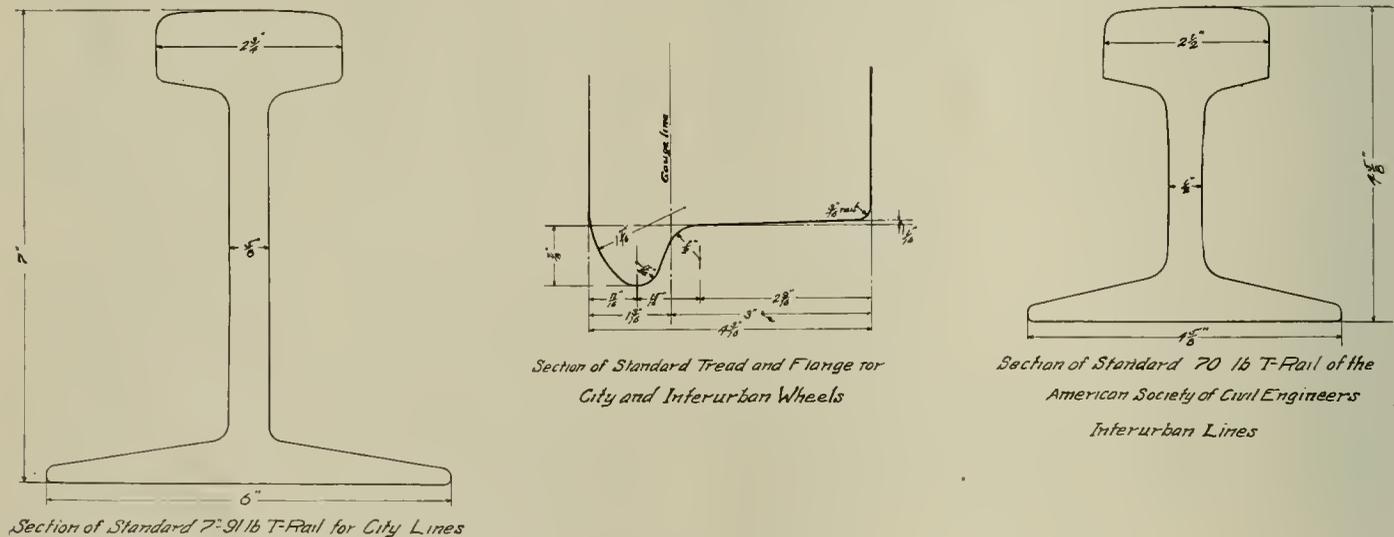

steam railroads, but adapted to a wheel tread three inches wide and consequently the shoe will be $2\frac{3}{4}$ inches wide, as shown in the attached drawings. (See illustrations.) Your committee is decidedly in favor of the shoe without the flange where it is possible to use these shoes with trucks which permit the use of brakebeams, since, in our opinion, much greater economy can be effected with the use of this type of shoe than with the flange shoe, and it is necessary to scrap a considerably smaller portion of the shoe. This shoe can also be reversed on the same wheel and requires but one pattern for all types of trucks, and can also be used, should occasion require, on wheels with the steam railroad standard width of tread.

However, we consider it advisable to include in our

recommending the journals to these standards, and also consider it very desirable to inaugurate a standard for gear fits and also for motor axle bearings, and while it may be necessary to vary from the dimensions, as recommended, for some particular style of motors or trucks, if these particular dimensions referred to above are adhered to, a decided benefit will be obtained.

Journal Boxes.

In connection with the axles already recommended we recommend the adoption of journal boxes which conform in detail to the dimensions commonly used with axles with journals of the dimensions as recommended and which have become standard on the various equipments on the steam roads.

Standardization Committee Report—Recommended Wheel Tread and Flange and Standard Rails for Street and Interurban Use.

recommendations a flange shoe which fits the same brakehead and can be used where desired in place of the shoe above recommended.

Your committee makes no recommendations as to the attachment of brakehead to the brakebeam, as this portion of the head will necessarily take the form of the various types of beams to which it is to be attached.

We would, however, recommend that with 3-inch tread wheels the center-to-center of brakeheads on the same beam shall measure $59\frac{1}{4}$ inches.

The attached drawings, covering the brakeheads and brakeshoes, are respectfully submitted. (See illustrations.)

Axles, Journals and Journal Boxes.

We would respectfully submit the attached drawings, covering axles for the various weight cars and different

The dimensions of these various parts of journal boxes, journal bearings and bearing keys are generally familiar, and your committee has not considered it advisable at this time to prepare detail drawings covering the dimensions of these parts. However, we desire to call particular attention to the dimensions of the boxes where they fit the pedestal jaws, as it is principally in this particular that the motor journal box differs from that commonly used in other trucks. We, therefore, submit the drawings attached, showing the dimensions where the journal boxes for the different axles fit the pedestal jaws. It will be noted that the dimensions of the boxes at the pedestal jaws are the same for the journal, $3\frac{3}{4}$ by 7 inches, as for the $4\frac{1}{4}$ by 8 inches, as it is found that this can very readily be accomplished, and it would, no doubt, be an advantage, as it frequently occurs that it is desirable to put in a $4\frac{1}{4}$ by 8 inch axle in place of one $3\frac{3}{4}$ by 7. These dimen-

sions for the 5 by 9 and 5½ by 10 inch journal boxes are what have usually been the practice on trucks where these axles have already been used.

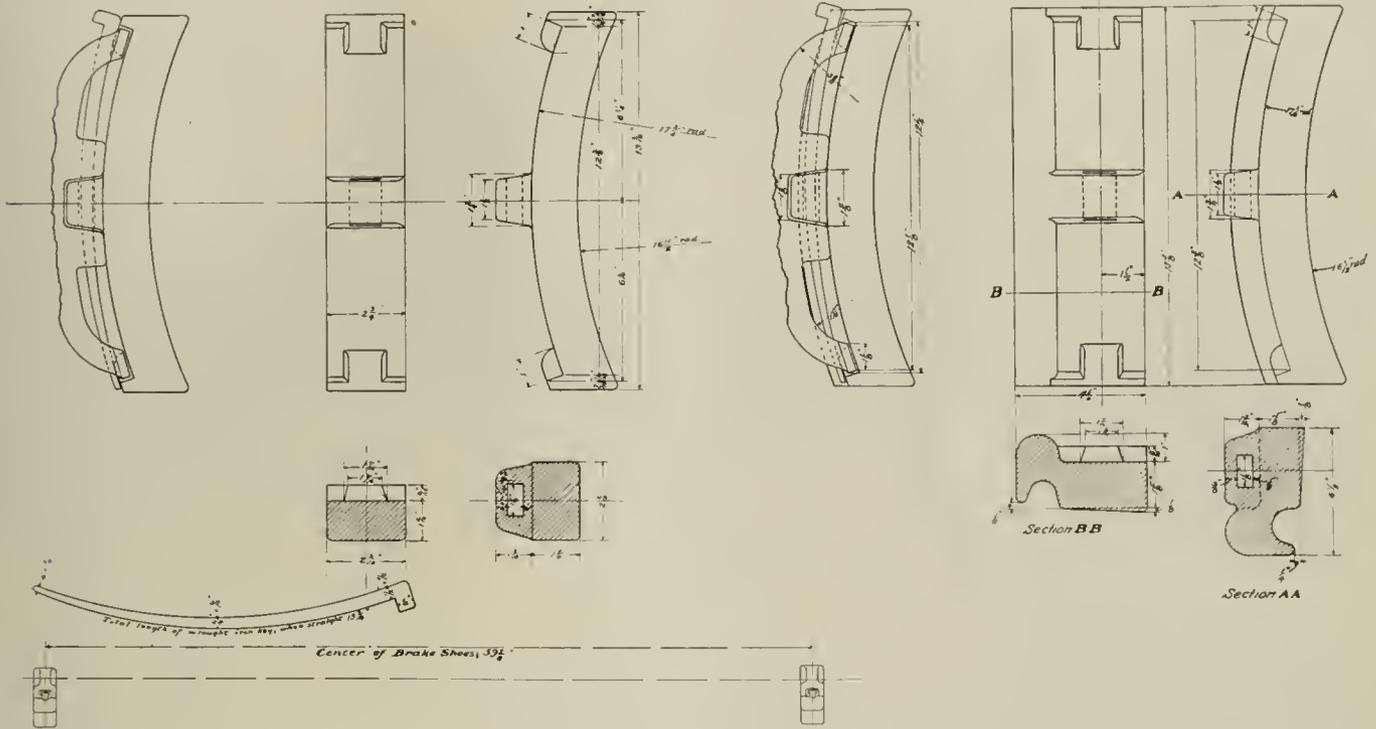

Tread and Flange of Wheels.

We would respectfully submit herewith a drawing of the tread and flange of wheels of dimensions which conform to

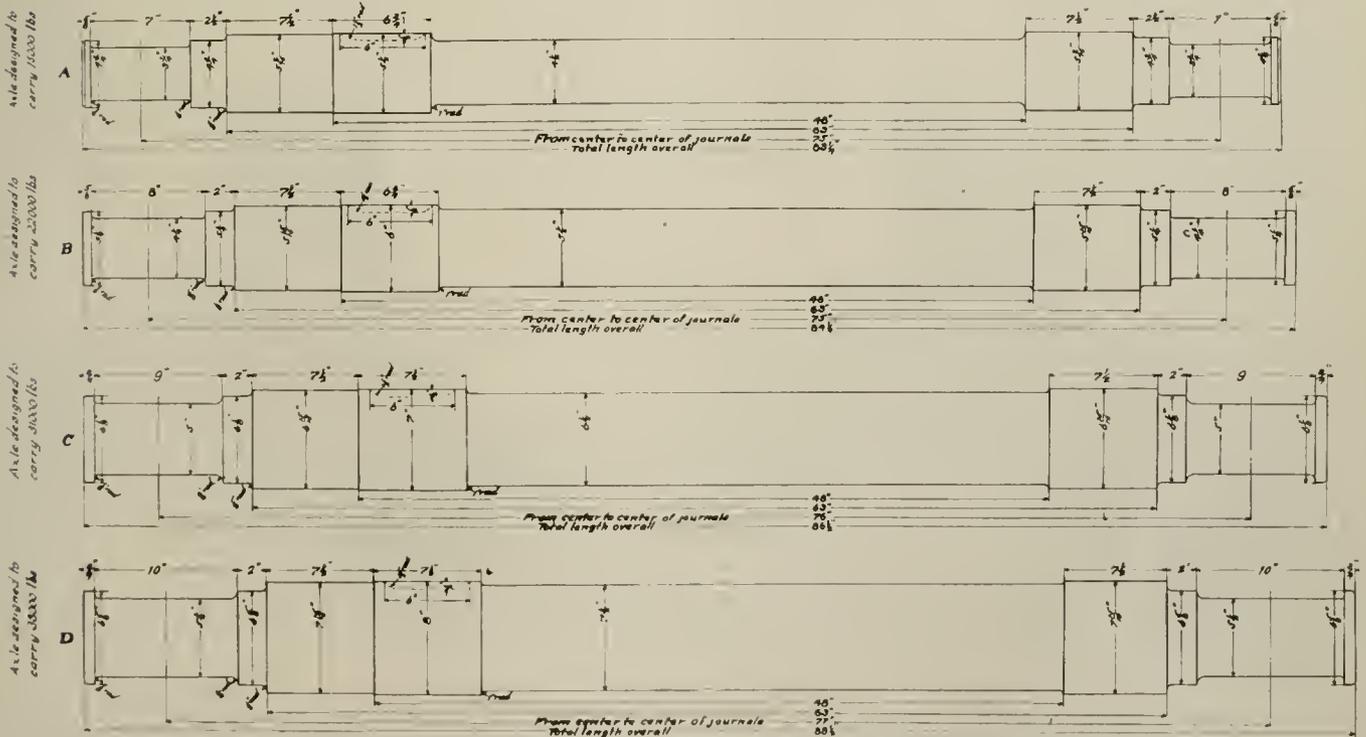

Rails for Street and Interurban Railways.

We would recommend the adoption as standard of what is known as the T-section rail for both city and interurban work.

For city tracks we would recommend what is known as the 7-inch T-rail section, 91 pounds to the yard, as shown in

Standardization Committee Report—Recommended Brakeshoes, Key and Center-to-Center Dimensions.

Standardization Committee Report—Axles Recommended for Various Loadings.

recommendations made at Ft. Wayne on September 27, 1906. In the opinion of the committee this tread and flange can be used equally well on city and interurban tracks, and was selected after a careful investigation of the types of wheels used by many of the largest traction companies in the country.

the attached drawings. This section of rail and others very similar to it have been used successfully on many of the large systems in the country, and in our opinion can well be adopted as standard.

For interurban tracks we would recommend the Ameri-

can Society of Civil Engineers' standard section, 70 pounds to the yard, as shown in the attached drawing. This rail is commonly used on interurban lines in the territory covered by our association, and so far as we have any information it has given very good satisfaction and appears to be of sufficient weight to amply take care of the interurban traction car requirements.

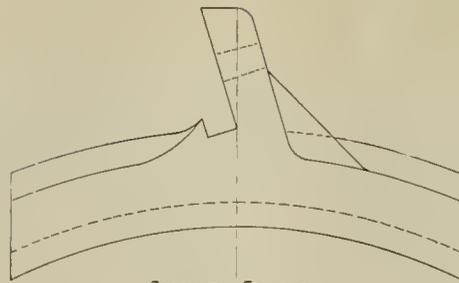

Respectfully submitted: W. H. Evans (chairman), R. C. Taylor, Fred Heckler, M. E. Baxter, W. A. Gibbs.

In introducing the report Mr. Evans explained that several subcommittees with chairmen had been appointed to handle the various phases of the work, as follows: Standardization of height of drawbar and coupler, R. C. Taylor, superintendent of motive power Indiana Union Traction Company; standardization of trolley base, wheel and parts, M. E. Baxter, electrical engineer and master mechanic Western Ohio Railway Company; standardization of classification lights and signals, W. A. Gibbs, general manager Indiana Columbus & Eastern Traction Company; standardization of foundation brake rigging and parts, Fred Heckler, superintendent of motive power and cars Lake Shore Electric Railway Company; standardization of electrical equipment, R. C. Taylor, superintendent of motive power Indiana Union Traction Company.

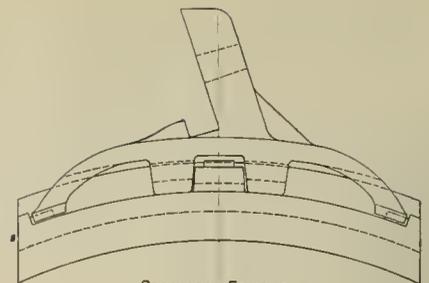

It was decided not to adopt at this meeting the report of the "Standardization Committee," but to distribute copies in printed form and thoroughly discuss the subject at the next meeting.

Messrs. McAdam and Woods of the Indiana railroad commission spoke regarding the relations between the state and the interurban railways. It was cited that whenever the freight earnings of a road become more than 33 per cent of that road's total earnings, then the board of railroad commissioners has jurisdiction over its operations. This commission has ready for immediate distribution on request a late and accurate map of the railroads and interurban lines in Indiana.

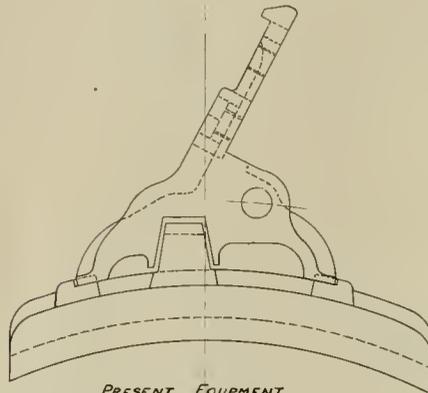

On account of the lateness of the hour it was decided to postpone hearing the report of the committee on "Express Contracts" until the next meeting of the association, after the summer recess, at Columbus in September.

STANDARDIZING BRAKESHOES.

The report of the standardization committee of the Central Electric Railway Association, which was presented before the meeting at Indianapolis on May 23, recommended the adoption of a standard brake shoe for all equipments. It was

Traction & Terminal Company, has considered for the use of this company's equipment, new attachment details for the various types of shoes now used in Indianapolis. Reference to the accompanying illustrations will aid in the explanation of how it has been found feasible to adopt a standard shoe, thus dispensing with 10 different patterns for brakeheads and

Standardizing Brakeshoes—Present Shoe and Head at the Left, with Flanged Shoe and Attachment Conforming to Recommended Practice at the Right.

proposed to use a brakehead and shoe similar to those now standard for steam railroads. As the wheel tread also recommended was 3 inches wide, the shoe would be designed 2 3/4 inches wide and in detail, as shown in the illustrations accompanying the report presented elsewhere in this issue. While the committee recommended the use of a shoe without flange it also included in its report a recommended design

replacing these by one which would be designed to hold the recommended standard shoe. It also should be noted that this shoe is interchangeable with the type adopted by the Master Car Builders' Association and now universally used on steam railway equipments, the attachment features of these being the same. The illustration presented on the opposite page, and which was reproduced from a line draw-

Standardizing Brakeshoes—Present Practice Shown at the Right, with Flanged Shoe and Attachment Conforming to Recommendation at the Left.

of shoe with flange for use on trucks without brakebeams. There was no recommendation made as to the attachment of the brakehead to the brakbeam, since, necessarily, this portion of the head must take the form of the various types of beams which will support it. The committee, however, did recommend that with the 3-inch tread wheels the center-to-center distance between brakeheads on the same beam should measure 59 1/4 inches.

W. H. Evans, master mechanic of the Indianapolis

ing, shows 10 combinations of brakeshoes and heads. The five combinations on the left-hand side of the illustration are brakeheads with shoes, each of which requires both right and left handed patterns, and none of which is interchangeable with the others. It also should be noted that none of the shoes on the left-hand side of the illustration is reversible.

The five combinations shown on the right-hand side of the illustration include various brakeheads, each carrying a shoe of the recommended standard dimensions. Thus at-

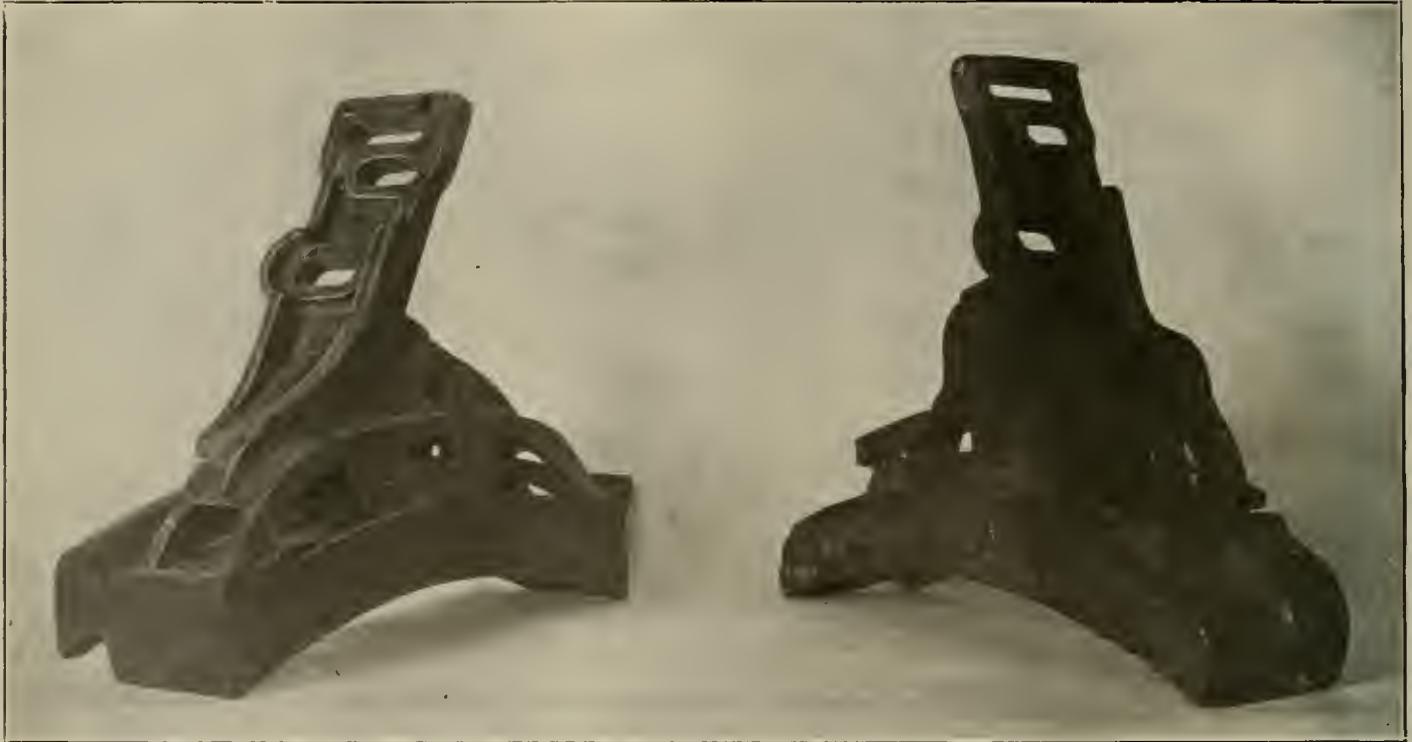

tached these brakeshoes are both reversible and interchangeable. The various heads are designed so that when attaching no changes need be made in the present beam arrangement and yet very desirable features of interchangeability and reversibility are provided.

It is well known that the present design of shoe, such as used on many interurban roads, can only be worn to about half its original weight, so that 50 per cent of the metal purchased must be sold as scrap. This undesirable feature has been well taken care of in the recommended standard shoe, since it so closely approaches the steam railroad practice

MODERN TRAIN DISPATCHING.*

BY J. K. GRAY, TRAINMASTER WESTERN OHIO RAILWAY COMPANY,
LIMA, O.

Not until recently have the managers of electric railways given very much attention to the most important part of train operation, the dispatching of trains. They have, however, lately come to realize that it is just as important to safely dispatch electric trains as steam trains. Both should be operated as nearly in the same manner as conditions will permit. There are still some electric roads that operate without a train dispatcher, but use the barn foreman or some centrally

Standardizing Brakeshoes—Present Shoe and Head Shown at the Right. Flanged Shoe at the Left Conforming to Recommended Practice.

and permits a minimum amount of scrap. Such a shoe weighing 20 pounds when new should wear to about four or five pounds for scrap.

Much credit is due to those who have taken the initiative and thus far carried on the details tending toward a standardization of electric railway rolling stock.

Steel Cars for Cement.

The United States Steel Corporation is ordering 200 all-steel box cars for its cement business in the Pittsburg and Chicago districts. The corporation made 2,076,000 barrels of its Universal portland cement in 1906, against 1,735,343 barrels in 1905. These all-steel box cars will have sides of steel plates, $\frac{1}{8}$ inch thick, which will be amply reinforced. The total weight will, it is expected, run about 3,000 pounds less than the weight of comparable wooden box cars. There is not the advantage there formerly was in owning private cars, as concessions allowed by the railroads are very small. The Steel corporation in this move is actuated chiefly by its desire to foster this new branch of the steel car business by setting a good example. It will be recalled that the Carnegie Steel Company was the first to use all-steel hopper cars, its example being followed by the regular railroads. At one time the company contemplated, so it was understood, the erection of a complete plant for the manufacture of steel cars, but desisted in connection with the famous contract for plates with the Pressed Steel Car Company, by which the latter was given plates on a sliding scale, based on the ascertained average selling price of bessemer pig iron.—Industrial World.

located, trusted employe, who does this as a kind of a side line along with his regular duties. This system seems to work very well where trains run slowly. When a train arrives at a given meeting point, in most cases the motorman calls up the barn or shops and says to the acting dispatcher, "This is Brown at Siding No. 4; Jones is not in sight"; the acting dispatcher will say, "Jones left Yorkville 15 minutes late; stay there until he comes," which they do, making a collision impossible; or if the telephone is not in working order the crew just sits down and waits for the opposing train.

The modern dispatching system is handled by a trustworthy man, preferably taken from the train service, where he has been for a period of time long enough to acquaint himself with every inch of the property, and to be thoroughly competent to hold a position where safety to both passengers and property must be assured regardless of cost and the speedy operation of trains, at the same time giving all possible dispatch with safety.

The dispatcher's office should be in a large, well ventilated room with plenty of light, and the door locked to all, for the presence of any person in the dispatcher's office is liable to distract his attention and cause him to make a mistake.

His office should be centrally located as nearly as possible so he can communicate with the trainmen distinctly, directing the movement of trains in addition to the movements provided for in the rules and timecard.

When the printed timetables, showing the meeting and passing points, and the time of all scheduled trains, and the rules directing how these trains are to proceed with relations to each other, are studied by all concerned, thoroughly understood by all, and faithfully observed, collisions will not occur.

There should be a good desk set where the telephone line is on the same poles on which the high-tension transmission line is carried, for it has happened that a live high-tension

*Read before the Central Electric Railway Association, Indianapolis, on May 23.

wire has fallen on the telephone line and had no bad effect whatever on a desk set; where the telephone line is on a separate line of poles, a cordless telephone board, equipped with 2-way cams and numbered drops, will give excellent service, but a live high-voltage wire falling on a line connected with this box will render the same unfit for service at once.

A regular train sheet must be kept, and all train movements recorded, just as soon as any train reports or is reported, and when one dispatcher relieves another all orders

Form of Train Order, Western Ohio Railway.

must be written on the prescribed form and placed in a conspicuous place so there will be no misunderstanding.

There should be three dispatchers daily, each working an 8-hour trick, to produce good results.

In order to obtain good results from trainmen they are first required to pass the examinations specified by the company, which include eye, ear and physical, stripped; if they qualify they are given a rule book and timecard with instruc-

double check. The train order is then placed in a clip fastened on the window sash directly in front of the motorman; the conductor places his copy in a clip in the rear end provided for him; thus both orders are in plain sight until fulfilled, superseded or annulled. We prefer the motorman, but permit either the motorman or conductor to receive orders from the dispatcher, for the purpose of causing the least possible delay; our telephone booths are located at the switchpoint of sidings so that when the conductor opens the switch to allow his train to take siding he is right at the telephone booth, while the motorman is on the car probably 100 feet from the booth; thus by having the conductor report and receive the train order we save a delay of possibly two or three minutes. In towns or cities the motorman invariably takes the orders, as the conductor is busy at the rear platform while at stations.

The telephone is used altogether for train dispatching on our road and excellent service is obtained; 80 miles consists of two No. 9 galvanized iron wires carried on cross-arms in the usual manner, on the same poles underneath the high-tension transmission lines and transposed every 10 poles to prevent interference from parallel power and feeder lines; 32 miles consists of two No. 12 copper lines, constructed the same as the iron line with the exception of the transposing, which is rolling every 10 poles.

On this line all the dispatching and commercial conversations are carried, keeping the line very busy at times; but if proper attention is given to the telephones and telephone line, good results will be obtained. There are 28 telephones on the line at all times and 38 telephones located in telephone booths that have cut-out switches. By connections, using just the ordinary 1-way switch, the dispatcher can communicate with Dayton, a distance of 60 miles; also with Toledo city limits, a distance of 94 miles; also with New Haven, Ind., a distance of 72 miles; also with Springfield, a distance of 70 miles.

This road is divided into three divisions, viz., Findlay-

Train Dispatching, Western Ohio Railway.—Telephone Booth at Siding.

Train Dispatching, Western Ohio Railway—Dispatcher's Office.

tions to study carefully; the student is then placed on a train with a competent man who teaches him everything possible pertaining to his division. After the new recruit has learned a division, he is called to the office and examined thoroughly, especially on train orders; after he has learned all the divisions he is again subjected to an examination. If he understands the rules and train orders thoroughly he is then permitted to operate a train with an old trainman, either motorman or conductor, as the case may be.

To obtain orders from the dispatcher, on the road I represent, the motorman or the conductor, as the case may be, steps into a telephone booth 3 by 3 by 8 feet with a window in each side 18 by 24 inches, giving one short ring, which calls the dispatcher, giving his train number and siding number to the dispatcher, who gives such orders as are necessary; the conductor or motorman, as the case may be, repeats the order as it is given and writes the same on the prescribed form, making two copies by the use of carbon paper. He then repeats the order back to the dispatcher, who checks it from the original order just given and if the same is correct the dispatcher will complete the same by giving the time and his initials. The motorman retains one order and gives the other to the conductor, who reads the order over to the motorman before the train is allowed to proceed, thus causing a

Celina division, a distance of 68 miles, operating 78 passenger trains and 8 freight trains; the Wapak-Piqua division, a distance of 32 miles, operating 50 passenger trains and 4 freight trains; and the St. Marys-Minster division, a distance of 12 miles, operating 24 passenger trains and 4 freight trains. Besides the above trains we operate a line car and work train daily except Sunday.

A novel feature in tunnel design devised by Charles M. Jacobs, the chief engineer of the Pennsylvania Railroad tunnels under the Hudson river, is found in the screw piles, which will be placed at intervals of 15 feet throughout the length of the tunnels. While the silt forming the bed of the river is sufficiently tenacious to hold the tunnels in perfect alignment during construction, it was not considered firm enough to do so when the tunnels are in use. To forestall this possible danger screw piles will be sunk to a solid foundation, and upon them the tunnel proper will rest. The piles will be 27 inches outside diameter, and the shell will be 1 1/4 inches thick. The sections will be 7 feet in length, and will be bolted together through internal flanges. The lowest section will be cast with one turn of a screw 4 feet 8 inches in diameter.—Scientific American.

THE ISSUING OF SUPPLIES—HOW TO PREVENT LEAKS.*

BY S. R. DUNBAR, PURCHASING AGENT INDIANA UNION TRACTION COMPANY, ANDERSON, IND.

A railroad, more than any other concern, it seems to me, must trust a great deal of valuable property to the hands of its employees. It places as many safeguards as possible about the handling of its cash and its cars, but is everything done which could be done to insure a proper use, as well as a proper issuing, of its material?

The cash is the heaviest problem, of course. What we do not get might pay for an accident or two, with a little material thrown in, but what fails to reach the treasury has to accomplish its disappearance before the eyes of at least a few people. When a car is put on the road with its load of humanity or freight, a great deal of property and life is entrusted to the crew and the dispatcher. They cannot disappear with it, but they can cause great loss. Unlike either of the foregoing, material can disappear and no one know where.

Preventing Leaks After Issuance.

The possibilities of loss do not stop with the issue of supplies from the storeroom, by any means, and if the title of this paper does not limit me to consideration of leaks before and at issuance I might suggest that one of the biggest problems is the care of material, tools and supplies after they leave the storeroom. The only ways to prevent leaks and waste after supplies are issued require continual vigilance on the part of the heads of departments and a policy of holding each employe strictly and individually responsible for all company property which may come into his hands.

Nowadays the concern which does not know just what its product should and does cost will not live to bother its competitors long. In order that the cost may be known, someone must know just how much material and time are necessary to accomplish the work in hand. We know that a railroad, with many of its workers away from any possibility of strict supervision, is up against difficulties which are hard—some of them impossible—to overcome, but a system of reports can be devised which will prevent excessive waste or loss.

Railroads generally supply most of the inhabitants in their territory with a complete set of tools before construction is over, but afterward I believe that absolutely no tool should be issued until the old one has been turned in, or additional tools are shown to be necessary.

As has been implied, there are, in my opinion, fewer difficulties in the way of properly issuing supplies than there are in the way of a proper use and care of them. There is an impersonality about a railroad which has its effect upon all who are employed by it; what loyalty there is more often is felt toward the head of a department, rather than toward the company itself. As the storeroom is concerned with all the departments, this "impersonality" has less effect, and, partly for that reason, the storeroom can be dealt with more strictly and exactly. The proper use and care of supplies will, I believe, always be more or less of an unsolved problem, but to my mind that is not the case with a storeroom. Leaks in the issuing of supplies can be prevented. The problem is solved by merely having a good system and sticking to that system. It is possible to do both, but, necessarily, as in all kinds of work, good tools (in this case a good system) should be in good hands. Good men are needed in the storeroom just as much as on any other part of the road. In fact, I would rather have enough good—that is, accurate and careful—men and a poor system, than cheap help and a good system.

The Storeroom.

The storeroom serves two purposes, that is, the holding of material in stock for use as needed and serving as a suspense account, so that charges are not made to the operating and other accounts until the material is actually used. Both are important, equally so as far as the storekeeper is concerned, although the auditor and the master mechanic may not agree as to which is the more important. I shall probably be unable to keep the stock and the accounting entirely separate, because what affects the one affects the other, but that there are two objects to be served should, nevertheless, be borne in mind. And as the subject is partly "How to Prevent Leaks," I shall not try to describe the leaks, but possibilities of one or more leaks will be found lurking somewhere near each suggestion that follows.

The starting points—the very foundation of our system, and without which there can be no system at all, but every-

thing left wide open for all kinds of leaks—should be a locked storeroom with big "Keep Out" signs over the inside gates, and well understood rules to the effect that nothing can be obtained from the storeroom without proper written authorization. The material and supplies in the storeroom represent cash to the company, are handled as cash in the accounting, and should be safeguarded the same as cash.

Requisitions.

To go with a locked storeroom must be rules that only someone of the storeroom force can give or take out material. The storekeeper cannot be held responsible unless he can prevent supplies from being stolen, or from being improperly issued or taken out.

The written authorization to obtain supplies should be on a specified form, generally known as a requisition, numbered if possible. As the requisition serves as the basis for the charges to the different accounts, as well as the authority on which the supplies are issued, the auditor should be at least concerned in getting up the form and in the instructions to be given in regard to its use.

The requisition is the cornerstone of any storeroom system. After the material has been issued on it, it takes the place of the material, so far as the accounts go, and must be treated as carefully as a voucher for a cash payment would be. If lost, or if misappropriated by the guardian of some source of expense because his accounts have been running high, no charge can be properly made, and the storeroom will be "short." It is important, therefore, that requisitions not only

be kept in a safe place, protected from fire if possible, until charges and stock records have been made from them, but that no one outside the storekeeper and his stock or charge clerks should have access to them. One lost, mislaid or misappropriated requisition does not mean much, perhaps, but a few of them for big charges would make a large shortage at the next inventory, which would have to be charged against profit and loss.

The storekeeper must of course issue material whenever a properly signed requisition is presented. He cannot have any discretion in the matter except as between proper and improper requisitions. He should, therefore, receive definite instructions as to what and whose requisitions to honor at the same time that heads of departments are instructed as to how requisitions should be made and signed. There are many possibilities for leaks, or an improper issuing of material, if requisitions are allowed to be made without being approved, or at least being seen, by the heads of the different departments.

The requisition should contain columns in which to enter the prices of the articles named and the accounts to which charges are to be made, as well as space for date, quantity of the article on hand, quantity required, quantity delivered, description and purpose for which intended.

A good system does not stop with the locked storeroom and the requisition. The more complete the system the fewer chances there are for leaks. The requirements of the auditing department and the necessities which exist for keeping an ample stock of all supplies on hand at all times, as well as the amount of money the management is willing to allow for

*Paper read before the Central Electric Railway Association, Indianapolis, Ind., on May 23, 1907.

running the storeroom, determine the details of the system to be maintained. One of the first details to be affected by the considerations referred to is the stock record. This should be kept, preferably, on cards, arranged in the manner usual to a card index, or in loose-leaf ledgers, the sheets being large enough and arranged to accommodate several items of the same class.

On the stock record should be shown, by dates and in as much detail as desired, the quantities issued and received, as they are issued and received, and deductions and additions made from day to day, so that the amount of a given article on hand may be ascertained at a glance. I shall refer to this feature again.

Leaks from an incomplete or ill-kept stock record may not show up very big until an inventory is taken, or there is a fire, when someone is likely to inquire, "What's the matter with the storeroom?" In case of fire a complete stock record, if intact from having been properly protected, would enable the company to show clearly to the insurance adjusters just what its loss had been. That is, it could show just what had been in the storeroom when the fire occurred, and, after deducting the value of the mess that is left, the difference, or the loss, could not be questioned. It would be difficult to say what the saving might be in such a case.

An incomplete stock record, as well as incompetent men on the floor, means leaks in other directions, that is, outside of the storeroom. I refer to "low stock." One side of the leaks from low stock is the expense of express, telephones and telegrams, and the time of the purchasing agent consumed in getting material in a hurry; the other side is the expense, trouble and inconvenience of waiting for material, or of making something else do, or of running risks with the equipment. I venture to assert that if the condition of "low stock" could have been avoided on almost any road in Ohio or Indiana during say the past year, a good extra stock record clerk would have been a minor expense.

The expense of maintaining a storeroom is borne for the purpose of keeping material and supplies on hand at all times, and the end in view is, therefore, partially defeated if there are frequent or even infrequent cases of "low stock." So, I claim, a complete stock record is necessary, because it is unfair to presume that the floorman can always remember when to report that a certain item, out of perhaps several thousand, is running low. There may be several men waiting with requisitions to be filled, or there may be any one of several circumstances to distract his mind and cause his failure to notice that the supply of a certain article should be replenished. Then, again, he may think there is ample stock, whereas it may take weeks or even months to replenish.

Replenishing Stock.

The stock record clerk should have before him on each of his cards, or sheets, the minimum amount of stock it is safe to carry; that is, the point at which the supply should be replenished, which should be determined by the time it takes to get delivery and the relative importance of the material in question. Only in this way can items be ordered in ample time. No one's memory is trusted. In making his entries, the stock clerk can easily get into the habit of referring to his "minimum," and the importance of showing the amount on hand after each entry, in order that the minimum may be recognized when it is reached can readily be seen.

To prevent, so far as possible, any item so important as "low stock" being overlooked, a printed form called, say, "Memorandum of Stock Required," of an individual shape, should be used. In this way such items will not escape attention as they might if miscellaneous slips of paper were used. These forms should be used both by the stock clerk and by the man issuing the material. Two chances of catching low stock, therefore, are at hand; that is, from the records and from the stock itself, and it will frequently happen that the stock clerk and the floorman will make out slips on the same items at the same time.

Perpetual Inventory.

The complete stock record may be made to serve still another purpose, namely, that of the "perpetual inventory." The annual inventory, with its attendant expense and confusion, is a nightmare to all concerned. Errors will creep in during a year's transactions, so that besides the actual work of an inventory, which may have to be made by a force already overcrowded, a difference will probably be found to exist between the actual value of the stock on hand and the book value, which means affecting an adjustment unwelcome to someone or everyone.

The "perpetual inventory," as I understand the term, is a stock record so exact that it coincides strictly with the actual quantities of material on hand each day, and is, in fact, a complete inventory. The perpetual inventory is strongly advocated by a large number of accountants, and

an approach to it is in vogue in numbers of establishments. I would not recommend, however, the theoretically perfect perpetual inventory, as it is expensive, but a near approach to it is practicable, and a complete count will be necessary only once in several years. With this system frequent counts are made of the different items as new stock is ordered, and these counts compared with the records. Where a discrepancy is found to exist, an apportionment of the charge or credit can be made to the accounts affected, after possible causes for the error have been investigated. In order to help locate the errors, and serve as an additional check, some systems go so far as to provide a card, kept in a rack at each bin, on which the store man enters the quantity, date and requisition number each time material is removed. This really makes two stock records.

Where these frequent counts are made, more time is required from day to day, but leaks and errors are discovered and adjusted more readily, and the extra clerical expense is distributed over the entire year, instead of at the time of the annual inventory. Besides, possible thefts are more easily detected.

Price Records.

Intimately concerned with the stock record are the methods of checking-in material, entering bills, and otherwise handling the storeroom accounts so as to prevent leaks. In this era of advancing prices it is particularly important that the price record should be kept always up to date, whatever system, or lack of system, is pursued. This includes the prompt entering of bills as they are passed. Otherwise the charges may be distributed to the various accounts at improper prices, and the store's account be the loser or the gainer, as the case may be—an undesirable situation.

Checking Materials.

Material should be checked-in when it is received, and not after the bill comes in. This applies to all departments, as well as to the storeroom. If there is no record from which to approve bills, then they have to be approved from someone's memory, or by guess; either way furnishing chances for error. In order to approve bills properly the department for which the material is ordered, say the storeroom, should have knowledge in advance of the receipt of material, as to just what is to be expected, and from whom it is to come; and blanks should be provided for recording exactly what comes in. The most serviceable form for this purpose is a triplicate of the order placed by the purchasing department. It serves as a notice of the placing of the order, and can be arranged for recording the dates and quantities of material received on the order. If the record and the bills do not agree, there is a fair claim against or in favor of the shipper. A permanent record of material received at the storeroom each day is advisable for various reasons, which I shall not take the time to go into here.

Distribution.

A distinct phase of the issuing of supplies, and one which touches closely both parts of the title of this paper, is the distribution of supplies from headquarters to the various points on the road at which they are required. There are more opportunities for loss here, it seems to me, than in any other one direction. There are, of course, practically only two means of distribution, the regular freight and passenger cars, or the supply car. If there are any objections to the supply car, someone else can urge them probably better than I, so, as the subject is "How to Prevent Leaks," I say take the deadhead stuff off the regular service, so far as possible, and put it on a supply car, unless the freight business is very light and the road be altogether too short in mileage.

It might be shown by investigation that a supply car would not be so much of an expense as an actual saving. No matter how much care is taken, or how many rules there may be, it seems to be almost impossible to have deadhead material handled with as much attention as it should be. Supplies are lost and never found; there are unavoidable delays in delivery; the freights must take time out to make special side trips to the company's property; and, frequently, cars are so crowded that a choice has to be made as to whether to leave paid freight or deadhead stuff. One is as bad as the other, or a good deal worse, to readjust the Irishman's remark. Company shipments should be billed out the same as any other freight. This takes time on the part of the freight department force, and time is valuable there as well as at the storeroom, where the billing, tagging, boxing, etc., all have to be carefully attended to. The boxing, wrapping, etc., are necessary on account of transfers, rough handling and misappropriations. So much for a few of the objections to the regular service.

The supply car can be loaded at or in the storeroom, and much time be saved that department from that circum-

stance, as well as others. The regular trips of the car can be utilized by the mechanical, roadway and electrical departments for the delivery of all kinds of supplies and material belonging to each, and, many times, a special trip of some work car could be saved. Especially valuable would be the return trips of the supply car, bringing into headquarters shipments which now burden the freights or make necessary the use of a separate car. Valuable scrap, for instance, and from which there are many leaks, could be better taken care of and classified. Last, and most important, supplies would be promptly, properly and surely delivered.

Briefly, in closing, I would recommend for the issuing of supplies, properly and with as few leaks as possible, a locked storeroom, governed by strict rules as to the taking out of material; a well-considered system; enough good men to carry out the system completely; facilities for the men to handle their work without confusion, that is, an adequate storeroom, both as to size and arrangement; the distribution of supplies through the medium of a supply car; and the inculcation in the minds of everyone on the road of a wholesome respect for the storeroom and for company property.

TRAIN DISPATCHING BY MODERN METHODS.*

BY M. C. STERN, GENERAL MANAGER GENERAL SYSTEMS COMPANY,
DAYTON, O.

Train dispatching, I contend, by proper methods, is as important as the very rails over which your cars are run, and the more thorough that system may be, which must be freed from unnecessary red tape, the better the service, the greater the results. Since double-tracking is an expensive luxury, the dispatching of trains on single tracks should certainly be so well designed as to protect life and property, also to improve time schedule, for the greater number of trips a car can make daily, the greater the earning power it assumes.

The people are not unjust when they demand safe travel, and there is not a single railway official, to my mind, who aims to refuse that demand, for all books of rules contain severe and pointed instructions regarding the safety of passengers and the protection of property.

Still further, when we consider the fact that as carriers of passengers, the greatest of responsibility rests upon the officials, since all are desirous of reaching safely the point of destination, and consequently expect every precaution to be exercised, beyond the question of doubt. Man is not infallible, and methods should be adopted not only to improve conditions, but also to prevent errors, thus increasing the responsibility that rests upon the shoulders of those connected with the operation of trains, from the dispatcher to the crew.

Responsibility should be imposed upon all men, for the man so held will develop his mental powers to their proper capacity, thereby making him more reliable, hence more valuable; at the same time it improves him morally, it teaches him to abstain from drink, from excessive habits that would tend to weaken the mind and sight, and by their development physically betters him in power, strength and purpose.

Now what constitutes the fundamental basis of a perfect dispatching system? First, I would say responsibility, as explained; second, elimination of verbal messages; third, convenient and frequent means for receiving messages; fourth, proper erection, correct installation and maintenance of signals, telephones and records; and, fifth, judicious economy.

In train dispatching, wherever the verbal message method is in vogue, there exist these possible means of escaping responsibility, or shifting of blame. Verbal messages are entirely void of any security, are lacking in product of search. It is an easy matter to shift blame from one to another, when no evidence can be brought forward to substantiate either one way or the other. And written messages, singly or in duplicate only, are likewise failing in their respective completeness, since it surely would be an easy matter to destroy such orders, thereby darkening the search for the party responsible or the cause, and that course would be followed, I dare say, in 99 cases out of 100, should an accident occur, or there may be any possibility of a reprimand.

The triplicate secret method is a step forward and I suggest the issuance of three distinct copies on the autographic dispatching registers, which may be placed in booths, on cars, or wherever messages are received. These machines produce three full copies of each train order—one for the conductor, one for the motorman and the third to be retained in a private receptacle under lock and key for auditing and checking by the proper official of the road.

The dispatcher, having a machine at his desk, records in duplicate each message that he issues. One is discharged from the machine, the other retained in a locked receptacle. The conductor writes the order as he receives it, repeating it to obtain dispatcher's "complete," signs his name to the order, declaring thereby his full understanding thereof. A like course may be followed by the motorman reading and repeating the message, signing his name with like declaration of that of the conductor. Thus we have the signatures of the dispatcher, conductor and motorman, stamping indelibly upon their memories the responsibility that rests upon them. I want to impress upon you the fact that so much depends upon these orders that the utmost care must necessarily be taken so that they may be absolutely correct.

For obtaining orders at booths the conductor as a rule should call the dispatcher, who in turn will give such orders as are necessary, whereupon the conductor should write the same plainly, without any abbreviation (this is quite important), on the dispatching register, reading and repeating them, and possibly the motorman should also read and repeat. At stations the agent should call the dispatcher upon approach of car, to ascertain if any orders are to be given. If so, the conductor is signaled, or the order may be taken by the agent, read and repeated to the dispatcher for his O. K., signed in a space provided, given to conductor upon his reading, repeated and signed, both original and duplicate—one for himself and the other for the motorman—taking a signature from the motorman on his, the conductor's, copy.

If portable telephones are carried on cars, jack boxes are installed at proper points or turn-outs, switches, etc. In such cases the motorman usually calls the dispatcher, giving necessary information as to car number, time, etc.; while the dispatcher gives the order, both the motorman and himself write it as given over the register. The message is read and completed, then reread and repeated by the conductor.

The motorman's copy should be placed on a clip directly in front of him, serving thus as a notice and a most excellent reminder. The third or secret copy is beyond reach, but ready for momentary inspection. This operation does not occupy unnecessary time, it works with clock-like precision and the men readily become accustomed to its operation.

The triplicate form of train orders provides great security, and the retaining of the third copy, securely locked, where it cannot be tampered with, gives an additional element of precaution and tends to increase the factor of safety.

The dispatcher's office should be entirely separate from all other offices. The switchboard that I find very highly recommended is of the cordless type, since the desk is entirely clear for the dispatcher's sheets. As the telephone provides immediate and direct communication, it is far preferable to the telegraph. The lines may be single or duplicate, the latter preferable. The rules regarding the use of telephones should be clear, limiting it, on the dispatch lines, to strictly dispatching business.

The standard steam road train-sheets seem exceedingly well adapted for the interurban work. The train order form should be so arranged as to avoid unnecessary rewriting and so worded as to be clearly understood by all. Avoid all abbreviations.

It may be regarded as well, in the use of triplicate copies, to have a white sheet for the motorman, a yellow sheet for the conductor, while the record copy should be white to assure clear carbon work.

The question of booths is solved in the octagonal shape covered with corrugated iron, with a peaked roof. This booth should be securely anchored by lag bolts into posts driven into the earth. Furthermore, they should be well lighted.

Let your telephones be of the best type, fastened to the wall of the booth, while on a shelf place the dispatching register in a position to take orders with perfect ease. Let not the first cost of installation play any too important part, for once installed the best always produces results.

The reason that single lamps are preferable to electroliers for the dome of a car is that they distribute the light better and have not the disadvantage of electroliers of bringing into a small space wires of different potentials. This feature of electrolier wiring can hardly be avoided; often the highest potential light and the lowest will be in the same cluster and if anything goes wrong, the entire circuit is affected. The same potential enters and leaves single lamps and the wiring for the circuit is safer and better in every particular. Specifications frequently call for the lamps to be placed under the ventilator rails, or elsewhere in a vertical position. Before the use of anchored filaments in lamps the vertical position lengthened the life of the lamps, but as all car lamps now have anchored filaments no advantage is gained; in fact, lamps on lower ventilator rails should be placed horizontally to be out of the way of hand-rail straps and signal cords.—Brill's Magazine.

*Paper read before the Central Electric Railway Association, Indianapolis, Ind., on May 23, 1907.

CONVENTION OF THE SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION.

The third annual convention of the Southwestern Electrical and Gas Association was held at the Menger hotel, San Antonio, Tex., on May 14, 15 and 16. In point of attendance, work and exhibits the convention was the most successful ever held by the association. The first session was opened at 10:30 a. m. on Tuesday, May 14, by an address of welcome by Reagan Houston. This was followed by the election of new members and the address of the president, H. S. Cooper, general manager of the Galveston Electric Company.

H. M. Moore then read a paper on "Education of Legislators with Reference to Public Service Corporations." The paper pointed out the necessity for keeping the good-will of the people who elect the legislators by giving the best possible service and the advantage of having exact figures and facts ready for presentation as arguments, especially such figures as records of payments for taxes, licenses and other public expenditures. Mr. Moore suggested the appointment of a committee on "Statistics" to obtain figures and information from the various companies to be compiled at certain intervals for circulation. The "Question Box" was next taken up and various subjects relating to street railway, electric and gas plants were discussed. At the afternoon session a paper on "Labor-Saving Tools and Devices for Central Stations and Car Barns" was read by V. W. Berry. Mr. Berry discussed a number of labor-saving devices with the uses to which they may be put and advocated their installation as a matter of economy. This was followed by another "Question Box" discussion.

The Wednesday morning session was devoted to papers. David Daly, manager of the Houston Electric Company, was to have presented a paper on "The Best Car for Urban Use," but as he was suddenly called to Boston on business the paper was not written. Arthur C. Scott, professor of electrical engineering at the University of Texas, read a paper on "The Value of Scientific Tests to Public Service Corporations," pointing out the rapid advances made in the field of public utilities by the application of scientific discoveries to practical engineering knowledge, and the value of research laboratories and scientific tests. He called attention to the meagerness of the facilities for obtaining reliable tests at the disposal of American engineers as compared with those obtainable abroad and after discussing what has been done in that direction in this country advocated a greater interest in and co-operation with the technical schools on the part of public corporations. F. C. Randall read a paper on "The Getting Up and Trying Out of Forms." He discussed the requisites of a good blank form for the purpose of securing or imparting information, with suggestions as to the systematic methods of getting up such a form. The afternoon session was occupied by "Question Box" discussions. The evening was devoted to the "Rejuvenation of the Sons of Jove."

The entire Thursday morning session was given over to the supply men and was deemed such a success, both by the association and by the supply interests, that the latter have requested that it be made a permanent institution. At the afternoon session a paper on "The Application of Gas to Mechanical and Industrial Uses," by an official of the San Antonio Gas & Electric Company, was presented. This was followed by a discussion on the remaining sections of the "Question Box," reports of committees, reports of the secretary and treasurer, and the election of officers. The new officers chosen were as follows:

President—H. T. Edgar, vice-president and manager Northern Texas Traction Company, Ft. Worth.

First Vice-President—W. B. Tuttle, manager San Antonio Traction Company, San Antonio.

Second Vice-President—J. P. Crerar, president and general manager Denison-Sherman Interurban Railway, Denison.

Third Vice-President—J. F. Strickland, president Dallas Securities Company, Dallas.

The office of secretary was filled by re-electing the present incumbent, R. B. Stichter, of the Dallas Securities Company, Dallas; and the office of treasurer was filled by re-electing for the third time A. E. Judge, president and general manager of the Tyler Electric Light & Power Company, Tyler.

An especial feature of the convention was the excellence, both in matter and manner, of the "Question Box," edited by Samuel Kahn, resident engineer of the San Antonio Traction Company, which was found of the greatest interest in the convention and aroused very thorough discussions.

For the diversion of the guests the San Antonio Traction Company on Wednesday evening gave an excursion to various points of interest and an entertainment at Electric Park, which was followed by a Mexican supper tendered by the San Antonio Gas & Electric Company.

ELECTRIC TRUNK LINE OPERATION.

At a meeting of the American Institute of Electrical Engineers, held on May 21, Frank J. Sprague presented a paper entitled "Some Facts and Problems Bearing on Electric Trunk Line Operation." The paper treated the subject at great length, covering 90 printed pages, and necessarily only a brief abstract can be given here.

The author started out by a quotation of E. H. Harriman, to the effect that the development of railway systems was dependent upon the use of electricity, and said that the keynote of all prophecies for the future was the word "capacity." This he interpreted to mean economy in its highest sense, that is, saving in passenger and ton mile operation, reduced train crews, higher operating schedules, better distributed service, less dead time on sidings, less interruptions to schedule and greater freedom from accidents. He referred to the fact that 15 years ago he had expressed a fervent hope for a "single-circuit alternating-current motor," and stated that his attitude on the broad question of trunk line operation is the same now as it had been consistently since that time.

In reference to the general problem of electrification, the author believes that the financial question is ever the dominant one, and in reference to the matter of equipment he expressed his dissent with views which had been presented at a recent meeting of the New York Railroad Club, in which it was stated that the general question of the adoption of electricity should be determined by a railroad quite independently of any details, and that systems, equipment and methods of operation could then be safely determined. He did not believe that a change of motive power could safely be determined except after the presentation of a comprehensive report and a general plan of equipment and operation based upon an investigation of previous practice and an analysis of important features and details. He then summarized certain conclusions which he believed would bear the test of time, as follows:

1. Of the two broad lines on which electrification can be considered, if increased economy, that is, reduction of operative expenses by replacing the steam locomotive by an electric one, with concentration of prime power and perhaps the use of water power, be deemed the dominant reason for change of motive power, then every wheel in an electrified division should be turned electrically; and the savings effected should pay not only a fair rate of depreciation of the total equipment, but a satisfactory rate of interest on the new capital expended, in fact a better rate than if spent in some other way.

2. Increase of capacity, both in locomotive haulage, schedule speeds, motor car trains and terminal facilities, of a character impossible to steam service—all resulting in augmented traffic, and increased use and capacity of the dead part of the systems, the tracks and roadbed—will ordinarily be the more potent influence in leading to the adoption of electric operation, and will often warrant heavy capital expenditures.

3. Every large road is a problem which must be con-

sidered financially and technically on its own merits, and in most features other than those which without effort can be harmonized its decision will be of little practical concern to other roads.

4. The adoption of electricity will ordinarily begin with those divisions where traffic is comparatively dense, and once adopted the territory over which it can be extended will naturally increase.

5. Terminal properties in great cities, underground and tunnel sections, and heavy mountain sections where duplication of tracks because of extra heavy construction cost is prohibitive, offer an immediate field for the serious consideration of electrification.

6. There cannot now be safely established any final standard, or any single system selected as the only, or in all cases the best for all roads. What is the best for one might easily be less advantageous for another, and there is no valid reason why any road should adopt something fitting to a less degree its particular requirements because of the action of some foreign road.

7. Extraordinary advances have been and are being made, and new discoveries are always possible. The limits of none of the systems now in use are clearly defined, and it would seem both natural and wise that the various manufacturing, technical and inventive activities should pursue every lead to its logical conclusion—for the best will be none too good.

The author then continued with a running comment upon various phases of the problem, gave comparative facts as developed up to the present time and illustrated in some detail features characteristic of three equipments which are now attracting considerable attention. Under this head he discussed motor equipments, limitation of design, behavior of conductors, etc.

Under the head of types of motors the author considered the four types which are now being exploited, namely: Polyphase alternating-current motor without commutator single-phase alternating-current motor without commutator, single-phase alternating-current motor with commutator and direct-current motor with commutator. He believed that the single-phase motor was at a disadvantage in comparison with other types of motors because it has an intermittent and variable rate of energy input and combines two distinct functions, those of a motor and a transformer. He then discussed at some length the comparative weights of direct-current and 25-cycle single-phase alternating-current motors, and concluded that a pair of alternating-current motors could handle only about one-half the total load of the direct-current motors with all the disadvantage of higher armature speed and smaller air gaps. He said that the direct-current motor offers a most effective machine to meet the conditions of railway service because of its high average weight efficiency, simplicity of construction, ease of control, automatic response in torque and speed to varying grades of curvatures and great sustained capacity at low speed. He referred then at some length to recent improvements in direct-current motors and summarized the differences between direct-current and single-phase alternating-current motors, as follows:

1. The input of current in one is continuous; in the other intermittent.

2. One has a single frame, the electrical and mechanical parts being integral; the other has a laminated frame contained within an independent casing. Hence there is not equal rigidity, or equal use of metal.

3. One has exposed and hence freely ventilated field coils; the other has field coils embedded in the field magnets.

4. One has a large polar clearance, and consequently ample bearing wear; the other has an armature clearance of about only one-third as much, and hence limited bearing wear.

5. One is operated with a high magnetic flux and consequently high torque for given armature-conductor current; the other has a weak field, and consequent lower armature torque.

6. One has a moderate-sized armature and commutator, and runs at a moderate speed; the other, with equal capacity, has a much larger diameter of armature and commutator, and runs at a much higher speed.

7. One permits of a low gear reduction, and consequently a large gear pitch; the other requires a higher gear reduction and a weaker gear pitch.

8. The windings of one are subject to electrical strains of one character; in those of the other the strains are of rapidly variable and alternating character.

9. The mean torque of one is the corresponding maxi-

mum; the mean torque of the other is only about two-thirds of the maximum.

10. The torque of one is of continuous character; that of the other is variable and pulsating, and changes from nothing to the maximum fifty times a second.

11. One has two to four main poles only, two paths only in the armature, and two fixed sets of brushes; the other has 8 to 14 poles, as many paths in the armature, leading to unbalancing, and as many movable sets of commutator brushes.

12. One can maintain a high torque for a considerable time while standing still; the other is apt to burn out the coils, which are short-circuited under the brushes.

13. In one, all armature-coil connections are made directly to the commutator; in the other, on the larger sizes resistances are introduced between the coils and every bar of the commutator, some of which are always in circuit, and the remainder always present.

14. In one the sustained capacity per given weight is within the reasonable requirements of construction; in the other it is only about half as much.

15. Finally, the gearless type, with armature and field varying relatively to each other, is available for one, but this construction is denied to the other.

Consideration was also given in detail to the matter of electric braking. In connection with this branch of the subject he arrived at the conclusion that it seemed wise to divide the matter of braking between electric power and air. The paper then continued with a description of numerous illustrations which were presented to the audience by means of a stereopticon of various types of working conductors. In this connection he called attention to the erroneous impression that direct-current systems are essentially and necessarily dependent upon the third rail, and that the overhead trolley has been developed for alternating-current operation only. Description was given at some length of the installation of working conductors for the New York Central Electric Zone and for the electrical work of the New York New Haven & Hartford Railroad. This was followed by a general comparison of working conductors and a comparison of direct-current potentials in overhead trolley and third rail.

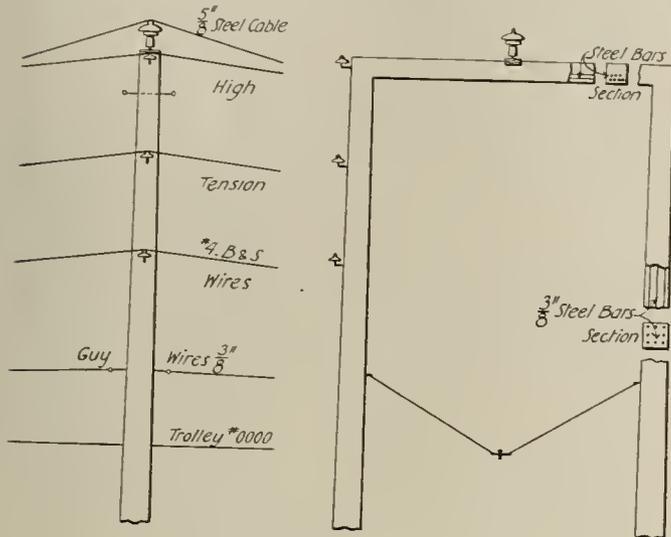

The paper then took up the matter of motor and locomotive construction and illustrated and described various types of electric locomotives designed and in use in this country and abroad. Most of this matter has been previously published. After making a general comparison of cost of direct-current and single-phase alternating-current systems, the author summed up his position in the statement that the present principal hope of usefulness of the single-phase system is on roads of considerable extent which operate an irregular and sparse traffic and where only a moderately expensive or second-class overhead construction which will keep down the ratio of line investment to that of the balance of equipment is tolerable. In departing from this condition and adopting more permanent construction in connection with the problems of denser current and higher capacities, any advantages of the single-phase system will disappear and the superiority of direct-current equipment become manifest. Any present claim for it for congested service demanding schedules of great capacity he believed not worth a moment's thought.

The paper was discussed by W. J. Wilgus, vice-president New York Central; L. B. Stillwell, consulting engineer; W. J. Potter, railway department General Electric Company; C. F. Scott and N. W. Storer, Westinghouse Electric & Manufacturing Company; G. R. Henderson, consulting engineer; and William McClellan, electrical engineer.

It is interesting to note that auxiliary poles are being used with practically every type of direct-current commutator machine on the market at the present time, including constant potential and variable-voltage generators for high speed and low speed; constant-speed and variable-speed generators for low and high voltage; constant-speed and variable-speed shunt and compound-wound motors and series-wound motors for low and high voltage. The last few months have witnessed the introduction of the auxiliary-pole motor for railway work, and many interesting developments are promised in connection with railway motors having high efficiency over a very large range of speed both for low and high voltages.—Electrical World.

REINFORCED CONCRETE TROLLEY ARCHES.

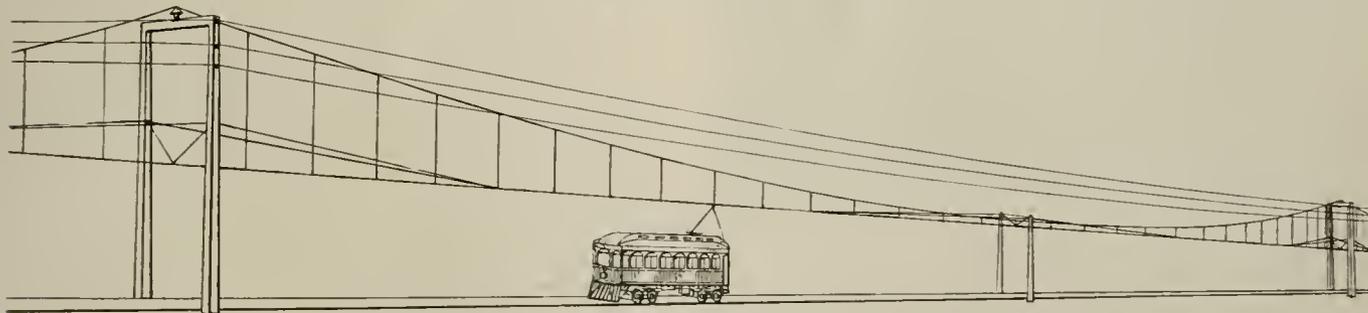

E. Darrow, general manager and chief engineer of the Toledo & Indiana Railway, Toledo, O., has developed an original idea for catenary direct-current trolley suspension, consisting of reinforced concrete arches instead of the ordinary wood or iron poles. This new construction, which is illustrated in the accompanying engravings from sketches furnished by Mr. Darrow, will be adopted on the company's extension from

Concrete Trolley Arches—Details.

Bryan, O., to Waterloo, Ind., and will probably be used to replace the present wooden pole construction on the original line from Toledo to Bryan as the pole construction requires renewal.

The arches will be set 9 feet in the ground and will extend 40 feet above the ground. They will be 12 inches square at the base and taper to 9 inches at the top. The vertical columns will be reinforced by eight and the bent by seven 3/8-inch steel bars, arranged as shown in the drawing. Midway

Concrete Trolley Arches—General Design of Catenary Suspension.

between the arches, which will be spaced 650 feet apart, will be placed two concrete poles to support the 3/8-inch bridle guys, which are anchored to steel eye-bolts in the concrete. The trolley will be also braced by bridle guys and sway braces anchored to the sides of the arches, as shown in the drawings. A 1/2-inch steel cable will be used for the messenger wire which supports the No. 0000 trolley wire. The high-tension wires, of No. 4 hard-drawn copper, are suspended on insulators on the outside of the columns, as shown, spaced 36 inches between centers at the points of suspension.

The cost of one section of the above construction, ready for wires, is \$107, as compared with about \$90 for the ordinary wood pole construction, with bracket fixtures.

The Philadelphia & Western Railroad was expected to be opened for traffic from Philadelphia to Strafford, Pa., on Friday or Saturday of this week.

HEARING OF INTERSTATE COMMERCE COMMISSION ON CHICAGO & MILWAUKEE ELECTRIC RAILROAD CASE.

Commissioners James S. Harlan and E. E. Clark of the interstate commerce commission took testimony in Chicago on May 21 in the proceeding begun by the Chicago & Milwaukee Electric Railroad to compel the Illinois Central Railroad to resume traffic relations which had been canceled. The Chicago & Milwaukee road secured from the Elgin Joliet & Eastern Railway, a belt railway at Chicago, and the Illinois Central road, a joint tariff on cabbage in car lots from Wisconsin points to Vicksburg, New Orleans, Natchez and Memphis, the tariff being filed with the interstate commerce commission on November 1, 1906. Five carloads of cabbage were shipped under this tariff. The electric road later secured a consignment of 25 carloads of cabbage for lower Mississippi points and asked the Illinois Central company to deliver cars at Rondout to transport it. Instead of complying with this request the Illinois Central road, on November 19, gave notice that the through traffic arrangement had been canceled.

The Chicago & Milwaukee Electric company was represented at the hearing by Fayette S. Munro, and the Illinois Central road by Blewett Lee, general attorney. Mr. Munro, in his opening statement, said that the Chicago & Milwaukee road was organized under the general railroad acts of Illinois and Wisconsin, and was equipped to handle a general freight business. He stated that 2,000 carloads of cabbage were shipped over the road in 1906 from Racine, Wis. Mr. Lee stated that the contention of the Illinois Central company was that the shippers in the territory through which the Chicago & Milwaukee road runs are already well served by existing steam lines and had nothing to do with the question of whether an electric line was a railroad within the meaning of the interstate commerce act.

Charles W. Merrilies, traffic manager of the Chicago & Milwaukee road, told in detail of the traffic arrangement with the steam roads. Asked why the electric line did not consign, in its own cars, the cabbage, for the transportation of which it complained that the Illinois Central had failed to furnish cars, he replied that his road had but three box

cars and that it had relied upon the usual practice of railways, according to which the line which is to get the long haul furnishes the cars.

Mr. Merrilies stated that his line had provided platforms and rooms at most of its stations for the handling of freight and express, the latter of which it handles for the United States Express Company. Mr. Merrilies stated, in response to questions by Mr. Lee, that the electric line came into competition at most points with either the Chicago & Northwestern Railway or the Chicago Milwaukee & St. Paul Railway, or both. He said that he had seen a letter from V. D. Fort, assistant general freight agent of the Illinois Central road, to the traffic manager of the Elgin Joliet & Eastern road, stating that the Chicago & Northwestern Railway had placed such pressure upon the Illinois Central road that it would have to cancel its traffic arrangement with the Chicago & Milwaukee company. Mr. Merrilies stated that

the electric line has a traffic arrangement with the Wisconsin Central Railway, under which it is handling freight in car lots from Chicago to Minneapolis, and had sought similar arrangements with the Chicago Indianapolis & Louisville Railway, the Chicago Rock Island & Pacific and the Wabash Railroad, but without success.

W. E. Keepers, general freight agent of the Illinois Central road, stated that at the time his road had refused to furnish the electric road with freight cars it was suffering severely from a shortage of equipment and was unable to allot the electric line cars, in view of the fact that this line had no cars which it could furnish in return.

The hearing was continued until some future date. In the meantime the Elgin Joliet & Eastern road will be brought into the proceeding.

COMMITTEE MEETINGS OF THE AMERICAN AND ENGINEERING ASSOCIATIONS.

A meeting of the executive committee of the American Street and Interurban Railway Association was held in New York on Monday, May 20. The members of the executive committee who were present were the following: President, John I. Beggs, president Milwaukee Electric Railway & Light Company, Milwaukee, Wis.; second vice-president, James F. Shaw, president Boston & Worcester Electric Companies, Boston, Mass.; third vice-president, Arthur W. Brady, president Indiana Union Traction Company, Anderson, Ind.; C. L. S. Tingley, second vice-president American Railways Company, Philadelphia, Pa.; H. H. Adams, superintendent of shops the United Railways & Electric Company, Baltimore, Md.; secretary and treasurer, B. V. Swenson.

It was announced that letters had been received from Messrs. Calvin G. Goodrich of Minneapolis and H. C. Bradley, acting president of the Claim Agents' Association, that they would be unable to be present at the meeting.

The past presidents of the association had been invited to attend the meeting and five of them were present. These were the following: Mr. Joel Hurt of Atlanta, Ga., president during 1894-1895; Mr. H. M. Littell of New York City, president during 1895-1896; Mr. Albion E. Lang of Toledo, president during 1897-1898; Mr. C. S. Sergeant of Boston, president during 1898-1899; Mr. Jere C. Hutchins of Detroit, president during 1902-1903.

Two of the other past presidents of the association, H. H. Vreeland, president of the New York City Railway Company, president of the association during 1901-1902, and Hon. W. Caryl Ely, president of the Ohio Valley Finance Company, and president of the association during 1903, 1904, 1905 and 1906, intended to be present, but were prevented by important business at the last moment. The secretary presented a report, in which were considered a number of matters relating to the association work. The active membership has increased from 200 companies on October 1, 1906, to 242 companies at the present day. The associate membership has increased from 113 companies on October 1, 1906, to 164 companies at the present time. A financial statement was presented which showed that the association had received more money from a larger number of active and associate members than had been received up to May 20, 1906. The secretary stated that the annual reports of the four associations containing the proceedings of the Columbus convention had been published and sent out to the various member companies and to associate members. Five hundred copies of the report of each of the four associations were bound in paper covers and each member company was supplied with one set of these paper covered reports. They are all of uniform style and octavo size.

The American Association report contains 472 pages, the Accountants' 352 pages, the Engineering 255 pages and the Claim Agents' 253 pages. In addition to the paper covered volumes, the four annual reports have been placed in two cloth bound volumes. Volume I, containing the proceedings of

the American and Engineering associations and Volume II those of the Accountants' and Claim Agents'. This arrangement of the volumes was made because associate members receive the reports of both the American and Engineering associations, whereas the reports of the Accountants' and Claim Agents' associations are reserved for member companies only.

Reprints have been made of the addresses of the presidents before the various associations, of the report of the committee on "Municipal Ownership" and of the report on "Standard Code of Rules."

The executive committee considered a number of matters relating to the association work and the plans for the 1907 convention were given particular attention. The report of the committee on subjects was presented by the chairman, Richard McCulloch of St. Louis, and accepted. This committee has provided for a number of most interesting and valuable papers relating to many of the most important problems which are now before the street and interurban railway people. It was decided to make a departure at the 1907 American association convention from the custom of recent years of having two sessions a day. It is proposed that the American association have but one session a day on Wednesday, Thursday and Friday, these sessions being from 9:30 a. m. to 1:30 p. m. It is expected by this arrangement that there will be a large attendance at all sessions and that ample opportunity will be given to all to examine the exhibits of the manufacturers during the afternoon hours of these days.

The question as to whether or not there should be a banquet was discussed at some length, and the general sentiment expressed was that a banquet should be given at the 1907 convention.

A meeting of the executive committee of the Manufacturers' association was held on the afternoon of Monday, May 20, and a dinner was given in the evening by this committee to the executive committee and past presidents of the American Street and Interurban Railway Association. The members of the committees on "Subjects" and "Standardization," which committees also met on Monday, were invited. This dinner was held in a private dining room of the Engineers' Club and proved to be a most pleasant occasion, 30 people being present.

Committee on Subjects, American Association.

The general committee on "Subjects" of the American Street and Interurban Railway Association consists of one representative from each of the affiliated associations and an equal number of representatives from the American association. This committee is in charge of the general arrangements of the programmes for the Atlantic City convention. In addition to this general committee on "Subjects," each association has its own committee which has direct charge of its specific convention programme, including the reports of the committees, the papers to be read, etc. The meeting of the general committee on "Subjects" was held at the association headquarters, Engineering Societies building, 29 West Thirtieth street, New York, on the morning of Monday, May 20.

Those present were: Richard McCulloch, St. Louis, Mo., chairman; Ernest Gonzenbach, Sheboygan, Wis., representing the American association; C. L. S. Tingley, Philadelphia, Pa., representing the Accountants' association; H. H. Adams, Baltimore, Md., representing the Engineering association; Peter C. Nickel, New York, representing the Claim Agents' Association.

Among the matters discussed were the following:

Meeting days of the different associations; committee reports and papers to be presented at the various conventions; convention halls to be used by the different associations; number of sessions to be held by the various conventions and the general arrangement of these sessions.

A bulletin will be issued in the near future.

Committee on Car House Construction, American Association.

A special committee on car house construction appointed by President Beggs of the American Street and Interurban

Railway Association for the purpose of formulating a set of rules and regulations governing the construction and equipment of modern car houses, held a meeting in New York on May 21. The committee consists of the following: H. H. Adams, superintendent of shops United Railways & Electric Company, Baltimore, Md., chairman; E. J. Cook, chief engineer Cleveland Electric Railway Company, Cleveland, O.; Charles F. Ferrin, architect Twin City Rapid Transit Company, Minneapolis, Minn.; L. H. Parker, engineering department Stone & Webster Engineering Corporation, Boston, Mass.; A. V. Porter, architect, New York City Railway Company, New York, N. Y., and Thomas Pnmfrey, civil engineer International Railway Company, Buffalo, N. Y.

A conference with the committee of the National Fire Protection Association was held first, which continued through the greater part of the forenoon. At this conference a tentative set of rules was discussed in a general way by the members of both committees.

After the first conference the committee of the American association held a separate meeting, which continued over until the middle of the afternoon. At this meeting the proposed rules for the construction of car houses was the subject under discussion. Later in the afternoon a second conference was held between the two committees and an agreement was arrived at concerning the rules which had been formulated to govern the construction of modern car houses. It was the understanding that these rules would be placed before the convention of the National Fire Protection Association on Thursday, May 23, for approval. If approved at that meeting, they will also be brought up for approval at the annual convention of the American Street and Interurban Railway Association next October.

Standardization Committee, Engineering Association.

A meeting of the "Standardization Committee" of the American Street and Interurban Railway Engineering Association was held at the office of the American Street and Interurban Railway Association on May 20 and 21.

There were present Messrs. Wallerstedt, Larned, Fairchild and Blake. Mr. Adams attended several of the meetings as president of the Engineering association. Messrs. George C. Fowler and F. W. Lane of New York were present by invitation.

The chairman of the committee announced that a number of previous meetings had been held by the New York members of the committee and that several tables of statistics had been drawn up containing the information obtained in the data sheets received from the member companies. These tables showed in complete form the data on rails, brake-shoes, wheels, etc., supplied by those answering the inquiries. The flanges and treads of wheels, brakeshoes, journals and rails were taken up. In the latter investigation the committee will receive the assistance of the "Maintenance of Way Committee."

A long communication was received from Mr. Evans of Indianapolis, a member of the committee on "Standardization," outlining the work up to date of the committee on "Standardization" of the Central Electric Railway Association.

Very valuable work was done and the chairman announced that another meeting of the committee would be called next month, the place and exact date to be announced later.

The new Ravenswood extension of the Northwestern Elevated Railroad of Chicago was opened for traffic on Saturday, May 18. The extension, which is about $3\frac{1}{2}$ miles long, leaves the main line at Clark and Roscoe streets and extends to Lincoln and Western avenues, Ravenswood. Ground was first broken for the road in November, 1905, and the first steel construction was started in September, 1906. It is planned to build a surface extension from the end of the line to Kimball and West Wilson avenues. All trains are to run as expresses, from 6 a. m. to 12 p. m., and the schedule time from Ravenswood to the Union Loop is 30 minutes. The line runs over a private right of way through a populous and rapidly growing territory.

GASOLINE-DRIVEN EMERGENCY TOWER WAGON.

About a year ago the Pacific Electric Railway purchased an Oldsmobile commercial wagon designed for trucking in city streets. Under the guidance of S. H. Anderson, chief electrician, the engines and framework of this equipment have been rebuilt and strengthened. As shown in the illustration, the automobile has been fitted with a substantial telescoping tower for trolley work. At the rear of the driver's seat is a large tool box with a second seat provided on top of it. In this box are kept all the tools necessary for the ordinary emergency work. There are also two mate-

Pacific Electric Railway—Automobile Trolley Wagon.

rial boxes along the sides of the tower. Supported from the rear is a box in which is carried a supply of rope, and ladders are placed under the tower. Since this wagon has been in use it is estimated that with one crew it has satisfactorily performed the service of two tower wagons driven by horses.

Station log books, or records in some form, of fuel and water consumption, hours of labor and times of putting machines in and out of service are kept in all well-operated power plants, but the usefulness of an engineer's diary is less generally appreciated. Many engineers may not favor such extra clerical work, but where the habit of recording important happenings day by day is not a serious burden, the operating company is likely to find it of value. The larger the plant the more important it is to keep on file the dates of various repairs, arrival of fuel and supplies, conferences with officials, accidents, shutdowns, unusual overloads, the construction of additions to the equipment and buildings, labor of contractors, visits of supply men and other similar incidents. When the company's business is carried into the courts such records may be invaluable; in the ordinary course of operation they may settle many disputed points quickly, and the keeping of a power plant diary only involves a few moments' work each day by the chief engineer.—The Iron Age.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Freight Carrier Not a Street Railway.

Spalding v. Macomb & Western Illinois Railway Company, 80 *Northeastern Reporter*, 327.—The supreme court of Illinois says that street railroads are generally understood to be only such as are constructed and operated in the streets of a city for the purpose of conveying passengers, with ordinary hand luggage, from one point to another along the line thereof. Whether the road be a street railroad or not will depend upon the character of its traffic. It was alleged that this road was carrying not only passengers with ordinary hand luggage, but practically freight of all kinds, from one point to another on the street and from town to town along the entire line of the road. Under these allegations, admitted to be true, it could not be held to be a street railway.

No Road in Street for Private Party.

Hatfield v. Strauss, 102 *New York Supplement*, 934.—The first appellate division of the supreme court of New York holds that there is no power lodged in any local authority to grant a permit for the construction in a street of spur surface railroad tracks to be operated by the underground electric system solely for the transportation of the goods of a private firm. It says that the only ground upon which surface railroads were ever permitted to be laid in the public streets, the only authority conferred upon a corporation to occupy for the purpose of making money for itself a portion of the public streets, was that it was a legitimate street use for the benefit of all the traveling public. But the moment such a right is given for the exclusive use of a private individual there has been a taking of public property for private use which cannot and ought not to be justified.

As to Seeing Where Passenger is Before Starting Car.

Millmore v. Boston Elevated Railway Company, 80 *Northeastern Reporter*, 445.—The supreme judicial court of Massachusetts says that, on the one hand, the rule is not that the conductor of a street car, after waiting a reasonable time for a passenger to get on or off, as the case may be, may start without taking any pains to see whether the passenger is either on or off. The conductor has not performed his duty when he has simply waited a reasonable time. He must exercise reasonable care to see that the passenger is on or off the car. On the other hand, the rule is not that the conductor must absolutely see whether the passenger is on or off. In this, as in every other detail, there is resting upon him the same degree of care, namely, the highest care consistent with the proper transaction of the business; and, if he has exercised that degree of care, he has not been negligent.

What Makes a Passenger?

Alabama City Gadsden & Attalla Railway Company v. Bates, 43 *Southern Reporter*, 98.—The supreme court of Alabama says that a passenger may be defined to be one who undertakes, with the consent of the carrier, to travel in a conveyance furnished by the latter, otherwise than in the service of the carrier as such. The relation of carrier and passenger is dependent upon the existence of a contract of carriage, express or implied, between the carrier and passenger, made by themselves or their respective agents; and this relation begins when a person puts himself in the care of the carrier or directly within its control, with the bona fide intention of becoming a passenger, and is accepted as such by the carrier. There is, however, seldom any formal act of delivery of the passenger's person into the care of the carrier, or of acceptance by the carrier of one who presents himself for transportation; hence, the existence of the relation

is generally to be implied from the attendant circumstances. But it is undoubtedly the rule that these circumstances must be such as will warrant the implication that one has offered himself to be carried and the offer has been accepted by the carrier. And this, of course, necessarily involves the existence of the fact that the person must signify his intention to take passage either by words or conduct, and those in charge of the car must assent by words or conduct to his becoming a passenger.

With Fencing Law Danger to Animals Deemed Imaginary.

Indianapolis & Cincinnati Traction Company v. Larrabee, 80 *Northeastern Reporter*, 413.—The supreme court of Indiana says that in view of the statute of 1903, imposing upon interurban railroads, traction lines, etc., the duty of constructing and maintaining fences on both sides of their right of way "sufficient and suitable to turn and prevent cattle, horses, mules, sheep, hogs or other stock from getting on such road, except at crossings of public highways," etc., the danger or peril of exposure to stock kept on the premises through which it is sought to condemn a right of way will be nothing more than speculative or imaginary, and should not be considered by the jury in determining the diminution of the market value of the remainder of the lands unappropriated.

Where Runaway Horse Collides with Car.

Demonte v. Patton, 43 *Southern Reporter*, 153.—The supreme court of Louisiana holds that where a runaway horse hitched to a cart, without lights, on a dark rainy night, dashes along the track of a street railway and collides with an electric car coming from the opposite direction, with the result that the motorman is knocked off and injured, the owner will be held liable; it appearing from the evidence that the motorman could not avoid the collision. Where in such a case the motorman was running his car on schedule time, he is not chargeable with negligence for not anticipating and being prepared for the unexpected and improbable appearance on the track of a runaway horse, at large through the negligence of his driver, and in contravention of police ordinances.

Liability for Inspector Wrongfully Examining Wounds.

South Covington & Cincinnati Street Railway Company v. Cleveland, 100 *Southwestern Reporter*, 283.—The court of appeals of Kentucky says that the jury were instructed that if they believed from the evidence that the inspector in entering the room where the plaintiff (Cleveland) was, acted in the scope of his employment, and without the request or consent of the plaintiff, placed his hands upon her person and examined her wounds, they should find for her in such sum as would fairly compensate her for the mental suffering, if any, and for her sense of shame or humiliation or wounded pride, if any, resulting from such action and indignity or insult to which she was thereby subjected. The argument was pressed that if the inspector did lay his hand on the plaintiff, in so doing he was acting entirely without the scope of his employment, and the company could not be held responsible for his conduct. But it was entirely within the scope of the inspector's duty to see and converse with injured persons, to ascertain their wants, learn how the accident occurred, and inquire as to the extent of the injury inflicted; and, in the performance of this duty the inspector did go into the room where the plaintiff was lying. It is evident that in approaching the plaintiff the inspector was acting in the interest of the company, and in laying his hand upon her person he was attempting to ascertain the extent of her injuries for its benefit. The law under circumstances like these will not undertake to make any nice distinctions fixing with precision the line that separates the act of the servant from the act of the individual. When there is doubt, it will be resolved against the master, upon the ground that he set in motion the servant who committed the wrong.

News of the Week

Increases of Wages.

The International Railway of Buffalo, N. Y., has announced a new scale of wages for its conductors and motormen, effective on June 1. For the first year of service the men will receive 22½ cents an hour, with an increase of ½ cent an hour for each succeeding year, including the seventh. They now receive 21 cents an hour for the first year and 25 cents after 10 years.

The St. Joseph (Mo.) Railway Light Heat & Power Company has made a new 3-year agreement with its motormen and conductors whereby they will receive an increase of 10 per cent in wages, the average pay being 23 cents per hour.

New York Public Utilities Bill Passed.

The so-called "public utilities bill" was passed by the New York senate on May 22. It already had been passed by the house. It is now in the hands of Mayor McClellan of New York City. Mayor McClellan, it is understood, will veto the measure, and it will be passed over his head. The only amendments made to the bill by the senate provide that companies which already have secured permission for extensions and improvements may make them without the approval of the commissions which the act creates, and that the present employes of the rapid transit commission shall be retained under the new New York City commission. These amendments have been assented to by Governor Hughes.

Strike at Evansville, Ind.

A strike of the conductors and motormen employed on the Evansville, Ind., city lines of the Evansville & Southern Indiana Traction Company was declared on May 15 by the newly organized union and took effect on Thursday, May 16, when about 120 men walked out. The reason was the refusal of the company to grant the demands of the union for a flat wage scale of 20 cents per hour and a 9-hour day, with 30 cents per hour overtime, in place of the present scale of 15 to 18 cents an hour, according to length of service, and a 12-hour day. The strike had been anticipated and the company has been able to continue the operation of some of its cars every day, although service has been discontinued at night. Several riots have taken place and many people have been injured. The cars have been operated by non-union men imported from other cities.

Chicago Traction Reorganization Assured.

Announcement was made on May 22 that the necessary number of shares of the Chicago Union Traction Company, common and preferred, and of the North Chicago and the West Chicago Street Railroad companies, to insure acceptance of the Chicago Railways Company ordinance have been deposited. The amount of stock of the Chicago West Division Railway Company required, and the necessary number of shares of the North Chicago City Railway Company, except a small number, the deposit of which had been promised, were on deposit as consenting to the reorganization.

The deposit of the stocks of the Union Traction Company and the underlying companies was essential to formulation of the reorganization plan. The distribution of the stocks of the reorganized company will now be arranged. The Chicago Railways Company, the new company, will distribute its stock, pro rata, among holders of the securities of the underlying companies. According to the terms of the ordinance, the plan of distribution is to be approved by P. S. Grosscup, judge of the United States circuit court at Chicago, and Prof. John C. Gray of Harvard University.

The board of supervising engineers will co-operate with the board of local improvements in order that the work of paving streets may be confined first to localities where there is the most urgent need of improvement.

Decisions on Toronto Service.

The Ontario railway and municipal board has given judgments in three cases brought by the city of Toronto against the Toronto Railway Company in regard to improvements to the service on the company's lines. These decisions have been rendered after a series of hearings at which the city engineer and the company's representatives presented arguments. The most important decision is in the so-called "overcrowding" case. The board states that the population of the city will probably increase during the next 10 years at the rate of 15,000 a year and finds that the company has been putting on more cars in the attempt to relieve the overcrowding, but cannot agree with the city's contention that more cars operating on existing lines would solve the problem, as this would endanger the pedestrian and vehicle traffic. Consequently the company is ordered to build, with reasonable dispatch, between 10 and 15 additional miles of double track and 100 new cars, the cars to be finished in time to be distributed and put in operation on the system as soon as the new lines are built. The matter of routes is left to the company and the city. The company has already applied for franchises for additional lines and Bion J. Arnold of Chicago, acting as an expert for the city, has submitted a report recommending certain routes as required by the conditions. An abstract of Mr. Arnold's report was published in the Electric Railway Review of April 27.

The other two cases refer to regulations for passengers and to removal of snow from the company's tracks. The company is directed to close the front vestibules of its cars by doors, from November to May, making arrangements for passengers to enter by the rear platform and to leave by the front platform, and is recommended to adopt regulations to prevent the "end seat hog"

nuisance and the crowding of the rear platform by smokers. The company is required to remove and carry away the snow on its tracks when the snowfall amounts to six inches or over, and when, after successive sweepings from the tracks, the snow has accumulated on the adjoining roadway and attained a depth of six inches the company is required to carry away any further snow it may sweep from the tracks.

The Cleveland Situation.

On Wednesday of this week Judge Phillips of the common pleas court gave his long looked for decision in the Central avenue-Quincy street franchise case. The case was that of a property owner, backed by the Cleveland Electric Railway, against the Low Fare Railway Company. The court held that the latter's franchise on those streets was invalid, in that the council had lacked jurisdiction to grant the franchise, because the necessary number of consents from abutting property owners had not been secured. This decision is a great victory for the Cleveland Electric Railway, which recently ceased operating in those streets and tore up its tracks, as previously reported in the Electric Railway Review, and has since been endeavoring to block the efforts of the rival company to operate in those streets while it has tried to secure a renewal of its own franchises.

This was the only important development of the week. On May 16 the Cleveland Electric refused the Low Fare company's offer, published in last week's Review, to negotiate for the use of the former's property in Central avenue and Quincy street, and sent a communication to the council offering to resume its service in those streets if the council would grant a new franchise on the basis of seven tickets for 25 cents. On the following day the company refused an offer of the Low Fare company of \$13,500 cash for the privilege of joint operation over its tracks in Euclid avenue, from the public square to East Fourteenth street. On Saturday afternoon about 20 Low Fare cars were operated over this line, but were stopped by an agreement of the attorneys.

Mayor Johnson, several of the city officers and President du Pont of the Municipal Traction Company on May 21 addressed a large tent meeting in the interest of 3-cent fares, and Forest City stock subscription blanks were circulated.

Two-Cent Fare for Passengers Without Seats.—The Civic Union of Seattle, Wash., has passed a resolution calling upon the city council to pass an ordinance prohibiting the Seattle Electric Company from charging more than a 2-cent fare when the passenger is unable to secure a seat.

New York Loop Bill Passes.—The New York senate on May 21 passed the Dowling loop bill, which enables the New York City authorities to take the initiative toward the erection of an elevated loop through the east side streets, to connect the Manhattan tunnels of the Brooklyn and Williamsburg bridges.

Pennsylvania Strike Averted.—A threatened strike of the employes of the Eastern Pennsylvania Railways Company for an increase of wages was averted on May 20 by an agreement to submit the differences to a board of arbitration, composed of a representative of the company and one of the men. If they cannot agree they will choose a third party.

Municipal Ownership Experiment in San Francisco.—It is reported that the board of supervisors of San Francisco has decided to take over the Geary Street Park & Ocean Railroad and besides operating it, convert it from a cable to an electric road. The company's franchise has expired. The board will appropriate \$400,000 to purchase the property, in addition to the \$350,000 already set aside for the purpose.

Employees' Clubroom Planned at Ft. Worth.—The Northern Texas Traction Company of Ft. Worth, Tex., is considering plans for the construction of a clubroom for employes, to be built as a second floor of the car house on East Front street. If the plan is carried out it is stated that a local organization of the Street Railway Young Men's Christian Association will be formed and the clubroom placed under the supervision of that body.

Installing Underground Conduit in Omaha.—The Omaha & Council Bluffs Street Railway is now installing several miles of underground conduit to carry its high-tension wires through the downtown district in Omaha, Neb. The present contract calls for four miles of conduit, from Fifth and Jackson streets to Twenty-seventh and Lake streets. Another conduit will be laid from the central power station to South Omaha, where a new substation is to be located.

Decision in Favor of T-Rails at New Albany, Ind.—Judge W. C. Utz of the circuit court at New Albany, Ind., has decided a suit brought by the city against the New Albany Street Railroad to compel the use of a girder rail, in favor of the company. The company's franchise ordinance granted several years ago permitted the use of the T-rail, but a later ordinance requires the use of a girder rail. The court holds that the first ordinance is a contract that cannot be annulled without the consent of both parties.

Street Railway Strike at Birmingham, Ala.—The street railway men employed by the Birmingham (Ala.) Railway Light & Power Company, who have recently formed a local chapter of the union, declared a strike on May 20, because of the refusal of the company to recognize the union. The men were offered by the company the alternative of surrendering their union cards or returning their badges of employment and the majority of them immediately returned their cards to the barns and left the company's service. On Tuesday the men sent to Robert Jemison, president of the company, a form of agreement under which they would return to work, involving complete reinstatement of the men, recognition of the union, and arbitration of future grievances. The question

of wages does not enter. President Jemison replied to the communication, stating that he would not employ union men. About 25 cars were operated on Wednesday. The mayor has ordered all saloons closed, the police have been put on double time and special deputies have been sworn in. No attempt at violence has been made and the company has operated a few cars each day, although at long intervals.

Opinion on Louisville Franchises.—City Attorney A. E. Richards of Louisville, Ky., has submitted to a special committee of the city council, appointed to investigate the franchise rights of the Louisville Railway Company, a lengthy opinion, which completely upholds the rights of the company in the streets. The report reviews the legislation, both state and municipal, affecting the roads now merged into the Louisville Railway, and finds that the company's franchises are valid, and except for a few short lines, have been extended by the legislature for 99 years from 1890.

New York Rapid Transit Affairs.—The rapid transit commission did not award the contract for building the second section of the bridge subway loop, as expected, because the necessary six votes were not present, and, as one of the members is expected to be kept away by ill health for some time, it was evident that if any action was to be taken before the public utilities bill became a law it would be necessary to appoint a new member to succeed Lewis Cass Ledyard, who resigned several months ago. Consequently Mayor McClellan on May 17 appointed William S. Hurley to fill the vacancy.

Waterloo Strike Settled.—The strike of the trainmen of the Waterloo Cedar Falls & Northern Railway, Waterloo, Ia., which has been in progress for about two months, was settled on May 9, by agreement between the company officials and the union leaders. Cars have been operated, but trouble has been frequent and union men have refused to patronize the cars. The company agrees to recognize the union, but will hire union or non-union men, indiscriminately, and will receive a grievance committee of the union at any time. No man is to be discharged without being furnished with the reason for his dismissal.

Electrical Engineers Elect Officers.—At a meeting of the American Institute of Electrical Engineers, held in New York City on May 21, the following officers were elected: President (for one year), H. G. Stott; vice-presidents (for two years), L. A. Ferguson, J. G. White, W. C. L. Eglin; managers (for three years), B. G. Lamme, H. W. Buck, P. H. Thomas, Morgan Brooks; treasurer (for one year), George A. Hamilton; secretary (for one year), Ralph W. Pope. Certain amendments to the constitution were proposed and adopted by the institute, and the new officers will hold office in accordance with the provisions of the amended constitution.

Hearing on Philadelphia Ordinance.—It is expected that the finance and the street railways committees of Philadelphia city councils will hold a joint meeting at which arguments on the proposed new ordinance for the Philadelphia Rapid Transit Company will be heard. An ordinance has been introduced in councils by Councilman Robert M. Fry, providing that the city shall take possession of the property and franchise of the Citizens' Passenger Railway Company under authority of the ordinance of July 7, 1857, and lease it to a company which offers to provide the purchase money, give 2 per cent of the gross earnings to the city and grant 4-cent fares. A resolution has also been introduced providing for the appointment of a commission by the mayor to investigate the traction situation.

Fender Tested by Chicago City Railway.—It is announced that this company has installed a new fender on one of its cars and is testing it in regular service. The fender, which was invented by George De Clement of Kalamazoo, Mich., consists of a buffer mounted on the front of the car, and a scoop fender mounted under the car, directly in front of the wheels. This scoop is normally held 6 or 8 inches clear of the track, but is automatically released and dropped to the ground should a person be struck by the car and fall on the track. The scoop fender under the car is automatically released by a special releasing fender, which is thrown upwards when it comes in contact with any object on the track. The inventor has great confidence in the efficiency of the new fender and a company will be formed to manufacture it.

Reports of the American Street Railway Association.—Secretary B. V. Swenson of the American Street and Interurban Railway Association has issued a complete summary, index and price list of the reports of the American Street Railway Association, together with a circular offering for sale, at prices ranging from 50 cents to \$1.50, copies of the reports for all of the 24 years of the existence of the association, except five, of which two are out of print and three are reserved to make up bound sets. The entire series consists of 24 reports, covering the period from the organization meeting in 1882 to and including the reorganization meeting in 1905. These reports contain the complete proceedings of the conventions of the association, including papers, committee reports, addresses, discussions, banquet speeches and much other material of great interest and value to the street railway fraternity. More than 5,600 pages octavo are contained in these reports. Each has a frontispiece, consisting of a steel engraving of the president for the year of the report. During these 24 years the business has passed through various stages. In 1882 there were no interurban railways and the street railway business of the country was confined principally to the small horse-car roads in the larger cities. During the first eight or ten years of the association work occurred the early attempts to propel the cars mechanically or electrically, the adoption of cable systems in the larger cities and the successful application of electric power. This was followed by a wonderful development of the business, especially after the interurban railway proved to be a success. The reports of the American Street Railway Association cover the

entire period of time from the old horse-car days to the present. They are paper-covered octavo volumes, averaging about 250 pages each. Several complete sets (except the first and second reports) have been bound in six volumes to the set. These will be sold at \$25 a set for cloth binding and \$30 for half morocco. A few additional sets (except the first, second and third reports) will be bound in six volumes to the set. These will be sold at \$20 a set for cloth binding and at \$25 a set for half morocco.

Seek to Annul Charter of Philadelphia Company.—Both branches of the Pittsburg city councils on May 21 passed resolutions authorizing the mayor to ask the governor to instruct the attorney-general to institute quo warranto proceedings against the Philadelphia Company, with a view to annulling its charter. The Philadelphia Company, which is controlled by the United Railways & Investment Company of San Francisco, controls the Pittsburg Railways Company and several gas and electric companies in and near Pittsburg. This step is part of a general agitation against the company and is said to have been influenced by the recent action of the company in raising the price of natural gas from 25 to 30 cents per 1,000 cubic feet. Bills have recently been presented against the Pittsburg Railways Company by the city, aggregating over \$600,000, for street cleaning, and an attempt is being made to secure a reduction of the night fare of 10 cents on the street cars.

Indiana Tax Commissioners Lenient with Electric Railways.—The Indiana state board of tax commissioners, which closed its first session on May 20, has increased the assessed valuation of the corporate property in the state from \$224,377,446, the 1906 figure, to \$236,790,754. Although the assessment of steam roads was increased from \$183,670,955 to \$191,337,619, there was practically no increase in the assessments of the interurban railways, the figures being \$20,616,599 in 1906 and \$20,990,004 for the present year. Various representatives of the interurban railway companies appeared at the preliminary hearings of the board, on April 22-25, as reported in the Electric Railway Review of April 27 and May 4, and argued that their assessments should not be increased because the roads were still in a period of development. The tax board appears to have taken this view of the matter. Another session will be begun on July 2 for the purpose of hearing appeals, after which the final assessments will be fixed.

Butte Cars Being Equipped with Vestibules.—The Butte (Mont.) Electric Railway Company is equipping all its winter cars with vestibules completely enclosing the platforms, in accordance with a law recently passed by the legislature. One side of the platform will be built up solidly, the other is to be provided with doors, which will be closed while the motorman occupies this platform, and will be locked open on the return trip when he changes platforms. This will leave only one entrance to the car and that on the opposite side from the double track, thus doing away with the danger of passengers stepping from one car into the path of another. Manager Wharton says that for many years the company opposed the use of the closed vestibules in Butte; the motormen were protected by windows in front of them, but while the old conditions of smoke and fog prevailed it was necessary for them to depend upon hearing any sound that might give warning of danger, and the sides were left open. These conditions have passed now, and there is no longer any need to sacrifice fullest protection to safety.

American Society of Mechanical Engineers.—The semi-annual meeting of the American Society of Mechanical Engineers, to be held in Indianapolis, Ind., on May 28 to 31, promises to be of especial interest to mechanical engineers. A wide range of subjects will be taken up and discussed, among which will be reports of committees on standard proportions for machine screws; standard tonnage basis for refrigeration, and papers on pumping engines, the heating of storehouses, and kilns for Portland cement. There will be special sessions for papers and discussions of superheated steam, including papers on its specific heat, its flow, furnace and superheat relations, the determination of entropy lines for superheated steam, the performance of Cole superheaters, superheated steam in an injector; the use of superheated steam on locomotives in America, analysis of locomotive tests, and material for the control of superheated steam. An automobile symposium has been planned for the Wednesday evening (May 30) session, at which papers, illustrated by lantern slides, on ball bearings in general and their use on automobiles in particular, air-cooling of automobile engines, materials for automobiles, special automobile steel, and the railway motor car will be read and discussed. These papers have been prepared by authors who have made important investigations in their particular lines of work. Accommodations for transportation and Pullman car service can be arranged for by addressing the secretary of the society. Several excursions have been arranged to different plants and points of interest in and around Indianapolis. One of the professional sessions devoted to superheated steam will be held at Purdue University, and an opportunity will be given the guests after the session of going over the university. The local committee at Indianapolis is endeavoring to secure reserved seats for those attending the convention, upon the occasion of President Roosevelt's speech at Indianapolis on Decoration Day. On Wednesday afternoon, May 29, a visit will be made in special cars to the Atlas Engine Works, and to the plant of the National Motor Vehicle Company. Another excursion on the same afternoon has been arranged for the works of the D. N. Parry Manufacturing Company and to those of the Nurdyke & Marmon Company. An attractive booklet describing Indianapolis and its industries for the benefit of the association has been executed and issued by Russell M. Seeds. The book is well illustrated by halftones and contains a small map and guide to the city of Indianapolis, showing which cars to take to get to the various manufacturing plants in the city of interest to members of the American Society of Mechanical Engineers.

Construction News

FRANCHISES.

Anderson, S. C.—O. W. Kelsey, representing the South Carolina Public Service Corporation, which was incorporated in January of this year to build a system of interurban electric lines in North and South Carolina and Georgia, has applied for a franchise to enter Anderson and to operate its line in several of the streets. A committee of three aldermen has been appointed to report on the proposition. A franchise also will be applied for in Greenville, S. C. Joseph J. Timmes, president, 52-53 Broad street, New York City.

Ensley, Ala.—The city council has granted a franchise to H. S. Meade, R. E. Meade, J. J. Walker, B. R. Pegram and others of this city to operate an electric street railway from Avenue E and Twentieth street to the city limits and back through Ensley Highlands. Work must be begun within six months. The line will develop a large tract of land adjoining the highlands.

Ft. Worth, Tex.—A franchise has been granted to the Northern Texas Traction Company for the extension of its lines in North Ft. Worth. Work is to begin within 90 days and be completed within nine months.

Girard, Kan.—A franchise has been granted to the Girard Coal Belt Electric Railway to build its interurban line in Crawford county. The line will extend from Girard to Mulberry, about 16 miles, with headquarters at Girard. J. B. McFarland, president.

Great Falls, Mont.—The Great Falls Street Railway Company has been granted a franchise to use the north bridge on First avenue for a period of five years, the privilege to be extended at the end of that time unless city traffic shall have increased sufficiently to demand the construction of a new bridge for street railway service. The company will pay one-half of the repairs on the bridge after it has laid its tracks across it. It is stated that the line may be extended to the west side of the river.

High Point, N. C.—Additional franchise rights have been granted to Dee Allen, W. T. Van Brunt and others, associated in the proposed electric line which will connect High Point with Greensboro, N. C., and it is stated that the Greensboro Electric Company and its holdings have been acquired by these interests. Practically all of the right of way has been secured in High Point and to the point connecting with the Greensboro line, and work is said to have been started.

Laurel, Miss.—Application for a franchise to build an electric street railway in Laurel has been made by the Gulf States Investment Company with a provision that the city may have the privilege of taking over the property at the expiration of the franchise in 1930, if desired. The petitioners agree to have one mile in operation within 18 months.

Moscow, Idaho.—The Spokane & Inland Empire Railroad has been granted a franchise to build and operate its line in this city.

Phoenixville, Pa.—A franchise has been granted to the Philadelphia Interurban Railway Company to build an electric line in this city. This is said to be part of an interurban line which the promoters agree to build between Sanatoga and Phoenixville within a year.

Port Angelus, Wash.—F. A. Ballin, H. B. Kennedy and others of Seattle, Wash., have applied for permission to build an electric street railway system in this city.

Port Jefferson, N. Y.—A franchise has been granted to the Suffolk Traction Company to build an electric line from Port Jefferson to Patchogue, L. I. The line is to be in operation within two years.

Tacoma, Wash.—The Pacific Traction Company has applied for a franchise to build a new line to the West End, which will serve the thickly settled district lying between two of the Tacoma Railway & Power Company's lines. The motive power will be either cable or electricity and it will connect with the line now under construction. The application has been referred to the franchise committee. The council has passed an ordinance providing for joint operation by the Pacific Traction Company and the Tacoma Railway & Power Company over the latter's tracks on Pacific avenue.

Whitehouse, O.—The Toledo & Defiance Railway has made application for a franchise in St. Louis avenue. The line, if built, will afford direct connection with Toledo.

RECENT INCORPORATIONS.

Clark's Summit & Lake Winola Street Railway.—Incorporated in Pennsylvania to build an 8-mile electric line from Chinchilla, Lackawanna county, to Lake Winola, Wyoming county. Capital stock, \$18,000. Thomas B. Rodham, president, Scranton, Pa.

Galveston-Houston Electric Company.—Incorporated in Maine with a capital stock of \$6,000,000, to build an interurban line between Galveston and Houston, Tex. Incorporators: William K. Neal, Richard E. Harvey, Charles E. Gurney, Ernest E. Noble, Albert E. Neal, Fred D. Harvey, John H. Ridge and David W. Snow.

Palmyra & Campbelltown Electric Street Railway, Campbell-

town, Pa.—It is announced that incorporation papers will soon be filed in Pennsylvania by this company for the purpose of building an electric line five miles long, from Palmyra to Campbelltown, Pa. Incorporators: Harry Baum, R. F. Dissinger and L. M. Reigert.

Philadelphia Valley Forge & Suburban Railroad.—Incorporated in Pennsylvania to build an electric line from the Sixty-ninth street station of the Philadelphia Rapid Transit Company's elevated road to Valley Forge and Phoenixville, Pa. It is stated that all the surveys have been made, although the exact location of the route has not been determined upon. Capital stock, \$600,000. Incorporators: L. Knowles Perot, Bala, Pa., president; A. D. Whiting, David Rumbold, Jr., Edward W. Johnson, Philadelphia; James A. Bunting, Secane; Morris H. Wetherill, Haverford, and Robert C. Selden, Norristown, Pa.

Piedmont-Carolina Railway.—Incorporated in North Carolina to build an electric railway in Salisbury, N. C. Capital stock, \$100,000. Incorporators: T. H. Vanderford, W. F. Snider and J. H. Horah.

Port Orange & Santa Ana Railway.—Incorporated in California to build a broad-gauge electric line, which will form the connecting link between the seashore and Santa Ana and will provide a direct connection by way of that city with all the principal cities of southern California, as well as with the three transcontinental steam roads. It will afford communication with a harbor 7½ miles long and 1 mile wide, at which point is the proposed site of Port Orange, named in the title. A large hotel, to be built at Creston Point, on the seashore, is one of the projects named in connection with the enterprise. It is stated that much of the material has been purchased and that work will commence as soon as possible. Capital stock, \$500,000, of which \$50,000 has been subscribed. Incorporators: Frank F. Johnson, Walter G. Hopkins, A. F. Lijal, Joseph M. Fletcher, Eugene Germain, C. L. Fredericks, Harry P. Vandever and G. H. McCarthy.

Portland & Northern Railroad.—Incorporated in Oregon to build an electric line from Portland to Bridgton, Ore. The line will be standard gauge to admit of interchanging freight with steam roads, and may be operated by third rail. It will be about 40 miles long and will pass through Windham, Raymond, Casco and Naples. As now planned the road will start from Portland at some point near Morrill's Corner, in the Deering district, and proceed by the old stage line to the terminus in Bridgton. Capital stock, \$160,000. Incorporators: William M. Sturges, N. D. Sturges, Scranton, Pa.; Tracy W. Holland, New York City; Howard Winslow, Henry L. Forham, Llewellyn Barton, Portland; S. O. Hancock, Casco, Ore.

Seymour & Brownstown Interurban Motor Line Railway, Seymour, Ind.—Incorporated in Indiana to build an interurban line between Seymour and Brownstown, Ind. Capital stock, \$10,000. Incorporators: Joseph I. Irwin, L. I. Sweeney, N. I. Sweeney and Z. T. Sweeney, all of Columbus, O.

Tanwax (Wash.) & Western Railway.—Incorporated in Washington to build a 35-mile electric line from Tanwax Junction to Olympia. It is stated that construction work is to be started at once. Capital stock, \$100,000. Henry S. Royce, Tacoma, Wash., is president.

Waynesburg (Pa.) & Monongahela Street Railway.—Application for a charter has been filed by this company, which is planning to build an electric line from Waynesburg, Pa., to East Waynesburg, Morrisville, Jefferson, Clarkesville, East Bethlehem and Millsboro. Thomas S. Crago, Waynesburg, and H. R. Myers, Washington, Pa., are interested.

Western Railways & Light Company.—This company has been incorporated and will be the holding company for the McKinley light and traction properties in northern Illinois, including the Galesburg Railway & Light Company, the Quincy Horse Railway & Carrying Company, the Illinois Valley Railway Company and the Citizens' Light Company of La Salle and Peru, and the Chicago Ottawa & Peoria Railway. The officers are: W. B. McKinley, president; George Duncan, vice-president; Edward Woodman, treasurer; T. H. McCauley, secretary; H. E. Chubbuck, general manager.

TRACK AND ROADWAY.

Albuquerque (N. M.) Traction Company.—This company is planning an extension of its Railroad avenue line to the Highlands; also the construction of one or two short cross-town lines.

Anderson, S. C.—W. L. Hodges of Hartwell, S. C., is interested in a project to build an electric railway from Athens, Ga., to Anderson, S. C., 67 miles, passing through either Carnesville or Danielsville, Ga., and Royston and Hartwell, S. C.

Asheville Rapid Transit Company, Asheville, N. C.—It is stated that a large consignment of trolley poles and cross ties for this company's extension to Overlook Park has been received and that a portion of the rails is expected shortly. Work on the grading of the line is progressing rapidly.

Bay City, Mich.—It is reported that Handy Brothers, who own a mine near Akron, Mich., will build an electric railway from Bay City to Akron and possibly through to Caro, Mich.

Bennington & Hoosick Valley Railway, Bennington, Vt.—This company, which was recently acquired by the Bennington & North Adams Street Railway, controlled by the Consolidated Railway of New Haven, Conn., is reported to have secured the right of way for an extension from Hoosick Falls to Troy, N. Y., 25 miles, via Eagle Bridge, Baskirk, Johnsonville, Valley Falls and Melrose,

paralleling the Boston & Maine Railroad; also branches from Hoosick Falls to Cambridge, N. Y., and Pownal, Vt. The road now has a line in operation from Bennington to Hoosick Falls, 16.5 miles.

Boise & Interurban Railway.—Chief Engineer F. H. Knox is quoted as saying that all but six miles of track have been laid on the line from Boise to Caldwell, Idaho, and that the poles have been set as far as Middleton. The substations at Park and Middleton are practically completed and it is probable that cars will be operated by June 15.

Boston & Worcester Street Railway.—Plans involving the expenditure of about \$300,000 have been completed by this company for the widening of Worcester street in South Framingham, Mass., to permit of the double-tracking of its line from Central square, Framingham, to the Southboro line. A year or more will be required in which to complete the work.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—This company has purchased right of way for its crossing under the tracks of the New York Chicago & St. Louis, Dunkirk Allegheny Valley & Pittsburg and Pennsylvania railroads in Dunkirk, N. Y.

Buffalo Rochester & Eastern Railroad.—We are officially advised that this company, whose incorporation was noted in the Electric Railway Review of May 4, proposes to build a steam instead of an electric road, from Buffalo to Rochester and Troy, N. Y.

Chicago Great Western Railroad.—L. S. Cass, third vice-president, St. Paul, Minn., is reported to have announced that the branch line from Rochester to Winona, Minn., is to be electrified.

Chicago Lake Shore & South Bend Railway, South Bend, Ind.—It is reported that tracklaying on this line has now been completed from South Bend to Hudson Lake, Ind., and that rails have been delivered at Michigan City sufficient to build 50 miles of the remaining distance to the Indiana-Illinois state line, where a connection will be made with the Illinois Central Railroad. The Illinois Central has built four miles of track from Kensington to the state line to meet the electric road. Grading is now in progress at Michigan City. J. B. Hanna, president.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—It is announced that contracts will soon be let by this company for the reconstruction of its line between Laporte and Michigan City, Ind.

Cincinnati Reading & Middletown Street Railroad.—Surveyors are now locating this company's proposed line from Sharon to Middletown, O. A franchise has been secured in Reading and it is stated that 90 per cent of the right of way has been secured.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—It is stated that work on the Cleveland Ashland & Mansfield division of this company's line between Mansfield and Ashland is progressing rapidly and may be completed by September 1. An effort also will be made to have the line between Seville and Mansfield completed by the first of the year. W. H. Abbott, consulting engineer, Cleveland, O.

Columbus Kenton & Lima Railway.—Engineers are at work on this company's line between Columbus and Magnetic Springs, O., and it is stated that the construction work between Columbus and Kenton will be finished this year. The extension from Kenton to Lima and from La Rue to Marion will not be completed until some time next year. W. H. Ogan of Columbus is interested.

Columbus (Ind.) Street Railway & Light Company.—Preparations are being made to resume work on the extension from Columbus to East Columbus. It is hoped to have the line in operation in two months.

Corinth & Shiloh Electric Railway, Corinth, Miss.—Abe Rubel, president, writes that this company proposes to build an electric railway from Corinth, Miss., to the United States National Park at Shiloh, Tenn., or Pittsburg Landing, on the Tennessee river. Surveys have been made and right of way secured. Special permission to run over the park property has been granted by congress. The road will extend along the top of a ridge and no trestles will be required on the entire line.

Cortland County Traction Company, Cortland, N. Y.—This company has been authorized by the state railroad commission to issue a mortgage for \$2,000,000 and to increase its capital stock from \$320,000 to \$1,000,000. A part of the new funds is to be used for the construction of a double-track extension to Syracuse, 23 miles, three miles of track in Syracuse and two miles in Cortland. W. C. Pearce, chief engineer.

Denver & South Platte Railroad.—Joseph A. Osner, Denver, has the contract for building this electric railway, which is financed by H. W. Hartman, Thomas B. Doane and others of Denver, from Englewood to Roxborough Park, Colo., 21 miles, via Littleton. Surveys have been completed and grading was begun last week. Power will be obtained from the Denver City Tramway Company and connection with Denver will be had over that company's lines. Roxborough Park is to be developed as a summer resort.

Duluth (Minn.) Street Railway.—This company has filed plans with the board of public works for its approval of an extension of its Nemadji line to Allouez.

East Hampton, Conn.—A company has been organized to build an electric line from East Hampton to Moodus, Conn. George F. Marshall of Malden, Mass., is president and Fred M. Hoadley of Providence, R. I., secretary and treasurer.

Edmonton, Alberta.—Contracts have been awarded for the construction of the proposed municipal railway to W. H. Harvey,

Vancouver, B. C., and the Bitulithic Company, Ltd., Winnipeg, Man.

Fairchance & Smithfield Traction Company.—This company's new line from Fairchance to York Run, Pa., about two miles, was opened for traffic last week. When completed, the line will connect Uniontown and Smithfield, a distance of seven miles. Owen Jones is superintendent in charge of both operation and construction.

Findlay-Marion Railway & Light Company.—It is announced that grading on this company's 47-mile line from Findlay to Marion, O., will begin the first week in June at Marseilles, O., and will be continued on to Marion. It is stated that the people of this section, which hitherto has been without electric railway service, have promised the company 400 carloads of freight per year. R. P. Hankey of Detroit, Mich., is president.

Fremont (O.) Street Railway.—George Champe, chief engineer, has announced that this company will begin at once the work of rebuilding its tracks on Front and Tiffin streets, and that the line to Ballville will be extended about one mile to the Oakwood cemetery.

Gainesville Whitesboro & Sherman Railway.—John King, president, Gainesville, Tex., states that grading will probably be resumed about June on this line from Gainesville to Sherman, Tex., which was graded last year from Gainesville to Callisburg.

Galveston-Houston Electric Railway.—The directors of this company, which is controlled by Stone & Webster of Boston, Mass., have authorized an issue of \$5,000,000 bonds for the purpose of constructing the line from Galveston to Houston, Tex. M. M. Phinney of Dallas is interested.

Georgia Railway & Electric Company, Atlanta, Ga.—The work of double-tracking west Peachtree street, Georgia avenue and the three main trunk lines reaching Ponce de Leon springs, has been completed and the line is now in operation.

Grafton (W. Va.) Traction Company.—It is announced that the contract for the construction this company's 2½-mile line in Grafton has been let to Tolbert Brothers of Fairmont and it is stated that a large force of men will be put at work at once. The contract provides that the work must be completed six weeks from May 28. After the completion of the present proposed line, which it is now planned to have in operation by early fall, the company is said to be planning for further extensions. A power plant is to be built and will be equipped with General Electric apparatus.

Indianapolis & Louisville Traction Company, Louisville, Ky.—We are officially advised that this company, which is now building a line from Seymour to Sellersburg, Ind., 41 miles, expects to begin operating from Louisville, Ky., to Scottsburg, Ind., by June 15, using the tracks of the Louisville & Northern Railway & Lighting Company as far as Sellersburg. By August 1 it is expected to begin operating from Louisville to Indianapolis, using the tracks of the Indianapolis Columbus & Southern Traction Company from Seymour north. The latter company is building an extension from Columbus south to Seymour, 19 miles, of which 17 have been graded, with 8 miles of track laid. A. A. Anderson of Columbus, Ind., general manager of the Indianapolis Columbus & Southern, has also been appointed general manager of the Indianapolis & Louisville and the two lines will be operated as one system. A power house and car house have been erected at Scottsburg. The line is to be operated with direct-current at 1,200 volts. John C. Mayo of Paintsville, Ky., is president and W. H. Cost, chief engineer.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind.—The contract for building this company's interurban station at Reddington, Ind., which is on the line of its extension to Seymour, has been let to Dunlap & Co. A. A. Anderson, Columbus, Ind., is general manager.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind.—A. A. Anderson, general manager, writes that eight miles of track, from Seymour to near Azalea, have been laid on the extension from Columbus to Seymour, Ind., 19.01 miles, and that grading has been completed from Seymour to near Columbus, a distance of 17.5 miles. Poles have been set for 15 miles. The overhead construction is of the bracket type. Substations, each containing one 200-kilowatt Stanley rotary converter and three air-cooled transformers, are under construction at Reddington and Columbus. The company is doing the construction work. This line will be operated from Indianapolis to Louisville, Ky., in connection with the Indianapolis & Louisville Traction Company, which is building from Sellersburg to Seymour. The tracks of the Louisville & Northern Railway & Lighting Company will be used from Sellersburg to Louisville. Through operation is expected to begin by August 1. Joseph I. Irwin, president.

Interborough-Metropolitan Company, New York, N. Y.—This company has issued \$15,000,000 of short-term notes, a part of the proceeds of which is to be used in installing the underground trolley system on the cross-town lines of the Metropolitan Street Railway, which are now operated by horse-power.

International Railway, Buffalo, N. Y.—A new line on Fillmore avenue, from Main street to Abbott road, six miles long, connecting with the steel plant district, has been completed and will be opened for traffic on May 30.

Indiana Southern Railway, Aurora, Ind.—C. M. McMullen, secretary, writes that this company proposes to build an electric railway from Aurora to Rising Sun, Ind., a distance of eight miles. Construction will be commenced as soon as a franchise can be secured in Aurora. E. W. Swarthout of Aurora is president.

Jackson (Mich.) Consolidated Traction Company.—It is stated that following the sale of this property to the Michigan United Railways several important improvements are planned for this company's lines and that rails have been ordered for an extension $3\frac{1}{2}$ miles long.

Jackson (Miss.) Electric Railway Light & Power Company.—An amendment to its charter, permitting it to construct and operate interurban and suburban lines, has been secured by this company. F. G. Preutt, Jackson, general manager.

Jefferson City (Tenn.) Electric Railway Light & Power Company.—J. H. Bundren writes that this company, recently incorporated, proposes to build an electric railway from Jefferson City to Dandridge, Tenn., 10 miles. A contract is to be let for a dam and construction of the road is to begin shortly. The company also expects to do a general light and power business. The organization has not yet been perfected.

Kansas Southern Electric Railway.—Frank V. Crouch of Iola, Kan., who is promoting an electric railway from Pittsburg to Girard, Erie and Iola, Kan., is now securing the necessary right of way. Surveys are now being made and Mr. Crouch states that the line has been financed.

Long Island Railroad.—According to the annual report of President Ralph Peters, plans are being prepared for the electrification of the lines from Long Island City to Port Washington and to Whitestone Landing, and as soon as the tunnels under the East river are completed, the lines will be electrified to Jamaica and to Woodhaven Junction, via the Glendale cut-off, a connection between the main line, the Montauk division and the Rockaway Beach division. Plans are also being made for an enlarged terminal at Jamaica, where the change from steam to electric locomotives will be made. It is reported that this company has abandoned the plan for an extension from Wading River to Riverhead and will build instead an extension from Wading River to Manor. Surveys have been started.

Louisiana Bowling Green & St. Charles Interurban Railway.—W. F. Manzke of Bowling Green, Mo., is interested in an attempt to promote an interurban line to run from Louisiana, Bowling Green, St. Clements, Ashley, New Hartford, Marling, Olney, Millwood, Silex, Old Monroe and to St. Charles.

Ludington, Mich.—Work is now in progress on the electric railway between Pentwater and Ludington, Mich.

Marshfield, Ore.—A project is on foot to build an electric railroad from Roseburg to Coos Bay and Marshfield, Ore., about 75 miles. Citizens of Roseburg have agreed to subscribe \$500,000 if a proportionate amount is subscribed in North Bend and Marshfield. It is estimated that the road would cost from \$1,100,000 to \$2,000,000.

Marquette County Gas & Electric Company, Ishpeming, Mich.—This company is planning a number of important extensions and changes of route on its city lines in Marquette, Mich.

Monroe, Mich.—It is reported that a project is on foot to build an electric railway from Monroe to Dundee, Mich.

New York, N. Y.—The shields in the north tube of the Belmont tunnel, from Manhattan Island to Long Island City, met on May 16. It is now expected to operate trains through the tunnel by August 1. The other tube is not expected to be cut through before that time.

Northwestern Ohio Electric Railway.—It is reported that Jerome, Hunter & Co. of Philadelphia have been awarded a contract for the construction of the line from Defiance to Montpelier, O., 34 miles, via Bryan and Evansport. Construction will begin at Bryan and proceed in both directions. M. Steinberg of Defiance, chief engineer.

Peoria Bloomington & Champaign Traction Company, Bloomington, Ill.—This company, which has recently completed its line from Peoria to Bloomington, Ill., and proposes to build to Champaign, as a part of the Illinois Traction System, has filed notice of an increase of capital stock to \$500,000.

Pontiac Oxford & Northern Railroad, Pontiac, Mich.—It is reported that Robert Oakman and Detroit capitalists have secured an option on 60 per cent of the capital stock of this company, which is now in receiver's hands, and will convert the steam road, operating between Pontiac and Caseville, Mich., about 100 miles, to an electric railway.

Puget Sound Skykomish & Eastern Railway, Everett, Wash.—This company is making rapid progress on the surveying of its line from Index to Galena, Wash., 10 miles, and shipments of rails have been delivered. Grading is to begin at once. Nicholas Rudebeck is one of the promoters.

Puget Sound Electric Railway, Tacoma, Wash.—W. S. Dimmock, manager, writes that the Seattle-Tacoma interurban line has just been double-tracked for 12 miles out of Seattle and the company is now undertaking the construction of the second track from Kent to Pacific City, nine miles, and for two or three miles out of Tacoma, leaving about 12 miles of single track through the hills and at points where a double track is not necessary at present, but which will probably be double-tracked within the next year or two. Seventy-pound rail is being used for the running rail and 100-pound rail for the third rail, and the road is ballasted with gravel in the best possible manner.—The new line from Tacoma to Orting, via Puyallup, 21 miles, is expected to be opened for traffic by the last of the summer. Construction materials are being delivered along the line and the right of

way purchases are being completed. About one mile of the line has been built.

Redlands Central Railway, Redlands, Cal.—John H. Fisher, chief engineer, writes that surveying is in progress on this proposed line from Redlands to Riverside, Cal., 18 miles, via Redlands Junction, Loma, Linda and Highgrove. Overhead work is now in progress on the line across the city, 3.67 miles. Ohio Brass Company's No. 00 grooved trolley wire is used. Grading is to begin on the interurban line on June 15. The rails will be 60-pound A. S. C. E. section, using Abbott rail joint plates. The power house will contain a 200-kilowatt General Electric motor generator. The car equipment will consist of two 37-foot Brill convertible cars, equipped with Westinghouse air brakes and GE-90 motors. A. G. Hubbard, president.

Rockford Oregon & Southern Railway, Oregon, Ill.—F. G. Jones, one of the incorporators, writes that this company will build an electric railway from Rockford to Dixon, Ill., 44 miles, via Stillman Valley, Oregon and Grand Detour. The organization of the company is not yet completed and no contracts have been let.

Rockville & Stafford Springs Street Railway.—It is reported that this company has secured the land necessary for its entrance to Rockville, Conn., and has secured options for land for car barns.

Russellville, Ark.—It is reported that plans are being made for the construction of an electric railway from the Arkansas river through Atkins, Economy and Appleton, Wis., with probable extensions to Hattiesville, Cleveland, Pottsville and other points. Local capital is said to be backing the project.

St. Louis Decatur & Champaign Railway, Champaign, Ill.—This company, which is now constructing a line from Champaign to Decatur, Ill., as a part of the Illinois Traction System, has filed a notice of increase of its capital stock from \$100,000 to \$500,000.

Southwestern Traction Company, London, Ont.—The extension to Port Stanley is expected to be in operation about July 1. The entire line is graded, tracklaying is completed to within a mile of Port Stanley and poles have been erected for a large part of the distance. C. P. Raikes, chief engineer.

Springfield (Ill.) Belt Railway.—This company has increased its capital stock from \$5,000 to \$500,000.

Springfield (Mass.) Street Railway.—The work on the Brimfield extension line to Palmer and Fiskdale is progressing so rapidly that it is believed the line may be operated by the middle of June. There still remains the erection of two 100-foot span bridges over the Quobaug river.

Stafford Springs Street Railway.—This company is surveying a new route into Rockville, Conn., using Hale and Grove streets.

Syracuse & South Bay Railway, Syracuse, N. Y.—This company has been authorized by the New York railroad commission to issue a first mortgage for \$1,000,000 for the construction of its line from Syracuse to South Bay, N. Y. William Nottingham is interested.

Texas Traction Company, Dallas, Tex.—H. K. Payne, representing the Fred A. Jones Company, which has the contract for building this line from Dallas to Sherman, Tex., 65 miles, states that one-fifth of the roadbed is completed and that it is expected to have the grading finished by October 1. Rails and equipment have been ordered.

Toledo Wabash & St. Louis Railroad, Toledo, O.—It is reported that the Riggs & Sherman Company, Toledo, is making surveys for this proposed line between Defiance, O., and Ft. Wayne, Ind. The line between Toledo and Defiance is already surveyed. L. A. Chenoweth is in charge for Riggs & Sherman. W. D. Whitney of Toledo, president.

Tri-City Railway, Davenport, Ia.—This company expects to begin work at once on the proposed construction work for the season in Rock Island, Ill. The Bridge line on Third avenue, between Fifteenth and Twentieth streets, will be double-tracked and rebuilt. The Moline avenue line will be rebuilt and the Red line will be rebuilt and possibly double-tracked for a part of its length. Parts of several other lines are to be rebuilt and the double-tracking will be extended.

West Virginia Interior Railroad.—Judge T. P. Jacobs of New Martinsville, W. Va., is interested in a proposition to build an interurban road from either Sistersville or New Martinsville to Middlebourne, W. Va.

POWER HOUSES AND SUBSTATIONS.

Capital Traction Company, Washington, D. C.—This company has contracted with James L. Parsons to build an addition to its electric plant at Grace street, near Potomac street, Washington, D. C. It is stated the improvements to the electric plant will cost about \$25,000 and are to be begun at once.

Choctaw Railway & Lighting Company, McAlester, I. T.—This company has recently purchased through the Knox Engineering Company, Chicago, one 500-kilowatt direct-connected unit from the Allis-Chalmers Company.

Illinois Traction Company.—It has been announced that this company will install mechanical stokers in its power house, and coal bunkers having a capacity of 1,000 pounds. The contract for the coal bunkers will also include the installation of a complete ash and coal handling conveyor.

Personal Mention

Mr. E. R. Kelsey of Toledo, O., has accepted the position of manager of the publicity department of the Toledo Railways & Light Company.

Mr. William W. Tracy, formerly general manager of the Whitman Electric Railway & Power Company, Colfax, Wash., has resigned to engage in other business at Butte, Mont.

Mr. C. Faller, superintendent of the Carlisle & Mt. Holly Railway, Carlisle, Pa., has been appointed superintendent of the Carlisle Gas & Water Company, vice Mr. Charles Ramsey, resigned.

Mr. David C. Young, Newark, N. J., one of the directors of the Lehigh Valley Transit Company, Allentown, Pa., at a meeting of the board of directors on May 21, was elected president of the company, succeeding Col. H. C. Trexler, resigned.

Mr. E. W. Moore of Cleveland, O., president of the Lake Shore Electric Railway, has been elected president of the Cleveland Painesville & Eastern Railroad of Willoughby, O., succeeding Mr. Charles W. Wason, resigned on account of ill health.

Mr. F. A. Bailey has been appointed superintendent of the Camden lines of the Public Service Corporation of New Jersey, effective on May 20. Mr. Bailey has been connected with the Columbus (O.) Railway & Light Company as foreman.

Mr. W. J. Achelpohl will henceforth have charge of the auditing department of the Illinois Valley Railway, Ottawa, Ill., and the street railway systems in Galesburg and Quincy, Ill., controlled by the McKinley interests, with headquarters at Ottawa.

Mr. John Powers on May 21 resigned as superintendent of the Sterling Dixon & Eastern Electric Railway and Lee County Lighting Company of Dixon, Ill. He will take a position with the Galesburg (Ill.) Railway & Light Company, in its lighting department.

Mr. William S. Hurley has been appointed by Mayor McClellan of New York as a member of the board of rapid transit railroad commissioners, succeeding Mr. Lewis Cass Ledyard, who resigned several months ago. Mr. Hurley is president of the Borough Bank of Brooklyn.

Mr. L. K. Burge, heretofore superintendent of the Lake Shore Electric Railway and the Lorain Street Railroad, at Norwalk, O., was on May 22 appointed general superintendent of the Lake Shore Electric Railway and all properties controlled by that company.

Mr. B. E. Van Vliet, treasurer of the Rapid Transit Railway and park manager of the Dallas Consolidated Electric Street Railway, Dallas, Tex., controlled by Stone & Webster of Boston, has been transferred to the home offices of the company in Boston. Mr. Van Vliet formerly was identified with the street railway interests of Des Moines, Ia.

Mr. J. H. Crawford, heretofore master mechanic of the Wheeling Traction Company, Wheeling, W. Va., has resigned, effective on May 1, to become superintendent of mines for the Empire Coal Mining Company, Bellaire, O. Mr. Frank O'Brien, formerly with the Public Service Corporation of New Jersey, will succeed Mr. Crawford.

Mr. L. C. Bradley, superintendent and purchasing agent of the Scioto Valley Traction Company, Columbus, O., has resigned to accept a position with J. G. White & Co. of New York. Mr. Calvin Skinner, heretofore master mechanic, has been appointed to succeed Mr. Bradley as superintendent. Mr. W. S. V. Robb, heretofore chief clerk to the general manager, has been appointed purchasing agent.

Mr. Frederick W. Hild, who has just been appointed general manager and chief engineer of the Havana Electric Railway, was married on May 22 to Georgia Marion Halstead at Dueskirk, O., and will reside at Havana, Cuba. Mr. Hild was formerly construction engineer for the General Electric Company, in charge of the installation of machinery on the Aurora Elgin & Chicago Railway, and was recently chief engineer of the Southwestern Wisconsin Railway, with headquarters at Dubuque, Ia.

Mr. Charles H. Bigelow, who has been superintendent of construction for the Stone & Webster Engineering Corporation, in charge of the recently completed power plant at Dallas, Tex., has resigned to accept a position with L. B. Stillwell of New York, in connection with power station construction of the United Railways & Electric Company at Baltimore, Md. Mr. Bigelow is a graduate of the Massachusetts Institute of Technology and since 1892 has had charge of several extensive electric and power plant installations in various sections of the country.

Mr. W. H. Evans, master mechanic of the Indianapolis Traction & Terminal Company, has resigned to become superintendent of motive power of the International Railway Company of Buffalo, effective on June 1. Mr. Evans began his street railway service several years ago with the Twin City Rapid Transit Company of Minneapolis, Minn., and was later for a short time with the Chicago City Railway Company. He has held his present position at Indianapolis for about two years. Mr. Evans has been prominently identified with the standardization work and besides being a member of the standardization committee of the American Street and Interurban Railway Association, he is also chairman of the standardization committee of the Central Electric Railway Association.

Financial News

American Cities Railway & Light Company, New York.—A. H. Ford, the president, makes the following statement: "In accordance with the proposition dated June 20, 1906, the company has proceeded to acquire a majority of the common and preferred stocks of the Birmingham Railway Light & Power Company, the Memphis Street Railway Company, the Little Rock Railway & Electric Company, the Knoxville Railway & Light Company, and the Houston Lighting & Power Company, upon the basis of the purchase price set forth in that proposition. The offer to purchase the stocks of the Nashville Railway & Light Company was withdrawn, and no stocks of that company have been purchased. On August 23, 1906, sufficient stocks of the five local companies mentioned had been deposited to warrant the directors in declaring the plan operative, which action was taken. The company has since acquired additional shares of the same companies, so that as of December 31, 1906, it owned 64,910 shares out of 77,500 shares of preferred stock of the five local companies, and 84,357 shares out of 94,919 shares of common stock, equivalent to 83.7 per cent and 88.8 per cent of the total respective issues. The income account of the company for the six months' period ended December 31, 1906, is shown below. The undivided surplus net earnings of the local companies are not taken into account in this statement, which includes only the dividends actually paid; as a matter of fact, dividends were paid on the common stocks of the Birmingham, the Little Rock and the Houston companies only. For the year ended December 31, 1906, had the entire surplus earnings of the five local companies, less sinking funds, been declared as dividends, after payment of preferred dividends in full, the amount of the common stock now held by the American Cities Railway & Light Company would have been entitled to \$477,635, which is equivalent to earnings of 4.44 per cent upon the common stock outstanding on December 31, 1906. The surplus earnings, however, have been invested in betterments and new property, which new construction, together with that obtained from the sale of the securities of the local companies, is showing its value by the large increases which are being obtained in both gross and net earnings." The income account of the company shows dividends received during the six months ended December 31, 1906, of \$309,908 and \$152 interest on bank balances, a total of \$310,060. General expenses amounted to \$1,968, and payment of a dividend of 3 per cent on the preferred stock to \$203,371, leaving a surplus of \$104,721. The combined income statement of the five local companies for the year ended December 31, 1906, follows:

Gross income, all sources	\$4,710,638
Operating expenses and taxes	2,675,104

Net earnings	\$2,035,534
Deduct interest charges	\$993,157
Sinking funds and reserve funds	148,315
Dividends paid	674,014
	<hr/>
	1,815,486

Undivided surplus for year\$ 220,048

Auburn & Turner Railroad, Lewiston, Me.—Justice A. R. Savage of the supreme court at Lewiston appointed A. L. Cavanaugh of Lewiston and John T. Burnett of Boston receivers of this road on May 13.

Belton & Temple Traction Company, Temple, Tex.—At the annual meeting of stockholders of this company on May 16 the following directors were elected: Samuel Watts, Calvin Greene, A. C. Mays, H. E. Ahrens, G. K. Watson, J. A. McDonald, L. F. Treaster, W. H. Taylor, J. C. Houser, W. R. Barefoot, W. C. Davies, A. F. Bentley and George W. Tyler.

Brooklyn Rapid Transit Company.—A plan for financing improvements and extensions and funding the floating debt of the Brooklyn Union Elevated Railroad and the Nassau Electric Railroad, subsidiary companies, was announced on May 18 by Charles D. Meneely, secretary and treasurer of the Brooklyn Rapid Transit Company. The amount needed is \$25,000,000, of which \$20,000,000 is for the Brooklyn Union elevated road and \$5,000,000 for the Nassau Electric road. In following the plan special meetings of stockholders of the Brooklyn Union company and the Nassau Electric company will be held on June 10 and 11, respectively, to authorize mortgages in the amounts named. These mortgages will secure certificates of indebtedness which have been issued or will be made by those companies to reimburse the Brooklyn Rapid Transit Company for cash advances. Mr. Meneely says in his statement: "The Brooklyn Rapid Transit Company has entered into agreement with most of its constituent companies to furnish from time to time within the next 10 years such moneys as each of these companies shall require for extensions, improvements, additions, etc., up to a maximum amount, and to take in exchange therefor the certificate of indebtedness of such company payable on demand. The board of railroad commissioners has already authorized such mortgages by the Sea Beach Railway Company, the Canarsie Railroad Company and the South Brooklyn Railway Company, and after the approval by the stockholders of the Nassau Electric and Brooklyn Union Elevated Railroad companies, will be asked to give its consent also to the mortgages to be issued by those. The mortgages for which consent is requested, to the extent that they secure past expenditures, do not add one dollar to outstanding capital charges; to the extent that they secure expenditures hereafter to be made, they carefully limit such expenditures to the actual cost of additions, improvements and extensions. The cer-

tificate of indebtedness shall not be issued at less than par and must represent such actual cost. Under the terms of the Brooklyn Rapid Transit Company mortgage, bonds issued under that mortgage must be issued at par for the par of such certificates of indebtedness, and any deficiency arising from the sale of Brooklyn Rapid Transit bonds at less than par must be made up out of the earnings of the company." Reports of the principal operating lines of the Brooklyn Rapid Transit Company for the quarter ended March 31 were as follows:

Brooklyn Heights Railway.			
January 1 to March 31—	1907.	1906.	1905.
Gross earnings	\$2,624,999	\$2,999,661	\$2,685,164

Cleveland Painesville & Eastern Railroad, Willoughby, O.—It is reported that control of this company will be purchased by the Northern Ohio Traction & Light Company.

Conway (Mass.) Electric Street Railway Company.—Governor Guild of Massachusetts signed on May 16 the bill giving approval to the purchase of control of this company by the Fitchburg Railroad, which is controlled by the Boston & Maine Railroad. An account of the hearing, at which the motive for the transaction was discussed, was published in the Electric Railway Review of March 2, 1907, page 287. The Conway company was chartered to carry freight, passengers, United States mail, and to do a general railroad business. The road connects the railroad station on the Fitchburg line at South river with the town of Conway. There are no houses at the South river terminus and no residences other than the railroad station occupied by the railroad people. There is no other entrance to South river save by the Fitchburg railroad, and there is no other railroad connection for Conway except this electric railroad. There are only six houses for the entire distance of five miles along the line.

Cortland County Traction Company, Cortland, N. Y.—The New York state railroad commission has given approval to the issue by this company of a first and refunding mortgage of \$2,000,000 and an increase in the capital stock from \$320,000 to \$1,000,000. The proceeds will be used for the retirement of outstanding bonds, the payment of floating debt and extensions.

Interborough-Metropolitan Company, New York.—This company has authorized the issue of \$15,000,000 of 3-year 5 per cent collateral trust notes. The company has recently borrowed from various banks and trust companies about \$3,000,000 on its 6 per cent notes running for six months, and these notes, and whatever similar notes may be issued meanwhile, will be taken up out of the proceeds of the 3-year notes when issued. The \$15,000,000 issue is to be taken by several large banks and trust companies. The security for these notes will be Metropolitan Street Railway 3-year 6 per cent improvement notes to the amount of \$8,000,000, to be

issued; 59,700 shares of stock of the Third Avenue Company, 430 shares of the Forty-second Street and Grand Street Ferry stock, 5,028 shares (the Metropolitan Street Railway Company's entire holding) of Central Crosstown Railroad stock, 1,507 shares of stock of the Second Avenue Railroad and 6,955 shares of stock of the Electric Storage Battery Company. The report of the combined operations of the Interborough Rapid Transit Company and the New York City Railway for the year ended March 31, 1907, compares as follows:

	1907.	1906.	Increase.
Gross earnings	\$43,353,841	\$40,693,671	\$2,660,170
Expenses	21,841,884	21,044,516	797,368
Net earnings	\$21,511,957	\$19,649,155	\$1,862,802

The New York City Railway reports for the quarter ended March 31:

Quarter ended March 31—	1907.	1906.	1905.
Gross earnings	\$3,800,559	\$3,960,771	\$3,639,467
Operating expenses	2,600,564	2,398,458	2,467,374
Net earnings	\$1,199,995	\$1,562,313	\$1,172,093
Other income	261,605	301,043	282,571
Total income	\$1,461,600	\$1,863,356	\$1,454,664
Charges	2,863,010	2,789,724	2,777,074
Deficit	\$1,401,410	\$ 926,368	\$1,322,406

Gross earnings of the subway division of the Interborough Rapid Transit Company in the first quarter of 1907 were \$2,408,921, as compared with \$2,052,641 in the corresponding period of 1906. Gross earnings of the Manhattan division were \$3,622,978, as compared with \$3,266,088.

Jackson (Mich.) Consolidated Traction Company.—Following the purchase of control of this company by interests identified with the Michigan United Railways, Bird S. Coler, the president, has retired from that office. He is succeeded by Myron W. Mills, president of the Michigan United Railways. The directors now are as follows: Myron W. Mills, Bird S. Coler, James R. Elliott, John C. Tomlinson, Charles B. Hole and Henry L. Haviland.

Liverpool Corporation Tramways.—The total revenue for the year 1906 was £583,619, as compared with £566,628 in 1905. Operating expenses, including rental of leased lines, amounted to £391,282, or 67 per cent of the total revenue. In 1906, as compared with £281,378 and 67.3 per cent in 1905. From the balance of £192,337 in 1906, and £185,250 in 1905, there were deducted for interest and sinking fund £109,580 and £109,291 in 1906 and 1905, respectively, leaving a balance in 1906 of £82,757, and in 1905 of £75,959. Of this balance £55,171 was applied to reserve, renewal and depreciation in 1906, as against £60,639 in 1905.

Long Island Railroad.—In the annual report for 1906 Ralph Peters, the president, makes the following statement: "In the report for 1905, attention was called to the organization of the Long Island Consolidated Electrical Companies. That company Electric Railway Company, and has also purchased during the year the Babylon railroad, a small line in the village of Babylon. The company has also planned the construction of a cross-island line from Huntington to Babylon, via Farmingdale and Amityville, and the necessary franchises for this extension have been secured. It is proposed to obtain the funds for this purpose through the sale of the Electrical companies' bonds, guaranteed by your company."

Mansfield (O.) Railway Light & Power Company.—It is announced that a majority of the \$1,000,000 capital stock of this company has been purchased by F. L. Fuller & Co. of Cleveland. It is stated that the stock was acquired on behalf of the Cleveland Southwestern & Columbus Railway Company.

Milwaukee Light Heat & Traction Company.—Of the new issue of \$30,000,000 refunding and extension mortgage 5 per cent bonds about \$7,500,000 bonds are immediately available, but it is stated that none will be sold in the immediate future. The \$5,000,000 first mortgage bonds are subject to call at 110, and \$5,500,000 of the new issue are reserved to refund these bonds.

Nashville (Tenn.) Railway & Light Company.—The company has completed the acquisition of a one-half interest in the New York & Long Island Traction Company and in the Long Island

has filed a trust deed covering the issue of \$15,000,000 of 5 per cent refunding and improvement mortgage bonds, dated July 2, 1906, and due on July 1, 1956. Of the authorized amount \$6,000,000 bonds are reserved to retire underlying bonds, \$7,000,000 are reserved to be issued at the rate of \$1,000 for each \$1,250 expended for future improvements and equipment, and \$2,000,000 are available for corporate purposes.

New York New Haven & Hartford Railroad.—Charles S. Mellen, president of this company, was questioned on May 15 by Dana Malone, attorney-general of Massachusetts, regarding the interests of the road in Massachusetts electric lines. Mr. Mellen said that the New Haven Railroad of Connecticut owns the stock of the Consolidated Railways Company, and that the stock is voted once a year in order to elect directors of the Consolidated company. These directors vote stock to elect trustees in voluntary associations, who in turn elect trustees of a second series of voluntary associations. The latter trustees elect directors of the individual street railway companies. For instance, he said, the New England Investment & Security Company, a voluntary association, which is controlled by the Consolidated Railways, owns the shares of the Springfield Railways Company, a voluntary association, which in turn owns control of the Springfield Street Railway Company, the Western Massachusetts Street Railway Company, etc.

North American Company.—Redmond & Co. and Lee, Higginson & Co. have purchased \$2,500,000 of an issue of \$5,000,000 of 5 per cent 5-year collateral trust notes. The following official statement was made: The subsidiary companies are largely in debt to the North American Company and besides need large sums to meet the rapidly increasing business. There is practically no market for the bonds of the subsidiary companies except at ruinous prices, and the directors believe that it is better financing to sell short time notes in order to help the subsidiary companies than to sell the long time bonds of these companies at low prices. The bonds of the subsidiary companies will be held in the treasury of the North American Company until such time as the market for investment bonds may assume normal conditions.

Omaha & Council Bluffs Street Railway, Omaha.—Application has been made to list \$10,000,000 common stock, \$5,000,000 preferred stock and \$7,350,000 first mortgage 5 per cent bonds of this company on the Cincinnati stock exchange.

Philadelphia & Western Railroad, Philadelphia.—The property of this company was sold under foreclosure at Westchester, Pa., on May 20, to Frank H. Brewster, representing William C. Sheldon & Co. and Mackay & Co. of New York, who held practically all of the stocks and bonds of the company. Joseph S. Clark, general counsel for the company, made the following statement: "William C. Sheldon & Co. and Mackay & Co. will be the new syndicate managers and will reorganize the company as soon as the legal formalities have been completed. This will require about three weeks. The new company will put out about \$4,000,000 of bonds and bring the capital stock more on a parity with the bond issue than it is at the present time. George J. Kobusch of St. Louis, while having disposed of the major portion of his holdings to the syndicate, will, however, retain a minority interest."

St. Joseph (Mo.) Railway Light Heat & Power Company.—The earnings for the year 1906 and for the four months ended April 30, 1907, were as follows:

	Year 1906.	Four months ended April 30, 1907.
Gross	\$834,438	\$261,289
Expenses	426,803	141,479
Net	\$407,635	\$119,810
Charges	236,454	79,017
Surplus	\$171,181	\$ 40,793
Dividends	38,000	26,000

San Bernardino Valley Traction Company, San Bernardino, Cal.—It is announced that H. E. Huntington has acquired control of this company.

Springfield & Eastern Street Railway, Palmer, Mass.—This company has petitioned the Massachusetts railroad commissioners to approve the issue of \$750,000 stock for building an extension to Fiskdale, acquiring additional real estate and rolling stock, and for paying floating debt.

Syracuse (N. Y.) Rapid Transit Company.—Earnings for the quarter ended March 31, 1907, follow:

Quarter ended March 31—	1907.	1906.	1905.
Gross	\$289,636	\$252,130	\$218,379
Expenses	162,253	144,304	130,411
Net	\$127,383	\$107,826	\$ 87,968
Other income	164	1,501	1,555
Total income	\$127,547	\$109,327	\$ 89,523
Charges	92,452	66,237	61,116
Surplus	\$ 35,095	\$ 43,090	\$ 28,407

Toledo (O.) Railways & Light Company.—The shareholders will vote on June 15 on the recommendation to increase the capital stock of the company from \$12,000,000 to \$15,000,000, and to purchase all the property and franchises of the Toledo Gas Electric & Heating Company.

United Traction Company, Albany, N. Y.—Earnings for the quarter ended March 31 were as follows:

Quarter ended March 31—	1907.	1906.	1905.
Gross	\$456,644	\$411,910	\$401,420
Expenses	292,621	250,317	234,813
Net	\$164,023	\$161,593	\$166,607
Other income	37,641	3,520	1,317
Total income	\$201,664	\$165,113	\$167,924
Charges	87,481	86,581	106,241
Surplus	\$114,183	\$ 78,532	\$ 61,683

United Railways Company, Portland, Ore.—It is reported that control of this company has been purchased by E. E. Lytle, president of the Pacific Railway & Navigation Company.

Utica & Mohawk Valley Railway, Utica, N. Y.—Earnings for the quarter ended March 31 follow:

Quarter ended March 31—	1907.	1906.	1905.
Gross	\$231,206	\$198,727	\$172,724
Expenses	148,581	123,901	126,776
Net	\$ 82,625	\$ 74,826	\$ 45,948
Other income	385	1,117	901
Total income	\$ 83,010	\$ 75,943	\$ 46,849
Charges	77,079	44,964	44,104
Surplus	\$ 5,931	\$ 30,979	\$ 2,745

The balance sheet shows cash on hand of \$40,104 and a profit and loss surplus of \$657,558.

Dividends Declared.

- American Railways Company, quarterly, 1½ per cent.
- Citizens' Traction Company, Pittsburg, 3 per cent.
- Columbus (O.) Railway Company, common, quarterly, 1¼ per cent.
- Grand Rapids (Mich.) Railway Company, common, quarterly, 1 per cent.
- Kansas City Railway & Light Company, preferred, quarterly, 1¼ per cent.
- Northern Ohio Traction & Light Company, Akron, O., quarterly, one-half of 1 per cent.
- Paducah (Ky.) Traction & Light Company, preferred, 1 per cent.
- Pensacola (Fla.) Electric Company, preferred, 3 per cent.

Directory of Electric Railway Associations.

- American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York. Annual meeting, Atlantic City, N. J., October 14-18.
- American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.
- American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.
- American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.
- American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.
- Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.
- Colorado Electric Light Power & Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.
- Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia.
- Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.
- Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.
- New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.
- Oklahoma Electric Light, Railway and Gas Association. Secretary, Galen C. Crow, general manager Guthrie Electric Light & Power Company, Guthrie, Okla.
- Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.
- Southwestern Electrical and Gas Association. Secretary, R. B. Stichter, Dallas, Tex.
- Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y. Next meeting, Bluff Point, N. Y., June 25 and 26.
- Wisconsin Electric and Interurban Railway Association. Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

Manufactures and Supplies

ROLLING STOCK.

Chippewa Valley Electric Railroad, Eau Claire, Wis., is in the market for six cars.

St. Thomas Street Railway, St. Thomas, Ont., has placed an order for 12 cars with the Ottawa Car Company.

Jackson Consolidated Traction Company, Jackson, Mich., is reported as about to purchase five new motor cars.

Aurora Elgin & Chicago Railway, Chicago, has placed an order for two interurban cars with the Hicks Locomotive & Car Works.

Louisville & Eastern Railroad, Louisville, Ky., has ordered two express cars from the McGuire-Cummings Manufacturing Company.

Peekskill Lighting & Railroad, Peekskill, N. Y., has ordered one car from the McGuire-Cummings Manufacturing Company and one from the Russell Car & Snow Plow Company.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind., is having three cars built by the Niles Car & Manufacturing Company. These will be equipped with Baldwin trucks and are for use over the line between Indianapolis and Seymour.

Chicago & Milwaukee Electric Railroad, Chicago, has ordered two locomotives from the American Locomotive Company and two from the Baldwin Locomotive Works, in addition to the two ordered from the Hicks Locomotive & Car Works, reported in the Electric Railway Review of May 4.

Georgia Railway & Electric Company, Atlanta, Ga., is building at its own shops 10 single-truck and 20 double-truck cars. To equip these cars the company has purchased from the General Electric Company ten 2-motor No. 80 and five 4-motor No. 80 equipments and from the Westinghouse Electric & Manufacturing Company fifteen 4-motor No. 101 equipments.

Tri-City Railway, Davenport, Ia., has purchased 10 new 2-motor No. 80 equipments from the General Electric Company, to be installed under 10 new cars which have just been built at the shops of the company. The car bodies are 21 feet in length, mounted on Peckham trucks. This will make a total of 20 new cars put into service on this line during the present year.

Hudson Valley Railway, Glens Falls, N. Y., has just received three 51-foot interurban cars, mounted on Baldwin high-speed trucks, equipped with four Westinghouse 93A motors, from the Niles Car & Manufacturing Company. The company has also ordered from the General Electric Company 12 GE-87 4-motor equipments with type M control, and from the American Locomotive Company 12 sets of high-speed trucks.

El Paso Electric Railway, El Paso, Tex., as reported in the Electric Railway Review of April 20, has placed an order with The J. G. Brill Company for four 15-bench Narragansett open cars, to be mounted on Brill 27-G1 trucks, for August delivery, and with the St. Louis Car Company for four 29-foot closed cars, mounted on St. Louis No. 47 trucks. The open cars will be 40 feet 4 inches in length over crown pieces, 7 feet 9½ inches wide over sills and 8 feet 7½ inches over posts. These cars will be finished in cherry and ash, will be equipped with Monitor deck roof, full length of car, will have 18-inch vertical brake wheels, Peacock brakes, Wilson trolley catchers, Brill gates, United States headlights, Pflugst fenders, International registers, Westinghouse air brakes and four GE-81 motors. The closed cars will have a length over bumpers of 40 feet, with a width over all of 8 feet 8 inches. They will have 11 windows on each side, platforms on each end of the car and cross seats upholstered in rattan. The interior finish of these cars will be the best quality of mahogany in natural color, trimmed with nickled bronze. The cars will be equipped with four GE-81 motors, Wood gates, Pflugst fenders, United States headlights, International registers, with rod operation, Pantasote curtains and Westinghouse air brakes. Push buttons have been specified on the side posts.

SHOPS AND BUILDINGS.

British Columbia Electric Railway, New Westminster, B. C.—It is reported that this company has made plans for extensive improvements to its property, including an expenditure of \$100,000 for new buildings. D. J. McQuarrie, manager.

Consolidated Railway, New Haven, Conn.—This company is purchasing property for a car house at Rockville, Conn.

La Crosse (Wis.) City Railway—Several changes are to be made at once in the building now used as a car house, power house and office building at La Crosse. The office rooms at the south side of the building are to be removed to make room for two additional tracks and the offices will be removed to an adjoining residence building, which will be remodeled for the purpose.

Oklahoma City Railway—It is announced that the object of this company, which was incorporated last week, is to build a large office building and terminal station at the corner of Grand avenue and Harvey street, Oklahoma City, for the Oklahoma City Railway.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has built seven new shelter stations on its interurban

line between Albright and Ft. Crook, Neb., and is preparing to build a passenger station at Bellevue.

TRADE NOTES.

C. H. Rockwell has been appointed a representative of the O. M. Edwards Company of Syracuse, N. Y. Mr. Rockwell was formerly general car inspector of the Delaware Lackawanna & Western.

Northern Engineering Works, Detroit, has received an order from the Edison Illuminating Company for a 25-ton electric Northern crane, which has been installed in the Beecher avenue (Detroit) substation of the company.

Cowing Engineering Company will soon move its offices from the Citizens' Bank building, Cleveland, to Collinwood, a suburb of Cleveland, where the company is erecting a new plant, the main building of which will be 100 by 450 feet.

G. P. Blackiston, for the past eight years connected with the Crucible Steel Company of America, has resigned to take a more active interest as president and general manager of the Pittsburg Automatic Vise & Tool Company of Pittsburg, Pa.

Electric Service Supplies Company, Philadelphia, has had plans prepared by Stearnes & Castor, architects, Stephen Girard building, Philadelphia, and has awarded the contract to Lynch Brothers for a new 3-story factory building, 57 by 152 feet, to be built at Ambler, Pa.

John A. Mead & Co., manufacturers of coal crushing, weighing and conveying machinery, the sole manufacturers of the McCaslin overlapping gravity bucket conveyor, have moved their offices from 11 Broadway to the twentieth floor of the new United States Express building, New York.

Frank H. Shipe, for the past two years representative in the railway department of the Acme White Lead & Color Works of Detroit, Mich., has been appointed manager of the Richmond branch of the Philip Carey Manufacturing Company, with headquarters at Richmond, Va.

Recording Fare Register Company, New Haven, Conn., has just closed a 2-year contract with the Consolidated Railway Company, with headquarters at New Haven, whereby Recording fare registers will be used on all cars built for this road or any of its lines controlled or leased by it.

Cross-Lachance Electric Company, New York, has opened offices at 253 Broadway and has equipped a machine shop at 155 West street, for the manufacture of field and armature coils, commutators and switchboards, rewind armatures and do a general repair business. Samuel Cross is engineer in charge of the shop.

Neil S. Buckbee, engineer, of Lake George, N. Y., has been engaged by the General Fireproofing Company and is at present connected with the home office at Youngstown, O. Mr. Buckbee graduated in April from the Thayer School, Dartmouth College. He formerly was with Durkee, White & Towne, engineers and contractors, Springfield, Mass.

J. G. Platt, who recently resigned his position as master mechanic of the American Steel Foundries, Franklin works, on account of his health, has accepted a position as mechanical representative with the Hunt-Spiller Manufacturing Corporation. Prior to Mr. Platt's connection with the American Steel Foundries he was, for many years, engineer of tests on the Erie Railroad.

American Nut & Bolt Fastener Company, Allegheny, Pa., although manufacturing about one million nut and bolt fasteners a month, finds the demand for its products increasing so rapidly that it has purchased a tract of land near its present factory, upon which the company will erect a new building, 80 by 150 feet. The new addition will have a capacity of about three million nut and bolt fasteners a month.

Dossert & Co. have received another large order from the New York Central for cable taps and 2-way connectors, to be used in the electrical installation between New York City and White Plains, N. Y. They have an order from the same road for their emergency jumper clamp connector, to be used on the third rail. They have also received another order from the Pennsylvania Railroad for 160 two-way connectors.

J. H. Wagenhorst & Co., Youngstown, O., manufacturers of electric blue printing machines, report the following sales: Thomson Stationery Company, Vancouver, B. C.; department of forestry, Ottawa, Ont.; New Jersey Zinc Company, New York; James Clark, Jr., & Co., St. Louis, Mo.; Howe Engineering Company, New York; Great Western Sugar Company, Ft. Collins, Colo.; Builders' Exchange Company, St. Paul, Minn.; C. N. Dunham, Philadelphia, Pa.

E. H. Symington, western manager of sales of the T. H. Symington Company, Chicago, while riding in Lincoln park on Saturday, May 18, threw his horse in an attempt to save a boy from being run down. The horse fell on Mr. Symington's head, injuring Mr. Symington so severely that for a time his life was seriously in danger. As we go to press Mr. Symington's physician reports that he is gradually regaining consciousness, and unless unforeseen complications develop, he will doubtless recover.

Preston Car & Coach Company, Limited, Preston, Ont., has recently been incorporated by Don M. Campbell and Charles S. Wright for the purpose of manufacturing electric cars, automobile bodies, railway cars, etc. Mr. Campbell was formerly chief engineer of the Cleveland plant of The J. G. Brill Company and later was

superintendent of the Ottawa Car Company. Mr. Wright has for the past 12 years been superintendent of the carriage department of the Ottawa Car Company. Work on the construction of the plant has been commenced.

F. H. Brown Machinery Company has opened an office at 1102 Park building, Pittsburg, Pa., as a representative of a number of machine tool manufacturers. The company will make a specialty of buying and selling second-hand machinery.

Nathan Manufacturing Company, 416 East One Hundred and Sixth street, New York, is building an addition, 25 by 100 feet, to its foundry building. Some new machinery will be purchased and when installed will greatly add to the capacity of the plant.

Pawling & Harnischfeger, Milwaukee, announce that their Chicago sales office is now located at 1241 Monadnock block, in charge of W. E. Kreamer as manager. Mr. Kreamer was formerly connected with the Denver office of the company and is succeeded by H. N. Steinberger. The company was formerly represented in Chicago by G. P. Nichols & Brother.

R. W. Marshall & Co. have moved into their new quarters on the eleventh floor at 95 Liberty street, New York, where they have more room for carrying on their business in railway materials and second-hand machinery and equipment. The company have just closed a contract for equipping the Ashville Loop Line Railway with two double-truck and two single-truck cars, having 50-horsepower motors, and have also sold three single-truck cars having 45-horsepower motors to the Pittsburg & Westmoreland Railway Company of Irwin, Pa.

Consolidated Equipment Company, 17 Battery place, New York City, has been appointed selling agent for the Emerson pump. This company's well-known triple vertical cylinder contractor's pump will be supplemented by a new product, the Emerson junior. This latter is made with but a single cylinder, weighs but 219 pounds, and has a capacity of 100 gallons per minute against a 25-foot head, and about half of this capacity on a 100-foot head. A stock of regular and junior Emerson pumps will be kept on hand in New York and at the factory in Alexandria, Va., which is to be enlarged to accommodate this new design.

Abner Doble Company, engineers, San Francisco, Cal., has appointed Mitsui & Co. to act as its sole agents in Japan and its territories, Korea, China and Manchuria, for the sale of Doble tangential water wheels and hydraulic apparatus. The industrial development that is now taking place in the orient, and the increasing demand for high-grade water wheel machinery will make this co-operative arrangement an advantageous one for both parties. Mitsui & Co. are a large and progressive engineering house and with their 35 branch offices are in a particularly good position to handle the water wheel products of the Abner Doble Company.

Allis-Chalmers Company, Milwaukee, has recently been awarded what is said to be the largest contract ever placed for alternating-current generators. This order was received from the United States Steel Corporation and includes 32 gas-engine-driven electric generators, aggregating 68,000 kilowatts, 16 of which are to be installed in the new plant at Gary, Ind., now in course of construction by the steel corporation. The other 16 units are for the Homestead plant of the Carnegie Steel Company, the South Chicago and Bay View (Milwaukee) works of the Illinois Steel Company, and for the central furnaces of the American Steel & Wire Company at Cleveland, O. These are Allis-Chalmers standard type, 25-cycle, 3-phase alternators, and will be direct-connected to twin tandem gas engines, operated on blast furnace gas.

Northwest Engineering Company, 153 LaSalle street, Chicago, has recently completed its organization and has arranged the personnel of its engineering forces with reference to doing particularly effective work as constructing and contracting engineers in all branches of the business. The company will undertake surveys, estimates and reports on existing and projected electric and steam railways, the construction and superintendence of power plants and central stations, also the erection of bridges and buildings and structures of reinforced concrete. Water supply, sewers and sewage disposal and kindred problems will be handled by specialized engineers. The engineering talent and experience that has become associated in the management of this company gives promise of thorough and economical methods in the handling of its contracts, the first of which are now being vigorously pushed. R. C. Canterbury is secretary and managing engineer of the company, with headquarters at the Chicago office.

ADVERTISING LITERATURE.

The Arnold Company, 181 La Salle Street, Chicago.—Bulletin No. 17 describes the Elgin & Belvidere Electric Railway. The matter contained in the bulletin is a reprint of much of the matter describing the railway, which appeared in the Electric Railway Review of August 1906, and March 9, 1907, and the Railway and Engineering Review of March 9, 1907.

Joseph Dixon Crucible Company, Jersey City, N. J.—This company has recently issued an interesting pamphlet, the nature of which is sufficiently described by its title, "Philosophy of Protective Paint." Linseed oil is first considered and its method of manufacture and drying properties by which it is converted into a tough and elastic substance. The pamphlet shows the reason for the addition of the pigment, and the reasons are given why the pigment must be inert and not subject to chemical change. An interesting feature of the pamphlet is the mathematics of the paint skin, and attention is called to the importance of proper application and the fallacy of purchasing paint on account of its great covering capacity. Finally, the pamphlet contains a discussion of the physical properties of protective paint pigments and the reasons

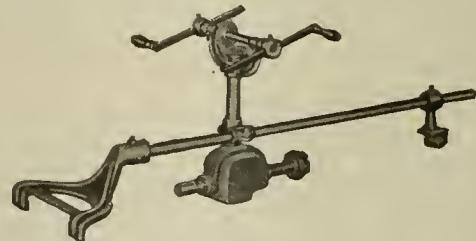

why flake graphite with silica is the ideal pigment for protective paint.

Marion Incline Filter & Heater Company, Marion, O.—This company, which is the manufacturer of feed-water heaters, heaters and receivers and chemical reagent systems, has completely described its feed-water heaters and purification in catalogue G-1. The economy of feed-water heaters is quite generally conceded and the matter of the most economical type of heater is accordingly a matter of interest. It is believed that the heaters and purifiers described in this publication are of the most modern type.

General Electric Company, Schenectady, N. Y.—Bulletin No. 4394-B deals with Form P belt-driven alternators of a design to meet the demand for small alternators to be able to carry a load of mixed character. Bulletin No. 4494 deals with the Edison "Gem" high efficiency incandescent units with bowl holophanes. Bulletin No. 4497 describes the security snap sockets for incandescent lamps. Current transformer panels are described in Bulletin No. 4500, which supersedes a previous bulletin dealing with the same subject and published as No. 4293. Price list No. 5164 covers the existing quotations on Thomson recording wattmeters and supersedes a previous list. Price list No. 5163 furnishes quotations on Gem regular incandescent units and Gem meridian units. Bulletin No. 3556 furnishes an approximate rule for size of wires for 3-phase transmission lines and a table of distances to which 3-phase current can be transmitted over different sizes of wire at different potentials, assuming an energy loss of 10 per cent and a power factor of 85 per cent.

Reed Track Drills.

The Francis Reed Company, 43 Hammond street, Worcester, Mass., has recently brought out a new track drill, which is manufactured in two sizes. That known as No. 18 is provided with two extension cranks located near enough together so that one man can use both arms in operating the drill. They are so placed as to be given direct motion from the body and the cranks may be so adjusted that two men can operate them if required. The drill is provided with automatic friction feed, which can be adjusted to fast or slow movement. This is utilized to secure a quick return of the spindle in reversing the cranks, the drill thus being backed out at a higher rate of speed. The drill is adjustable in every manner required for a track drill. The socket is bored for 41-64-

The Reed Track Drill.

inch straight shank drills and there is also provided a sleeve which will enable the use of drills with 1/2-inch straight shank. One revolution of the crank gives one revolution of the drill. If required the top yoke can be removed and one crank mounted upon the upright shaft, by which a speed of one revolution of the crank to two revolutions of the drill is obtained.

The drill known as No. 19 is heavier than that just described. It was designed to meet the demand for an efficient track drill to drill 7/8-inch holes in heavy rails for bonding. This drill is designed to be operated by two men standing, thus enabling the work to be done to the best advantage. The adjustments are similar to those described in connection with No. 18. The drill weighs 185 pounds and is easily handled by two men. A recent addition to both types of drill is a cast-iron gear casing to protect the lower gears from dust or other obstruction.

THE MILLOY TROLLEY BASE AND RETRIEVER.

Uniform tension between the trolley wheel and the trolley wire is one of the vital requisites for the successful operation of street and interurban cars. To obtain this uniformity it is necessary to provide a substantial, well-designed trolley base. The Milloy Electric Company, Bucyrus, O., has been developing the details of the Milloy trolley base and now announces that it is filling the want along this line for cars used in electric railway operation.

The company has recently equipped its own factory at Bucyrus and is now prepared to manufacture the trolley base and the Milloy trolley retriever in all sizes. The company claims that the base, by furnishing uniform tension, gives longer life to both the trolley wheel and the trolley wire. It has a double roller bearing, has no center post, no fulcrum developer, no friction and requires no lubrication to keep it in good condition. The cable connection is under cover out of the weather. All parts of the base are interlocking and can be assembled or disassembled without tools.

The Milloy retriever aids in making high speed safe. It is self-adjusting and is operated by compressed air. When installed for use the retriever occupies a position on the roof of the car, where it cannot be tampered with and where the suction dust does not reach. The maintenance expense of the retriever is nominal.

Efforts to prevent the manufacture of the Milloy trolley base have been defeated by a sweeping decision of the United States court of appeals in favor of the Milloy Electric Company.

The value of comprehensive forms is emphasized in a paper read last month by F. C. Randall of Galveston, Tex., at the annual meeting of the Southwestern Electrical and Gas Association at San Antonio, Tex. Mr. Randall spoke of the desirability of reducing the number of forms used by a company to a minimum, and expressed the opinion that if many managers would look over the forms in use they would find many that could have been eliminated by the judicious wording or combining of forms designed for similar purposes. In preparing or revising forms it is most essential to avoid practices which will exact a maximum of clerical time and yield only a minimum of satisfaction or help to the managers or executives of properties.

The Value of Comprehensive Forms.

The new track laid by the United Railroads of San Francisco during the past year, as described in this issue of the Electric Railway Review, conforms to tried and well established practice. There appears, however, an innovation in subgrade construction by the placing of concrete between the ties in the form of two interrupted beams, one under each rail. The broken stone subgrade on which the wooden ties rest is placed in the trench as usual and the rails are lined and surfaced. This ballast is tamped under the ties and filled up to the general level of their upper surface except for a space between the ties and 15 inches on either side of the rails. In this space, under each rail, an interrupted girder of concrete is placed. The use of this concrete filler between the ties has apparent advantages. It assures a continuous firm base for the rails to rest upon, anchors the ties to the ballast below and, uniting with the floor of concrete above the ties, it firmly anchors the rail to the substructure. There is in this design of track a combination of the concrete girder and the more common tie-and-ballast types of substructure. Each of these has its advocates. Thus the engineers of the United Railroads seem to have wisely chosen for standards not only a form of tie construction heretofore

found serviceable on their own lines, but also meritorious features of girder construction that elsewhere have been demonstrated as valuable.

The "Question Box" of the Southwestern Electrical and Gas Association as presented at the recent meeting of that body was well prepared. Among the large number of answers to queries the following one is easily remarked for the brevity with which its author sums the various methods available for lessening accidents. The editor of the "Question Box" asks: "What are you doing, or what have you done since the last meeting of the association to lessen your accident risk or cost?" The reply follows: "Made fewer settlements and more vigorous fight against damage suit attorneys; increased number of air brakes on the rolling stock; better car barn inspection; reconstructed and better maintained track and overhead; safety stops at points of crossings with automobiles on paved roads; formed an instruction department with traveling instructor, and reduced speed at congested points." Such steps are an index of the advancement of any railway operating management.

It is well known that the comparative economy of engines, turbines and gas engines cannot be judged by the steam economy at full load alone, and especially is this true when it is necessary to compare prime movers intended for variable load work. Neither would a comparison at under or overload be correct, unless the form of the economy curves of the engines being compared are identical. The correct method of determining the relative values of several prime movers is to compare the average steam consumption taken over the entire range of loading under which they are expected to operate. Since, however, the economy lines are curved, the arithmetical average cannot be employed. The simplest method of obtaining the true average economy is to find the area under the curves between

Better Service in a Nutshell.

Prime Movers and Economy Curves.

two ordinates, drawn through the minimum and maximum loads, respectively. Dividing the areas, in square inches, by the distance in inches between the maximum and minimum load ordinates, and multiplying by the number of pounds of steam, or coal per hour per inch of the ordinates, gives the true mean economy. If the relative economies alone are required, it is only necessary to compare the areas under the curves, provided the diagrams are all drawn to the same scales.

One of the loose ends of operation frequently found in surface car service in large cities is the failure of conductors, motormen and inspectors to announce temporary changes in routes to passengers about to board cars bound for definite destinations ordinarily reached in a known schedule time. It is natural for a management to

feel that it has done its duty by the public when it has arranged for the delivery of passengers to the desired points by a roundabout journey on a single fare, but it often occurs that considerable inconvenience arises when passengers are deflected from their usual routes without notification. In large systems a suburban passenger may board a car far from the center of the city, planning to connect with some important in-town railroad station in entire ignorance of the blockade, parade or other obstruction ahead which will necessitate a deflection from the usual route when the car reaches the congested district. Unless the conductor announces the fact that the car will be diverted, as soon as he knows it, the passengers counting on traversing the line as usual may be greatly distributed in their schedules and put to much unnecessary delay. The exact route which a diverted car will follow is often unknown to its motorman and conductor except as the diversions follow one another in successive steps signaled by switchmen or street inspectors, but, so far as the route is known, it ought to be announced. The failure to do this is not a grave dereliction; but it contributes to the perfection of the service and costs the company nothing to make known so far as possible to its passengers all temporary changes in routes. From the passenger's standpoint the interests at stake are sometimes serious.

About 20 years ago Elisha Gray invented the telautograph, an ingenious instrument for electrically transmitting handwriting. During the years which have

The Telautograph and Train Dispatching. passed since its invention, the telautograph has, through constant effort, been developed from a complicated experimental curiosity into a simple commercial commodity. Though six wires were required to operate the first telautograph invented by Elisha Gray, and it was necessary to keep the pencil constantly on the paper, thus making the writing difficult to read, the telautograph of today operates with but two wires, and permits using the pencil in the usual manner. The telautograph is no longer an experimental instrument: it is a practical device of great importance for use where it is imperative that orders should be properly received, without chance of misunderstanding, and where it is essential to fix the blame if orders are not properly received or executed. Because it fulfills these conditions, is not affected by vibrations, and noise does not prevent its operation or introduce the danger of misinterpretation of messages, the telautograph has been adopted by the United States war department for communicating between the stations of the range finders of our coast defense. As considerable current is required to operate the telautograph, it is not easily affected by induced currents and by static discharges as is the telephone. From these considerations it would almost seem as if it had been especially designed for issuing train orders on interurban railway lines, as it meets all the conditions of this service perfectly. It has the advantage over the tele-

phone, in that the train dispatcher can issue the orders before the trains get to the boxes, thus all that is necessary is for the motorman or conductor to get off, unlock the box and tear off the order, which is in the train dispatcher's own handwriting and bears a facsimile of his signature. A carbon copy could be made and deposited in a box where the crew could not see it. Thus there would be three copies of each order issued—the original, a carbon deposited in the signal station boxes and the one taken by the motorman. It is obvious that this system removes the possibility of misunderstanding train orders because of line disturbances, of noise of the wind, etc., as well as the errors possible in the telegraphic system due to careless operators. A very effective system could be had by combining the telautograph and telephone, making the one receiving the orders repeat them to the dispatcher by telephone, thus putting him verbally in touch with the operator to report accidents or delays.

THREE-PHASE VERSUS SINGLE-PHASE TRANSFORMERS.

A careful examination of the relative advantages obtained by using one 3-phase or three single-phase transformers, would indicate that at present the location and the transportation facilities are among the most important points to be considered. Owing to the phase relation in a 3-phase circuit, the copper and core of a 3-phase transformer can be made lighter in weight than the cores and copper of three single-phase transformers of equivalent capacity. Further, only one casing, which is also of lighter weight than the casings of the single-phase transformers, is required. A 3-phase transformer for a given service does, however, weigh more than each of the 1-phase transformers for the same service, and for this reason it may sometimes be advantageous to use three single-phase transformers in stations not properly equipped to handle heavy pieces of machinery, or where it is necessary to haul them by wagon. The question of weight also enters into the repair problem. The lighter weight single-phase transformers are cheaper to repair because of the greater facility with which they can be handled. When transformers must be mounted on poles, the advantages are in favor of the 3-phase transformers because of the reduced weight and also because of their appearance.

The 3-phase transformer has the advantage of higher efficiency and simplicity of connections and station wiring. All the connections can be made inside of the transformer case, it being necessary only to bring out the three high and the three low tension leads. Consequently, besides the reduced first cost of the 3-phase transformer, there is also a considerable saving on the cost of cable for making the connections, accompanied by a lower labor cost.

There is a slight disadvantage accompanying the use of 3-phase transformers in instances where it is necessary to bring out a large number of taps for different voltages. This complicates the wiring within the case, but such instances are comparatively rare and unimportant. As the radiating surface of a 3-phase transformer is less than that of three single-phase transformers of equal normal capacity, self-cooled 3-phase transformers cannot be designed (for any allowable temperature rise) for so great a normal capacity in one unit as can three single-phase transformers, but the gain in efficiency and in the reduced danger of breakdown when oil or water cooling is employed should settle this question.

One disadvantage of the 3-phase transformer is that in case of failure of one of the coils, it is highly probable that the remaining coils would be injured, and that it is therefore necessary to keep available a complete unit for emergency purposes. In the case of the single-phase transformers only a third of the total capacity need be kept in reserve. As the art of designing and manufacturing transformers progresses, however, the force of this argument diminishes, for breakdowns are becoming less frequent.

As the cost of a 3-phase transformer is approximately but 80 per cent of the cost of three single-phase transformers of equivalent output, the investment in emergency units will only be greater for the 3-phase transformer when but one transformer is installed, and will probably be less than the investment required for the three single-phase transformers if the installation consists of a number of units.

In cities where real estate is valuable the great saving in floor area, and in a slightly reduced height, furnishes a strong argument in favor of the 3-phase units. This point deserves especial consideration when transformers are installed in subcellar substations, where in many cases only a certain amount of space is available, and additional room, without consideration of the cost, is practically unavailable. The regulation of the 3-phase and three 1-phase transformers is equally good with changes of load or power factor and need not, therefore, be considered.

OPERATIONS OF STONE & WEBSTER PROPERTIES.

The statistical book which is published annually by Stone & Webster of Boston, Mass., contains in the last edition the main financial results for 1906 of 20 companies which operate electric railways either as their principal business or as part of their operations. These companies operate in a wide range of territory, extending from Ponce, Porto Rico, on the south to Sydney, Nova Scotia, on the north, and from Massachusetts in the east to the Washington coast in the west.

While the figures of the operations of these companies are not given in sufficient detail to enable a comparison to be made which would indicate the sources of the variation in their operating results, the percentage of gross earnings used in operating expenses may be presented in order to indicate in a general way the difference in the expenditures charged to operation of the various properties in the year.

The following table shows the gross earnings and percentage of operating expenses in 1906, and the percentage of increase in gross earnings over 1905:

	Gross earnings, 1906.	Operating Increase expenses, in gross 1906— earnings percent- in 1906 age of over 1905 gross —per- earnings. centage.	
Blue Hill St. Ry. Co., Canton, Mass. \$	89,041.34	75.9	5.35
Brockton & Plymouth St. Ry. Co., Plymouth, Mass.	111,775.03	63.4	9.4
*Cape Breton Electric Co., Ltd., Sydney, N. S.	258,416.80	59.7	21.9

Tampa (Fla.) Electric Co.	469,222.08	59.6	13.9
Terre Haute (Ind.) Traction & Light Co.	823,162.54	56.9	30.7
Whatcom County Ry. & Light Co., Bellingham, Wash.	279,469.45	66.2	43.3

*Includes one-half of Sydney & Glace Bay Railway Company, Ltd., earnings. †Figures for 1905 were for eight months only.

A glance at this table will indicate how greatly the expense of operation and the increase in earnings varied in the different properties. It is found that the lowest operating expense (expressed in percentage of gross earnings) is reported by the Puget Sound Electric Railway, 52.8 per cent, while the highest is the Blue Hill Street Railway Company

of Canton, Mass., 75.9 per cent. Operating expenses of the Columbus (Ga.) Electric Company, the Ponce (Porto Rico) Electric Company, the Puget Sound Electric Railway and the Terre Haute Traction & Light Company were relatively near together.

While the greatest discrepancy in the percentage of gross revenue applied to operating expenses is shown in the results of the Blue Hill Street Railway and the Puget Sound Electric Railway, it should be borne in mind that these companies operate under conditions that are hardly comparable, and attention is called especially to them only because they happen to show the most striking differences of the 20 companies reporting. The Blue Hill Street Railway is located in a territory in which the available business is not at all developed and it terminates in Boston under traffic agreements that add greatly to the cost of operation. Furthermore, the operating expenses are affected by climatic conditions in winter. The Puget Sound Electric Railway, on the other hand, serves a territory in which the available business has been developed rapidly and the conditions of operation are very favorable. It has near at hand inexpensive water power, and, as there is very little snow to contend with in winter, the climatic conditions ordinarily are favorable. Another factor which affects materially the proportion of gross earnings indicated as required for operating expenses is that the Puget Sound railway derives an income on the securities of the Tacoma Railway & Power Company which it owns. No expense is incurred on account of these securities.

That similar striking differences occurred in the gains of the respective companies in gross earnings is a matter not of management but of local conditions peculiar to the various territories served. For instance, the revenue of the Whatcom County Railway & Light Company, which showed a gain in gross earnings of 43.3 per cent over the previous year, reflected the remarkable growth that has taken place in the cities of the northwest, and especially in Bellingham. In this instance no large extensions of track were made during 1906 and the increase represents greater density of travel.

The smallest increase reported by those companies in which comparison is possible was that of the Savannah (Ga.) Electric Company, which gained but 4.2 per cent over 1905. This small increase is due to a boycott to which the company has been subjected by negroes since September, 1906, owing to the passage of a "Jim Crow" law by the city of Savannah, requiring the separation of races on the cars. The boycott conditions have improved materially this year and it is hoped that the earnings will soon assume their normal increases.

The increase of 37.2 per cent in gross revenue of the Houghton County Street Railway Company, Hancock, Mich., is due in part to the fact that in 1905 the company suffered from the effect of a strike and boycott.

The foregoing figures show how the financial results of different electric properties may be affected by local conditions, notwithstanding the advantages of affiliated control and executive management.

According to the Brooklyn Rapid Transit Company officials the new transfer system put in service on the surface lines of the company a few weeks ago is working as well as was expected. The public for the most part has accepted the new system willingly and complaints against its operation come almost entirely from those who had abused the privileges given under the old plan. It is too soon as yet to ascertain just how much the company will be benefited financially by the new system, but the officials believe the benefit will be considerable. The last reports of statistics of New York City traffic published by the state board of railroad commissioners showed that during the nine months ended September 30, 1906, the Brooklyn Rapid Transit Company's cash fares increased only 9.57 per cent, as compared with the corresponding period of 1905, during which the number of transfers increased 58.63 per cent. Since September 30 the number of transfers increased, until a month ago the company's management reported that it was issuing approximately 85 per cent more transfers than a year previous.

TRACK RECONSTRUCTION IN SAN FRANCISCO.

At the time of the earthquake and fire of April, 1906, the United Railroads of San Francisco had 250 miles of single track. Of this trackage there were 84 miles in the burned

San Francisco Track—New Track Ready for Concrete Under Rails, Showing Space Left for Concrete.

San Francisco Track—Condition of New Unpaved Track in Street After Earthquake and Fire.

district, comprising 25 miles of cable track, 57 miles of electric track and two miles of track over which horse cars were operated. The fire left in operating condition none of this total of 84 miles of track, but steps were immediately taken toward rebuilding and electrifying a large proportion of the

cross sections of which are shown in the accompanying illustrations, is of a single type with variations in the weight of rails according to the service required. The substructure might be designated as a combination of ties and concrete stringers. The ties are of standard dimensions, spaced 2

San Francisco Track—Breaking Off Old Cable Yokes and Rolling Bed for New Track.

cable-operated tracks and the rehabilitation of that track which had previously been built for electrical operation.

During the past year there has been approximately 40 miles of single track torn up and replaced by an entirely new structure of accepted permanent design. Two-thirds of the track that has been reconstructed was formerly used for cable cars, and in the reconstruction several interesting meth-

ods for tearing up the old substructure were tried. It is the purpose of this article to describe the standard track that is now being built, and some of the labor-saving methods that have been employed in the work.

The standard track construction for electrical operation,

up about the rails to a height sufficient to afford an even surface for supporting the paving.

In general there are two types of paving between rails, one comprising 9-inch Belgian blocks and the other being an asphalt surface. A cushion of two inches of sand is provided for the blocks. The asphalt rests directly on the concrete. The dimensions of these two types of construction for differing street surfaces are shown in one of the accompanying illustrations.

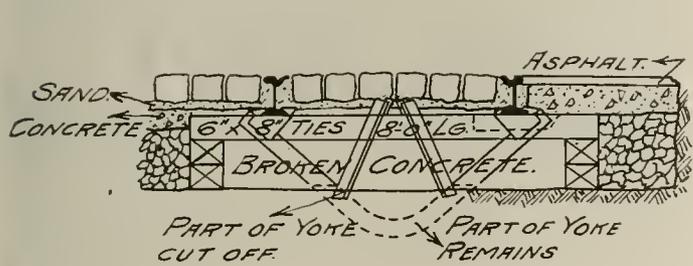

Standard Track.

The sections of rail used under various conditions of traffic include, for the main trunk lines bearing the heaviest traffic, a 9-inch grooved girder rail weighing 141 pounds per yard, or 221.57 gross tons per mile of single track. For the lines of average travel the rail section is likewise nine inches

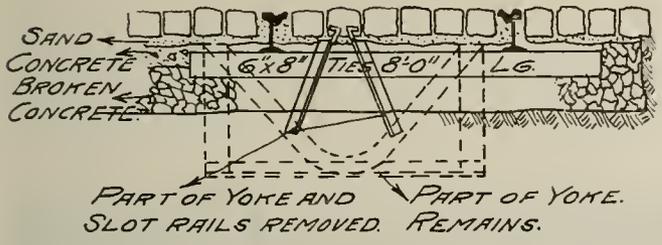

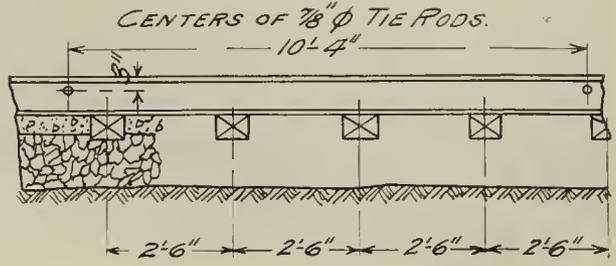

mil bonds. The terminals of the bonds are all screw-compressed to place.

Special Track Work.

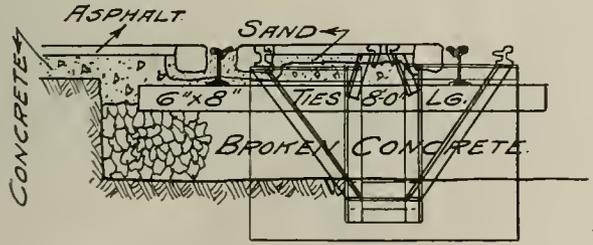

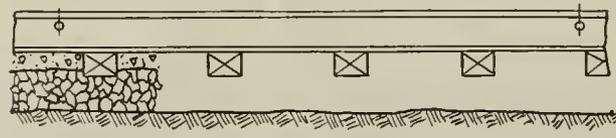

The special work at all intersections is the Lorain Steel Company's hard and renewable-center construction built of 9-inch rails. Uniform standards have been adopted for all special track work. In the older portions of the town, north of Market street, where the streets are narrow, the curves have a 42-foot 7½-inch center radius, and south of Market, in the wider streets, the standard radius is 50 feet 1½ inches. In designing the special track work the integral sections are made to conform to standard dimensions so that it is possible to interchange parts of one layout with those of another. Each section of any layout is known by a designating letter and all pieces of the same letter

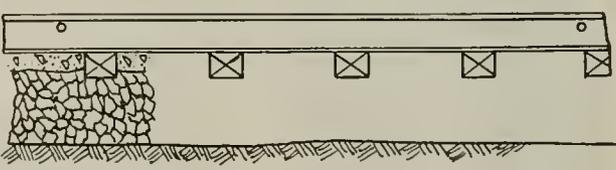

MARKET STREET.

LARKIN STREET.

SACRAMENTO STREET.

San Francisco Track—Rebuilt Cable Tracks, Showing Slot Yokes and Parts Removed.

high and of a similar contour. This latter rail, however, weighs 109 pounds per yard. For curved tracks, serving the same traffic as the latter mentioned rails, a 119-pound guard section is used. These three rail sections just mentioned are illustrated herewith, and are rolled by the Lorain Steel Company. The drilling of rail ends for joints in these sections is also illustrated. Tie rods are spaced from 8 feet 4 inches to 10 feet 4 inches apart and 3 inches below the tread of the rail, depending upon the section used.

For the reconstructed cable lines a 4-inch 81-pound Trilby rail was used, its low height permitting it, on some streets, to be installed above the old cable yokes. On other track, in asphalt paved streets, not subject to heavy teaming, a 9-inch rail of Pennsylvania Steel Company section No. 201, weighing 85 pounds per yard, was used.

The track rails are connected with 36-inch 12-bolt "Continuous" rail joints, and these joints are bonded for the 9-inch rails with four No. 0000 10-inch by 7/8-inch bonds and for the 81-pound rails with 24-inch by 1-inch 400,000-circular-

throughout the city are identical. The value of this scheme for any large company whose mileage is rapidly growing is easily recognized.

Paving.

After the ballast in the trench has been thoroughly rolled with a steam roller the steel is spiked to the ties and put in line and surface; then the concrete mixture which comprises cement, sand and unscreened rock in the proportions of 1-2-6 is tamped between and above the ties, as earlier described. The peculiar shape of the concrete stringer, combined with the larger mass of concrete, assures that the ties and the rails will form a unit, distributing all stresses over the surface of the subgrade.

Generally speaking, the paving is of asphalt or stone blocks, such blocks being of basalt and six inches thick. The asphalt streets have a 2-inch surface of that material. The city requires the railroad company to pave and maintain the streets, not only between the tracks but for two feet outside the rails. It should here be noted that the track centers of

the United Railroads are especially wide, the dimensions being 11 feet $\frac{1}{2}$ inch in the residence portion and 12 feet $\frac{1}{2}$ inch in the business portion. The toothing blocks used are of basalt, alternating 8 and 5 inches in length. All block paving is done by the railroad, the blocks being quarried

the steel work being so strong that it remained unbroken. The second type of yoke would not stand the strain attendant on tearing it from the concrete. The rivets would shear before the iron could be pulled away from the solid mass of concrete. For this reason it was found advisable to leave

San Francisco Track—Lifting Cable Yokes and Concrete with Derrick Car.

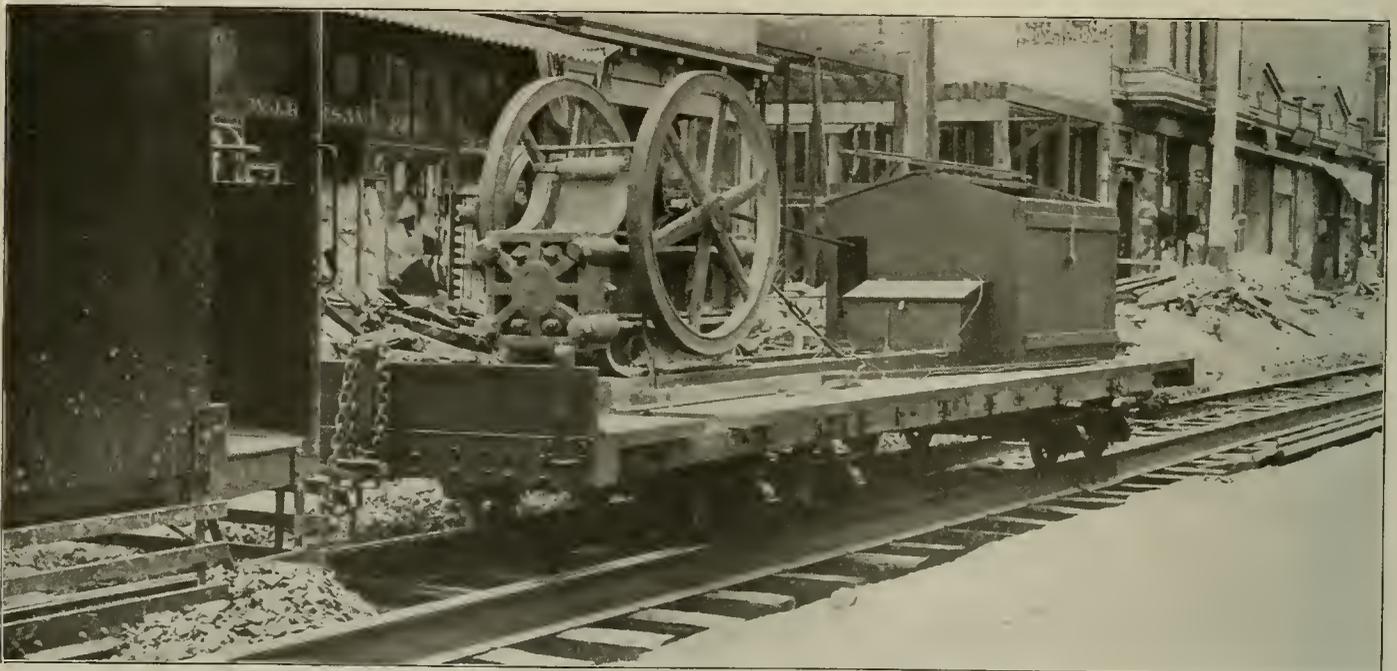

San Francisco Track—Breaking Brick Cable Conduit with Battering Ram.

about 50 miles from San Francisco. The asphalt paving is done by contract.

Reconstruction Methods.

In tearing up the old cable tracks preparatory to rebuilding for electrical operation, two types of substructure were encountered. These are roughly shown in one of the accom-

panying illustrations depicting the disposition of the cable yokes. In the old cable substructure with its concrete bed in the ground, only cutting down the yoke far enough to permit of placing the pavement. As the track center dimension was increased at the time of reconstruction the substructure took the appearance shown in the lower views of the accompanying illustration depicting the disposition of the cable yokes. In

San Francisco Track—Motor-Driven Rock Crusher Plant on Flat Car.

panying illustrations depicting the track structure as rebuilt and showing those parts of the old structure left intact. One of the types of cable yoke comprised a 60-pound T-section, bent to a V-shape, and braced with structural sections. The second type was built up entirely of straight structural iron members. When attempting to tear up these two types of cable tracks it was found that the first-mentioned type of yoke could be lifted from the concrete with a derrick car,

this case the cable conduit was filled with miscellaneous material.

Early in the reconstruction a scheme was tried for placing the rails directly on chairs supported on the old cable yokes, but as this necessitated conforming the surface of the track quite rigidly to that of the old cable structure, it was abandoned.

Several methods were tried for breaking up the old cable

and supplies manufactured in 1905 had an aggregate value of \$4,243,893, as compared with \$3,679,045 in 1900.

NEW ENGLAND STREET RAILWAY CLUB.

P. F. Sullivan, president of the Boston & Northern Street Railway and the Old Colony Street Railway, was the speaker of the evening at the monthly meeting of the New England Street Railway Club at the American House, Boston, on May 23. The meeting was the last before the fall season. President Henry C. Page introduced the speaker, who discussed the public relations and capital interests of electric railways.

Considering public relations, Mr. Sullivan sketched the gradual acquirement of jurisdiction over locations and changes in location by the railroad commission as a desirable step away from a much broadened power on the part of local authorities. The same principle has been applied in the freight and express law of 1907. Mr. Sullivan called special attention to the burdensome excise tax which was inserted in the bill of 1898 at a time when the cost of maintenance was getting high. Last year the street railways of Massachusetts paid \$3,550,000 in dividends and \$1,923,000 in taxes.

In Massachusetts there is one mile of trolley track to every three square miles of area, as compared with 15 square miles in Pennsylvania and 17 square miles in New York. Between 1865 and 1885, in the era of horse traction, the street railway mileage of Massachusetts increased 174 per cent, from 137 to 376 miles, and the income increased 233 per cent. In this period the investment increased 200 per cent. The income per mile of track showed improvement. Electric motive power was adopted soon after 1885, with subsequent development along new lines, and between 1885 and 1905 the miles of tracks increased from 376 to 2,777, or 640 per cent, income increased 420 per cent, indicating lower earnings per mile of track, and investment increased 900 per cent.

Mr. Sullivan defined the ratio of capital to income as the investment required to secure \$1.00 of income and stated that this ratio was as \$3.00 to \$1.00 in the horse traction period, but the ratio had increased to \$5.50 to \$1.00 between 1895 and 1905. The change from horses to electricity required financial risks, especially by Whitney and his confreres in the West End system of Boston. Although electricity means the use of 60 to 65 per cent of gross earnings in operating expenses as compared with 80 per cent on the horse basis, the investment needed to effect this running economy is often overlooked. Earnings per car-mile are not the only figures which tell. If the cars are run at high speeds, the cost of operation is bound to go up, with the exception of car men's wages. High speed means more power and more capital to be supported for the purchase of this power.

To compare the working of two Massachusetts companies of large size, Mr. Sullivan cited the following figures:

	Company 1.	Company 2.
Investment per car operated.....	\$55,000	\$236,000
Power station investment per car operated....	3,400	37,000
Operating expenses—percentage of gross earnings	71	51
Dividends, per cent	7 to 8	showing 6
Maintenance—percentage of income.....	22	13
Track maintenance—percentage of income...	14	3
Ratio capital to income	\$4 to \$1	\$7.50 to \$1

The cost of power in the case of Company 2 was 2.5 times that of Company 1, though the price of coal was substantially the same in each case. There was no water in the stock in either instance.

The ratio of capital to income in 46 Massachusetts companies operating 760 miles of track is \$8.35 to \$1.00. This is a danger signal, and when the ratio climbs to \$20 to \$1.00 and thereabouts, receiverships are inevitable. Massachusetts has dense traffic and populous territory, but the difference in conditions from those prevailing in the west is not often realized. Electric railway service in the east calls for a large investment, and there is danger that facilities may be needlessly duplicated by interurban lines built without regard to the special conditions of the state, and intended to operate on a plan only suited to infrequent service in an open country.

OPERATING ACCOUNTS AS DEFINED BY INTERSTATE COMMERCE COMMISSION.

Prof. Henry C. Adams, in charge of statistics and accounts for the interstate commerce commission, has issued a circular defining in a general way the objects and scope of the operating revenue and operating expense accounts which are to be followed by railways subject to the jurisdiction of the commission in the new system of accounting to be followed after July 1 in accordance with the Hepburn law. Other circulars will be issued defining the scope of "outside operations," "train, engine and car miles" and "construction and equipment expenditures."

Operating revenues are defined as covering revenues derived from the transportation of traffic, including mail and express, for which a specific rate or charge is made, and revenues derived from operations other than the transportation of traffic, the expenses of which cannot be accurately determined and separated from operating expenses. Revenues from operation are consequently divided into two general accounts, revenues from transportation and revenues from operations other than transportation. The aggregate of revenues from operations will produce "total operating revenue," which reduced by "operating expenses," leaves "net operating revenue." From this balance taxes are to be deducted and the remainder, called "operating income," will be carried to the income account. It will be noted that the phrase "total operating revenue" is adopted as a substitute for gross earnings, which is now employed generally by steam railways.

Operating expenses, as defined, cover costs to maintain the integrity of the property operated from which operating revenues are derived, and the costs incident to transportation and administration incurred in performing the services incident to the production of the revenues enumerated in the classification of operating revenue accounts. These operating expenses must not be burdened with expenditures for additions, such as new and additional equipment, tracks, buildings, ballast, etc., the purposes of which are to improve the property; with expenditures for maintaining and operating property, the operations of which are classified under outside operations; or with expenditures for earnings of property used in operation, such as tracks, yards, terminals and equipment. Neither should they be reduced by rents received for tracks, yards, terminals and equipment; nor for buildings and other property, the operating costs of which can be separated from other costs of maintenance and operation.

Operating expenses are divided into five general accounts:

1. Maintenance of way and structures.
2. Maintenance of equipment.
3. Traffic expenses.
4. Transportation expenses.
5. General expenses.

The revenue drawn from and expenses incident to the hire of equipment are to be dealt with through the income account rather than through the operating accounts.

It is intended to make a subject of special investigation the extent to which the rule of depreciation shall be applied to maintenance of way and structure accounts.

Postpones Purchase of Electric Lines.

Plans for the purchase of several additional traction lines in the northern part of New York state which were to have come before a meeting of the directors of the Mohawk Valley Company, a subsidiary of the New York Central & Hudson River Railroad, were not acted upon. It was learned after the meeting that the reason no action was taken in the matter was that the difficulty which the New York Central road, in common with other railroads, has experienced in raising new capital even for necessary improvements, deterred the management from carrying out its plans for the acquisition of these electric lines at this time. It is understood that these purchases, which had been practically agreed upon, have been allowed to go over indefinitely.—New York Times.

RAPID TRANSIT IN BOSTON AND VICINITY.

BY EDWARD HUNGERFORD.

Boston, with an elaborate and practical plan of subway and elevated loops already in successful operation, and more elevated and subway lines under construction, is now not only planning to facilitate transit within the most congested section, but also is following out a definite plan to bind outlying communities more closely to the business center. Boston has, from the first, reduced its transit problem to a scientific basis. It has been decided that the only good theory of passenger operation for a large city is to collect surface car passengers at points outside of the business and congested residence districts and then to carry them in trains with few stops in the residence districts, and these only to exchange passengers with other surface lines. In the business heart of the city there would be many stations which would be the theoretical terminals. For convenience of operation trains would be sent directly across the business center and, serving a second purpose, out into the residence districts again until they reached an outer terminal for physical exchange of passengers with surface and suburban trolley lines. A supplemental idea provided for collecting surface car lines that approached the center of the city and bringing them through its most congested portion by tunnel or subway to a convenient loop terminal.

It was this last idea in Boston that brought the larger transit plans in the end. Tremont street was and is the city's showiest business street, largely devoted to hotels, cafes, theaters and the best class of retail shops. It was so insufferably crowded with surface trolley tracks that some sort of relief was found an absolute necessity. Out of manifold schemes an elaborate plan of relief was found and carried out, surface car tracks torn from Tremont street and general transit quickened.

The Plan for Transit Relief.

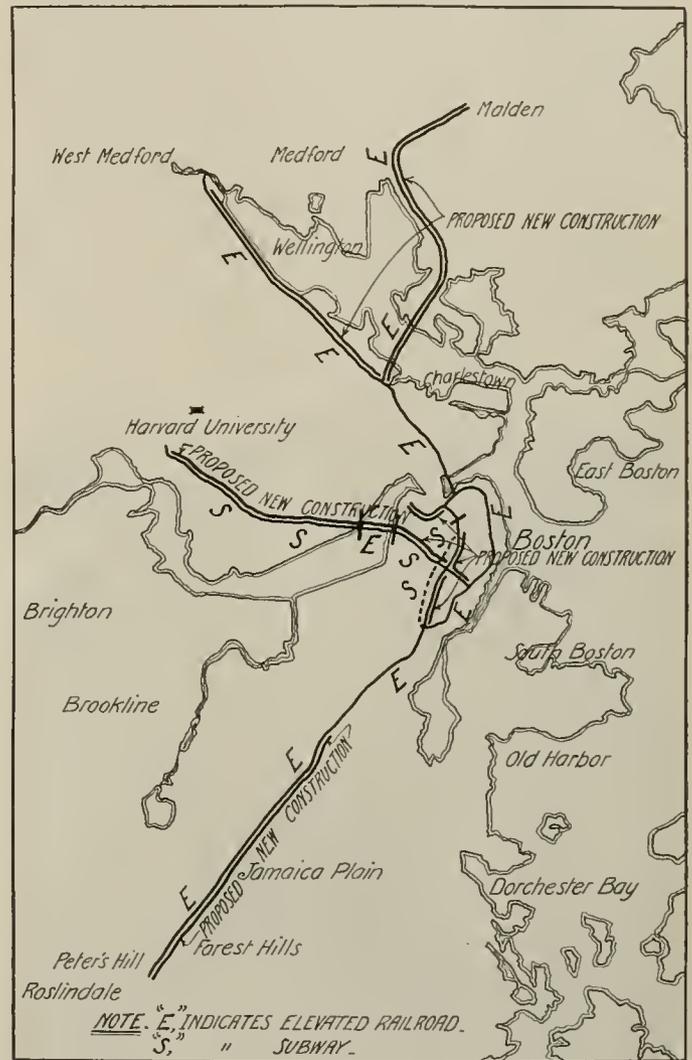

Briefly, the original plan was this: A transfer station was built at Sullivan square, Charlestown, the northerly end of the transit relief scheme, which was then and now is the largest electric railroad station in the world. This station gathered passengers from Malden, Melrose, Everett, Chelsea, Revere Beach, Lynn and many other suburban and outlying districts to the north and gave them free physical transfer to an elevated railroad which crosses the Charles river, sweeps around the water front of old Boston, past the South terminal station of the New York New Haven & Hartford and Boston & Albany railroads, and after two turns continues south to Dudley street, where a terminal station, smaller but similar to that at Sullivan square, distributes passengers to surface trolleys continuing out to Brookline, Forest Hills, Hyde Park and Mattapan.

In addition to this line through the business part of downtown Boston another line forked from it at the south end of the bridge across the Charles river, passed in front of the North terminal station, used by the many lines of the Boston & Maine Railroad, dipped beneath the surface at Haymarket square, followed a devious course beneath Tremont street and, finally rising to an elevated structure again a little south of Boylston street, joined the elevated track again in Washington avenue. The supplementary plan, which was the surface relief of Tremont street, consisted of bringing surface trolley cars from Cambridge, the fashionable and highly populous West End with Newtown and portions of Brookline outlying, by an incline through extra tracks in the elevated subway to a terminal loop under Tremont street at the Park street intersection. Similarly surface cars from Charlestown, East Cambridge and outlying points were brought beneath the surface at Haymarket square and looped around a city block from Adams square to Scollay square, where they were given a terminal. Surface car passengers wishing to go from the

Park street terminal of south and west bound cars to the Scollay square terminal of north and east bound cars were enabled to do so without the payment of an additional fare by use of the elevated trains running through the Tremont street subway.

Elevated Roads.

The elevated train operation was threefold. The first operation consisted of the trains sent from the Sullivan square terminal, which took the Tremont street subway and Washington street elevated cars through to the Dudley street terminal, returning by the same route. The second operation was of trains starting from Sullivan square, taking the Atlantic avenue line along the water front and returning to Sullivan square by the way of the Tremont street subway, with a

Rapid Transit in Boston—Location of Proposed Extensions.

reverse movement also. The third operation consisted of trains starting from Dudley street, continuing along Atlantic avenue and returning through the Tremont street subway, without ever crossing the Charles river, to Dudley street.

This system of operation was found nearly ideal. It kept an even service from both Dudley street and Sullivan square terminals, and yet gave Tremont street, the place of theaters, retail stores and hotels, the location of two important subway surface car terminals, a much better service than was required to handle business on the Atlantic avenue section of elevated railroad. Yet, as time wore on, conditions were found less ideal. Boston, like every other large American city, was growing rapidly and her transit relief plan began to be overtaxed. Tremont street was a bad one to operate through. The physical limitations that have ham-

pered all plans for transit facilities in Boston from the outset were here present in great numbers. The narrow streets and their many twistings made the Tremont street subway a series of sharp and difficult curves, while the dips and curves made necessary in the profile to accommodate the auxiliary feature of surface car operation brought in one case an 8 per cent grade on a descending track and several ascending grades of more than 5 per cent. Then the surface car terminals began to be badly overcrowded. Cambridge people at times almost monopolized the surface car platforms at Park street. It was obvious that some relief would have to be obtained at once.

Washington Street Tunnel.

To obtain first relief it was decided to place a tunnel under Washington street from near the Castle street intersection, where the existing elevated now makes right-angled turns right and left; on the right, to the incline that leads to the Tremont street subway; on the left, eventually, to the Atlantic avenue section. The tunnel would be reached by an incline from near this elevated junction and would terminate on the north at the Haymarket square station and incline of the present system. When dug and completed the Washington street subway will be completely substituted for the Tremont street subway as far as train operation is concerned. Tremont street subway will then be given entirely over to surface car operation, which will be divided into three classes: surface cars crossing the city on the present elevated tracks, and, as at present, surface cars terminating at Park street station and surface cars terminating at Scollay square station.

Rapid Transit in Boston—Concreted Steel Columns in Washington Street Tunnel.

Washington street had once before been suggested as a tunnel or subway route when it was first proposed to take the trolley tracks up from Tremont street. The city passed it by for the time being, built the elevated and subway loop as above described, and even dug a deep tunnel under the harbor to East Boston—a separate and distinct operating proposition and designed for surface cars only—before it finally began operations in Washington street. The narrowness of that busy thoroughfare was a serious obstacle to all subway plans. But the tunnel builders of Boston have had

experience and their experience has resulted in a most successful adaptation of their limited space in at least one point in Washington street, the station platforms in the neighborhood of School and of Milk streets.

It was necessary, close to this point, to depress the Washington street tunnel to pass beneath the East Boston tunnel, which runs through State street from Scollay square to the harbor, the bottom of the tunnel here being from 30 to 48 feet below the street. The feature of interest is that the north-

Rapid Transit in Boston—Uncompleted Platform Over East Track, Washington Street Tunnel.

bound track has been brought beneath the platform of the southbound track, and the passageway leading from that platform to the State street entrance of the tunnel. Even with this radical economy of space the westerly wall of the tunnel for more than 100 feet lies directly beneath the front walls of the buildings above.

The stations, profiles and sections of the Washington street tunnel were shown in the *Electric Railway Review* for August, 1906, page 463. Illustrations here reproduced for the first time give an idea of some of the details of its construction. In one the device is shown by which an extra large number of pipes have been located where the roof of the tunnel is close to the surface of the street. By bringing the roof down in a sharp curve at the outer edge of the bore, accommodation is given to many pipes and conduits without taking away from the material dimensions of the interior of the tunnel.

The other illustration shows how the steel columns are encased in concrete in this Boston construction instead of being left exposed, as in New York, Philadelphia and older Boston subways. This form of construction has so won the favor of the Boston transit commission at the outset as to make it a probable feature of the new Cambridge subway, to which reference is made hereafter.

Four Years of Excavation.

After four years of slow excavation—the city only permitted open-cut work to proceed between 6:45 p. m. and 7:15 a. m., the excavation being temporarily paved with planking during heavy business hours—the Washington street tunnel is practically dug, save for a stretch of about 150 feet in the neighborhood of School street and certain station approaches and exits. Placing the tracks, contact rails, wiring and station fixtures is the business of the Boston Elevated Railway Company, which is to operate this in addition to the other transit facilities of the central portion of the city. It will take a year to place these appurtenances in position, and it is expected that Washington street tunnel will be completed and ready for business in June, 1908.

Once the change is made and Washington street thus becomes for its entire length a route for high speed elevated

trains, the Tremont street subway will quickly be adapted for exclusive surface car operation along the lines heretofore suggested. The spur of subway extending under Tremont street from Boylston street to Pleasant street, about 1,000 feet, will not become absolutely useless after the change is made, for the transit commission has figured that surface cars from outer Tremont street and Shawmut avenue can easily be brought down an incline on the site of the present Pleasant street elevated station and so through the old subway to Haymarket square out upon the incline there and to outlying districts to the north of Boston. But for the 1,000 feet of elevated structure extending from the incline at Pleasant street station to Washington street no operating use is planned after the change. It is probable that it will be torn down.

Track Arrangement at Haymarket Square.

At Haymarket square there is at present a 4-track dip into the Tremont street subway. Two outer tracks carry the elevated trains and the two inner, surface cars from Charles-ton and outlying points to the Scollay square terminal. In order to accommodate the Washington street tunnel, which also has its terminal at Haymarket square, two additional tracks must be built upon the incline so that the six tracks when completed will be divided as follows: The two tracks to the east will be given wholly to elevated trains passing from the structure in Canseway street to the new Washington street tunnel. The other four tracks will be given exclusively to surface cars, cars which have Scollay square for a terminal using the two middle of these two tracks, and cars bound for Park street, Pleasant street and outlying points using the two outer. The present Haymarket square subway station is to be remodeled for exclusive surface car use, the Washington street tunnel building a new Haymarket square station at lower level.

To make these changes with the heavy Haymarket square traffic in constant progress will involve some engineering niceties. Fortunately for the engineers, there is spare space on each side of the present incline. That structure was built on the site of the former passenger station and yard of the Haymarket square terminal of the Boston & Maine Railroad, which was of more than ample size. It is planned first to build the two additional tracks needed, then transfer the elevated route into Washington street, and finally to adjust the various surface car tracks to meet the situation.

The Cambridge Subway.

Before the Washington street tunnel is ready for business, work on Boston's next move toward transit relief, the subway to Cambridge, will be well under way. This structure will afford a needed relief to the overtaxed surface lines leading to the college town. On the Boston side of the Charles river the subway will be built by the Boston transit commission and operated by the Boston Elevated Railway Company as its predecessors have been built and operated. It will cross the Charles river on a center and reserved section of the new West Boston bridge, an elaborate structure rapidly approaching completion. Through Cambridge the line becomes subway after crossing the river and will be both built and operated by the Boston Elevated Railway Company. It will extend through to Harvard square, where many surface lines will have their terminals and reach for long distances out into the country. One station will be built at Central square, where a number of other surface lines intersect, but many persons in Cambridge are pleading for two more subway stations. One station at the Cambridge end of the West Boston bridge the railway company is not disposed to grant in any event, holding that passengers from a section so closely adjacent to Boston itself can find both quick and convenient transit on existing surface lines. The other station, which is demanded on Massachusetts avenue, half way between Central and Harvard squares, the railroad company is opposed to, because of its desire to make the new Cambridge subway a

genuinely high-speed line for long-distance passengers, letting the surface lines take care of short-haul and short-distance passengers.

No unique types of construction are planned in the Cambridge structure, but the subway as it passes through Boston to Tremont street will be unusual in several ways. It was originally planned to bring it through Cambridge and Court streets to Scollay square, as was shown upon the map published in connection with the article to which previous reference has been made, but the extreme narrowness of these thoroughfares, with their many turnings, led to an ultimate abandonment of this idea and a decision to turn the road under Beacon hill and bring it through a third of a mile of private right of way and under a corner of the Common to a stub-end terminal directly under Park street station of the present Tremont street subway. Property is being rapidly acquired by the Boston transit commission in the fulfillment of this plan and after the subway has been dug structures can be erected and leased for a variety of purposes over its right of way. Light and air openings can be secured at short intervals by this style of construction.

Unfortunately this new Cambridge road will have no track connections with the other subway or elevated lines in Boston so as to render an interchange of train equipment possible. Yet already the plan is being pressed in the Massachusetts legislature for an enactment to enable the Cambridge subway, through Winter and Summer streets to the South terminal, with an elevated extension into South Boston, left for a vague and distant future. There is no direct route from the hotel and theater district to South station by ele-

Rapid Transit in Boston—Washington Street Tunnel Under Construction.

vated or subway as yet and such a line would render itself popular from the outset.

Contemplated Elevated Extensions.

At the north end of the Boston metropolitan district two elevated extensions are now contemplated from the Sullivan square terminal. One of these will turn toward the northeast and run along Broadway until it reaches South Everett, where it will turn north again and be built, according to present plans, past Everett and into Malden, along the marsh land

which reaches back from the Malden river and Malden canal. At Malden connection will be made with more outlying surface lines of the Boston Elevated Railway as well as with the suburban lines of the extensive Boston & Northern system which stretch north to Lynn, Salem and Newburyport.

The other arm north from Sullivan square will reach more toward the west and will follow the short straight stretch of old Mystic avenue into Melrose, where it will also have extensive ramifications by means of suburban surface car lines. Each of these arms will be approximately three miles long.

From the Dudley street terminal at the south of the present elevated system construction has progressed steadily throughout the hard winter on an elevated extension south two miles in Washington street to Forest Hills. The matter of terminal facilities at this last point is still a matter of doubt and discussion and the Boston Elevated Railway Company seems now to favor extending its structure south of the heart of Forest Hills and building a loop terminal in private right of way.

When these arms are complete Sullivan square and Dudley street will be retained as part terminals. "Short line" trains will continue to be turned on the loops at each of these points and a large number of suburban lines will continue using them as their downtown terminals.

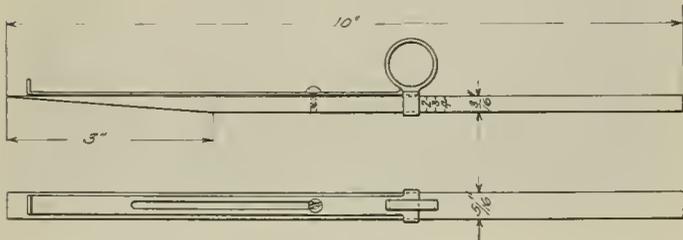

Other Plans Tentative.

Other transit relief plans in Boston are still tentative. The most definite of these is the building of an elevated structure from the existing elevated and incline at Haymarket square through Causeway street, past the North station and across the Charles river into East Cambridge for surface car operation. Owing to the existence of nearby freight terminals and the extreme narrowness of Causeway street it is often badly congested with trucks and other street traffic, causing much delay in surface car operation. Such an elevated structure for a little more than half a mile would greatly relieve the situation.

An elevated railroad, of ornamental design and architectural appropriateness, has also been suggested for the Charles river bank extending from the existing system out toward Newton. This road will undoubtedly follow the others in due time. At present it is a vague suggestion of the indefinite future.

ARMATURE CLEARANCE TESTING DEVICE.

Charles Munson, master mechanic of the Cedar Rapids & Iowa City Railway Company, has devised, at the company's Cedar Rapids (Ia.) shops, a gauge that has proved very useful

Gauge for Accurately Determining Armature Clearance.

in taking and recording the clearance between the armatures and pole faces of motors.

The gauge is marked out in detail so as to show a variation of the sixty-fourth part of an inch in the clearance. It is made of steel and is 10 inches long, 5-16 inch wide and 3-16 inch thick. One side of the scale has a straight edge and the reverse side tapers from a point at one end to the full thickness of the bar at a distance of three inches from the end. On the straight edge a sliding scale, which has a 1/4-inch lip at the lower end and a circular hand finger clip at the other,

is attached by a screw which fits in a slot, 2 3/4 inches long, cut lengthwise of the slide.

In testing motors for armature clearance the hand-hole plates are removed as usual and the gauge is inserted so that the lip of the slide engages with the pole piece, while the tapering end of the gauge is inserted as far as possible between the pole and the armature. By carefully removing the gauge the relative positions of the slide and the gauge proper indicate the exact clearance. The taper given to the end of the gauge is such that a variation of a sixty-fourth part of an inch in the clearance is marked by a longitudinal variation of one-fourth of an inch on the straight edge.

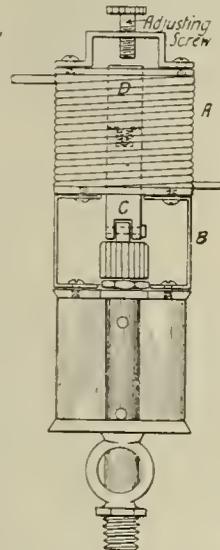

COMMUNICATIONS.

An Automatic Oil Cup.

To the Editors:

There are many operations in the car shop and barns which require intermittent power, conveniently supplied by means of small electric motors. For such service, however, unless the bearings are of the ring oiling type or special provision is made to oil the bearings, they are very apt to be neglected. Particularly is this true of motors operated by a number of different employes. If the motor is in an out of

the way place, each man assumes that the motor was oiled the last time it was used, and if located where it is easily reached, each man using it gives it a little oil, with the result that the oil overflows from the bearings, soils the floor and works its way into the armature and field coils. Ordinary oil cups are not very satisfactory for such service, as they are apt to be turned on and forgotten, resulting in flooding the bearings and surrounding floor.

Automatic Oil Cup.

To obviate these difficulties which presented themselves to the writer in the operation of a small portable air compressor, the automatic oil cup illustrated herewith was designed by him. The operation and construction of this oil cup are clearly shown in the cut. The solenoid A was taken from an old Mosher arc headlight and rewound with wire of the same size as that on the armature of the motor. The supporting brackets, B, are made of 1-16 by 3/4 inch phosphor bronze. The lower portion of the solenoid plunger, C, is iron and the upper part is brass. The solenoid plunger was in this case attached to the needle valves of standard Lunkenheimer Sentinel snap-lever, sight-feed, glass oil cups.

The solenoid coils are connected in series with the armature, hence when the current is turned on the solenoids are energized, pull up the needle valves and supply the bearings with oil. When the current is turned off the springs and weight of the plungers force them down and shut off the oil supply. The oil cup attachments are easily made and work perfectly.

SHOP KINK.

Lexington, Ky., May 22, 1907.

Wrong Motor Connections.

To the Editors:

I noticed a communication in the May 4, 1907, issue of the Electric Railway Review, from "Car Trouble," stating the symptoms of some motor trouble experienced by him. I inclose a diagram showing controller and motor connections for a K-6 controller and four G.E.-1,000 motors. As will be seen by reference to this diagram, the difficulty in your correspondent's case probably arose through the crossing of the A² with the A¹ and the AA² with the AA¹ wires on or near

IMPROVEMENTS OF THE OTTUMWA (IA.) RAILWAY & LIGHT COMPANY.

During the last year the properties of the Ottumwa (Ia.) Railway & Light Company have been rebuilt and they are now among the best equipped railway and lighting properties of the state of Iowa.

Ottumwa is a city of about 22,000 people and is located in a prosperous farming and mining community in the south-western part of the state. Early in 1906 the electric railway and lighting interests were purchased by H. M. Byllesby &

Ottumwa Railway & Light Company—Exterior of Power House.

Co. of Chicago and the following officers were elected: President, A. S. Huey, Chicago; secretary, R. J. Graf, Chicago; treasurer, J. J. O'Brien; general manager, W. F. Raber. Since the new management has had control of the properties a new power house, car barn and machine shop and office building have been constructed, the overhead lines and the railway tracks have been rebuilt and several new cars have been added to the rolling stock.

The company operates cars over 12 miles of track, which, for convenience in operation, is divided into six divisions. Cars are operated on a 10-minute headway. The rolling stock equipment consists of 35 cars, 30 feet in length, of which 14 are required to maintain the schedule on the various divisions.

The Office Building.

The office building, containing the general offices of the company, the public waiting room, trainmen's quarters and other apartments essential for the comfort of the employes, is situated at Second and Market streets, approximately the traffic center of the city. At this point all cars are started on their outgoing runs and all transfers of passengers are made. The office building is of brick construction. It has a frontage of 67 feet 7 inches, is 64 feet 2 inches deep, and three stories high. On the first floor are the waiting room and the general offices. The basement is furnished for the use of trainmen. The second and third floors of the building are to be leased for public office purposes.

The main public waiting room, located in the corner of the building, has large plate glass windows, which allow an unobstructed view of all cars as they approach the transfer corner. A door connects this room with the public lobby, which is used as a waiting room for patrons who have business to transact at the company's offices. Doors open from the lobby into the general manager's and the superintendent's offices, and windows open into the cashier's and treasurer's offices at the north side of the room. The offices are all finished in nut brown color and are designed after the mission style of architecture.

Car House and Repair Shops.

The new car house and repair shops are located on a triangular plat of ground on West Second street. They cover

a floor space 155 and 190 feet long by 107 feet wide. At the side of the main building there is an addition, 26 feet deep by 85 feet long, which is divided into rooms designed respectively for the storage of coal, sand, salt, tools, oil and general supplies. The car house and storeroom buildings are constructed of brick and are one story high. The floors are of concrete. The armature winding room occupies a space immediately at the rear of the machine shop, which is shown in the accompanying car house layout.

The Power House.

In the rehabilitation of the Ottumwa property much thought was given to the arrangement of the power house. The new building is 150 feet long, 80 feet wide and 25 feet high. The walls are of brick, the floors of concrete and the roof is of tar and gravel construction.

The engine room equipment consists of two Fulton Iron Works engines, each 20 and 40 by 48 inches, which are direct connected to a Western Electric 500-kilowatt, 2,300-volt, 60-cycle alternator and a 500-kilowatt, 550-volt, direct-current generator. These engines have 17-foot flywheels. The other generating units are a 30-kilowatt, 125-volt steam-driven exciter, which is used in starting the alternator, and a General Electric induction motor direct connected to a 125-volt direct-current generator. In addition to these units the company has installed for a reserve equipment the following machines which were formerly in service in the old power station: Edward Allis engine, 16 by 42 inches, belt connected to a Western Electric 100-kilowatt, 2,300-volt, 60-cycle, 3-phase alternator; a Hamilton-Corliss engine, 24 by 48 inches, belt connected to a

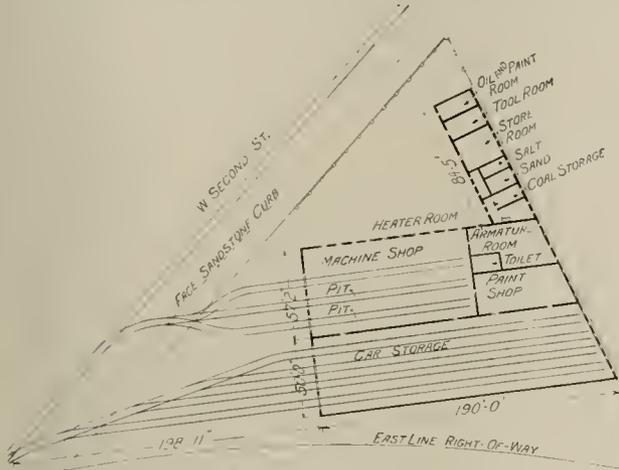

Ottumwa Railway & Light Company—Office Building.

300-kilowatt, 2,300-volt alternator; a Ball engine, 20 by 18 inches, belt connected to a 200-kilowatt, 550-volt generator; an Edison-General Electric bi-polar 100-kilowatt, 500-volt motor and generator, which is used in supplying current for the city metallic circuit.

The switchboard has 27 panels, which are divided as follows: Seven for the railway circuits, two for stationary motor circuits, two for the exciter sets, three for synchronizing, seven for incandescent lighting, two for 3-phase power, four for arc circuits.

The switchboard panels are made of blue marble and are equipped with the necessary recording and measuring apparatus. A space 9 feet wide and 40 feet long is provided between the switchboard and the west wall of the building for the oil switches, busbars and cable connections. The cables are carried overhead in order that there may be free passage around the board. The floor at the rear of the switchboard is three feet lower than the floor of the balance of the engine room. The kicking coils, lightning arresters, etc., are arranged along the west wall of the building, where

Ottumwa Railway & Light Company—Layout of Car Barn and Shops.

the main cables leave the structure. The lighting circuits throughout the building are laid in lead covered conduits.

A gravity oiling system has been installed in the engine room. This consists of a 100-gallon tank, which is near the roof, and a Turner oil purifier in the basement. Oil from the tank is fed by gravity, first to all parts of the engines requiring a lubricant, then to the purifier, and finally returned to the tank.

The boiler room is equipped with five Stirling boilers, three of which have a rated capacity of 410 horsepower and two of 300 horsepower. These are arranged in three banks and are worked under a steam pressure of 150 pounds. Between the first and second banks of boilers are located two Blake duplex feedwater pumps, each 10 and 6 by 10 inches, and a Hoppes exhaust heater.

The feedwater is obtained from the Des Moines river at a point about 100 yards from the boiler room. The suction pumps, 6 and 5¼ by 6 inches, are of the Worthington manufacture. The suction pipe is 4 inches and the exhaust pipe is 3 inches in diameter. The pumps are at the south end of the boiler room in a pit 10 feet deep. Between the pumps and the heater is a Kennicott water softener, which has given very satisfactory service.

Along the east side of the boiler room is a bin 12 by 100 feet, which is used for storing coal. By the use of a Hunt conveyor coal is carried overhead in spouts from the coal hopper located beneath the coal track at the south side of the building to the coal bins in front of the boilers. Before entering the spouts the coal passes through a crusher. An ash elevator carries the cinders from the boiler room to a bin located above the coal track, and the cinders are dumped into a car and drawn away. The coal and ash conveyors and the coal crusher are driven by separate motors.

A number of fire exits opening into the ventilating shafts have recently been installed in the New York subway for the use of passengers as a means of escape in case of a fire or blockade without the necessity of groping their way to stations. Signs marking the points by which escape may be made are five feet long and a foot high and bear the word "Exit" in white on a ground of blue enamel. Shaded electric lights are placed over them. Near the illuminated legend is a door which opens into the air chambers at the side of the tracks. An iron ladder with a rail leads to the top of the pit.

A NOTEWORTHY SAVING IN OIL.

Although the value of an automatic oil feeder system for power houses is recognized, the first cost of installation is often considered too great for adoption in the smaller plants used in supplying current for railway or lighting purposes. Some time ago Levi Paxson, chief engineer of the Fort Branch (Ind.) power house of the Evansville & Princeton Traction Company, installed an oil feeder system that, because of its initial cost, and the oil and labor-saving features which it has developed, is worthy of comment.

Exclusive of the oil filters the system referred to cost but a trivial amount to install and has for nearly a year reduced the engine room expense more than \$140 a month. Previous to its installation an oiler was employed on both the day and night shifts and the quantity of oil used was unusually large. At present no oiler is necessary and the oil consumption has been reduced to 40 gallons of engine oil and 30 gallons each of high and low pressure cylinder oil per month.

In installing the oiling device old gas pipe and other second-hand materials were utilized. The main storage tank, 60 gallons capacity, is located near the roof of the plant. Leading from this to the basement is a 1-inch pipe which passes up to the engine and is reduced to ¼ inch where it enters the oil cups. The oil supply is furnished to the cups by gravity. The waste oil from the engine passes by gravity through another pipe line to a tank in the basement, from where it is forced by a small air pump to two Acme filters located in an oil room adjoining the engine room. From these filters the oil is returned to the storage reservoir by air pressure. The air pipe in this case is attached to the top of the filter reservoir. When it is desired to fill the storage tank the air cock between the filter and the filter reservoir is closed and the oil is forced to the top of the structure through a ¾-inch pipe, which completes the circuit of the oil.

As a precautionary measure a small air whistle has been placed in the pipe leading from the filter to the storage tank. When the oil supply in the filter tank has been exhausted the air in passing through the pipes blows the whistle, which is a signal to stop the air compressor.

The machinery supplied by this automatic oiling device consists of two (18 and 36 by 42) engines, direct connected to a 400-kilowatt generator; two high-speed engines direct connected to excitors, and a 300-kilowatt rotary converter.

The Wastefulness of Chimney Draft.

In a discussion of the methods for the utilization of waste heat, the wastefulness of the usual method of producing draft by the ascent of heated air in a chimney must be considered.

Taking the boiler as the wasteful member in a steam plant, its efficiency varies from 60 per cent in a bad boiler to 80 per cent in a very good one, these proportions of the heat produced by the combustion of the coal being realized in steam available for the engine in each case.

The difference may be said, without greatly stretching the truth, to go up the chimney. It is not to be disputed that much of the waste heat might be caught and utilized; but there are reasons why it is not so caught. In the first place, the gases must be hot when they go into the chimney, or there will not be a draft.

As a matter of fact, a draft obtained in this way is the most expensive possible, save one. The exception is a steam jet in the chimney. A fan can be run for about one-tenth of the power represented by the waste heat required to command a good draft. A tall chimney will cost from \$5,000 to \$25,000, very much more than will a fan plant. But the fan is not used and the chimney is—largely because it is essential to discharge the products of combustion high up in the air over the roofs of surrounding houses. This necessity must be taken into consideration in so far as factories are concerned, yet it is believed that in some cases a chimney stack 100 feet high would be sufficient, because with a fan combustion could be more easily controlled than is possible with a chimney, to the end of preventing the giving off of smoke.

DEPRECIATION.*

BY ROBERT HAMMOND.

The object of the present paper is to invite the members of the institution to consider the question of depreciation in all its bearings as applicable to electricity supply undertakings, in the hope that some definite conclusion may be arrived at as to the proper provision which should be made in the case of undertakings owned, whether by companies or by local authorities.

The word "depreciation" is used in a wide sense, and it is desired to include in the inquiry not only the consideration of the provision which should be made to cover the depreciation in value of the assets of an undertaking, but also as to what other charges beyond the ordinary working costs should be debited to the revenue account before arriving at the net profits of the undertaking.

Following these lines, we have first to consider the question of depreciation proper, then the advisability of creating a reserve fund to provide for unforeseen expenses which may be incurred owing to accident or other emergency, and, lastly, the provision of a further fund to cover antiquation of machinery, apparatus and mains, thereby preparing for the possible necessity of scrapping machinery, etc., which may be in good working order, but which may have become obsolete owing to improvements introduced in methods of generation and distribution.

Companies.

Whether the undertakings are owned by companies or by local authorities, the conditions governing their working are such that in order to give a continuous supply of electricity it is essential that machinery, apparatus and mains should be kept in a high state of efficiency.

The cost of so maintaining the plant is, of course, regarded as part of the working costs, and is assumed to be so dealt with. Plant, well maintained as it may be, must, however, gradually depreciate, and a time will come when the frequency and extent of repairs and renewals necessitate so heavy an item of annual expenditure that it is preferable to replace it with entirely new plant.

In order to arrive at the amount with which the gross profits should be debited annually in order to cover this depreciation, it is necessary to settle the number of years which will elapse before the various classes of plant and apparatus in use will arrive at the scrapping stage and will require entire renewal.

At the outset we are confronted with the difficulty that the life of machinery so largely depends upon the way in which it is maintained, that a definite period, at which any particular class of machinery or apparatus would in the ordinary course be entirely worn out, can hardly be taken as of universal application.

On the basis, however, that all plant would be carefully maintained and faulty parts renewed out of revenue, it is suggested that the periods named below represent a fair approximation of the life of the various classes of machinery and apparatus, etc., named:

Estimated Years of Life.

	Years.		Years.
Land and buildings	60	Accumulators	15
Machinery and plant—		Transformers, static	15
Boilers	20	Converters, rotary	20
Pumps and pipework.....	25	Switching apparatus and instruments	20
Conveyors	10	Meters	10
Engines	25	Mains—	
Turbines	20	Armored	25
Dynamos and alternators..	25	Solid system	30
Motors	20	Ducts	30
Tools and sundries	10		

The "lives" set forth will doubtless provoke some criticism, but it is repeated that the "life" largely depends upon the degree of thoroughness with which the plant is maintained.

With accumulators, for instance, it seems sanguine at first sight to give a life of 15 years. Further consideration shows, however, that for all practical purposes, with careful upkeep, the life given is merely that of the boxes containing the plates, connections, etc. There is no reason why a battery of accumulators should not last considerably longer than 15 years if the plates are regularly renewed out of revenue.

If the above periods be accepted, it becomes a simple calculation as to the amount which must annually be written off or set aside to a sinking fund.

So far, the formation of a depreciation fund in the narrow sense of the word has alone been dealt with. The formation of such a fund, apart from the method of accountancy adopted,

appears to be essential whether the company is working at a profit or a loss. In the event of its working at a loss for, let us suppose, the first few years, it seems only sound that before any moneys are distributed as dividends, not only should the trading losses be made good, but the contributions to the depreciation fund which otherwise would have been set aside should also be made.

General Reserve Fund.

As regards the second item, to which reference has already been made as coming within the purview of the paper, namely, the provision of a general reserve fund, it seems to the author that, however wise the formation of a general reserve fund might be for the purpose of equalization of dividends, it nevertheless does not rank as a strict necessity as does a depreciation fund. Further, he does not agree with those who hold that such a fund is necessary, not only for the equalization of dividends, but for the purpose of providing against extraordinary expenditure due to unforeseen emergencies.

Such emergencies are caused by accident in one form or another and such risks should be fully insured against and the premiums regarded as part of the ordinary working costs.

Antiquation.

Lastly, there is to be considered whether a fund to cover antiquation should be deemed obligatory.

It has been urged on the one hand that no provision whatever need be made under this heading. Those who hold this view contend that any great revolution in engineering methods which would cause their present plant to become obsolete would necessarily carry with it its own advantages either in the direction of a great improvement in efficiency or in an extension of the uses to which electricity might be put. They contend that these advantages if really extensive would in themselves more than pay for their adoption, and that unless a company could see its way to larger dividends by adopting an improvement, it would, of course, continue on the old lines.

On the other hand, many hold the view that an antiquation fund is of vital importance, and they point out that a radical improvement might arise which would entirely supersede the existing methods of generation and distribution, and while such an improvement would entirely take the field in opposition to the present methods, nevertheless, the improvement might not carry with itself a sufficient margin of profit to cope with the dead weight of interest on capital expended upon superseded plant. A company which was without an antiquation fund would then be faced by the possible competition of a new concern not so overburdened with capital charges, which could completely relieve it of its business.

The author does not share the latter view to the full extent, but, on the other hand, he thinks that no electricity supply undertaking can be regarded as in a thoroughly sound position unless some provision has been made in the direction of an antiquation fund. At the same time this provision is, in his opinion, not one which would rank on the same footing as a depreciation fund per se, but is one which might wisely be contributed to out of profits as a sort of nest egg for the future.

The distinction which he desires to draw between the contributions to a depreciation fund and contributions to an antiquation fund is practically that the former should be built up whether the undertaking is working at a loss or not, while contributions to the latter fund need only be regarded as advisable when a concern is in a flourishing condition.

Residual Value.

To arrive at an absolutely accurate amount of annual contribution to a depreciation fund it would be necessary to determine the residual value of the machinery, apparatus, etc., at the end of their respective lives. In the case of land it, of course, remains, and the scrap value of machinery, apparatus, mains, etc., containing a fair amount of copper and other metals, is appreciable. As, however, a depreciation fund must in its nature be based upon an estimate, it has seemed to the author wise to regard the residual value as an item which the undertaking would have to the good at the end of the respective lives, and one which to that extent would be in hand as a contribution toward the cost of new plant.

An auto-car line in Pennsylvania was opened on May 20. Cars seating 20 passengers are operated between Picture Rocks and Montgomery, via Muncy, a distance of 20 miles.

A. E. Reynolds, president of the Indianapolis Crawfordsville & Western Traction Company on May 24 drove the last spike at Crawfordsville, Ind., in the track connecting Indianapolis and Crawfordsville. The new cars from the Jewett Car Company, Newark, O., are to be delivered on June 1 and regular passenger traffic started very soon thereafter.

*Abstract of paper read before the Institution of Electrical Engineers of Great Britain April 25.

DISCUSSION OF TRANSFORMERS BY AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

A special meeting of the Chicago branch of the American Institute of Electrical Engineers was held on May 24, 1907. The meeting was attended by about 175 members and guests. H. W. Tobey, engineer with the General Electric Company, Schenectady, N. Y., presented a paper entitled "Relative Merits of Three-Phase and One-Phase Transformers." John S. Peck, electrical engineer with the British Westinghouse Electric & Manufacturing Company, read a paper on "Relative Advantages of Single-Phase and Three-Phase Transformers." These papers were discussed together.

In the discussion it was stated that the Commonwealth Electric Company of Chicago had adopted the 3-phase transformer about six years ago, and now has about 45,000-kilowatt capacity in these units and 6,000-kilowatt capacity in single-phase transformers. Less trouble had been experienced with the former total installation than with the 6,000-kilowatt capacity of three 1-phase transformers. Some allowance must be made for the three 1-phase transformers, as they have been in use considerably over six years, and, therefore, the design, insulation, material and workmanship cannot be considered equal to those of the later 3-phase transformers.

The patent situation has had much to do with the slow progress of the 3-phase transformer; competition being barred by the patents, the financial advantages of the 3-phase transformer did not materialize, and the manufacturers did not wish to sell 3-phase transformers, as there is more profit in three 1-phase transformers.

It was suggested by one speaker that in the smaller companies at least, which do a combined power and lighting business, the three 1-phase transformers have the advantage over the one 3-phase transformer, in that the same transformers can be used either for lighting or power work, and hence it is necessary to carry less than one-third the emergency capacity of various transformers, than is the case with 3-phase transformers.

A paper on "Potential Stresses as Affected by Overhead Grounded Conductors," was read by R. P. Jackson, Westinghouse Electric & Manufacturing Company. Overhead grounded conductors were said to be of considerable value in reducing the strain on the insulators, especially with the steel tower construction. Mr. Jackson suggested that by the use of a ground wire the static strain on the insulators on metallic poles or towers would be reduced one-half. If the maximum strains to which insulators are subjected is four or five times the normal strain, then a reduction of one-half would not be of much avail, but on the other hand, if the maximum strain only exceeds the normal strain by half, a reduction to half the maximum amount would no doubt almost eliminate the breaking of insulators.

It was also pointed out that the value of the overhead grounded conductor is not so great if wooden poles are used as in the case of steel poles or towers. As concrete is a better insulating material than wood (when wet) the overhead grounded conductors should be of less value on concrete poles than on wooden poles.

Prof. Morgan Brooks of the University of Illinois discussed the rise of pressure accompanying the closing of transformer circuits and the breakdown effect on the insulators. He cited the results of some experiments which are being made at the University of Illinois, which showed a rise of potential from 50,000 to about 71,000 volts in cases where the switch was closed at the "peak" of the pressure wave. W. J. Andree, a student of the University of Illinois, described these experiments, saying that they showed conclusively that the surge following the closing of a transformer circuit could be entirely eliminated if the switch were closed at the proper instant, that is, when the generator pressure wave is passing through zero. His experiments also showed that residual magnetism in the transformer had no effect upon the value

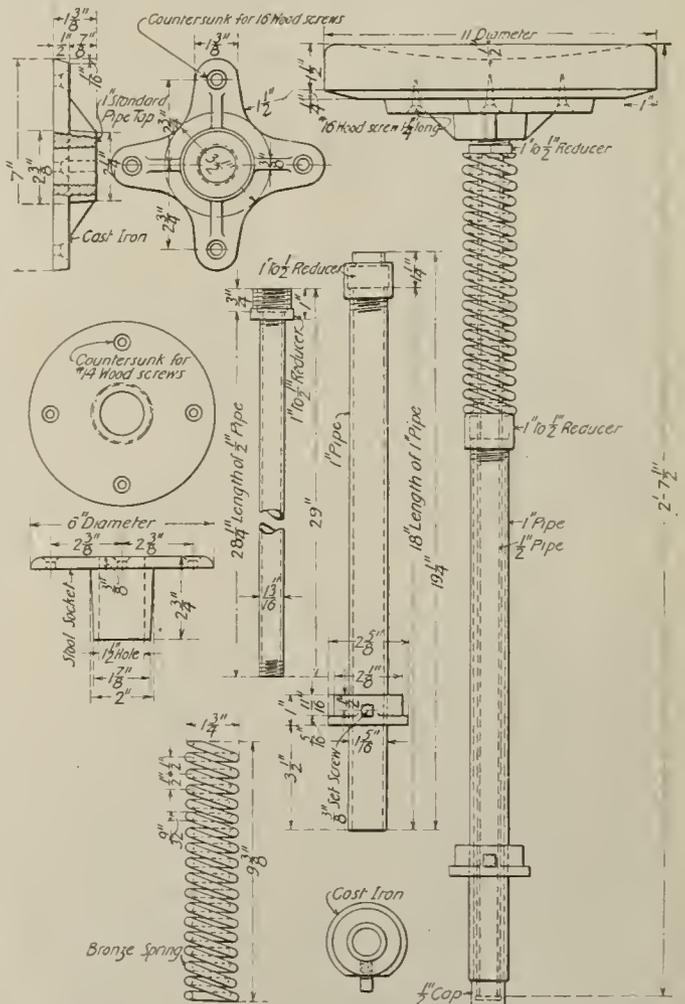

of the surge electro-motive force, the same rise in pressure being noted whether the transformer core was demagnetized or magnetized in a positive or negative direction, provided always, that the circuit was closed at the same point of the pressure wave. He then described how the same result was obtained by inserting a coreless reactance in the generator circuit between the generator and transformer. Though the reactance coil does not entirely prevent the surge, it reduces it by about 90 per cent. After three or four cycles, the coreless reactance coil is shunted and cut out of the circuit.

C. C. Chesney, chief engineer Stanley Electric & Manufacturing Company, read a paper on "Forced Oil and Water Circulation for Cooling Oil Insulated Transformers." The paper was freely discussed by a number of members, after which F. O. Blackwell's paper, "Open Versus Inclosed High-Voltage Station Wiring," was read.

The entertainment features of the meeting included a visit to the Fisk street station of the Commonwealth Electric Company in Chicago and an excursion to the Grand Rapids-Holland substations across Lake Michigan from Chicago.

A PORTABLE SPRING SEAT.

The Los Angeles Railway Company provides its motormen with seats built after the design shown in the accom-

Los Angeles Railway—Portable Spring Seat for Motormen.

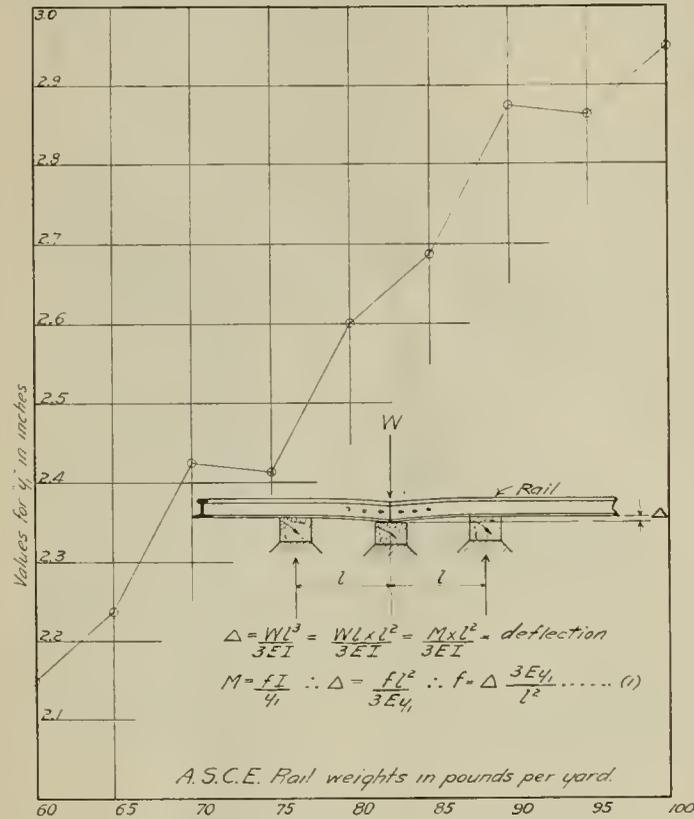

panying drawing. One seat is provided for each car and is moved from the front to the rear platform when the trolley is turned. The stool socket, 6 inches in diameter, is countersunk in the platform floor, and by means of the collar and set screw the height of the standard seat can be varied by moving an adjustable collar up and down the pipe. A bronze spring, as shown, provides elasticity to the upper part of the stool. To prevent motormen from habitually riding with their shoes on the varnished dashboard special foot rests are fastened at a convenient height, one on either side of the center of the dash.

THE RAILWAY TRACK OF THE PAST AND ITS POSSIBLE DEVELOPMENT IN THE FUTURE.*

BY J. W. SCHLAUB.

No concerted effort has been made to analyze the rail problem, other than to blame the rail manufacturer for the poor quality of the rails, but there is another side to this question that has not received proper consideration. To begin with, is the difficulty due entirely to the poor quality of the rail? We have heard much of the speed with which rails are rolled, and of the high temperature of the steel when on the cooling bed. This may account for some of the difficulty; but, on the other hand, is the structure upon which the rail rests free from blame?

Let us see what are some of the defects of the present cross-tie system of rail support: In the first place it is not mechanical. Given a line of rails which have to carry moving loads reaching 20,000 or 30,000 pounds and more per wheel, the loads which they carry must be distributed over large areas. The cross-tie system accomplishes this by inserting 16 to 20 independent supports under each 30 feet of rail, and

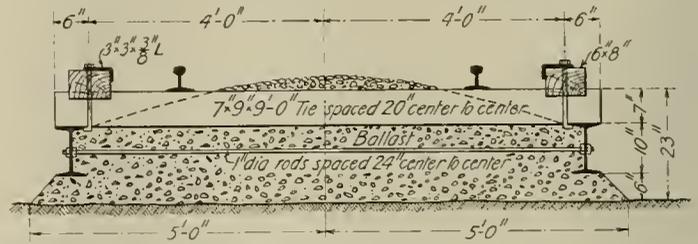

Railway Track in the Future—Figure 1—Diagram Showing Stress in Rails of Various Weights for a Given Deflection.

upon the track department is placed the impossible task of so adjusting these supports that each shall bear an equal part of the load. This is the real secret of the enormous amount of labor spent on surfacing a track, in order to carry trains at high speed, and it is a work that goes on forever. Moreover, assuming a joint has not been kept up to surface, what happens when a wheel passes over it? Within certain limits the ends of the rail will deflect until the tie receives a firm bearing; and all track shows, more or less, the effect of the lack of continuity in the rail by the dip of the rail at every joint. This happens in an instant, when the operation is repeated by the next wheel, and so on. In Figure 1, assuming the deflection of the end of the rail to be "delta" when the tie reaches a firm bearing, the equation shows that for a given deflection of a rail the fiber stress varies directly with the distance of the outer fibers from the neutral axis, and nothing else. In other words, if the rail deflects until the tie brings up on a firm bearing, regardless of the wheel load, then the stiffer the rail the more work it will be called upon to do, and consequently the higher the fiber stress on the steel will be. Now, is this not approximately what takes place under ordinary conditions? The load comes on the rail, and if the rail lacks a firm bearing it will deflect until

it finds a reaction. The equation tells us that in order to reduce the work done by the rail it will be necessary to reduce the deflection. In other words, make the ballast and substructure as unyielding as possible so that the rail will be relieved from a duty which it is not qualified to perform, and which it should never have been called upon to perform.

The usual argument against an unyielding roadbed is offered by the railroad manager about as follows: He says the track must be elastic, otherwise the rails would be destroyed or broken, and therefore the present form of track must be maintained. Yet this same manager will order the heaviest rails to be placed in the track, to be supported on the heaviest ties that he can procure and laid on the deepest ballast, to make a firm and unyielding roadbed as near as can be made by such devices. If a rail could be laid on a solid bed uniform throughout its entire length, so that every

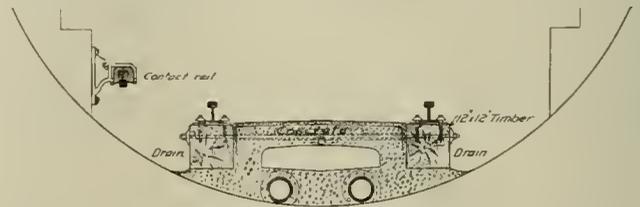

Railway Track in the Future—Figure 2—Design for Rigid Permanent Way, by Gustav Lindenthal.

part is supported exactly the same as every other part, where will the rail break?

But how shall a roadbed be built that will meet such conditions? In the first place, the substructure upon which it is to be laid must be absolutely unyielding, and its foundation must be free from all moisture or below the action of frost. In some cases concrete walls must be built upon which the superstructure is to rest. In other cases piles must be driven, each case being treated as the conditions require. Upon this the superstructure must be laid. This must be some departure from the cross-tie laid on ballast. Nothing can be expected from any longitudinal support laid on ballast, for it can be shown that unless some transverse support is given to the longitudinals, it will be impossible to keep such a track in surface.

But how can this be accomplished? Take the present form of track, with cross-ties sawed to dimensions and surfaced on one side to uniform thickness, laid on a rock ballast at least 16 inches deep. Insert steel I-beams temporarily under the ends of the ties, so that each tie will have a full bearing on the beam at each end (see Figure 2). The steel beams are to be of the "Special" type, with broad flanges as rolled by the Bethlehem Steel Company. The beams are tied together by tie rods spaced two feet on centers, so as to confine

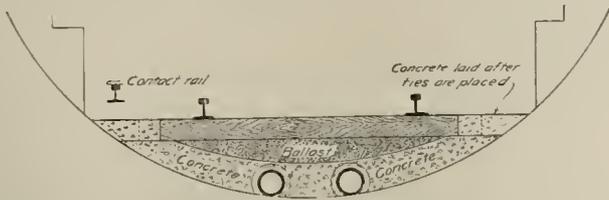

Railway Track in the Future—Figure 3—Proposed Design for Track in the East River Tubes.

the ballast between the beams. On the ends of the ties previously laid, place a bond timber, notched over the ties at least one inch, and hold it down by means of hook bolts, passing through the tie, and anchored to the inside flanges of the beams. An angle iron nosing on the inside of the bond timber serves as a guard rail. After all is in place, the extraneous ballast, that outside of the beams, is removed. No part of this operation need interfere with traffic. In bringing such a track to surface, the entire structure is to be lifted by means of track jacks placed under the flanges of the beams. After the ballast is once in place, very little work should be necessary to keep such a track in surface. The ballast is confined between the beams, so that an arch action can take place, with the thrust of the arch taken up by the tie rods. This assumption makes it possible to find the tension on the rods and properly proportion them.

But, how does this form of track offer any advantage over the present form of track? Solely in the introduction of the longitudinal beams. These beams are to perform two distinct functions. First, the special beam, with a moment

*Abstract of a paper read before the Western Society of Engineers, Chicago, on May 29, 1907.

of inertia equal to five times that of an 80-pound rail, should do just five times the work done by the rail when both are working together under the same conditions, neglecting the work done between the cross ties in either case. The work done by the rail would then be principally to distribute the load over the ties, and not to make up for the deficiencies in the substructure, as it does now. Second, in confining the ballast, and thereby preventing the track structure from

Railway Track of the Future—Figure 4—Proposed Design for Track in the East River Tubes.

working its way down through the ballast as it does now in the present form of track. After this form of track has been proved by experiment to be correctly designed, the timber should be removed, and the ballast replaced by concrete flush with the tops of the beams, forming a permanent substructure, upon which the superstructure is to be placed. At the same time the steel beams can be removed. This superstructure should be some form of longitudinal support bedded in concrete, so as to distribute the loads over large areas, offer perfect drainage and be absolutely imperishable and unyielding.

MOTIVE POWER FOR ELECTRIC TRUNK LINE OPERATION DISCUSSED.

In the *Electric Railway Review* for May 25, page 685, there appeared in abstract a paper on electric trunk line operation by Frank J. Sprague. The statements of the author were the subject of an especially interesting discussion, an abstract of which follows:

Discussion by W. J. Wilgus.

With respect to the conditions that will justify the use of electricity as a motive power in trunk line operation, I believe that evolution will govern rather than revolution. It now looks as if the first movement in this process of evolution is the substitution of electricity for steam in congested passenger terminals at large centers of population, where the public demands a cessation of nuisances incident to steam locomotives, and where the increasing volume of traffic requires increased capacity that cannot be secured by present motive power. The success of the New York Central installation in both of these particulars is an illustration of what can be accomplished, and imitation will surely ensue at other places where like conditions exist.

With a start in the substitution of electricity for steam in the operation of congested terminals, connecting lines between large centers of population and long pusher grades with heavy freight traffic, we may look with confidence to a gradual expansion of the use of the new motive power in other directions. For example, in the case of the New York Central the primary object of the use of electricity was to abate the smoke nuisance in the Park avenue tunnel and increase the capacity of the Grand Central terminal. When this decision was reached it became self-evident that the use of the motive power should extend to the end of the suburban territory at Croton on the Hudson division, a distance of about thirty-five miles. While the northerly terminus of the main line is thus planned for the present at Croton, it is probable that just as soon as the developments in the electrical field will warrant such action, the electric zone will be extended as far as Albany, a total distance of 142 miles.

This brings up the question of the respective merits of the three electrical systems now warmly advocated by their respective friends—the direct current, the single-phase alternating current and the 3-phase alternating current.

If, instead of blindly teaching the merits of one system to the exclusion of others, the electrical engineers could unite upon the axiom that each special condition should be carefully studied and the system best suited to it adopted, I feel certain that the cause will be further advanced.

Entirely apart from any arguments, pro and con, of the relative merits of the two systems, it will be seen that the physical and legal conditions prevented the adoption of any other system than the direct current. The question of rela-

bility is much more important with a trunk line steam railroad carrying passengers from remote points as well as suburbanites, and mail and express from all over the country, than with local street car systems. The New York Central to secure reliability has not only provided storage batteries, but it has also provided duplicate power stations with access for fuel by both rail and water. Duplicate transmission lines have been adopted for like reasons.

Further commenting on the necessity for a study of local conditions, I have recently had in my charge the adoption of an electric system for operating combined freight and passenger service through a double-track tunnel now under construction. In view of the claims made by the advocates of different systems it seemed wise to prepare the specifications so as not to cramp or restrict the best judgment of the competitors, but leave the widest latitude for ingenuity and exercise of skill, consistent with the accomplishing of the desired object. The invitation to domestic and foreign companies, in addition to asking for bids, also requested the filling in of blanks to show the annual costs, including interest charges, depreciation, taxes and operation. The result showed conclusively that, for that particular installation, the direct-current system was the cheapest in both first cost and annual cost, to the extent of being from 20 to 25 per cent less than its nearest competitor.

We are often told that the overhead single-phase system should be used because of the advantage of requiring no substations and substation attendance, but nothing at the same time is said about the higher cost of alternating-current locomotives for performing the same service, nor the higher cost of overhead construction as compared with the third rail.

I do not know of any important question of the day that so much requires absolute openness and frankness, with a careful examination of all sides of the case, as the adaptation of electricity to trunk line practice. Any concealment of the facts sooner or later reacts to the detriment of those responsible therefor and to the financial embarrassment of the suffering company.

In making a selection between the rival electric systems, relative acceleration should be compared not only in connection with the movement of suburban trains but also with through trains hauled by electric locomotives. Some recent observations have demonstrated to me the marked difference of acceleration between the two principal electric systems.

Always having in mind the primal elements of safety and reliability, all the inventive genius of the great manufacturing corporations should be bent on devising means of accomplishing a desired result at less cost, as this will mean in the end such an increase in the use of electricity as a motive power as to more than compensate for the comparatively small loss in decreased unit prices of apparatus. One of the promising movements in this direction is the hints that have been given of the possibility of substituting for the expensive rotary converters and substation attendance with the direct-current system a very simple device which will cost very little and require no attendance.

Discussion by N. W. Storer.

When it comes to statements in regard to single-phase equipments, I desire to take issue with the author of the paper, as information I have, based on the present practice of the Westinghouse Electric & Manufacturing Company, is entirely inconsistent with what appears in the paper. In the first place, there are given 15 so-called differences between direct-current and the alternating-current single-phase motors. These might have been headed "the advantages of direct-current motors as compared with single-phase motors," as this is what they are made to appear. Although many of these are of little consequence they will nevertheless be considered in order.

Comparison of Direct and Alternating Systems.

1. "The input of current in one is continuous, in the other, intermittent." Quite true, but the drawbar pull is quite as effective in one case as in the other.

2. The direct-current motor has a solid frame like the single-phase motor. It has, further, two or more laminated poles bolted in and if the interpole construction is used has as many more relatively small and delicate poles. The alternating-current motor as built by the Westinghouse company has, in all sizes up to a diameter of 38 inches, field punchings made in a single piece and built up and keyed in the frame, making it as solid a construction as an armature on its spider. A claim for less rigidity in the single-phase motor is hardly sustained.

3. "One has exposed and hence freely ventilated field coils, the other has field coils embedded in the field magnets." It is known to most motor designers that coils in contact with iron will dissipate heat much faster than when in the open air. This is especially true of coils in an inclosed motor. I

have repeatedly noticed that motor field coils which have been removed on account of roasting out have shown the insulation in contact with the pole pieces to be in good condition, while other sides were badly roasted. I therefore know that in respect to ventilation of field coils the single-phase motor is superior to the direct-current motor. Smaller cross section of coils also allows the heat to be radiated better with the single-phase motors, and the fact that a large part of the loss in the motor is concentrated in the field iron will enable the motor to dissipate a much larger amount of heat for a given temperature rise than a direct-current motor.

4. Concerning "polar clearances." Many thousands of direct-current motors are today in operation with a clearance of $\frac{1}{8}$ to 3-16 inch between poles and armatures and in practically all cases where more than 3-16 inch clearance is used it is for electrical reasons. Further, while the smaller air gap used for single-phase motors was at first much feared, the fears have proved to be without foundation, and the present clearances of from 0.1 to 0.15 inch have proved to be ample and fully as good as 0.15 to 0.25 inch on direct-current motors because there is no unbalanced magnetic pull.

5. Concerning "torque." The torque of an armature is the pull it will exert at 1-foot radius. It therefore makes no difference in the result whether it is obtained with large flux and few armature conductors, or vice versa.

6. "Much larger diameter of armature and commutator and much higher speed." This is a very general statement; what are the facts? The armature diameters ordinarily run from 5 to 15 per cent larger than for direct-current motors of corresponding output. It is undoubtedly true that the armature speeds of the earlier single-phase motors were much higher than the speeds of corresponding direct-current motors. At present, however, the speed at the nominal rating of the motor is practically the same as that of direct-current motors and the maximum operating armature speeds are within the safe limits set for direct-current motors.

7. Concerning "gear reduction and gear pitch." The gear reduction, of course, depends upon the speed, and as far as gear pitch is concerned, the same gear pitch is used for single-phase motors as for direct-current motors of the same capacity.

8. Windings of one subject to electrical strains of one character; in those of the other strains of rapidly variable and alternating character. No conclusion is drawn from this. It may be of interest to know that there have been a number of instances where the single-phase motor has broken down in service on a direct-current section of the line, necessitating cutting it out of the circuit, but when the car reached the alternating-current section of the line it has been again connected in circuit and operated satisfactorily, thus indicating that the electrical strains on alternating current are less severe than with direct current.

9-10. Concerning the "variable torque of the single-phase motor." No comment is made as to the relative merits of uniform or pulsating torque. In a recent discussion before the institute, Mr. Potter called attention to certain characteristics of the torque exerted by an alternating-current motor, especially when it reached the slipping point of the wheels. It was stated that there was an apparent advantage in the pulsating torque, because, when the motor starts to slip it does not immediately decrease its mean torque as is done in the case of the direct-current motor, but slips in a series of jerks, apparently regaining the hold on the rail at every pulsation.

11. Concerning the "number of poles." The paper states that the direct-current motor has "two or four main poles only." No direct-current motors built in the last 15 years except those on the New York Central locomotives have less than four poles. The paper states that the alternating-current motor has "8 to 14 poles." The single-phase motors built by the Westinghouse Electric & Manufacturing Company have four poles for all sizes up to and including 125 horsepower. The largest single-phase motor thus far built has a capacity of 500 horsepower. It has but 12 poles.

12. Concerning "a high torque while standing still." As we understand the matter, railway motors are designed to move a train rather than hold it at rest. At the same time we know that the single-phase motor is amply protected against mistakes of motormen in leaving the current on the motor for a half minute or so with brakes set.

13. Concerning "resistance in commutator leads." It is well known that the resistance leads which are used in single-phase armatures are used for the purpose of reducing the loss due to the transformer action in the short-circuited coil to a minimum. Their presence is fully justified and the efficiency is higher than it would be if they were not used.

14. This refers to relative weights, concerning which we shall have something to say further on.

15. On this point I agree absolutely with the author. There is one type of construction to which the single-phase

motor is not adapted. This is so far employed in only a single case.

More or less has been said in the paper concerning the lower efficiency of the single-phase motor and inference might be drawn that it is about 10 per cent lower than that of the corresponding direct-current motor. Just to show what modern motors are capable of doing, I give below in parallel columns the efficiencies of corresponding sizes of direct and alternating current motors at different percentages of their full load torque.

Per cent of full load torque125	100	80	60	40	25
Direct-current 90-horsepower motor	\$6.25	\$6.8	87	86.5	85	82
Alternating-current 25-cycle 100-horsepower motor82	\$5	\$6	\$6.8	86	82.5
Direct-current 200-horsepower motor88.8	89	89.2	88.8	87	84
Alternating-current 15-cycle 200-horsepower motor87.3	88	88.3	87.7	85	82

From this it does not appear that within the ordinary range of tractive efforts exerted by railway motors the single-phase motor is so far deficient. In fact, it comes remarkably close to that of the direct-current motor.

Mr. Storer attacked the comparison between direct-current and single-phase motors made by Mr. Sprague on the ground that it was unfair. In conclusion he said:

Now, concerning the use of high-voltage direct current. Motors can certainly be built to commute satisfactorily on 1,200 volts direct current. Such motors, however, must restrain the voltage between bars to a safe limit and have extra space for insulation. The construction of this motor would, therefore, put it on a par with the 15-cycle single-phase motor both in weight and dimensions. Moreover, it would have practically the same air gap in moderate sizes of motors and might possibly have to be designed with the same style of compensating winding on the field as is now used for single-phase motors. It would have in addition the disadvantage of a high voltage always present on the windings and brush holders. If it were not for the greater possibilities of the single-phase system there is no question but that the high-voltage direct-current motor would be quite attractive.

General Discussion.

L. B. Stillwell, consulting engineer, thought the author's comparisons were defective for various reasons, among which are that it compares two motors of equal weight, that the comparison is made with a direct-current motor weighing only 23 pounds per horsepower, while the latest motors offered weigh 28 and 30 pounds per horsepower on one hour rating, and that the comparison is between a direct-current and an alternating-current motor operating at 25 cycles and not at 15 cycles, which was the efficiency suggested by the speaker and Mr. Putnam. In conclusions as to capacity, attention should not be limited to the motor, but should be given to the comparative methods of transmitting power to trains.

W. B. Potter, General Electric Company, said that it was not the intention of the company which he represented to be the advocate of any particular system for the sake of the system itself. In nearly every case there are controlling conditions which determine which particular form of operation is best suited. Within the past few years there has been made a distinct and radical improvement in respect to the mechanical features of the direct-current motor. One of the particular difficulties with the single-phase motor has been in the matter of commutation. Since the presentation at a previous meeting of the paper by Messrs. Stillwell and Putnam, such improvements had been made in the single-phase motor that the armature speed would not be more than 15 per cent higher, and with a larger air gap than had been used heretofore. He believed that these improvements would make that motor much more nearly comparable to the direct-current motor than anything that had been seen thus far, and in which the weights would still be in the neighborhood of 25 per cent more than those of the direct-current motor of the same horsepower. He suggested that in consideration of higher voltages, the step should be made from 600 to 1,200 volts at once and not by successive stages, which would introduce great complication.

Charles F. Scott, Westinghouse Electric & Manufacturing Company, indorsed the view of Mr. Potter, that it was not the function of the engineer to advocate a particular sys-

tem for all cases. He questioned the data upon which the author of the paper had arrived at his conclusions. It seemed to him that a number of points made by Mr. Sprague had been upon comparisons upon a particular basis, and that he had not considered fully the different methods or conditions under which the two motors may operate. Under the control of a motorman the alternating-current motor may have different characteristics of acceleration. It may accelerate to a high point, or it may have the same mean acceleration from start to maximum speed with a less maximum rate of acceleration. With the alternating-current motor any increasing voltage applied to the motor allows an increased output with the same current going through its armature.

William McClellan, Westinghouse, Church, Kerr & Co., was disappointed in the paper, that no definite information had been given with regard to the 1,200-volt system. He was also sorry that the author had thought wise to take up the question of the motor only. The real question is on the general system.

A. H. Armstrong, General Electric Company, referred approvingly to the statements made by Mr. Wilgus. He could not feel the same confidence in the future of any one type of equipment as expressed by Mr. Sprague and Mr. McClellan. Some previous impressions which he had had of the alternating-current motor had been badly broken up.

Prof. C. P. Steinmetz agreed with Mr. Wilgus that the great problem was to replace the steam locomotive by electric motors in those cases where conditions of service have grown beyond the capacity of steam locomotives to handle, and the question whether alternating or direct current motors had the advantage was a secondary one.

BOILER ROOM RECORDS.

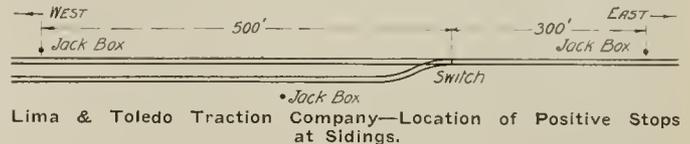

BY R. W. PARRY.

A novel form of boiler room log is shown in the accompanying illustration. Its use would no doubt materially reduce the work of keeping records of the repairs made to boilers. A further advantage of this form of log is that the time required to find any desired information about any of the boilers is much less than in the case of a card index system, or where the records have been kept in a book, and,

REGULATION OF TRAINS AT MEETING POINTS.

The operating department of the Lima & Toledo Traction Company has given much attention to the regulation of trains and trainmen at car meeting points. On the Ft. Wayne division of this railway iron-clad rules have been made which are designed to prevent east and west bound cars from approaching, on the same track, nearer than 500 feet from each other.

The sidings at meeting points are all of the stub-end type and are laid with the switch point to the east. Unless otherwise directed from the dispatcher's office eastbound cars are

given the right of way and westbound cars are required to get into clear. In working out a system of operation whereby the dangers of head-on and "side-swipe" collisions at meeting points are reduced to a minimum three positive stop points have been designated, as shown in the accompanying illustration. These are located respectively 500 feet to the west and 300 feet to the east of the switch point and 100 feet back of the switch point on the siding. At each of these points a telephone jack-box which connects with the dispatcher's wires, has been located. As each car is equipped with a portable telephone communication is readily established with the train dispatcher. If both "meeting" cars are running on their schedule the westbound car is switched to the siding without special orders from the dispatcher, but if either of the cars is running behind the schedule the "stop" points are not passed until orders to proceed are received. When a westbound car has entered a siding the eastbound car does not leave its "stop" point until the conductor of the car on the siding signals that the track is clear. Before doing this, however, it is necessary that he ascertain that his car has reached a point at least 100 feet back of the switch stand. He must then lock the switch and step to the opposite side of the track, after which he can flag ahead the

Form for Keeping Boiler-Room Records.

moreover, a glance at the log diagram gives a graphical indication of the proportion of the total time each boiler has been in use. The paper used for this diagrammatic log is the ordinary "contractor's" cross-section paper ruled in 1/8-inch squares. This paper can be obtained easily for a few cents a sheet. The sheets are cut into strips wide enough to receive a record of all the boilers in a plant and are sufficiently long to accommodate about a four months' log, additional strips being pasted to the first, so as to have the whole year's record in one piece.

The writer has also used this same graphical system for keeping a record of the repairs and running hours of the engines and has found it to give entire satisfaction in both instances.

Once or twice a year this record is copied into the log book to avoid losing the record should the graphical log be lost.

eastbound car. In taking and leaving sidings the rule that a conductor must always lock the switch and step to the opposite side of the track before signaling his motorman is adhered to. This prevents an accidental opening of switches and the resulting damage to track and car equipment.

This system of operation at car meeting points has been used successfully for more than a year and it is now proposed to adopt the same regulations on the other divisions of the company's lines.

Successful trial trips have been made on the line of the Indianapolis & Louisville Traction Company between Scottsburg and Henryville, Ind. It is now believed that regular service will be started as far as Scottsburg in a few days and, within a few weeks thereafter, the Seymour-Columbus division of the Indianapolis Columbus & Southern Traction Company will be completed and service between Louisville and Indianapolis commenced.

"QUESTION BOX" OF THE SOUTHWESTERN ASSOCIATION.

An especially interesting feature of the third annual convention of the Southwestern Electrical and Gas Association which was held at San Antonio, Tex., on May 14, 15 and 16, and was briefly reported in the Electric Railway Review of last week, was the "Question Box," edited by Samuel Kahn, resident engineer of the San Antonio Traction Company. The "Question Box" forms a book of 75 pages, bound in cloth, with an index of contributors and of topical headings, and is well gotten up. The list of questions and answers is large and varied and provoked some very interesting discussions at the convention, the latter part of each session and one entire afternoon session being devoted to the discussion of the "Question Box."

The questions and answers are arranged under headings, each indexed by a letter of the alphabet and numbered in series under each heading. The subjects taken up include practically every branch of gas, electric lighting and railway work, but are especially concerned with the mechanical and engineering departments. It was the plan of the editor to make the "Question Box," a publication of general interest to every individual, ranging from the president and manager to the fireman, in order to bring forth every phase of management and operation.

TRAINING MOTORMEN FOR CAR REPAIR WORK.

In the successful operation of an electric railway the hiring and training of motormen are among the most vital problems that confront operating officials. As the speed of cars and the travel increase and as the construction of car equipment becomes more complicated, these problems become more intricate.

The Scioto Valley Traction Company of Columbus, O., has given much attention to the training of motormen and is obtaining gratifying results from the stringent rules adopted for training new men who are to serve as motormen. For the account of the practice of this company, as herewith given, we are indebted to C. Skinner, superintendent of the company. The account supplements Mr. Skinner's remarks on the subject at the March meeting of the Central Electric Railway Association at Dayton, O.

The company requires that, to be employed as a motorman, a man must have had at least four years' experience in the operation of trains on a steam railway and must pass a rigid examination on the rules for train service adopted by the American Railway Association.

After the examination has been passed and the man has been accepted as a desirable employe he is required to spend two or three weeks in learning the road and the company's method of handling cars. He is then sent into the company's shops and is given practical work in caring for motors and tracing out the causes of trouble that develop in cars. After he has become moderately efficient in this work he is transferred to the car electrician for three or four days, during which he is shown the different car wiring circuits and is instructed as to the results of too rapid acceleration and as to the improper use of the controller. A shop record is kept of all troubles that have arisen in the car equipment and the student is taught how to make the requisite repairs.

He is then taken to the air brake inspector who, for two or three days, instructs him in air brake operation. After this the man is given an examination by the master mechanic or shop foreman and is required to reassemble and connect up parts and wires that, without his knowledge, have been disassembled and disconnected. To fit the man better for his work the wire circuits are often broken by removing the fuses and by substituting blank fuses in their places; the wires are tampered with at points where troubles have previously been found; the air pipes are opened and the

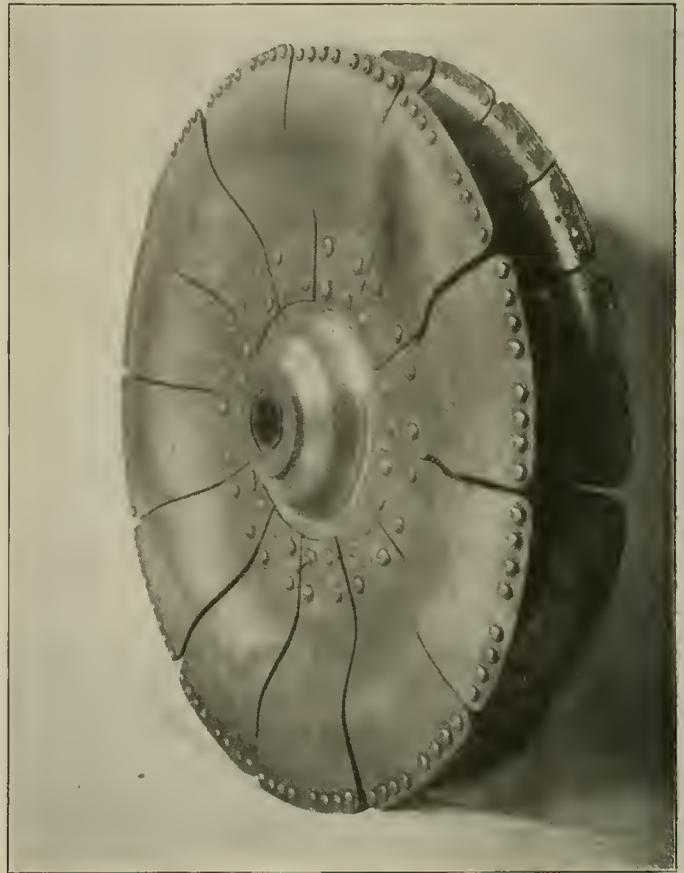

compressor governor is blocked; and the compressor brushes are insulated so as to break the circuit.

The candidate is then taken to the car and asked to make the necessary repairs, beginning with the air compressor, as this part of the equipment should always be in working order before the car is set in motion.

After the air apparatus is in good condition the student is allowed to make the other repairs in his own way. If he proves himself competent to do the work expected he is placed on the motormen's list, but if he has not yet become efficient he is kept in the shops until he can satisfy the master mechanic that he is capable of tracing and repairing almost any troubles that may arise in the equipment of a car.

A FLEXIBLE TROLLEY WHEEL.

The accompanying illustration is reproduced from a photograph of a trolley wheel, patents for which have been obtained by Edward S. Cobb, consulting engineer, Los Angeles, Cal. The design of this wheel is novel, in that the flanges are made of stiff spring metal, but so divided into

Flexible Trolley Wheel.

sections, all riveted to a common center, that the wheel when in position against the wire offers an increased contact surface and elasticity which prevent it from jumping at sharp angles in the wire. The principle involved in making the flanges of the wheel flexible and in providing spring contact surface between the flanges is novel.

The first consignment of 15 new cars ordered by the Lake Shore Electric Railway has arrived. They will cost about \$10,000 each. They are furnished with Westinghouse automatic air brakes. They are also equipped to run in trains. The cars are geared for 75 miles per hour in actual service. One new feature is the all-glass partitions, enabling a passenger in any part of the car to see ahead of the car and thereby enjoy a better view of the scenery. The lavatory is tile finished and modern in every particular. All of the 15 cars ordered will be put into the limited service on the main line as soon as they are delivered.

PIPING AND POWER STATION SYSTEMS—XLI.

BY W. L. MORRIS, M. E.

Many large power stations are either located in small towns or have feeder lines running through them. Such towns generally have waterworks and lighting systems that are both expensive to operate and frequently out of service. A suburban railway will invariably find that it can profitably sell a considerable amount of current to such customers along its lines. The lighting load generally occurs at times when the traffic load is lightest, and the pumping load should be arranged so that it can be thrown on when the station load is light.

Owing to the loss of economy of steam engines operating under light loads that steam turbines are able to make such a favorable showing, the best economy of the steam turbine being considerably less than the best economy of a reciprocating engine, but the economy of the turbine is not affected to such a great extent by load variation. The highest economy possible in the operation of a railway power station would be obtained from units having an auxiliary load, which increases or decreases as the railway load decreases or increases, thus keeping the load constant. This result can be accomplished by the use of storage batteries, but the fixed charges and depreciation on this system are a large item of loss.

To secure the highest economy by the use of a waterworks load it would perhaps be necessary to use a separate feeder system from the power station to the different pumping stations, this feeder being fed with current of variable frequency depending upon the railway load. Either synchronous or induction motors could be used to operate the pumps. The waterworks pumps might then run at full speed and in a fraction of a minute the speed might be reduced nearly to zero, and vice versa, the speed varying constantly with changes in the railway load. This service may appear to be severe on the motors, but it should be no more so than the variable speed at which railway motors are operated. The engines that drive the railway generator would also have to drive the generator carrying the pumping load either on the same shaft or by means of a motor generator. A separate engine for the waterworks load run at varying speed would be a readily developed detail, but this arrangement would merely keep a constant load on the boiler plant and not maintain a uniform load on the railway generating engine. To secure the highest possible efficiency with such a system there should be but one set of feeders, and possibly a controller circuit of small carrying capacity running from the power plant to all the pumping stations, this controller circuit operating magnets or small motors which lengthen or shorten the stroke of the pump, the pump motors in this case being run at a constant speed. This combined traction and pumping load could be supplied with power in so many different ways that it is quite possible a satisfactory method can be developed to control the water discharge.

Railroad operators are inclined to look upon the waterworks scheme as merely an additional consumer of current and do not give proper consideration to the economy which results from keeping the units in the station properly loaded. The fact that the total load of the station is large is no indication that more load is not wanted. A 1,500-kilowatt average load may be the full load of the station if there is but one 1,500-kilowatt generator in service, and a 3,500-kilowatt average may be a light load if three units are in operation. This feature of underload and overload is known only at the generating station. A difference of six to eight pounds of steam per kilowatt-hour is possible with these extreme load conditions, and this is equivalent to about one pound of coal per kilowatt-hour. A 5,000-horsepower plant will deliver about 50,000 kilowatt-hours per day, and if the load could be kept practically constant a saving of nearly 25 tons of coal per day would be possible.

City Water Connections to and from the Meter—Class K 2.

A suitable location for the water meter is sometimes difficult to find. The meter in any case should be properly protected from frost. If located in the basement of the building it is liable to be subjected to low temperatures which injure the meter, and in such cases the meter should be placed in a brick well outside of the building with a tight cover over it, and a small drain run from the bottom of the well to a sewer or to low ground. To further protect the meter from extremely low temperatures straw should be placed over it to prevent air from circulating in the well. These meter pits are objectionable, as they are generally damp and cause the iron parts of the meter to become rust eaten, and are in inconvenient places to get into to read or make repairs. Ordinarily a well-constructed wooden box around the meter would protect it from the lowest temperatures found in the basement, and if arranged so that the well can readily be removed repairs are more easily made. To prevent freezing it is first necessary to confine the air surrounding the part to be protected, and, second, to prevent the air from circulating as far as possible.

If the meter is placed inside of a building, proper means should be provided for shutting off its and all other inside piping to prevent waste of water in case of fire. Such an arrangement is illustrated in Figure 280, in which a valve is shown outside of the building. If the water lines from the meter carry only city water and have no connection with any other water supply system, then the check valve and stop valve on the discharge side of the meter is unnecessary. If the meter is constantly in service there should be a by-pass around it with a valve in it which can be sealed by the water department to prevent water being drawn from the system without registering on the meter. A by-pass is necessary to permit uninterrupted service while repairs or adjustments are being made to the meter. Before making such provisions, however, the details of the arrangement with a sketch should be submitted to the city water department for approval.

City Water to Plumbing Fixtures—Class K 3.

Ordinarily this service presents no unusual features, the most conspicuous feature being that the city water enters the building quite cool, and, if the lines pass through warm basements, the course of the pipe line is generally outlined along the floor by the constant dripping from the cold pipe. This difficulty can be overcome by burying the pipe line, but in power plant work the pipe lines are wherever possible kept out of the ground to facilitate repairs, etc. By encasing the pipe with a cheap wool felt covering, the annoyance of sweating is overcome and at the same time the water is thus kept at a lower temperature. The different wrought-iron pipe lines used for conveying water to and from the plumbing fixtures should be galvanized to avoid as far as possible the stain caused by rust from black pipes, which gives the plumbing fixtures a very untidy appearance. This point should be observed both for cold and hot water lines to the plumbing fixtures.

Before determining what faucets are to be used for the city cold water it would be advisable to ascertain what water is to be used for hot water service, since it may be found simpler to use high pressure valves and take hot water from the feed main under boiler pressure. This point is more fully explained under Class D 10. The washstands in power plants would become exceedingly dirty if some care were not exercised over the men using them, and although white enamel basins are difficult to keep clean they are the only kind that should be used. Their untidy appearance assures that greater care will be taken in keeping them clean.

City Water to Low Pressure Water System—Class K 4.

This service is shown in Figure 280 and would ordinarily only be an emergency connection, the regular service being taken from the station water supply. Such connections as

this are quite necessary to insure continuous operation, and how to avoid the abuse of these provisions is oftentimes a serious problem. It is a well-known fact in station operation that systems having two or more means supplied for meeting an emergency are not as carefully looked after as those having no reserve supplied. The result is that where city water is connected to the station system for emergency service it is generally quite extensively used, even though it be at a loss to the company and could to a great extent be avoided.

Possibly as effective a method as can be followed for reducing the waste of city water is to have the water meter reading placed on the daily station log, showing from day to day the amount of water used; also a line from the operator to state the reason why the valve, d, in Figure 280, was open. The most satisfactory method of taking these readings is to

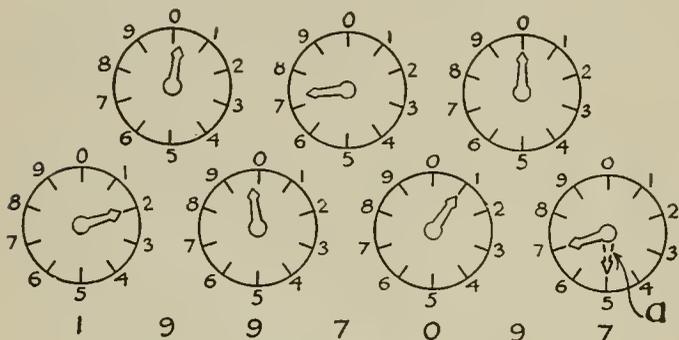

Figure 281 (K4-1).

print the dials on the record sheet and let the operator mark the position of the pointers, as shown in Figure (281) K4-1, from which the chief engineer can figure the water consumption instead of entrusting it to an assistant. Mistakes are easily made in reading meters, and if the chart, as shown, were used it would reduce the possibility of error to a minimum.

The reason dials are confusing is due to the incorrect registering of the pointer, caused by the wear or inaccurate workmanship. If this inaccuracy allows the pointer to be on a graduation when the pointer of the next lower dial is on 5, then the meter can be read in two ways

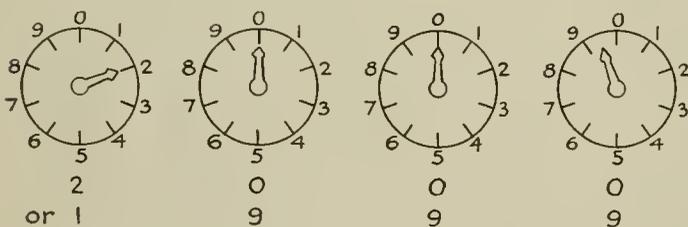

Figure 282 (K4-2).

and with no certainty that either reading is correct. For example, if the unity dial shows 5 as indicated at a, then the meter can be read 105 or 95, the assumption being that it is 7105, as the pointer of the fourth dial has passed 7. There are two different methods of reading a meter, that of placing the unit figure first being the most direct and least liable to cause errors on the part of those who have not become skilled in reading meters. If the high figure (on the left dial) is to be put down first, note must be taken of the next lower dial as to the position of its pointer; if the next lower dial has its pointer at some other point than zero, then it is known whether the number is approaching or following the higher number. In case the unit dial is between divisions the reader would have to assume one, the variation or inaccuracy being negligible. Figure (282) K4-2 shows two readings, either being correct, as the unit pointer is half way between 9 and 10.

(To be continued.)

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL.B., OF THE CHICAGO BAR.

Right of Action of Passenger Given Wrong Transfer.

Montgomery Traction Company v. Fitzpatrick, 43 Southern Reporter, 136.—The supreme court of Alabama says that while it may be admitted that the weight of authority is that the conductor must rely entirely on the ticket in determining his action, and one could not be guilty of a wrong for ejecting a passenger who did not produce a proper transfer, yet all of the authorities recognize that, while in such case there may not be a right of recovery on the ground of a wrongful ejection, yet there can be a recovery for the failure to fulfill the contract to carry, or for the negligence of the agent in giving the wrong ticket or transfer.

Running-Time Orders and Care—Uniform Spacing.

McGahan v. St. Louis Transit Company, 100 Southwestern Reporter, 601.—The supreme court of Missouri, Division No. 2, holds that whatever order a motorman might have been given respecting the running time of the car, that would in no way release him from the duty of exercising due care in the handling or operation of the car, and avoiding the danger of collisions with cars or other obstructions which might be on the track.

The court also says that no such thing as a uniform spacing of cars is practicable on a street railway, as it is matter of common knowledge that blockades frequently occur on the streets which the operators of the lines are powerless to prevent.

Immunity as to Paving Not Transferred.

Rochester Railway Company v. City of Rochester, 27 Supreme Court Reporter, 469.—The supreme court of the United States says that in this case the city sued the railway company to recover \$18,274.02, the expense of making new pavements of two streets within the space between the tracks, the rails of the tracks, and two feet in width outside the tracks of the railroad.

The Rochester Railroad was incorporated for the purpose of acquiring the property of the Brighton Railroad, which was accomplished by a lease of the property, franchises, rights and privileges of the Brighton Railroad, followed by the purchase of its capital stock. This was done under the authority of a statute which provided that a railroad corporation, being the lessee of the property of another railroad corporation, might acquire the whole of the capital stock of the latter, and in such a case its "estate, property, rights, privileges and franchises should vest in and be held and enjoyed by" the purchasing corporation. It was contended that the effect of the transfer under this law was to vest in the Rochester Railroad the exemption from the expense of street pavement which the Brighton Railroad enjoyed through a contract with the state of New York. But the court holds against the company.

The court says that it thinks it is now the rule, notwithstanding earlier decisions and dicta to the contrary, that a statute authorizing or directing the grant or transfer of the "privileges" of a corporation which enjoys immunity from taxation or regulation should not be interpreted as including that immunity. It, therefore, concludes that the words, "the estate, property, rights, privileges and franchises" did not embrace within their meaning the immunity from the burden of paving enjoyed by the Brighton Railroad Company.

The requirement of permanent repair includes the duty of laying new pavements.

Nor does the court agree with the contention that this was not a case of transfer of an exemption; that the rules governing transfer were not applicable here; that the Brighton Railroad had not ceased to exist as a corporation; that

it had been merely joined by merger with the Rochester Railroad, which controlled it by stock holdings, and operated it by virtue of its franchises; and that, therefore, the Rochester Railroad might claim and enjoy the exemption of the Brighton Railroad in its behalf in respect of its property.

The court says that the Rochester Railroad first took a lease of the Brighton Railroad, apparently for the purpose of bringing itself within the provisions of the act of 1879. Then all the stock of the latter corporation was acquired by exchange of shares of stock of former corporation. Then a certificate of the transfer of stock was filed with the secretary of state. Thereupon, by operation of the law, the "estate, property, rights, privileges and franchises" of the Brighton Railroad vested in the Rochester Railroad, to be thereafter controlled by the Rochester Railroad in its own corporate name. The law does not expressly dissolve the selling corporation, but it leaves it without shareholders, property or franchises. A corporation without shareholders, without officers to manage its business, without property with which to do business, and without the right lawfully to do business, is dissolved by the operation of the law which brings this condition into existence.

Interurban Roads Not Subject to Grade-Crossing Act.

Commissioners of Ross County v. Scioto Valley Traction Company, 80 Northeastern Reporter, 176.—The supreme court of Ohio says that the question presented in this court was whether the company was within the act of April 25, 1901, "to provide how railroad and highway crossings may be constructed," its construction being for the operation of its cars by electricity conducted upon a third rail, and its cars being in fact so operated. The scope of the act is indicated by its first section, which provides that, "except as in this act elsewhere provided, all crossings hereinafter constructed, whether of highways by railroads or of railroads by highways, shall be above or below the grade thereof." The conclusion is that an interurban railroad for the operation of cars by electricity and by the tractive friction resulting from their own weight is not within the act of April 25, 1901. Obviously the word "railroad" needs not to be used in a strained or unnatural sense to include an interurban road operated by electricity. But the court thinks that in the provisions which the legislature has made for the safety of those who are participating in the common use of crossings and highways and the tracks of common carriers it has preserved a distinction on account of the motive power or the tractive methods employed by the carriers. A substantial basis for such distinction is found in the greater weight and momentum of trains drawn by locomotives in comparison with cars for whose propulsion reliance is had upon the tractive friction produced by their own weight, and the promptness with which the latter may be stopped.

Duty and Liability Arising from Muddy Step.

San Antonio Traction Company v. Flory, 100 Southwestern Reporter, 200.—The court of civil appeals of Texas does not think an instruction erroneous which told the jury that if they believed from the evidence that the step or platform, or both, was muddy and slippery, that the conductor failed to assist the plaintiff's wife to alight, that his failure to assist her from the car was negligence, that it was the proximate cause of the accident to the plaintiff's wife, and that she was injured thereby, then the jury must find a verdict for the plaintiff.

The court thinks it is safe to say that, when the carrier sees fit to maintain a place of exit that is dangerous, such duties then become entailed upon it as warning or assisting the passenger, in the exercise of proper care due to that situation. What omissions, in such a situation, would amount to negligence, are questions of fact for the jury.

Take the case of a young and robust person, unencum-

bered with luggage, who is about to alight from a car. If the exit is a safe one, there is nothing either in respect to the exit, or to the person alighting, to present or suggest the appearance of danger to the mind of the conductor. In such a case there would be no such issue to submit as the necessity of warning or assisting such person, because clearly no duty in that regard could be said to have arisen.

The rule, upon principle, is the same whether the appearance of danger arises from the condition of the passenger or from the condition of the means of egress. The rule has frequently been applied in cases where the car was stopped so that the descending passenger would step into a dangerous place, where such danger was known, or should have been known, to the carrier. It is obvious that whether the dangerous agency is upon the ground or upon the car step is immaterial.

Injury to Bystander by Runaway Car—Risks Taken in Operation of Cars in Hilly Country—Bad Weather.

Small v. Pittsburg Railways Company, 66 Atlantic Reporter, 76.—The supreme court of Pennsylvania says that at the foot of a slope where the company's street railway runs for a distance of a mile and a quarter upon a grade of 6 per cent the tracks terminate directly across the street from a railroad station. On an evening in January, shortly before 8 o'clock, the plaintiff, who was standing on the station platform, was struck by a piece of wood broken from a near-by telephone pole. A car of the company had gotten beyond control while going down the hill, and had left the track at the terminus, crossed the street, and collided with the telephone pole, breaking it and running against the wall of the railroad station. A fragment of the broken pole was thrown against the plaintiff, and inflicted serious injuries.

The testimony showed that the car escaped from control while going down the hill by reason of the slippery condition of the tracks upon the grade. Rain had fallen, which froze to the rails as it fell. The car was in good condition and properly equipped with brakes, and was provided with sand; but the tracks were so incased in ice that, when the motorman attempted to apply the sand, the wheels would not take hold, even when reversed. In consequence the car slid down the grade.

A judgment for the plaintiff is reversed, the court feeling that the facts of this case negated any inference of negligence arising out of the mere attempt upon the part of the motorman to operate the car, proceeding, as he did, slowly and cautiously, feeling his way, as it were, until unfortunately he found by trial that the conditions were so unusual that, contrary to his expectation, based upon long experience, the sand would not enable him to control his car.

The sole fault which could be imputed to the motorman, under the evidence, the court says, was that he erred in his judgment when he started his car down the grade. As the sequence showed, he underestimated the difficulty caused by the presence of ice on the rails. The motorman of the car immediately ahead of him made the same mistake. But the exercise of judgment—even though it be mistaken judgment—is not negligence. He occupied the place of greatest danger on the front platform, and regard for his own safety would naturally quicken his instinct to anticipate danger if, in his judgment, there had been any real occasion for it.

Negligence is not to be presumed upon the happening of an occurrence which is the result of exceptional and extraordinary conditions. It must be presumed that in a hilly country, such as that in the region of Pittsburg, some risks must be taken in the operation of street cars. It will not do to stop them at every change in the weather. The public need for them is greatest in bad weather.

Hindsight is better than foresight, no doubt, and it is easy to criticize after the event; but the law holds men responsible only for such consequence as can, in the exercise of reasonable prudence, be foreseen.

News of the Week.

Cambridge Subway Stations.

William Barclay Parsons of New York, the expert employed by Mayor Wardwell of Cambridge, Mass., to advise with him and City Engineer Hastings in regard to the construction of the new Cambridge subway, has submitted his report as to the number of stations needed from and including Charles river and Harvard square. He gives it as his opinion that four is the proper number, and that these should be located at Harvard square, Dana street, Central square and Sixth street. Mr. Parsons anticipates that with the institution of the subway the traffic is likely to increase beyond expectation, because of additional population. In different localities in upper New York the travel has increased from 60 to 300 per cent as a result of the subway's operation, and it is to be expected that this experience will be repeated in Cambridge, with an additional traffic of between 40 and 50 per cent inside of six months after the opening of the subway. Mr. Parsons regrets that the subway is not to be a four-track line, and agrees with the Boston Elevated Railway Company that Kendall square is an undesirable location for a station on account of the grade.

Legislation Affecting Electric Railways.

New York.—Mayor McClellan of New York City on Tuesday of this week sent the public utilities bill back to the legislature without his signature. The bill, which was passed by the legislature on May 22, provides for the appointment by the governor of two commissions to have jurisdiction over public service corporations, one for New York City and one for the remainder of the state. In a memorandum accompanying the measure the mayor explains that, while he is in accord with the general principles embodied in the bill, it is as a whole so destructive of the principle of home rule that but one course was open to him. This was his basic objection, but the mayor adds, in effect, that such legislation would result inevitably in the appointment of partisan commissioners, who in times of party stress would use their power to coerce the transportation companies into furnishing funds with which to corrupt the electorate. It is considered probable that the bill will be passed over this veto, as only a majority in the legislature is required. As the bill was formulated by Governor Hughes, and as the amendments have met his approval, there is no doubt as to its becoming a law. The bill was submitted to Mayor McClellan for approval because it provides for a commission for the city alone, to supersede the present rapid transit commission.

Illinois.—Governor Deneen has signed a bill providing that no steam or electric road shall cross the tracks of another without permission of the state railroad and warehouse commission.

Stockholders of Underlying Chicago Roads Ask Representation.

Stockholders of the Chicago West Division Railway Company and the North Chicago City Railway Company, underlying companies of the Chicago Union Traction Company, have asked Judge P. S. Grosscup of the United States circuit court to direct that an attorney representing them be permitted to participate with G. W. Wickersham and L. C. Krauthoff, attorneys for the New York interests in the property, in the reorganization plan which is now being framed. The request was made by Cyrus H. McCormick, representing a committee of stockholders of these two underlying companies. The members of the committee are Cyrus H. McCormick, Thomas Templeton, Charles W. Ware and John F. Bass for the West Chicago company and Leon Mandel, Charles A. Mair, James F. Porter, John A. Chapman and John F. Bass for the North Chicago company.

Certificates of deposit representing the stock of the Chicago Union Traction Company which has been placed with the Central Trust Company, New York, have been listed on the New York stock exchange. These certificates show the deposit of \$14,168,200 of common stock and \$10,044,300 of preferred stock, or 50.8 and 84 per cent, respectively, of the outstanding issues.

The United States supreme court denied, on May 27, the petition for a writ of certiorari in the cases of the North Chicago Street Railroad Company and the West Chicago Street Railroad Company versus the Chicago Consolidated Traction Company, the effect of which, if granted, would have been to take the cases to that court for review.

The cases involved charges against the methods of the late Charles T. Yerkes in bringing about the consolidation of Chicago street railroads.

Rapid Transit Affairs in New York.

The rapid transit commission on May 23 began advertising for bids for the construction of the last three sections of the bridge subway loop, from Delancey to Norfolk streets, from Center street to the Bowery, and from Pearl street to Park Row. Bids will be opened on June 13. The contract for the second section was awarded to the Cranford Company. Several property owners on Broadway and Fifth avenue are seeking to enjoin the commission from accepting bids for the construction of section 5 of the Lexington avenue route by the open cut method. No bids have been received.

F. B. Behr, who is seeking a franchise for a monorail line from Brooklyn to Coney Island, has accepted the terms imposed by the commission and has agreed to deposit \$25,000 to insure the construction of the road if the plans are approved.

The New York Tunnel Company, which has a subcontract for the actual boring of the tunnel under the East river, from the Battery to Brooklyn, was placed in the hands of a receiver on May 23. It was stated at the offices of the Rapid Transit Subway Construc-

tion Company, however, that this would in no way affect the progress of the tunnel work.

Justice Fitzgerald of the supreme court has decided that the city and the board of rapid transit commissioners are entitled to an injunction to restrain the Interborough Rapid Transit Company, which operates the subway under lease from the city, from delivering to the New York City Railway the use of electric currents through certain ducts or masonry chambers built in the walls of the subway. The court also enjoined the New York City Railway Company from receiving the electricity from the Interborough Rapid Transit Company. The court also holds that the railroad companies mentioned must account to the city for the electricity already used. In this decision Justice Fitzgerald said that the ducts are the property of the city.

Mayor McClellan on May 28 vetoed the public utilities bill, because of its violation of the home rule principle.

Chicago Employes Accept Wage Increase.

The differences between the Chicago City Railway Company and its motormen and conductors in regard to wages were settled on Tuesday of this week when the men voted to accept the company's offer of approximately two cents an hour increase. Previous to the recent city election, at which the "general settlement" ordinances were approved by the voters, the company offered to make a new agreement with the men, if the ordinances passed, for a new wage scale, effective as of April 1, of 23 cents an hour for the first three months, 25 for the following nine months and 27 cents thereafter, instead of the old scale of 19, 24 and 25 cents, which has been paid under an agreement expiring July 31, 1907. The union met on April 13 and voted not to accept the increase unless a similar one were granted to the employes of the Chicago Union Traction Company. Later a demand was made for 25 cents an hour for the first six months' service and 33 1-3 cents thereafter, with a 9-hour day, which President Mitten last week finally refused to grant. On May 23 a general ballot was held and the men voted by a majority of more than two to one to accept the company's offer.

The executive committee of the union met with President Mitten on Wednesday and signed an agreement on this basis running to July 31, 1908. The company also agreed to make the same scale effective for car house employes, to increase the pay of men employed on snowplows and sweepers from 30 to 35 cents an hour, and that in the event of a strike on the other lines of the city the men should not be forced to work as strikebreakers.

The employes of the Chicago Union Traction Company have made similar demands to those of the south side men and an answer is expected early next week on the return of General Manager J. M. Roach from New York.

Tests of Reinforced Concrete.

The results of important tests on reinforced concrete beams which have been carried on in the testing laboratories of the University of Wisconsin for the past four years have been published in a bulletin prepared by E. A. Moritz of the college of engineering entitled "Tests on Reinforced Concrete Beams." The bulletin calls attention to the fact that to Rudolph Hartman, formerly instructor in the testing laboratory, belongs the credit of discovering several years ago the fact, now commonly recognized, that the concrete in a beam really cracks much earlier than is shown on the surface. The tests have included investigation of the efficiency of different methods of reinforcing and preventing inclined tension failures, and other interesting matters connected with these beams.

The investigation showed that the concrete cracks before evidences of the break can be detected with the eye, and that after it has cracked, though only minutely, its strength in tension is zero. Comparative tests of reinforced and plain concrete beams show that the first indications of cracking appear on the reinforced beams at about the same load at which the plain beams fail. It is evident, therefore, that concrete reinforced with steel will not stretch more before cracking than plain concrete, and that consequently the tensile resistance of concrete should not be taken into consideration in reinforced concrete design.

When reinforced concrete first came into general use it was thought that horizontal bars of steel were sufficient, and the peculiar failures which often occurred were usually ascribed to the rods pulling out. The latter idea led to the invention of various forms of deformed bars now on the market. It has been found that even beams reinforced with deformed bars often fail along inclined cracks, and something besides horizontal rods is necessary to prevent such failures. Stirrups have been used extensively to overcome the difficulty, but although they assist in carrying internal stresses to some extent, their use will not always prevent inclined tension failures.

Various tests were made in the laboratory as to the best form of steel reinforcement for concrete. The anchoring of the rods at the ends of the beams, which has been advocated heretofore, did not seem to strengthen them materially. The experiments apparently demonstrated that the cracking in the plane of reinforcement is not due to the pulling out of the rods, but rather to the pulling of the concrete upward away from the rods, and that it therefore cannot be prevented by anchoring the rods at the ends. In most reinforcement with bent rods, the angle of these rods with the horizontal has been too large, and consequently the adhesive area of the rods has been too small. Numerous tests on both large and small beams made in connection with this work have shown that these methods are not effective in preventing inclined tension failures.

Accident on the Grand Rapids-Muskegon Line.—A passenger car running from Muskegon to Grand Rapids, Mich., on the line of the Grand Rapids Grand Haven & Muskegon Railway, on May 24 collided head-on with a westbound baggage and express car

and the two motormen were killed and five passengers were injured. The two cars were wrecked.

"Jim Crow" Law Declared Unreasonable.—The city court at Montgomery, Ala., has annulled the city ordinance requiring separate street cars for white and black passengers, holding that it is not reasonable or just to the street railway company.

Accident on the Cleveland & Southwestern.—Four persons were killed and 13 injured, according to newspaper reports, in a rear-end collision on the Cleveland & Southwestern Traction Company's line at Elyria, O., on Thursday evening of this week.

Flood Suspends Traffic in Salt Lake City. Several of the street railway lines of the Utah Light & Railway Company in Salt Lake City, Utah, were obliged to suspend operations last week on account of a flood caused by melting snow in City Creek Canyon, which overflowed the ditch on North Temple street, leading to the Jordan river.

Mail Carriers Ask to Ride Free.—The United States mail carriers of Buffalo, N. Y., have submitted a request to the International Railway Company that they be allowed to ride free on the street cars while off duty. This privilege is granted to the policemen and firemen. The mail carriers are now given free tickets good only while they are on duty.

Attractive Folder Issued for Jamestown Visitors.—The Newport News & Old Point Comfort Railway & Electric Company of Hampton, Va., has just issued an especially attractive 16-page folder advertising the service which it affords in the vicinity of the Jamestown exposition grounds. The folder is largely made up of halftones and colored maps, thus presenting a very attractive appearance.

Accident on East St. Louis & Suburban Railroad.—A passenger car on the East St. Louis & Suburban Railroad was struck on a crossing near Brooklyn, two miles from East St. Louis, Ill., by a Toledo St. Louis & Western switch locomotive running light and 12 passengers were injured, one probably fatally, on May 27. Different versions of the story vary; the car had partly passed the crossing and the motorman was unable to get it entirely across after he saw the engine.

Evansville Strike Settled.—Most of the motormen and conductors of the Evansville & Southern Indiana Railway, who declared a strike on May 15, as reported in last week's issue of the Electric Railway Review, returned to work on Sunday of this week. By the terms of the settlement the men get platform time, an 11-hour day instead of 12 hours, and will be paid 16, 17 and 18 cents an hour, instead of 15, 16, 17 and 18 as formerly. The men struck for a flat scale of 20 cents an hour and a 9-hour day.

Terminal Station Planned for South Bend.—Samuel Murdock, president of the Chicago South Bend & Northern Indiana Traction Company, together with a party of interurban men, inspected the traction terminal station at Indianapolis during the past week with a view to building a similar station in South Bend. The station in South Bend, while not on so large a scale as the Indianapolis station, will be artistically finished and provided with all the late improvements and equipment desired for an up-to-date terminal station.

Strike at Oil City, Pa.—The motormen and conductors of the Venango Traction & Power Company, controlling the electric railways in Oil City and Franklin, Pa., with other lines in Venango county, declared a strike on May 24, tying up service on 32 miles of track. About 75 of the men had formed a branch of the Street and Electrical Railway Employees the night before. The reason for declaring a strike is said to have been the dismissal of seven men by the company and because the men objected to paying fare when not in uniform. No disorder has resulted.

Vote to Strike in Detroit.—The motormen and conductors employed by the Detroit United Railway on Monday of this week voted to strike for higher wages. The vote, which was taken by secret ballot, was 1,002 to 235. The men are asking for 28 cents an hour, time and a half for overtime and holidays, and pay while waiting for "trippers." The present wage scale, under an agreement made last June, is 23 cents an hour for the first year, 24 cents for the second, and 25 thereafter. The matter has been placed in the hands of W. D. Mahon, president of the National Association of Street Railway Employees.

Chicago City Railway Offices Moved.—The general offices of the Chicago City Railway Company, which are now located at 2020 State street, as well as the offices of the legal and claim departments, now located in the Ashland block and those of President T. E. Mitten and Purchasing Agent R. B. Hamilton, on the seventh floor of the First National Bank building, are to be transferred on June 1 to the sixteenth floor of the First National Bank building. The vacated State street offices are to be used as headquarters for the rehabilitation work and will be turned over to the engineers and the construction department.

Willow Grove Park.—A 48-page booklet, describing Willow Grove park, which is owned by the Philadelphia Rapid Transit Company, and which is located on that company's lines, 13 miles north from the center of Philadelphia, has just been issued. The pamphlet is filled with attractive halftone illustrations of views of the park, one of the finest in the country, which contains 130 acres of land, whose natural beauties and picturesque surroundings make it an ideal outing place. Besides a large number of attractions of the usual sort, the park contains a casino, whose piazzas accommodate 500 guests, the Lakeside cafe, with tables for 750 persons, and many unique forms of entertainment, which are all described and illustrated. The chief distinguishing and most popular feature of the park is the superior order of band and orchestral music that is provided for the enjoyment of the park patrons. For the season

of 1907 this form of entertainment will be furnished by Walter Damrosch and the New York Symphony Orchestra, Arthur Pryor and his band, Victor Herbert's orchestra and Sousa and his band.

Views of the Twin City Lines.—A. W. Warnock, general passenger agent of the Twin City Rapid Transit Company, Minneapolis, Minn., has issued a series of handsomely illustrated lithograph postal cards, containing a large number of different views of beauty spots on the company's suburban lines, which reach many lakes and other points of interest and attractiveness, including the company's magnificent amusement resort, Big Island park, at Lake Minnetonka. Interior and exterior views of the type of cars used and of the excursion boats on Lake Minnetonka are also included.

Judgment Against Manhattan Railway.—The appellate division of the New York supreme court has affirmed the report of Referee Hamilton Odell in regard to a judgment of \$275,538 against the Manhattan Railway Company in favor of the city of New York. The amount is due under a law passed in 1867, authorizing the West Side & Yonkers Patent Railway to construct an elevated railroad in Manhattan on the condition that it should pay the city 5 per cent of the net income from passenger traffic. The company has been acquired by the Manhattan Railway Company and the litigation was caused by a dispute as to what items constituted the net income.

Officials of United Railroads of San Francisco Indicted.—The grand jury at San Francisco on May 24 returned true bills against four officials of the United Railroads on the charge of bribing fourteen members of the board of supervisors to grant a franchise permitting the company to operate its lines by the overhead trolley system. The four officials indicted are: Patrick Calhoun, president; Thornwell Mulally, assistant to the president; Tiley L. Ford, general counsel, and W. M. Abbott, attorney. President Calhoun has issued a long statement denying the charges and claiming the entire affair to be the result of a conspiracy by Rudolph Spreckels and the labor party.

Exception to Fellow-Servant Principle.—The Indiana supreme court has decided that the Ft. Wayne & Wabash Valley Traction Company is liable for the injury to a conductor occasioned by the running into his car from the rear of another car under the charge of a motorman who had gone to sleep by reason of long hours of labor. The court said that an electric railroad company that negligently required a motorman to operate a car after he had been continuously working without sleep for more than 24 hours, cannot take advantage of the fellow-servant principle if his omission of duty by reason of the resultant physical condition causes an injury to the conductor on another car.

Sight-Seeing Car for Omaha.—Beginning on June 1 the Omaha & Council Bluffs Street Railway Company will operate a sight-seeing car from Omaha to South Omaha, Benson, Florence and Council Bluffs. The arrangements are now for two trips, one in the forenoon and one in the afternoon of each week day. One of the larger cars from the Council Bluffs line will be fitted especially for this service and a lecturer will accompany the car on all trips to point out the places of interest along the route. Each trip is expected to consume about three hours and to cover between 35 and 40 miles. A photographer will take the picture of the people as they start and will have the photos ready for delivery upon the return from the trip.

Electric Railways in the Central West.—The series of three articles on "Electric Railroads as a Factor in Twentieth Century Transportation," by Charles N. Wilson, president of the American Engineering Company of Indianapolis, which recently appeared in The Tradesman of Chattanooga, Tenn., has been reprinted and issued in pamphlet form, together with some of the comments and commendations from the newspapers and others. The articles outline the history of the development of the electric railway industry in the central west and discuss some of the benefits which have been made possible by this comparatively new form of transportation. Some especially interesting information is given with regard to the progress of the electric railways of Indiana.

San Francisco Union Leaders Arrested.—Three officials of the street railway employees' union of San Francisco were arrested on May 29 on a charge that they were responsible for an explosion on the line of the United Railroads about a week ago, by which a switchboard in the main station was destroyed and the entire plant put out of commission. Two of the men arrested are members of the executive committee of the union. While there appears no immediate prospect of a cessation of the strike, the United Railroads has been able to operate many of its cars with non-union men. On Friday of last week 200 cars were in service on 28 lines, covering about 200 miles of track, or about 25 miles less than the total mileage within the city limits. About 125,000 passengers a day were carried last week. Each day fewer disturbances caused by the strikers are reported.

New Suit Against Air Line.—Certain stockholders of the Chicago-New York Electric Air Line Railroad Company on Wednesday of this week filed a bill of complaint against the company before Judge Windes of Chicago, reiterating the charges of mismanagement made in the recent suit of Theodore Nemoier, as reported in the Electric Railway Review of May 11, and petitioning for an injunction against the practices complained of, an accounting and the appointment of a receiver. Mr. Nemoier's motion for an injunction and the appointment of a receiver in Judge Honore's court was withdrawn last week, when the court declined to appoint a receiver or grant an injunction without a full hearing. The company has filed a general demurrer to Nemoier's allegations. Nemoier charged that the proceeds from the sale of stock were being wasted and that the officers were drawing large salaries.

Construction News

FRANCHISES.

Bucyrus, O.—The Columbus Marion & Bucyrus Railway, which is building an extension of the Columbus Delaware & Marion Railway from Marion to Bucyrus, has been granted a franchise to enter this city. The council also granted a franchise to the Toledo Bucyrus & Columbus Electric Railway, a proposed interurban line from Fremont to Bucyrus, via Tiffin and Melmore, O. It is stated that surveys have been completed and franchises secured by the latter road. When completed these two lines will afford a connection between Toledo and Cincinnati.

Chicago, Ill.—An ordinance was introduced into the city council on May 27 to permit the Chicago Milwaukee & St. Paul Railway to operate by the electric trolley system from a connection with the Northwestern Elevated Railroad at Wilson avenue, north to the city limits, and to build an additional track. The electric tracks are to be used by the Northwestern Elevated and possibly by the Chicago & Milwaukee Electric Railroad. The ordinance was referred to the committee on local transportation.

Coffeyville, Kan.—The Union Traction Company of Kansas has been granted a franchise on North Penn avenue.

Cleburne, Tex.—W. L. Martin has applied for a franchise to build an electric line in this city.

Granite City, Ill.—A franchise has been granted to the Danville & Edwardsville Terminal Railroad, a part of the Illinois Traction System, for a new single-track line through the city on G street, which will give the system two lines to the proposed bridge across the Mississippi river to St. Louis.

Menominee, Mich.—C. O. Johnson of the Hydro-Electric Water Power Company, Oshkosh, Wis., is seeking a franchise for an electric railway to connect Menominee, Mich., with Marinette, Wis., in connection with the company's proposed power plant on the Peshtigo river.

Middletown, O.—The Cincinnati & Middletown Traction Company has applied for a franchise.

Napoleon, O.—The Toledo Wabash & St. Louis Railroad has applied for a franchise.

New York, N. Y.—A franchise has been granted to the Ft. George Street Railway to build an electric line from the Dyckman street station of the Interborough Rapid Transit Company, along St. Nicholas avenue, to West One Hundred and Ninetieth street.

Oakland, Cal.—The Oakland Traction Company has secured a 50-year franchise for the extension of its line on Over street, Allendale, Glen, Boulevard Park and Leise avenues. The bid of this company of \$500 for the privilege was the only one received by the board of supervisors.

Olympia, Wash.—The Pacific Traction Company of Tacoma, Wash., has applied for a franchise on several streets for its proposed line from Tacoma.

Phillipsburg, N. J.—The Easton Transit Company, under the charter of the Phillipsburg Horse Car Railroad, has been granted a 20-year franchise for the construction of five miles of additional track through the Fifth and Sixth wards. Harrison R. Fehr, president and general manager, Easton, Pa.

Richmond, Va.—At a special meeting of the common council the ordinance recently passed by the board of aldermen granting consent to the transfer of all rights, franchises and privileges of the Citizens' Rapid Transit Company to the Richmond & Henrico Railway Company, was ratified, with the provision that a bond for \$5,000, together with acceptance in writing by the company, be filed within 30 days.

Russellville, Ark.—A 50-year franchise has been granted to the Southern Engineering Construction Company to build an interurban line between Russellville and Dover, Ark. The company also will operate a light and water plant in Russellville. Adam J. Robinson, Pine Bluff, Ark., president; J. C. Wilson, St. Louis, Mo., secretary.

South Bend, Ind.—The Chicago Lake Shore & South Bend Railway, which is building from South Bend, Ind., to Kensington, Ill., has secured an extension of time under its franchise until July 1, 1908, in which to have its line completed, although the promoters say the line will be in operation by January next. J. B. Hanna, president, South Bend, Ind.

Summit, N. J.—The Morris County Traction Company has been granted a 40-year franchise for its extension from Elizabeth to Summit, which is now built to within a mile of the latter place.

Tenino, Wash.—Janson M. Averill, Seattle, Wash., has applied for a franchise to build an electric railway in this city.

RECENT INCORPORATIONS.

Bridgeport & Danbury Electric Railway.—Incorporated in Connecticut to build an electric railway 20 miles long, connecting the towns of Bridgeport, Trumbull, Monroe, Newtown, Bethel and Danbury, Conn., covering a section at present without electric railway service. Capital stock, \$2,000,000. Incorporators: John T. King, Henry E. Reilly and William H. Marigold.

Buffalo Genesee & Rochester Railway.—Incorporated in New York to build a 60-mile interurban electric line from Buffalo to Rochester, N. Y. The line will follow practically the same route as that laid out by the Buffalo & Rochester Traction Company, whose application early in the year for a certificate of public necessity was refused in April by the state railroad commission, on the ground that the territory was sufficiently provided with transportation facilities. It is stated that the main line of the new company will not touch Le Roy, as was the intention when the Buffalo & Rochester Traction Company was incorporated, but will reach it by a branch line, which will, in part, overcome one of the objections raised by the state railroad commission to the Buffalo & Rochester. The latter road, after the refusal of its petition to the railroad commissioners, obtained an order from the appellate division of the supreme court requiring the commissioners to show cause why a certificate should not be granted, but as the law allows no proceedings within one year after the refusal of a certificate by the commission, the incorporation of the Buffalo Genesee & Rochester was resorted to in order to avoid delay in the work already started. Capital stock, \$7,500,000. Incorporators: Henry H. Kingston, Jr., Samuel Welch, Philadelphia; John Baker, Herbert P. Bissell, Buffalo, N. Y.

Joplin & Pittsburg Railroad.—Application for a charter has been filed by this company at Topeka, Kan., and Jefferson City, Mo., for permission to construct and operate an 80-mile interurban railway in southwest Missouri and eastern Kansas. The line will connect Joplin and Webb City in Jasper county, Missouri, extending to Baxter Springs and Pittsburg, Kan., and to the Quapaw Indian reservation. The charter also empowers the new company to take over the Pittsburg Railway & Light Company, now operating from Columbus to Pittsburg, Kan., and the new Heim street railway system, now under construction in Joplin, Mo. Capital stock, \$5,000,000, of which \$2,800,000 is paid in. J. J. Heim, Kansas City, Mo., is interested.

Ohio Electric Railway, Cincinnati, O.—Incorporated in Ohio with power to build, own, operate and acquire electric railways from Zanesville to the Indiana state line, near New Paris, and from there to Richmond, Ind., Cincinnati, Columbus, Washington Court House, Springfield, Dayton, Defiance, Lima, O., and Ft. Wayne, Ind. Capital stock, \$100,000. As the incorporators are all employees in the office of W. Kesley Schoepf, it is stated that the object of the company is to effect a merger of all of the Schoepf-McGowan properties in the state, which now operate in the cities and towns named, and which include the Indiana Columbus & Eastern Traction Company, the Lima & Toledo Traction Company and the Cincinnati Northern Traction Company.

Philadelphia Valley Forge & Suburban Railroad.—Incorporated in Pennsylvania with a capital stock of \$60,000 to build a link in the system of electric railway lines projected by the Public Service Investment Company, a holding company, to connect Philadelphia with Lower Merion, East and West Conshohocken, Norristown, Valley Forge, Phoenixville, Royersford and Pottstown. With this charter there has also been granted for the system other charters for the following railways: Valley Forge, Colonial Springs & Phoenixville, Cynwyd Fairview & Ardmore, Fairview & Merion Square, Merion Square & Barren Hill and the Audubon Lower Merion Bala & Wynnefield. All of these, financed by L. Knowles Perot of Bala and others, are included in the holding corporation. Mr. Perot is president. The other incorporators are: A. D. Whiting, David Rombold, Jr., and Edward W. Johnson, Philadelphia; James A. Bunting, Secans; Morris H. Wetherill, Haverford, and Robert C. Seldon, Norristown.

Portland (Me.) & Northern Railroad.—We are officially advised that this company has been incorporated in Maine, instead of Oregon, as incorrectly reported in last week's issue of the Electric Railway Review, and will build an electric line 40 miles long from Portland to Bridgton, Me., through Windham, Raymond, Casco and Naples. Capital stock, \$160,000. Incorporators: William M. Sturges, N. D. Sturges, Scranton, Pa.; Tracy W. Holland, New York City; Howard Winslow, Henry L. Forham, Llewellyn Barton, Portland; S. O. Hancock, Casco, Me.

Putnam (Conn.) & Rhode Island Street Railway.—Incorporated in Connecticut with a capital stock of \$200,000, to build an electric railway from Putnam to Gloucester, Mass., using the old Hartford and Providence turnpike road.

S. E. Jackman Railway, Seattle, Wash.—Incorporated in Washington, with \$40,000 capital stock. Incorporators: A. Warren Gould, E. E. Carpenter, C. E. Patton and Charles A. Spirk.

Windsorville & East Hartford Railway.—Governor Woodruff of Connecticut has vetoed the house resolution incorporating the above company.

TRACK AND ROADWAY.

Accomac Traction & Power Company, Onancock, Va.—It is reported that Truberhauer & Co. of Philadelphia have arranged to underwrite this company's issue of \$100,000 5 per cent bonds, which will make possible the construction of the proposed line from Onancock to Tasley, Accomac Courthouse and Metompkin Bay, Va., nine miles.

Barberton Doylestown & Orrville Railway.—The Cleveland Engineering Company, which has the contract for making plans, specifications and profiles for this proposed line from Barberton to Orrville, O., has begun the work of surveying the line.

Buffalo Batavia & Rochester Electric Railway.—Owing to the failure of this company to cancel the mortgage for \$3,500,000, and the \$117,500 bonds issued by the Buffalo & Williamsville Electric

Railway, the New York board of railroad commissioners has withdrawn its consent to the issuance of a first mortgage for \$3,500,000 by the Buffalo Batavia & Rochester company.

Chicago & Milwaukee Electric Railroad, Highwood, Ill.—This company has begun condemnation proceedings to secure a right of way in the southern part of Milwaukee, Wis.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—Seven carloads of rails have been delivered at Rolling Prairie, Ind., to be used for the construction of the track from that point to La Porte. Options have been secured on two routes. S. Riddle, South Bend, general manager.

Cleveland Ashland & Mansfield Railway.—Work on the grading of this company's line near Mansfield will be begun in the near future by William E. Burke & Son, South Akron, O. This firm also has the contract for grading the line between West Salem and Seville, O., about four miles.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—This company is said to be considering the construction of a line from Wellington to Medina, O.

Cortland & Auburn Railroad.—The New York railroad commission has consented to an issue of a first mortgage for \$1,000,000. The company proposes to build from Cortland to Auburn, N. Y. W. L. Weber of Philadelphia, chief engineer.

Covington & Southwestern Traction Company.—This company has filed a mortgage for \$275,000 in favor of the Collins Construction Company of Chicago to secure payment on a contract for building the first eight miles of this road, which is to be operated by gasoline power, from Covington to Coal Creek, Ind. President, W. G. Ruhl, Chicago, states that this section will be in operation in six months. It is intended to extend later to Crawfordsville.

Edmonton (Alberta) Electric Railway.—Surveys have been made for the municipal street railway on Jasper avenue, First and Strathcona streets, seven miles. Track and power house will be built by the city. R. R. Keely, chief engineer.

El Paso, Tex.—It is reported that Chicago capitalists are planning to build an electric railway from El Paso, Tex., to Las Cruces, N. M., and that they will apply for franchises within the next few days.

Eugene & Eastern Railway, Portland, Ore.—A. Welch, president of this company, writes that surveys are being made from Eugene to Blue River, Ore., the terminals of the line, and that grading will commence next September. The line, which will be operated by both steam and electricity, will be 52 miles long and will serve the intermediate towns of Corvallis, Springfield and Wendling. Power for the electrical operation of the road will be generated at the power house in Springfield, now being built. Six miles of the overhead construction work, which is of the single-phase type, already has been completed from Eugene to Springfield, with three miles now under construction in Eugene. The electrical equipment of the power house and substations will be furnished by the General Electric Company. The J. G. Brill Company has the contract for furnishing the cars. A. Welch, president and chief engineer, 502 Fenton building, Portland, Ore.; E. W. Hall, secretary.

Evansville & Southern Indiana Traction Company, Evansville, Ind.—A large force of men is engaged in rebuilding the line of the Evansville Princeton & Vincennes Interurban Railway, which has been absorbed by this company, from Evansville to Princeton, Ind., 23 miles. The line was built about four years ago, and has some very steep grades and several short-radius curves. When the work now in progress is completed the maximum curvature will be 4 degrees and the maximum grade 2 per cent. This involves the rebuilding of about half the line. R. H. Cole, chief engineer.

Fairfield, Me.—It is reported that arrangements for an electric railway to Shawmut, Me., together with plans for the construction of a car house, 24 by 90 feet, have been completed by A. F. Gerald. Surveys are now completed and the route decided upon.

Grand Valley Railway.—The Grand Valley Railway and the Brantford Street Railway of Brantford, Ont., and the Woodstock & Ingersoll Railway have arranged for a consolidation under the name of the former company, which will be headed by M. A. Verner of Pittsburg, and several important improvements have been planned. The track mileage in Brantford will be doubled and Colborne street double-tracked. The system will be extended to Cainsville on the east and a new line will be constructed on the private right of way, via Burford and Cathcart, to Woodstock, there connecting with the Woodstock & Ingersoll line, which will be extended to London. It is also planned to build by private right of way to Port Dover, via Mt. Pleasant, Boston, Waterford and Simcoe.

Greenfield Bernardston & Northfield Street Railway, Greenfield, Mass.—This company, which was recently incorporated to build an electric railway from Greenfield to Northfield, Mass., 13 miles, has elected C. H. Webster of Northfield president and A. D. Flower of Greenfield secretary and treasurer. It has been decided to enter Greenfield on Chapman street and to proceed to Northfield via Bernardston and past the Country Club golf links.

Greensboro (N. C.) Electric Company.—It is reported that this property, including an electric line from Greensboro to White City, and electric lighting and gas plants, has been purchased by W. T. Van Brunt and associates of New York, who will extend the line to High Point, N. C.

Hattiesburg (Miss.) Traction Company.—H. A. Camp, presi-

dent, states that this company will begin operating cars over its new line by August 1. Five miles of track has already been laid and the remaining two miles will be completed by the time the cars arrive.

Helena & Butte Electric Railway.—Surveys are being completed for this line from Helena to Butte, Mont., which will connect these two cities with the pleasure resorts at Lake Hauser and the Broadwater natorium, and will run through a rich mining district. It is estimated that the line can be built with 30-pound rails for \$40,000 per mile. H. G. Pickett, president.

Helena (Mont.) Light & Railway Company.—The Eighth street line in Helena has recently been rebuilt and work is to begin soon on the reconstruction of the Harrison street and other lines. The State street line is to be extended.

Illinois Traction Company, Champaign, Ill.—Work on the Lincoln-Mackinaw line was begun last week. The Crescent Construction Company, subcontractors under Tuttle Brothers of Decatur, has pitched a camp six miles south of Mackinaw, where there is some of the heaviest work on the line. Work is also in progress between Lincoln and Congerville.

Indianapolis & Western Traction Company.—Chief Engineer Hohn of the Keystone Construction Company announces that the track from Indianapolis to Plainfield, Ind., will be completed this week. This will enable the operation of a through service between Greencastle and Indianapolis.

Indiana Union Traction Company, Anderson, Ind.—Several important improvements are to be made on the Muncie-Union City division. The roadbed is to be improved and widened and the overhead work is being overhauled. New rails are being laid on several of the city lines in Muncie.

Jackson (Mich.) Consolidated Traction Company.—This company has begun the work of constructing an extension of the Vandercook lake line to Wolverine park, where several new amusement devices are being installed.

Kalamazoo Lake Shore & Chicago Traction Company, Kalamazoo, Mich.—It is stated that the construction of this company's proposed branch line from Toquin to Paw Paw Lake has been decided upon. James Grant, general manager, Kalamazoo, Mich.

Kansas City Springfield & Southern Railway, Nevada, Mo.—C. C. McFaun, general manager, states that a change in the company's route has delayed the date of beginning construction. It was originally planned to build the road from Springfield to Stotesbury, Mo., 94 miles, but it has now been decided to build to terminus at Nevada by a shorter route, which will necessitate making new right of way contracts. Construction is to begin at Carthage.

Lewisberry & Strinestown Street Railway.—Governor Stuart of Pennsylvania has approved this company's application for an extension of its chartered route from New Market to New Cumberland and Harrisburg, Pa. It is stated that the company will soon apply for franchises on several streets in Harrisburg.

Mexico Perry & Santa Fe Traction Company, Mexico, Mo.—An officer is reported to have stated that contracts are to be let this month for building this proposed electric line from Mexico to Perry, Mo., via Molino and Santa Fe, 27 miles. The work will include two steel bridges and three trestles. S. L. Robinson, president, Mexico; C. O. Thon, chief engineer, Brilleville.

Mineral Wells (Tex.) Electric Railway.—It is reported that this company's new street railway line in Mineral Wells will be in operation in about two weeks.

Mississippi Valley Electric Railway, Nauvoo, Ill.—Between the dates of June 1 and June 15 this company will let contracts for grading its 45-mile interurban line between Carthage and Nauvoo, Ill., and is now ready to receive bids on ties, poles and other electric railway equipment. T. R. Smith, principal assistant engineer, 1034 Rookery building, Chicago, Ill.

Nashville (Tenn.) Interurban Railway.—President H. H. Mayberry has announced that actual construction work on the interurban line from Nashville to Mt. Pleasant, Tenn., will be started some time during the present week. Surveys have been completed and the deals for right of way are being closed up. The Interurban Company of New York has the contract. D. A. Proctor, chief engineer, Nashville.

Negaunee, Mich.—Work on the proposed 14-mile interurban electric line from Negaunee to Marquette, Mich., has been postponed until next fall. Right of way has been secured and surveys are being made by the Lake Superior Construction Company, Cleveland, O., which has the letting of the contracts for the road. T. F. Laist, Lennox building, Cleveland, O., is chief engineer.

Nipissing Central Railway, Cobalt, Ont.—It is reported that this company is considering the construction of an electric railway from Cobalt to New Liskeard.

Oklahoma City El Reno & Southwestern Interurban Railway, Oklahoma City, Okla.—It is reported that this company expects to begin work in about 90 days on the electric line to connect Oklahoma City, El Reno and Shawnee, and that G. W. Martin, representing the company, has closed a contract with the Oklahoma City Railway for the use of its terminals and tracks within the city.

Oregon Electric Railway, Portland, Ore.—This company is now securing right of way from Beaverton to Hillsboro, Ore., for its proposed line from Portland.

Philadelphia & Western Railroad.—Regular operation over this company's new elevated line from Sixty-ninth and Market streets, Philadelphia, Pa., was started on May 22. A half-hour schedule will be maintained for a short time, but it is expected to install a 15-minute schedule later. W. H. Simms, general superintendent.

San Bernardino Valley Traction Company, San Bernardino, Cal.—It is stated that the Arrowhead extension will be opened for traffic by June 7. The rails have been laid and the ballasting is being completed this week. F. R. Harris, chief engineer.

San Joaquin (Cal.) Power Company.—It is reported that surveys have been completed for this company's proposed line to the Yosemite valley, through Wawona, Crane valley and Pollasky, and that financial arrangements are being made for the construction of the line. A. C. Balch of Los Angeles is president.

Seymour & Brownstown (Ind.) Interurban Motor Line Railway Company.—This company, incorporated to build a traction line between the two cities named, is to be constructed of concrete upon which to operate automobiles and motor cycles as common carriers. Joseph I. Irwin of the Indianapolis Columbus & Southern Traction Company and Z. T. Sweeny of Columbus, Ind., are back of the project.

Sioux City Traction Company.—Material for building three miles of additional track has been ordered by this company and six new cars and four trailers are now being built. E. L. Kirk, manager, Sioux City, Ia.

Spokane & Inland Empire Railroad, Spokane, Wash.—Passenger and freight service is expected to be started within a few days between Oakesdale and Garfield, Wash. The line has been operating between Spokane and Spring Valley Junction for several months and service was recently extended to Oakesdale. The poles are up as far as Garfield and the overhead work is nearly completed. Track is laid between Garfield and Palouse and when the electric operation is extended to Garfield it is expected to run the trains into Palouse by steam temporarily. Rapid progress is being made on the grading between Palouse and Moscow, Idaho.

Springfield (Ill.) Consolidated Railway.—This company has started grading on the extension to the Zoo park, north of the city, and it is expected to have cars running some time this summer. Several of the city lines are being relaid with 73-pound rails.

Suitman, Ark.—It is reported that R. L. Kane and W. T. Hammock are interested in a project to build an electric railway to Conway.

Syracuse, N. Y.—It is understood that the street railway interests headed by Mr. C. D. Beebe of Syracuse have decided to construct a new line from Auburn to Seneca Falls, N. Y., 14 miles. This line will necessitate a 2-mile bridge or viaduct over Cayuga lake. Preliminary surveys have been completed.

United Traction Company, Albany, N. Y.—Michael F. Dollard has the contract for grading an extension from Madison avenue and Allen street, 1,500 feet west to the city limits.

Washington (D. C.) Railway & Electric Company.—This company has decided to build an extension of the Washington & Rockville Railroad, a subsidiary company, from Rockville to Gaithersburg, five miles. The Rockville & Gaithersburg Railroad will be incorporated to build the new line, it is stated, and right of way will be acquired at once. Surveys have been started and construction is to begin as soon as the preliminaries can be arranged. H. W. Fuller, general manager.

West Shore Railroad.—The first electric car was operated over the newly electrified road between Utica and Syracuse, N. Y., on May 21, to test the new electrical equipment.

POWER HOUSES AND SUBSTATIONS

Claremont (N. H.) Railway & Lighting Company.—This company will build an extension to its power plant, in which a Deisel oil engine of 1,000 horsepower and a Fort Wayne generator of 600-kilowatts capacity will be installed. Material for a 17-mile 11,000-volt transmission line will also be purchased. I. N. Wheelock, Claremont, N. H., is manager.

Edmonton (Alberta) Municipal Railway.—Contracts have been let to the Allis-Chalmers Company of Milwaukee for gas engines and to the Power & Mining Machinery Company of Milwaukee for producers for the power house of the new municipal street railway system. The power house is to be built by the city.

Hattiesburg (Miss.) Traction Company.—This company announces that work on a new power house will be begun at once. H. A. Camp, president.

Ontario Light & Traction Company, Canandaigua, N. Y.—It is announced that this company will spend about \$30,000 on overhauling its plant. J. H. Pardee is general manager.

Springfield (Mass.) Street Railway Company.—This company is planning to improve its power house at Goulds Mills, Mass. During the coming summer the height of the dam will be increased one foot, giving a fall of 24 feet, which can be increased to 25 feet by flash boards when necessary. A pair of waterwheels, driving 200-kilowatt General Electric generators, will be installed. This work will be done by the Black Company, Keene, N. H.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—This company has let a contract for building a substation at East Bradford, Pa.

Personal Mention

Mr. Eugene V. Maling has resigned as superintendent of the Sheburne Falls & Colerain Street Railway, Sheburne Falls, Mass., effective on June 1.

Mr. F. L. Reed has been appointed superintendent of the Sheburne Falls (Mass.) & Colerain Street Railway, succeeding Mr. A. V. Maling, resigned.

Mr. Wade Watterson, assistant superintendent of the Illinois Traction System at Carlinville, Ill., has been appointed superintendent of terminals at Springfield, Ill., and St. Louis, Mo.

Mr. W. A. Satterlee, assistant general manager of the Kansas City Railway & Light Company, has been appointed assistant to the sales manager of the Ohio Brass Company at St. Louis, Mo.

Mr. H. F. Scott, formerly with the New Jersey & Pennsylvania Traction Company, Trenton, N. J., has been appointed master mechanic of the Roanoke (Va.) Railway & Electric Company.

Mr. Frank Shorton has accepted a position with the Evansville (Ind.) Electric Railway as superintendent of its recently completed line between Evansville and Rockport, Ind. The line will be formally opened on June 1.

Mr. P. Barnard, Jr., has resigned his position as superintendent of the Central Kentucky Traction Company to become secretary and general manager of the New Tuscarawas County Electric Light & Power Company, New Philadelphia, O.

Mr. C. E. Flynn, second vice-president of the Conneaut & Erie Traction Company, Erie, Pa., has resigned, effective on June 30, and Mr. B. E. Walker, now superintendent and engineer of the power station, has been appointed to succeed him.

Mr. Joseph Burdreau, heretofore superintendent of the Hartford (Conn.) lines of the Consolidated Railway, and associated with this road for the past 13 years, has resigned to become superintendent of the Scranton Railway, with headquarters at Scranton, Pa.

Mr. S. K. Holland, formerly of Springfield, Ill., has been appointed traffic manager of the Peoria Bloomington & Champaign Traction Company, a part of the Illinois Traction System, which recently opened its line from Peoria to Bloomington, Ill. Mr. Holland will have headquarters at Peoria.

Mr. E. L. Schmock, who resigned in February as auditor of the Kokomo Marion & Western Traction Company, to become assistant secretary of the Cleveland Painesville & Eastern Railroad, has been appointed purchasing agent of that company, with headquarters at Willoughby, O., effective on May 20.

Mr. C. F. Bryant, heretofore auditor of the Connecticut Railway & Lighting Company, Bridgeport, Conn., has resigned to become assistant to Mr. A. L. Linn, Jr., auditor of the Mohawk Valley Company, the holding company for the electric properties of the Andrews syndicate and the New York Central & Hudson River Railroad. Mr. Bryant's headquarters will be in New York City.

Mr. A. L. Gillette has resigned as superintendent and electrical engineer of the Escanaba (Mich.) Electric Street Railway to accept a similar position with the Sterling Dixon & Eastern Electric Railway at Sterling, Ill., succeeding Mr. John Powers, who resigned recently, as noted in the Electric Railway Review of May 25, to become connected with the Galesburg Railway & Light Company.

Mr. John Hanf has resigned as master mechanic of the International Railway Company, Buffalo, N. Y., on account of ill health. Previous to his appointment with the International Railway in 1900 Mr. Hanf was connected with the Wilmington (Del.) City Railway and still earlier with the Philadelphia Rapid Transit Company and the Hestonville Mantua & Fairmont Park Railway. He also at one time was connected with The J. G. Brill Company of Philadelphia. Mr. W. H. Evans, master mechanic of the Indianapolis Traction & Terminal Company, has been appointed to succeed Mr. Hanf, as noted in the Electric Railway Review of May 25.

Mr. C. V. Wood, formerly superintendent of the Pittsburg and Cleveland divisions of the Wheeling & Lake Erie Railroad, the Wabash-Pittsburg Terminal Railway and the West Side Belt Railroad at Canton, O., has been appointed general freight and passenger agent of all the electric lines in Massachusetts under the control of the New York New Haven & Hartford Railroad, with headquarters at Worcester, Mass. This appointment marks the first definite step in the inauguration of through passenger, freight and express business on the lines controlled by this company in Massachusetts. Mr. Wood is well qualified to fill the position, having had an extensive steam railway experience dating from 1881, when he entered the service of the Grand Trunk Railway as telegraph operator. Since that time he has filled important positions on various steam roads of the east and middle west. In 1899 he became general manager of an electric freight line in Pittsburg, where he remained until October, 1902, when he was appointed superintendent of the West Side Belt Railroad at Pittsburg, and later division superintendent of the Wheeling & Lake Erie, as noted above. Mr. Wood's jurisdiction will extend over the Worcester Consolidated, the Worcester & Southbridge, Worcester & Blackstone Valley railways and the Springfield and Berkshire systems, and will include entire charge of the excursion as well as the through passenger and parcels express business of

the company. He will be assisted by Mr. A. B. Smith, general traffic manager of the New England Investment & Security Company.

Mr. Calvin Skinner, heretofore master mechanic of the Scioto Valley Traction Company, Columbus, O., has been appointed superintendent, succeeding Mr. L. C. Bradley, resigned, as reported in last week's issue of the Electric Railway Review. Mr. Skinner's experience in mechanical work covers a period of 27 years, most of which, until his connection with the Scioto Valley company, was spent in steam railway work. He was born on August 22, 1855, near Zanesville, O., and obtained his first experience with the Pittsburg Cincinnati & St. Louis Railway, where he remained until 1890, serving consecutively as apprentice machinist, locomotive fireman and locomotive engineer. From 1890 to 1891 he was road foreman of engines with the Chicago & Erie Railroad; from 1891 to 1894 master mechanic of the Ohio & Mississippi Railway, serving in the same capacity with the Alabama Great Southern from 1894 to 1899. Since that time he has served on several other steam roads, among them the Chicago & Alton and the Peoria division of the Cleveland Cincinnati Chicago & St. Louis. He has been connected with the Scioto Valley company since its reorganization in 1903.

Mr. J. N. Shannahan has resigned as general superintendent of the Fonda Johnstown & Gloversville Railroad, and as president of the Adirondack Lakes Traction Company of Gloversville, N. Y.,

J. N. Shannahan.

to become general manager of the Washington Baltimore & Annapolis Electric Railway of Baltimore, Md., now under construction between the cities mentioned in its title, and soon to be placed in partial operation. Mr. Shannahan was graduated from Rensselaer Polytechnic Institute in 1894. Entering the employ of the government he worked for nine months as a draughtsman at the Watervliet arsenal. This position he resigned to enter the service of the New York Central & Hudson River Railroad at Rochester, N. Y., as inspector of signals. After several years' service with this company he became connected with the Fonda Johnstown & Gloversville Railroad as chief engineer. This was in 1899,

and just about the time the Fonda Johnstown & Gloversville Railroad was being partially equipped for electrical operation. In this way, during the next four years Mr. Shannahan had charge of building the double-track electric line between Gloversville and Schenectady, N. Y., and the single-track line between Amsterdam and Hagaman. On January 1, 1903, Mr. Shannahan was made general superintendent of the company, in charge of both steam and electrical operation, and at the same time was elected manager of the Edison Electric Light & Power Company of Amsterdam, N. Y. Early in 1904 he was elected president of the Adirondack Lakes Traction Company. For several years Mr. Shannahan has taken an active interest in the affairs of the Street Railway Association of the State of New York, of which body he is at the present time president, having been elected to that office in June, 1906. Mr. Shannahan also is an associate member of the American Society of Civil Engineers and during 1905 and 1906 served as president of the Rensselaer Society of Engineers. He will be succeeded on the Fonda Johnstown & Gloversville Railroad by Mr. W. H. Collins, master mechanic of the company.

The directors of the Scioto Valley Traction Company have re-elected Mr. F. A. Davis president and general manager, Mr. W. S. Courtright vice-president, and Mr. E. R. Sharp secretary and treasurer. The directors also accepted the resignation of Mr. L. C. Bradley and passed the following resolution: "Whereas, Mr. L. C. Bradley, who has been the superintendent of this company since it began operation, has tendered his resignation, to accept a position with J. G. White & Co., be it resolved by the board of directors of this company that the resignation of Mr. Bradley be accepted with regret and that in accepting said resignation, this board takes the opportunity to express its appreciation of the careful, faithful and efficient service which Mr. Bradley has rendered to the company, with notable ability and capacity. Be it further resolved that we extend to Mr. Bradley our best wishes for his future success, and commend him to his new employes as a capable and efficient operator of electric railways." At the close of the directors' meeting Mr. Davis, on behalf of the officers and employes of the company, presented Mr. Bradley with a Patek Philippe watch. In accepting the watch Mr. Bradley expressed his regret at leaving the company and spoke of the pleasant relations which had existed between the company, its officers and himself. Mr. Davis has issued the following circular: "The resignation of Mr. L. C. Bradley as superintendent of this company will become effective on May 25. Effective on May 26 the following appointments are hereby made: Mr. W. V. S. Robb, purchasing agent and chief clerk to general manager, with authority to use the name and signature of the general manager in matters of operation. Mr. C. Skinner,

superintendent in charge of transportation, mechanical and roadway departments; trainmaster, shop foreman and roadmaster will report to and receive instructions from him. Mr. L. K. Leggett, trainmaster; dispatchers and trainmen will report to and receive instructions from him. Mr. George A. Stiles, shop foreman; all employes of the mechanical department will report to and receive instructions from him. Mr. P. Maloney, roadmaster; all employes of the roadway department will report to and receive instructions from him. Mr. J. O. Bradfield, general freight agent, in charge of the freight traffic department; all local agents and station employes will report to and receive instructions from him. Mr. C. Skinner, superintendent, and Mr. J. O. Bradfield, general freight agent, will report to the general manager. Mr. F. K. Young, auditor; Mr. Julian Griggs, chief engineer; Mr. R. Fullerton, chief electrician; Mr. R. W. Parry, chief engineer power house; Mr. N. E. Rees, passenger and claim agent; and Mr. R. E. Wood, storekeeper, will continue in charge of their respective departments and will report to the general manager."

Mr. L. C. Bradley, for the past three years superintendent of the Scioto Valley Traction Company at Columbus, O., has resigned his position, effective on May 25, to become associated with J. G. White & Co. of New York City. Mr. Bradley was connected for a number of years with Stone & Webster of Boston, Mass., serving in an engineering capacity on some of the important western properties of this company. For several years previous to his connection with the Columbus property he was superintendent of the Puget Sound Electric Railway, formerly the Seattle-Tacoma Interurban Railway, resigning in May, 1904, to accept a similar position with the Scioto Valley Traction Company. This company, which has the distinction of being the first in Ohio to operate its interurban lines by the third rail, has since become one of the most important of the third-rail systems of the country, and to Mr. Bradley is due, in large measure, the rapid development to its present high state of efficiency. His familiarity with third-rail operation has led to his present appointment, although a more extended range of work covering the supervision of the reorganization details and actual operation of properties will be included in his new duties and will afford a wider scope for his executive ability. He will be succeeded by Mr. Calvin Skinner, master mechanic of the Scioto Valley company.

Mr. Edward W. Moore of Cleveland, O., president of the Lake Shore Electric Railway, the Lorain Street Railroad and the Sandusky Fremont & Southern Railway, has recently been elected

president of the Cleveland Painesville & Eastern Railroad of Willoughby, O., as announced in last week's issue of the Electric Railway Review, succeeding Mr. Charles W. Wason, resigned. Mr. Moore was born in Ohio on July 3, 1864, and was educated in the public schools. He began his career with Everett, Weddell & Co., bankers, with whom he remained from 1880 to 1883, and was later with the construction company that built the New York Chicago & St. Louis Railway. From 1883 to 1888 he was in the treasury department of the railway. From 1888 to 1890 he was with the East End Savings & Banking Company and was one of the organizers and the first treasurer, from 1891 to 1899, of the Dime Savings

Edward W. Moore.

& Banking Company. From 1899 to 1901 he was vice-president of this company. He was also one of the organizers of the Western Reserve Trust Company. He is a director in numerous electric traction and telephone companies in and around Cleveland, Toledo and Detroit, many of which he helped organize, and now devotes his whole time to looking after his large financial interests. Mr. Moore has long been connected with the development of electric railways and it is estimated that since he made his first street railway investment in the East Cleveland Railroad in 1889 he has been interested in traction lines aggregating about 3,000 miles. The more important properties in the promotion of which he has been interested include the Aurora Elgin & Chicago Railway, the Scioto Valley Traction Company, the Washington Baltimore & Annapolis Electric Railway, the Montreal Street Railway and the Syracuse Rapid Transit Company. He is at present largely interested and a director in the Detroit United Railway, the Toledo Railways & Light Company, the Northern Ohio Traction & Light Company, the London Street Railway, the Cleveland Painesville & Eastern Railway, the Lake Shore Electric Railway and the Eastern Ohio Traction Company. He was elected president of the Lake Shore Electric Railway in January, 1906. An extended biography of Mr. Moore was published in the Street Railway Review of March 15, 1906.

Obituary.

George F. Chapman, vice-president and general manager of the United Railroads of San Francisco, died in that city on May 23, after a brief illness resulting from a cold contracted the previous Saturday, which rapidly developed into pneumonia. ▲

Manufactures and Supplies

ROLLING STOCK.

Barre & Montpelier Power & Traction Company, Barre, Vt.—Control of this company has been sold to a syndicate represented by Frank M. Corey, president of the First National bank of Montpelier, Vt.; Edward H. Devitt, Vermont state treasurer; and J. M. Frost, electrical engineer. The company operates 9.2 miles of road, extending between Barre and Montpelier.

Detroit United Railway Company.—It is announced that this company has purchased the property of the Jackson Ann Arbor & Detroit Electric Railway Company, which has done some construction work in the vicinity of Dearborn, Mich.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.—Gross earnings for March amounted to \$92,500.22 as compared with \$79,991.82 in March, 1906. Operating expenses were \$58,844.24 in March, 1907 and \$51,472.90 in March, 1906, leaving net earnings of \$33,655.98 and \$28,518.92, respectively.

Grand Rapids Grand Haven & Muskegon Railway Company, Grand Rapids, Mich.—At a meeting of stockholders on May 21 the following directors were elected: George C. Smith of Pittsburg, Pa.; Wallace Franklin of Detroit, Thomas F. Carroll of Grand Rapids, Sydney E. Junkins and Carl M. Vail of New York City.

Grand Valley Radial Railway, Brantford, Ont.—It is announced that this company will be formed to acquire the properties of the Brantford Street Railway Company, the Grand Valley Radial Company and the Woodstock & Ingersoll Railway Company.

Hudson Valley Railway, Glens Falls, N. Y.—Earnings for the quarter ended March 31 were as follows:

Quarter ended March 31—	1907.	1906.	1905.
Gross	\$107,884	\$96,698	\$80,993
Expenses	103,602	73,453	72,821
Net	\$ 4,282	\$23,245	\$ 8,172
Other income	1,788	2,664	3,969
Total income	\$ 6,070	\$25,909	\$12,141
Charges	50,029	64,178	63,171
Deficit	\$ 43,959	\$38,269	\$51,030

North American Company.—In offering for sale the new issue of short-time notes of this company, Lee, Higginson & Co. and Redmond & Co. give the following statement of earnings: "The surplus earnings for 1906 of the principal companies in which the North American Company is interested, after deducting all operating expenses, reserves, interest charges and dividends paid, amounted to \$1,193,934.66, of which, if distributed, the share of the North American Company would have been \$886,518.58. The net cash income of the company for the fiscal and calendar year 1907 is estimated at \$1,850,000, or \$1,600,000 in excess of the total interest charges upon the entire authorized issue of notes.

St. Joseph (Mo.) Railway Light Heat & Power Company.—The New York stock exchange has listed \$58,000 additional 5 per cent first mortgage bonds of this company. These bonds were issued on account of the following expenditures for improvements to the property:

Extension and reconstruction of tracks, including special work	\$ 3,377.52
Extension of overhead lines—railway	561.50
New paving	17,326.86
New electric cars, trucks and motors	9,654.93
Construction of tunnel	4,650.83
Power house equipment	26,265.91
New car shops	563.64
Extension of overhead lines, new transformers and new meters, light and power department	6,819.52
Extension of steam heat lines	5.00
Total	\$69,225.71

Western Railways & Light Company.—We are officially advised that this company has been organized as a holding company, which will take over the following properties, controlled by W. B. McKinley of Champaign, Ill., and W. B. Duncan of Portland, Me.: Quincy (Ill.) Railway Company, Galesburg (Ill.) Railway & Light Company, Citizens' Lighting Company of La Salle and Peru, Ill., Illinois Valley Railway Company, La Salle, Ill., and Wichita (Kan.) Railway & Light Company. The Western Railways & Light Company will have no connection with the Illinois Traction Company.

Wilmington New Castle & Southern Railway Company, New Castle, Del.—Wilmer Palmer and J. Chester Gibson of Wilmington, Del., were appointed receivers of this road on May 23. The company operates 16 miles of road between Wilmington, New Castle and Delaware City.

Dividends Declared.

Chattanooga (Tenn.) Railways Company, preferred, quarterly, 1 1/4 per cent.
 Metropolitan Street Railway, New York, quarterly, 1 3/4 per cent.
 Metropolitan West Side Elevated Railway, Chicago, preferred, quarterly, three-fourths of 1 per cent.
 Norfolk (Va.) Railway & Light Company, 1 per cent.

Tramway Rural, Buenos Aires, S. A., is reported in the market for 75 electric cars.

Eugene & Eastern Railway, Portland, Ore., now under construction, has placed an order with The J. G. Brill Company for a number of cars. E. W. Hall, secretary, Portland, Ore.

Waupaca Electric Light & Railway Company, Waupaca, Wis., expects to purchase soon one double-truck closed car, with a seating capacity of 48 passengers.

Sioux City Traction Company, Sioux City, Ia., is building four trailer cars at its own shops, in addition to the six summer cars reported in the Electric Railway Review of February 9.

Delta Electric Light Power & Manufacturing Company, Greenville, Miss., is in the market for two closed vestibuled cars, having cross seats, with a seating capacity of 28 to 32 passengers.

Whatcom County Railway & Light Company, Bellingham, Wash., is building an electric locomotive and one express car at its own shops and has also placed an order for three passenger cars.

Worcester Consolidated Street Railway, Worcester, Mass., is receiving bids on five large closed suburban cars and will award the contract in a few days. The cars are for use on the Clinton Hudson & Leominster Railway.

Mexico Santa Fe & Perry Traction Company, a projected line from Perry to Mexico, Mo., a distance of 27 miles, will be in the market for rolling stock in about 30 days. S. L. Robinson, president, Mexico, Mo.

Wagner Lake Shore & Armour Traction Company, recently incorporated to build a new line in South Dakota, it is reported will purchase new rolling stock in about 90 days. A. H. Pease, Wagner, S. D., may be addressed.

Indianapolis & Eastern Railway, Indianapolis, Ind., has placed an order with the Cincinnati Car Company for five combination passenger, smoking and baggage cars, to be 61 feet 6 inches in length, in addition to the 10 similar cars previously reported.

Pittsburg & Westmoreland Railway, Pittsburg, Pa., will soon place an order for four or seven semi-convertible cars, to be equipped with Monitor roofs and four 50-horsepower motors each. R. W. Marshall & Co., 95 Liberty street, New York, will place the order.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind., as reported in the Electric Railway Review of March 9, has placed an order with the Cincinnati Car Company for 10 interurban cars 61 feet 6 inches in length. These will be the same width as standard steam passenger coaches and will be mounted on Baldwin M. C. B. trucks.

Virginia Passenger & Power Company, Richmond, Va., as reported in the Electric Railway Review of May 18, has ordered 20 semi-convertible cars from The J. G. Brill Company. The specifications call for the following details:

Seating capacity..42 passengers	Height, track to trolley base.....
Wheel base4 ft. 6 in.11 ft. 11 in.
Width over all.....8 ft. 4 in.	Body
	UnderframeWood and steel

Sacramento Electric Gas & Railway Company, Sacramento, has placed an order for 44 closed cars, to be built at the Sacramento shops of the company. These cars are now under construction and will be put into service by the Union Traction Company at Santa Cruz, Santa Clara Interurban Railway at Palo Alto, San Jose & Santa Clara County Railroad at San Jose, and the Sacramento Electric Gas & Railway Company. The specifications call for the following details:

Seating capacity..44 passengers	Height, inside
Weight62,500 lb.	Sill to trolley base...9 ft. 7 in.
Wheel base4 ft.	Track to trolley base.....
Length, body20 ft. 6 in.11 ft. 11 in.

SHOPS AND BUILDINGS.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—This company's car house at Blaisdell, N. Y., was destroyed by fire on May 22, together with 25 cars.

Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich.—The directors at the recent annual meeting decided to erect a new freight depot and car house at Muskegon at once.

Kalamazoo Lake Shore & Chicago Traction Company, Kalamazoo, Mich.—This company is planning the construction of a passenger station and freight yards at Kalamazoo and South Haven, Mich.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has completed a deal for the purchase of a piece of land, 262 by 685 feet, on the corner of Tenth and Dorcas streets, Omaha, on which will be erected a car house, 150 by 450 feet, for the accommodation of the Harney, Farnam and Dodge street cars.

TRADE NOTES.

Patrick H. Joyce, president of the Illinois Bolt, Nut & Forging Company, Chicago, died suddenly of apoplexy on May 24.

Francis Ludlow Clark, chief engineer of the Westinghouse Air Brake Company, Pittsburg, died on May 26 from paralysis. He was 65 years of age.

Lord Electric Company, New York, has been incorporated with a capital stock of \$100,000, by Frederick W. Lord, Thomas P. Curtis and Robert H. Hallowell.

Fred A. Daley, formerly treasurer and manager of the Under-feed Stoker Company of America, Marquette building, Chicago, has been elected president and treasurer of the company, effective on May 24.

Fairbanks, Morse & Co., Chicago, have leased for 20 years the property on the southwest corner of Eldridge court and Wabash avenue, upon which the company will erect an 8-story building of brick and steel construction, with ground dimensions of 42½ by 165½ feet.

Interurban Construction Company has been incorporated in Colorado with a capitalization of \$150,000, for the purpose of conducting a general contracting and engineering business. George S. Van Law of Denver, Henry P. Dickinson and Eben N. Reaser are interested.

E. H. Symington, western sales manager of the T. H. Symington Company, who was seriously hurt on May 18 while riding in Lincoln park, is slowly recovering. Although he has not entirely regained consciousness, there is a marked improvement in his condition since our issue of last week.

Columbia Metal Supply Company, Brooklyn, N. Y., has been incorporated for the purpose of manufacturing engines, boilers, machinery, tools, etc. The incorporators are: Charles A. Wessell, 300 Carlton avenue, Brooklyn; F. H. Wessell, and Burnham W. King, 318 West Eighty-fourth street, New York.

Stanley-G. I. Electric Manufacturing Company, Pittsfield, Mass., has had plans prepared for a 3-story foundry building. A portion of this will be the main casting room for generator frames, beds, etc., while another department will be used to cast small parts of machinery. The structure will cost approximately \$300,000, and a large amount will be expended for new machinery, including cranes, pattern making and casting machinery.

Joseph H. Berry, prominent in industrial affairs and the head of Berry Brothers, manufacturers of varnishes, Detroit, Mich., died on May 22 from inflammatory rheumatism. He was born in Elizabeth, N. J., in 1839, and went to Detroit at the age of 17 years. He was the projector of the Detroit Terminal Railroad and carried its construction forward until it was purchased by other roads. He was president of the Dwight Lumber Company and of the Detroit Heating & Lighting Company, and was actively interested in numerous other companies, with lines of manufacture covering car wheels, pressed steel barrels, pig iron and sugar. He was also a director of the Commercial National bank of Detroit.

Sirocco Engineering Company has recently been incorporated in New Jersey for the purpose of the American manufacturing rights of the Sirocco Engineering Works of Belfast, Ireland. The company has been capitalized at \$500,000 and has opened offices in the new West Street building, 140 Cedar street, New York. A temporary plant will be erected at the Bush Terminal stores, South Brooklyn, and later on permanent works will be built near New York City. The plant is to be devoted to turning out ventilating fans, blowers, engines, pumps and other apparatus made at the Belfast works. Samuel C. Davidson of Davidson & Co., owner of the Belfast works, is president of the company. The vice-president is William C. Redfield, formerly president of J. H. Williams & Co. of Brooklyn.

Industrial Engineering & Supply Company, S. A., of Mexico City, Mex., has recently been organized to do a general machinery and supply business, and for this purpose has acquired a 4-story building at Alcantera No. 27, where the company will keep in stock a large portion of its goods and where the headquarters of the company will be located. The president of the company, W. W. Wheatly, was formerly president and general manager of the Mexico City Tramway. James A. Pierce, general manager, was formerly general superintendent of the Mexico Tramway Company and was at one time connected with Rossiter,

McGovern & Co. of New York. The general sales agent is William C. Benbow, who for many years has been in Mexico engaged in selling mining, milling and manufacturing machinery and electrical supplies. Mr. Benbow will represent in the future the Wellman-Seaver-Morgan Company of Cleveland, as well as the Industrial Engineering & Supply Company, S. A.

Under-Feed Stoker Company of America, Marquette building, Chicago, reports among recent sales one to the Amoskeag Manufacturing Company, operating the largest cotton mill in the United States, which has placed its fourth order for 28 Jones stokers, making a total of an even 100 purchased by that company and its allied interests. Sixty of this number have been in operation for some time past in the Manchester mills, controlled by the Amoskeag Manufacturing Company, and 12 in the Amoskeag plant since 1902, where the fourth order for 28 will be installed. The York Manufacturing Company, Saco, Me., now operating 21 Jones stokers, the result of three orders, the first of which was placed in September, 1902, has contracted for an additional 12 stokers, which will make a total of 33 in its plant.

G. U. G. Holman has been appointed manager of the electrical department of the Boston branch of the H. W. Johns-Manville Company, New York, and has already entered upon his new work. Mr. Holman is well known in electrical circles. After graduating from the Massachusetts Institute of Technology, he was for several years with the Thomson-Houston and General Electric companies in Lynn, Mass., New York City and also in Minnesota. He left the General Electric Company in 1892 to become railway engineer of the Mather Electric Company of Manchester, Conn., and later was engaged in the lighting field in Philadelphia for five years. In the last few years he has been connected with the construction and operation of electrical enterprises in New York, Philadelphia and Canada, and is ably qualified to make the most of the opportunities offered him in his new field.

Electric Service Supplies Company, Philadelphia, manufacturer of electrical and mechanical supplies, announces that Willis V. Sweeten, formerly with the Elmer P. Morris Company, New York, has been appointed to a position with the Electric Service Supplies Company. Mr. Sweeten will travel through New York state and will make his headquarters at the New York office of the company, 2 Rector street. F. C. Peck, formerly real estate agent for the Delaware & Hudson, is now connected with this company in Philadelphia, covering the Philadelphia trade. T. F. McKenna, who for some years has been traveling for Machado & Roller of New York City, is now traveling in Pennsylvania for the Electric Service Supplies Company, making his headquarters at the Mayer & Englund department in Philadelphia. This company is the general sales agent for the National trolley guard, which was described in the Electric Railway Review of May 18, on page 667.

John A. Walker, vice-president, treasurer and a director of the Joseph Dixon Crucible Company, of Jersey City, N. J., died of heart disease on May 23, at his home in that city. He was born in New York City on September 22, 1837. He entered the employ of Joseph Dixon & Co. in 1867 and in the following year became secretary of the newly organized Crucible company. Since that time he has spent his business life in official capacities directing the interests of the company. His ability and foresight as a manager and his knowledge of industrial and commercial conditions made him the recipient of many honors. At the convention of the National Association of Stationers and Manufacturers at St. Louis, in October, 1905, he was elected first vice-president. He was appointed by the governor of New Jersey as a representative delegate to the national convention for the extension of the foreign commerce of the United States, held in Washington, in January, 1907. He was first vice-president of the Colonial Life Insurance Company and a director of the Title Guarantee & Trust Company. He was a member of the board of trade, the Union League Club, the Cosmos Club, the Carteret Club and the Twilight Club of New York City.

John A. Walker.

He was first vice-president of the Colonial Life Insurance Company and a director of the Title Guarantee & Trust Company. He was a member of the board of trade, the Union League Club, the Cosmos Club, the Carteret Club and the Twilight Club of New York City.

Tweedy-Randolph Company, dealer in railway supplies, with offices in the Fisher building, Chicago, was incorporated in November, 1906, with the following officers: President, S. F. Randolph, Jr.; treasurer, O. S. Tweedy; secretary and manager, P. W. Hood. Mr. Hood was for four years manager of the western railway department of the Diamond Rubber Company of Akron, O., with headquarters in Chicago. The company is railway representative in Chicago of the Gutta Percha & Rubber Manufacturing Company of New York City, manufacturer of air brake, steam, water, car-heating and tender hose; also packings, matings, etc. The company is also the representative of the Washburn Steel Castings & Coupler Company of Minneapolis, Minn., manufacturer of couplers for locomotives, locomotive tenders, freight and passenger

cars, as well as steel couplers for interurban and city electric cars; also for J. H. Gautier & Co., Jersey City, N. J., manufacturers of crucibles. In addition to these cited the company handles hard rubber battery jars for train lighting, rubber and leather belting, cedar and cypress poles and seat springs for railway coaches, etc., the latter article being manufactured by the company at its Jackson, Mich., factory.

Union Electric Company and the General Railway Supply Company, both of Pittsburgh, have consolidated their interests and will be operated hereafter under the name of the Union Electric Company. The new company is capitalized at \$250,000. The following officers have been elected: George W. Provost, president; Percy R. Frost, vice-president and manager of lighting department; J. P. Provost, treasurer; L. H. Keller, secretary. Thomas M. Cluley has been appointed manager of the railway department. The new company will continue the sale of railway, power, marine and telephone supplies and will also continue the agencies carried by the General Railway Supply Company, namely, R. D. Nuttall Company, gears, pinions and trolleys; International Register Company's products; General Electric line material and rail bonds; Crouse-Hinds arc headlights; Locke high-tension insulators, and Wilson trolley clutches; also motor and controller parts for Westinghouse and General Electric apparatus.

CHANGES IN THE REVIEW STAFF.

Mr. John B. Bennett, formerly connected with the Street Railway Journal and more recently manager of the Municipal Journal and Engineer, has joined the business staff of the Electric Railway Review as eastern manager, with office at 150 Nassau street, New York City. Mr. Bennett's strong individuality, his wide acquaintance in the street and electric railway field and his large practical experience in the business of publishing technical journals make him a strong addition to our already strong organization.

Mr. C. R. Mills, who has for several years been advertising representative of The Railway Age, has been appointed western advertising manager of the Electric Railway Review, with headquarters at the general offices in Chicago.

Mr. E. J. Hunt has been transferred from the circulation to the advertising department and will be district manager in charge of advertising in the central territory, with office at Cleveland, O.

Mr. William Padget, who has hitherto represented the Review in the east, has been appointed district manager of The Railway Age, with office at Cleveland.

HAWLEY DOWN DRAFT FURNACE.

At no time during the history of the steam engine and boiler has there been carried on such a lively crusade as that which is now being prosecuted by municipalities against factories, lighting and railway plants which are producing smoke. With ordinary grates it is well known that it is an absolute impossibility to prevent the formation of smoke. It is quite impossible to secure firemen who will properly work the fires so as to coke the coal and to regulate the upper draft so that the volatile gases which are distilled from the green fuel are properly mixed with the required volume of air at a sufficiently high temperature to insure complete combustion.

There are practically no engineers who do not recognize the coking method as the only satisfactory and proper method of obtaining complete combustion, and as this method is acknowledged superior to all others, it has been adopted as the operating basis of the improved Hawley down draft furnace, manufactured by the Hawley Down Draft Furnace Company of New York and Chicago.

These furnaces, as it will be seen from the illustration, consist of an ordinary grate, above which is located a second grate formed of water tubes expanded into front and back headers, which are connected respectively with the lower and upper portion of the boiler, the exact location of the connections depending upon the type and the design of boiler to which the furnace is fitted.

The operation of the grate is as follows: The fire on the upper grate distills the volatile matter from the green coal as it is fired, which is then drawn downward and mixed with the proper amount of air directly above the incandescent coke, thus maintaining the temperature of the gases sufficiently high to insure perfect combustion and preventing the formation of at least 90 per cent of the smoke. The coke, formed by the distillation process on the upper grate, gradually falls onto the lower grate, where it burns freely with an intense heat; the two processes (being thus separate) are carried out under the most favorable conditions.

The green coal may either be charged onto the water-tube grate automatically through chutes from overhead bunkers or may be charged by hand through the upper firing doors. It is self-evident that besides insuring complete combustion, further economies are assured by the use of this grate, because of the materially increased circulation, resulting from the method of connecting the

furnace to the boiler. This is especially valuable in the Scotch marine type of boiler, largely used in electric railway and pumping stations, since by connecting the down-comers to the shell of the boiler directly beneath the furnaces, a rapid positive circulation is established in that portion of the boiler in which ordinarily the circulation is almost totally missing.

A further gain resulting from the use of the Hawley furnace is an increased heating surface. This materially adds to the capacity of the plant without the installation of further boilers, and is a point of considerable importance in plants working beyond their normal capacity.

This system of combustion is installed by the company under rigid guarantees of performance which insure the customer against risk of any kind, and the better operation of the furnaces effects a large economy in fuel consumption. The furnaces, it is stated, practically earn their cost in less than two years. During the past 17 years of the company's existence over 6,000 furnaces, with an aggregate horsepower of about 1,650,000, have been installed, both in this country and abroad.

RED "E" SOLDERING PASTE.

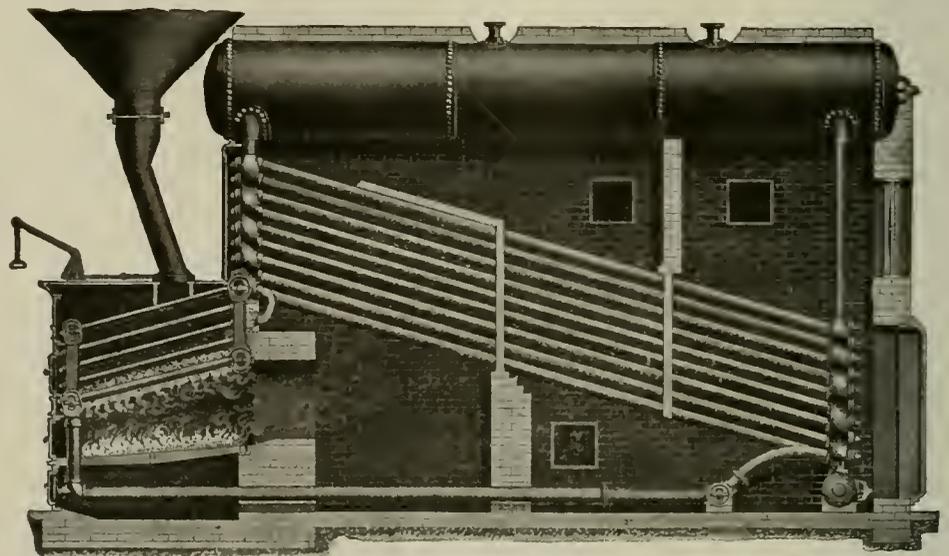

The desirability of securing a soldering flux put up in such form as to be convenient and cleanly to handle, easily and quickly applied and at the same time achieve satisfactory results and "keep" indefinitely, is realized by electricians, linemen or repair or shop men having use for a preparation of this nature in either large or small quantities. The demand for a combination of these desirable features also has been recognized by manufacturers and from time to time there have been placed upon the market pastes designed to meet these requirements.

A soldering flux which, although new to the public, has been tested and said to have proved satisfactory in every way is known as the Red "E" soldering paste and is a product of the Chase-Shawmut Company of Newburyport, Mass. This paste is put up in collapsible tubes of sizes convenient for carrying in the pocket or the tool bag, the smaller size being $\frac{1}{2}$ by 4 inches and the larger 1 by 6 inches. It is said to be non-corrosive and therefore does not eat into but cleans the surfaces to which it is applied, thus allowing the solder to run freely and affording more satisfactory results. The paste also is said to be but little affected by temperature, weather or the material with which it comes in contact, and therefore will keep indefinitely.

The combination of these desirable qualities, together with the low price for which it is sold, should serve to make this product of considerable value.

Electric Railway Guide for Chicago and Vicinity.

The Chicago and Interurban Trolley Guide Company of Chicago has issued an electric railway guide to Chicago and vicinity, a booklet of 40 pages containing schedules of the cities, towns,

Hawley Downdraft Furnace.

villages, suburbs and amusement, summer and fishing resorts which may be reached by electric railways, giving maps, fares, time and mileage to such points. Chicago is now well provided with electric railways, both trolley and third rail, which put the residents of the city within easy reach of the many points of interest. The lines out of Chicago include the Aurora Elgin & Chicago Railway, the Chicago & Joliet Electric Railway, the Chicago & Southern Traction Company, the South Chicago City Railway, the Chicago & Milwaukee Electric Railroad, the Calumet Electric Railway and the Chicago Riverside & Lagrange Suburban Railroad.

Joseph T. Ryerson & Son, Chicago, have had plans prepared by Ritter & Mott, 204 Dearborn street, Chicago, for a warehouse and office building, to be built at Rockwell and Fifteenth streets. The building will be one and three stories in height, of fireproof construction, with brick exterior and concrete foundation.

In the designs for axles recommended by the standardization committee of the Central Electric Railway Association and presented in the Electric Railway Review

Key Seats In Axle Gear-Fits.

for May 25, page 677, it will be noted that the key seat in the gear-fit is shown with its bottom surface rounded at the ends to a 1½-inch radius and not made as usually, by drilling two holes in the shaft and slotting-out the metal between these holes. Experience has shown that when key seats are cut by the latter method breaks in the shaft frequently start with a crack originating at the end of the key seat where one of the holes has been drilled and where a sharp angle exists. To remove this weak point it is suggested that the key seats for the gears be made with a milling cutter instead of a key-seating machine. This will provide a fillet at either end of the seat, sloping from the inner surface to the gear-fit. Trouble might be expected from the round-end keys not staying in place while the gears were being pressed on. This difficulty, however, can be overcome by using a collar that will fit closely over the shaft and one end of the key during the pressing-on process, and which, in turn, will be pressed off as the gear assumes a permanent position.

The desirability of keeping tension springs on trolley poles properly adjusted is generally recognized. Various methods are adopted for performing this task. On some roads where a uniform pressure between the wheel and the wire assures satisfactory operation for all cars, a weight is provided equal to the number of pounds pressure required. This weight can quickly be hung on the trolley harp and the condition of the springs ascertained. With such a weight, equal to the trolley pressure desired, hung from the harp, the springs can be regulated to just hold the wheel against the wire. Then with the weight removed it is known that the tension in the springs is adjusted correctly. On other systems it is found desirable for different cars to operate over different divisions with the

Adjusting The Trolley Springs.

tensions in the trolley-pole springs adjusted to suit the particular requirements of each division or car. To permit of such adjustments one extensive system in Indiana uses a spring-balance which by means of the trolley rope can be hooked to the end of the pole. When the pole is drawn down to the proper height above the roof the rope can be tied and the tension springs in the trolley base adjusted until the spring-balance shows on its scale that the proper tension will exist between the trolley wheel and the wire. These two practical methods are outlined here, not so much to suggest how the details should be carried out, but rather to emphasize the recognized need for a careful consideration of the desirability of thoroughly inspecting car equipments.

There are many interesting details included in the design of the portable substations of the Northern Electric Railway described elsewhere in this issue. The desirability of using portable substations is well recognized by companies which have rapidly extending mileages and which desire to operate new track as rapidly as it may be laid. The type of substation adopted for the Northern Electric lines does not differ in general from other portable substations, but it is noticeable for the thoroughness with which the details of construction have been executed. For example, portable jacks and rail clamps are hung under the car sills to permit of quickly leveling the car body so that no undue stresses will be thrown on the electrical apparatus supported by the car floor. The proper adjustment of the jacks is ascertained by the inspection of level bubbles recessed in the sheathing of the car and protected by glass. To permit of greater freedom of movement inside the car body all the low-tension wiring carrying both direct and alternating current is placed in a conduit below the car floor. Over this conduit the floor is made usable by placing, as a cover for the boxes containing the wiring, a removable wooden grille-work strong enough to bear the weight of the occupants of the car and yet light enough for portability. The openings

Well-Built Portable Substations.

in the grating provide ventilation and means for observing whether or not the cables are all in normal operating condition. The transformers receive current at 60,000 volts potential. It is thought that these portable equipments are the only ones now operating under such a high transmission voltage. The entrances to the car for the transmission wires are made through large glass plates. This satisfactory method not only affords sufficient insulation, but amply serves to light the transformer end of the car body. Where it is feasible to use portable substations as auxiliaries to the permanent equipment and where it is known that such stations will be required for some time, it would seem wise that special care should be taken, as exemplified in the Northern Electric Railway substations, to provide, by careful construction, an assurance of as few possibilities of breakdown as might be expected from the types of permanent substations now in general use.

Discussion on the subject of freight accounting forms and methods at the Indianapolis meeting of the Central Electric Accounting Conference on June 1 revealed the entire absence of uniformity in the forms used by the various roads for handling freight accounts. As the interchange of freight between connecting roads in

Forms in Freight Accounting.

Ohio and Indiana will increase steadily in the natural course of events, the adoption of uniform forms by the various lines will facilitate the work of the accounting departments. Although the requirements of the different lines may vary, the committee which has been appointed to consider the subject will endeavor to frame standard forms which will meet the needs of each road. The exchange of ideas and consideration of forms now in use may point the way to improvement in the practice of different lines even if the preparation of uniform forms, on account of different conditions of business, should prove difficult. The committee will undoubtedly bear in mind in its work the patent fact that the handling of freight on interurban roads contains promise of great growth, and will recommend forms which, viewed in the future with heavier traffic conditions, will be found satisfactory.

Though the New York public utilities law may do no more harm under an able, well-meaning governor than to inconvenience and harass the railways and to bring about a gradual reduction of enterprising construction and improvement work, which would assist in upbuilding the state, its possibilities for evil in the hands

New York Public Utilities Law.

of demagogic authorities are enormous. No one can read thoughtfully the abstract of the new law, which is printed in another part of this issue of the Electric Railway Review, without a full realization of the extreme limits which the public agitation against corporations has reached. Fares, rates, schedules, equipment, appliances, capitalization, franchises, accidents, reports, improvements, terminals, tracks, investments, new issues of securities—all these and many other essential matters in the operation of street railroads are hereafter to be supervised. The soul of the new law is supervision run riot. Hereafter the people who are most familiar with local conditions and requirements are not to decide how roads shall be operated; commissions which may be removed by the governor on 10 days' notice have the fullest power in the decision of important questions which the law can give. Stockholders may continue to elect directors, and directors to choose officers; but the commissions, and not these officers, may be supreme in the management of the properties. The companies may petition for a rehearing on any question, but the bill has become a law without any provision for a court review of the findings of the commissions. The endeavor to be fair to the public stirred the framers of this law intensely, but the law would not have been

weakened had there been included a provision for a court review in the event of unwarranted decisions.

A GOOD ROADBED AND TRACK.

The maintenance of track in satisfactory condition is so essential to perfect service and such a large proportion of the total operating expenses of a road are spent for this purpose that more consideration of the subject may well be given. At the outset it should be remembered that the expense of maintaining track in surface is greatly reduced if a proper and solid foundation is provided for the ties and ballast. Only the soundest and hardest material should be used to form a satisfactory foundation upon which the track may be built. Spongy or water-holding clay and quicksand should never be used, and where the roadbed is built on such soils at least three or four feet of some solid material should be placed on top of the surface. In grading through cuts, any spongy clay or quicksand should be removed to a sufficient depth to allow placing three or four feet of proper ballast under the ties. These considerations of proper foundation are intimately related to the drainage problem, which is one of the most important in the proper and economical maintenance of track.

The first essential of a good roadbed is that it should be kept well drained. If the roadbed is built of material which will hold water, frequent cross drains should be provided, say, every 500 feet. To maintain surface ditches in an efficient condition the shrubs and growth should be removed at least once a year. It is likewise important that all ditches should have a free outlet to prevent any obstruction to the flow of water from them. Difficulty may be experienced in maintaining the drainage ditches in cuts if the proper slope is not maintained.

The short-sighted policy of making the top of fills barely wide enough to support the ties has been followed by a goodly number of railway companies, with the result that a large amount of money is spent yearly for reclaiming ties, ballast and rails which have rolled down high banks. When this needless expense is considered, the wisdom of a slightly increased first investment in a sufficiently wide roadbed will be evident.

The depth of ballast on new roadbeds should be at least 12 inches. Hard stone ballast is a good investment, for not only does it materially reduce the cost of maintenance of the track, but a uniform and even surface can be maintained, resulting in smooth riding at high speeds, and the absence of dust is a point which receives the most favorable consideration of the passengers. When gravel ballast is employed, if possible, it should be washed to remove dust and clay, for if this is not done it becomes soft in wet weather, and in spite of the most careful precautions to properly drain the roadbed it will soon heave out of surface. We recall a western road that obtains excellent gravel ballast from gold-dredger tailings. Stone ballast has an advantage over gravel in that it can be worked in wet weather.

In selecting ties particular attention should be given to uniformity of dimensions, as an equal extension of the tie beyond the rail on both sides is of considerable importance in maintaining track in true surface. When ties are to be renewed, if permissible to make a general renewal of the track, the best results are obtained by raising the rails with jacks to a sufficient height to remove the ties without disturbing the roadbed under them; new ties can then be put in place and the track carefully resurfaced. The ballast under the ties should be carefully tamped, the best method for surfacing being to raise one end of the tie, tamp the ballast under it and then raise the other end and tamp the ballast until the rails are in true surface. The tamping should be hardest near the end of the ties and comparatively light near the center, since this will prevent the ties from becoming centerbound. To obtain a thorough job when re-

surfacing is done, the tamping the first day should be comparatively light, and then for the two or three days following the track should be carefully tamped and resurfaced. This prevents the track from sagging, due to the natural settling which will occur for the first few days after the track has been resurfaced.

It is hardly necessary to comment on the absolute necessity of perfect gauging and having the track absolutely straight on tangents. On curves the gauge of the track should be increased slightly, depending upon the radius, the general increase of gauge on curves for steam railroad practice being from $\frac{1}{8}$ to about $1\frac{1}{2}$ inches. Breaks of grade in the track may make it impossible to line up long tangents without the use of instruments. The value of using surveying instruments for correctly lining up tracks and for properly locating the center line of long curves should not be overlooked.

While these essential requirements for a good roadway may read like an elementary treatise of the subject, it is well to remember that the traveling public forms its opinion of any service largely from the relative degree of comfort which it is afforded. With a smooth track, comfortable riding is assured, and together with that desirable feature is the one of lower cost of rolling stock maintenance which is assured by not "rattling" good cars over a poor roadway.

PERMANENCE IN POWER HOUSE DESIGN.

One of the most notable features of modern power-house design is its substantial and lasting character. In very few of the later stations is there any evidence of temporary or uncertain work, and this is why each new installation completed by responsible engineers and built along progressive lines is of so much interest as representing the most modern tendencies of practice. Thus, the keynote of the design of the new railway lighting and power plant of the Potomac Electric Power Company near Washington, D. C., is permanence and solidity of construction. The plant represents standard practice in many features of the cycle between the coal pile and the outgoing feeder system, but in its large capacity, liberal use of concrete in walls and foundations, and provision for continuous service it is of special interest.

The use of concrete piles in power-house construction is a marked tendency of the times in the later installations. The extensive applications of concrete in the field of power-plant building, both reinforced and plain, contribute to the permanence of the construction and tend to reduce the first cost of the station as well. By the use of concrete piles there has already resulted in not a few cases a decided saving in the investment for foundations, and this without much regard to the condition of the soil. For a given load fewer concrete piles are required, and less excavation and a smaller amount of masonry are needed than when wooden piles are used. The first cost of the concrete pile itself is generally much higher than that of its wooden competitor, often from 50 to 100 per cent more per foot, but the concrete pile has a much larger bearing surface in proportion to its cost. In average practice the area of the concrete pile at the top may be 2.5 or 3 times as great, and the greater amount of tapering possible enables a much less quantity of lineal piling to be used than when the wooden pile of small taper is driven. The speed with which concrete piles can be driven is another favorable point; in a single day from twenty to thirty can be sunk under average conditions of driving. Of course, the driving must be properly done—and thus far there has not been much success in the driving of concrete piles after they have been built. This is a matter of arranging a suitable guarantee in the contract with the pile makers, for at present the processes of concrete pile driving are rather closely controlled. The larger the plant the more likely it is that the use of the concrete piles will pay, though in all cases costs,

results and material should be carefully figured in advance of deciding whether or not wood shall be used. In a plant as large as the Potomac station, which is designed for a normal rating of 19,000 kw., the advantages of concrete pile construction should be easily demonstrated. The reinforcement of the foundations of the main generating units with steel rails and the tying together of all the foundations to prevent uneven settlement and to distribute the load properly is an excellent feature of the construction. In street railway work there is often no need of buying expensive patented reinforcing steel bars of special shapes when old rails are available.

In compactness, the Potomac plant makes a good showing, even in comparison with recent gas engine stations. To develop a kilowatt on 1.52 square feet of total floor area is doing better than the reciprocating steam and high-class gas engine plants of the day show, though the latter type are as yet installed in such small sizes that perhaps a fair balancing must come later. It is impossible, however, to study the layout of the Potomac station without being impressed with the concentration of equipment, which allows straightforward production of power with very little doubling back of main steam lines or auxiliaries. The double-aisle arrangement of the boiler room is not objectionable from the standpoint of ease of control, particularly as mechanical stokers are used, but in all such cases there is little doubt that all the steam gauges—or one extra set—should be produced on a single central tablet or panel, so that the boiler room foreman can at all times be instantly acquainted with the situation. It may pay to duplicate the water columns, too, where the attendance is small, though the low-water column and fusible plug ordinarily are enough to prevent trouble of any serious nature.

The use of equalizer pipes, long-radius bends, concentration of auxiliary piping in the basement and the installation of two feed-water heaters all make for continuous service, and the control of the feed supply from two points is an economical feature. The removal of the auxiliary machinery from the more or less unskilled supervision of the boiler house is also commendable, as is the use of dull finish on the switchboard instead of the trying glaze of older practice.

Economy of operation should be well served by the choice of two sizes of generating units, enabling the station to be run with highly efficient combinations as to lighting, railway and power loading. In a plant of this kind the load factor is so much more flexible than in a pure and simple railway station that the use of two sizes of generators ought to be thoroughly satisfactory in relation to the efficient production of current. The relatively large heating surface of each boiler—6,040 square feet—should also tend toward economy in the consumption of fuel. Superheated steam in such an installation is a matter of course.

Defrauding with Duplicate Registers.

An ingenious conspiracy by which two employes have been systematically robbing the Calumet Electric Street Railway Company of Chicago out of a large portion of their collections of fares was discovered by officials of the company last Saturday, June 1. The two men, one a motorman and the other a conductor, had taken a fare register of the removable type from the storeroom at the car house and had been using it during rush hours in place of the official register. The stolen register was used on the trip out, and at the end of the line, or whenever it could be done unobserved, the official register was replaced and the fares registered on the "dummy" register were pocketed by the men. The attention of the company was first called to the practice through the auditor's trip reports, which showed an abnormal decrease at times, and detectives were employed to watch the men. The detectives caught one of the men last Saturday in the act of changing the registers and they were arrested on charges of embezzlement.

THE NORTHERN ELECTRIC RAILWAY.

On April 25, 1906, regular service was started on the portion of the new line of the Northern Electric Railway Company between Chico and Oroville, Cal. On December 3, 1906, this service was extended to Marysville, 35 miles south of Oroville. Reference to the accompanying map will serve to show the geographical location of the present operating line

surveyed, right of way has been secured and grading camps have been established, so that roadbed construction work can be started in the near future.

Other than this extensive interurban system with a straightaway mileage of 131.5 miles of main track and 38.1 miles of branch line, the Northern Electric Railway Company operates local service in Chico and Marysville. There are 5.5 miles of track in the latter town.

Northern Electric Railway—Standard Trestle and Bridge Spans.

of this company, the mileage now under construction and the proposed extensions. The towns which the new road will serve derive a substantial support from the exceedingly fertile valley of the Sacramento river, along which the route of the new line extends.

Routes.

The new road is now in complete operation between Chico and Marysville, 48.8 miles. Near the middle point of this

The topography of the valley through which the new line is built is such that an excellent roadbed suitable for high-speed operation has been obtained.

Roadway.

The tracks outside of the towns are built along a fenced private right of way, varying in width from 80 to 100 feet. In Sacramento this private right of way extends to the center of the city. There are few curves and one 9-mile tangent.

Northern Electric Railway—Locomotive with Freight Train.

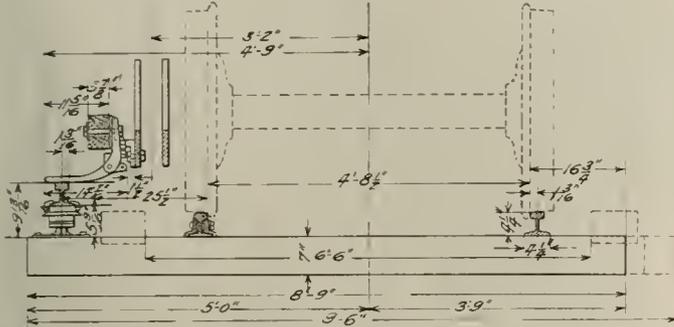

section of the line is a branch 5.5 miles long to Oroville. South from Marysville, 41 miles to Sacramento, grading has been completed and service is planned for September 1 of this year. From Marysville west to Colusa, a distance of 21.6 miles, a right of way has been purchased and preparations have been made for early construction. From Chico west 11 miles to Hamilton, all preparations have been made for immediate construction of a branch line. The route of an extension north from Chico 41.7 miles to Red Bluff has been

The ruling grade and curvature, which, however, are comparatively light, occur on the Chico-Oroville division. The curve of shortest radius is one of 6 degrees, this occurring near Oroville, on the branch line. In the 48.8 miles of route between Chico and Marysville there are only three curves outside of the city limits, and none of these is sharper than 3 degrees. The maximum grade of the entire road is 0.5 per cent.

The track construction is of standard dimensions, using

60-pound rails bonded at the joints with two 500,000-circular-mil Chase-Shawmut soldered bonds. This track is gravel ballasted from an excellent supply obtained in the company's pits at Oroville, near the middle of the route. The company also is establishing a rock-crusher plant and will use part of its output as ballast, selling the rest for commercial purposes. Sidings are approximately five miles apart.

Except in towns where standard overhead trolley construction is necessary, and here the Brown pantagraph trolley

Northern Electric Railway—Track and Third Rail Measurements.

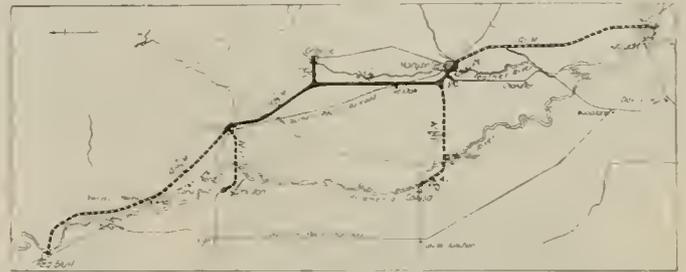

is used, current will be distributed to the cars through a 60-pound third rail. Thirty-five miles of the route is now so equipped. The third rail is bonded at the joints with two 250,000-circular-mil Chase-Shawmut soldered bonds. At road crossings the ends of the third rail on opposite sides of the highway are connected with a copper conductor of 500,000-circular-mils cross section inclosed in a bituminized fiber conduit and buried. The ends of this conduit are filled with insulating compound to keep out water. One of the accompanying illustrations shows the general arrangement of track and third rails at a switch. It will be noted that a variation from the usual practice occurs in the omission of the drop rail opposite the switchpoint.

Substations.

Current for the operation of the entire line is purchased from the Pacific Gas & Electric Corporation, being delivered to the substations at 60,000 volts potential from the Bay Counties transmission system, which is fed by numerous hydroelectric plants. The selling company owns the step-down

side walls are covered with a cement plaster supported on metal lath. The gable ends have metal lath on both sides and are covered with cement mortar, thus forming a double wall. The roof structure is supported on a timber truss with iron rods as tension members. The weather surface comprises No. 24 corrugated galvanized iron, laid with 10 inches lap. Inside the building the roof is ceiled with No. 28 painted corrugated iron. Accompanying illustrations will serve to show the interior arrangement of the structure and the disposition of the apparatus.

The equipment for each standard substation comprises a

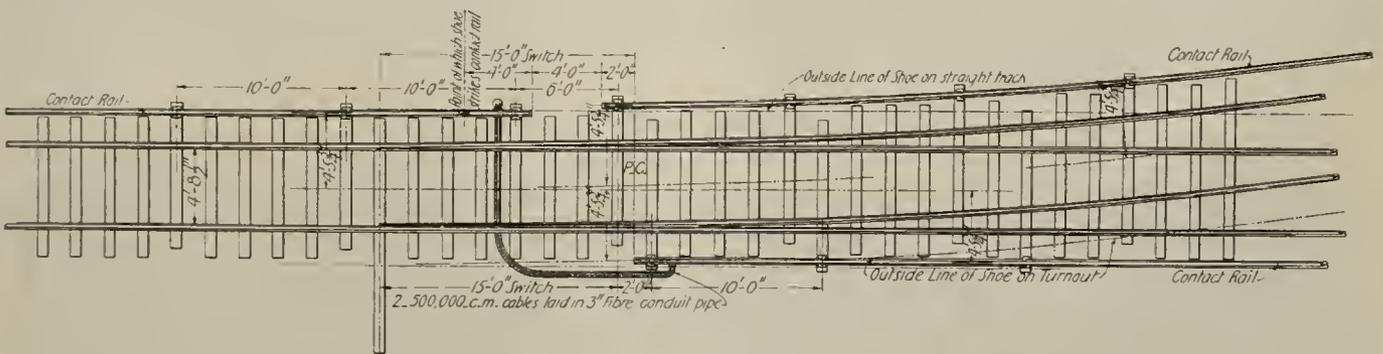

Northern Electric Railway—Map of Lines in Operation and Under Construction.

three-phase 60-cycle 2,200-volt induction motor, direct-connected to a 400-kilowatt 600-volt railway generator, both machines of this unit being of Westinghouse manufacture. Three transformers, each of 150-kilowatt capacity, oil-insulated and water-cooled, step down the line pressure from 60,000 volts to that of the motor-generator set, 2,200 volts. The switchboard comprises the following panels: Starting, induction motor, railway generator and two feeder panels.

Opposite each substation a circuit-breaker sectionalizes the third rail. Current is taken from the feeder panels underground through fiber conduit to the track.

Portable Substations.

The Northern Electric Railway now has in operation two 60,000-volt portable substations, each of 400-kilowatt capacity, that were designed and built at its shops in Chico. These substations, illustrations of which are shown, are believed to be the only portable stations in existence which receive current at 60,000 volts potential. The equipment in each substation is similar to that in the permanent substations earlier

Northern Electric Railway—General Arrangement of Track and Third Rails at Switches.

transformers in the substations and delivers current to the Northern Electric Company at 2,200 volts pressure.

There are five substations of the type shown in the accompanying illustration, located along the route adjacent to the right of way. The equipment in all these stations is similar except in one instance, where there is a duplication of the standard apparatus. The substations are approximately 10 miles apart.

The construction of the substation buildings differs somewhat in appearance and materials from the type used on eastern roads. The building frame is of timber supported on concrete foundations. The floor is made of concrete and the

described, except that the three 150-kilowatt transformers are oil-cooled. The high-potential current is led to the transformers, which are mounted over one pair of trucks through entrance windows insulated with large sheets of glass. All the 2,200-volt wiring is carried in ducts below the level of the car floor. Above the ducts the floor is made of wooden grating, so that any disturbance below can quickly be noted. Repairs are thus facilitated and ventilation provided. All potential and current coils and the autostarter for the induction motor are also carried under the car floor.

The cars which contain the portable substation apparatus were built especially for this purpose. Each is 40 feet long

over all, 10 feet wide and 14 feet from rail to roof. It will be noted from the illustration that special means are provided for leveling the car. On each side of the car body, recessed in the sheathing, is a level tube with its glass and bubble unobstructed to view from the outside. Underneath the car, hanging from special anchors bolted to the bottom of the sills, are eight portable screw jacks. These jacks connect with their anchors by through pins, so that while the car is being moved they may be hooked up close to the floor. When it is desired to place a car for operation the jacks are let down. Next, portable tongs are clamped over the rail and then the jacks are manipulated, the level bubbles being observed meanwhile, until the car body is in such position that

company's engineering offices is shown. The buildings include a general car house and repair shop, with six tracks, two of which are over open pits, as illustrated. It will be noted that this building is a timber structure, sheathed and roofed

Northern Electric Railway—Typical Substation Structure.

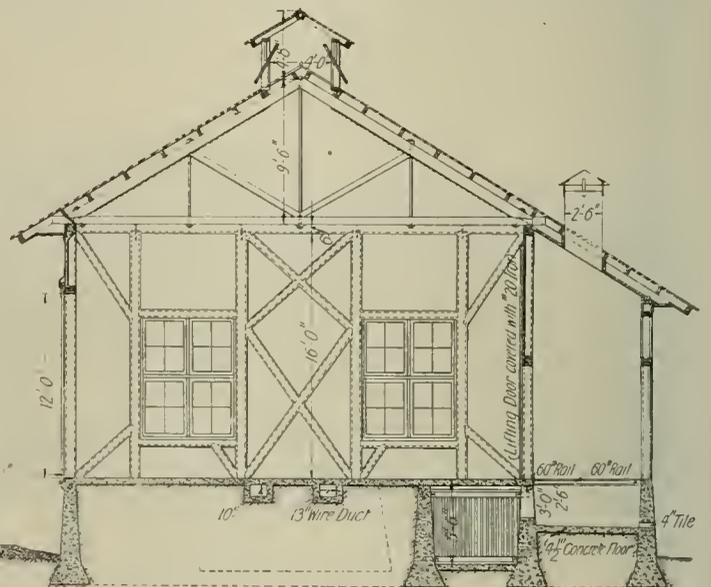

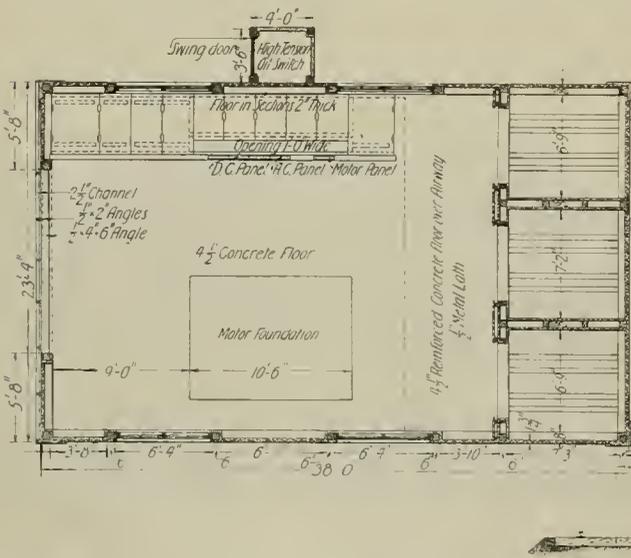

Northern Electric Railway—Interior of 60,000-Volt Portable Substation.

the shaft of the motor-generator set takes a horizontal position. It is stated that this operation can be performed in 10 minutes.

The complete weight of a portable substation equipment ready for operation is 90,500 pounds. Some of the details making up this total are machinery, 42,000 pounds; trans-

formers, 30,000 pounds; switchboard and electrical equipment, 10,000 pounds. The portable substations are equipped with automatic couplers and automatic air brakes. These latter mentioned departments are housed

Northern Electric Railway—Floor Plan and Vertical Section of Substation.

formers, 30,000 pounds; switchboard and electrical equipment, 10,000 pounds. The portable substations are equipped with automatic couplers and automatic air brakes.

Shops.

The main shops for the through line and branches are located at Chico. A front view of these buildings and the

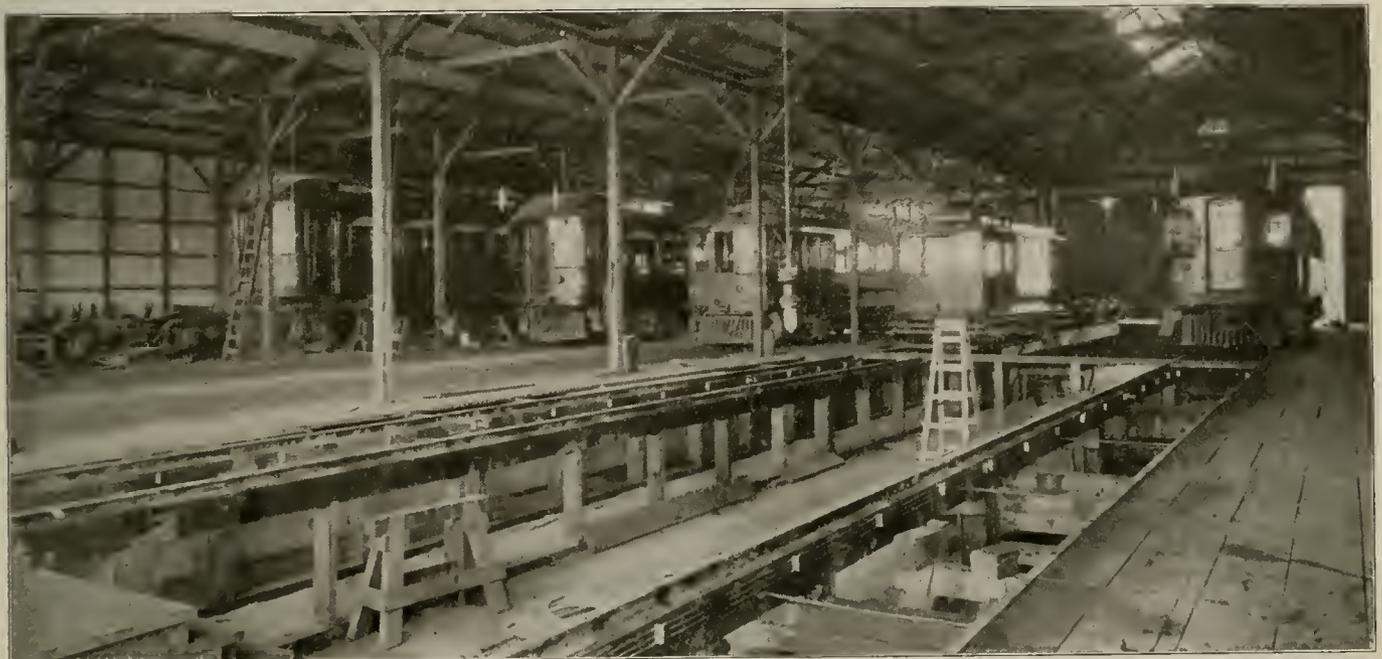

in one bay, the front of which is utilized as a substation.

At the rear of the shop just described is a similarly built structure in which are the painting, erection and mill departments. The paint and erecting shops each have two tracks and the mill is well equipped for the carpenter work necessary in the construction of freight and passenger cars.

The blacksmith shop is a separate building supplied with

Northern Electric Railway—Shops and Engineering Offices at Chico.

Northern Electric Railway—Interior of General Repair Shops.

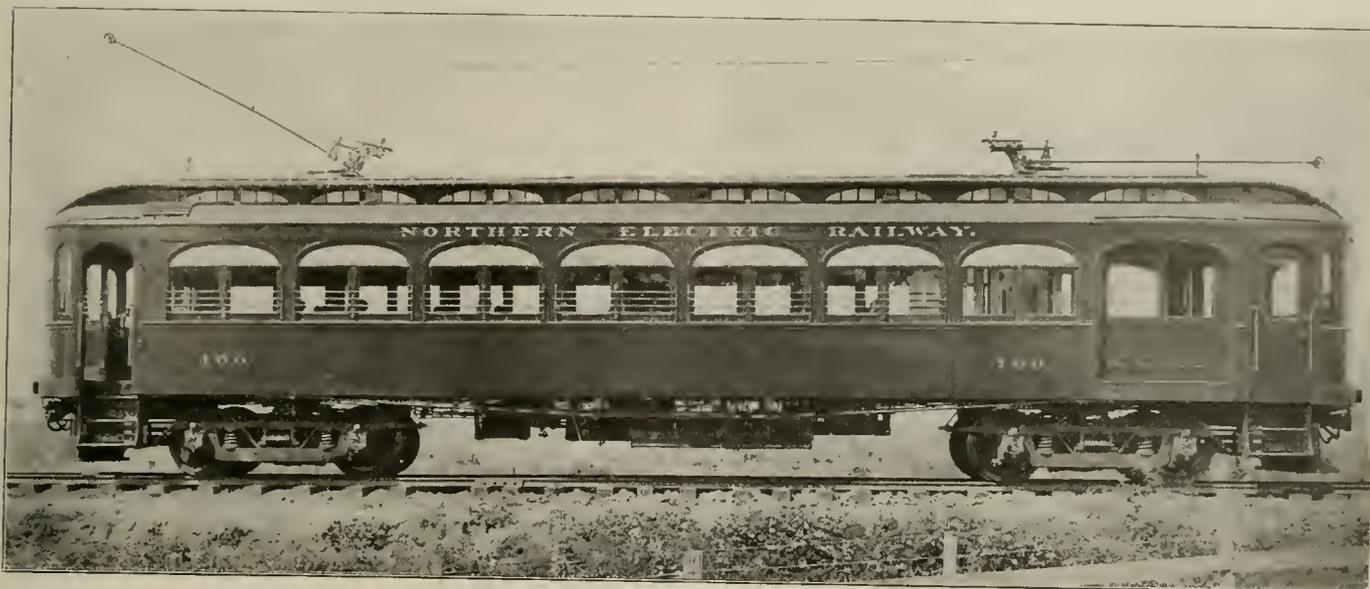

Northern Electric Railway—Portable Substation with 60,000-Volt Transformers and Motor-Generator Set.

and the cars are fitted with Westinghouse automatic air brake equipments and Gould radial couplers, with coupling heads conforming to the Master Car Builders' standard contour. The seats in the new cars will be upholstered in pantasote.

Locomotives and Miscellaneous Equipment.

The electric locomotive, as illustrated, has the same truck

Other miscellaneous equipment includes the following: One construction locomotive built as a flat car, having the same motor and brake equipments as the previously described locomotive and weighing about 40 tons; three 16 by 24 inch Baldwin steam locomotives, used for construction purposes; one 15-ton wrecking car, as illustrated, without motors; two hundred 40-ton standard M. C. B. flat cars, built by the Fitz-

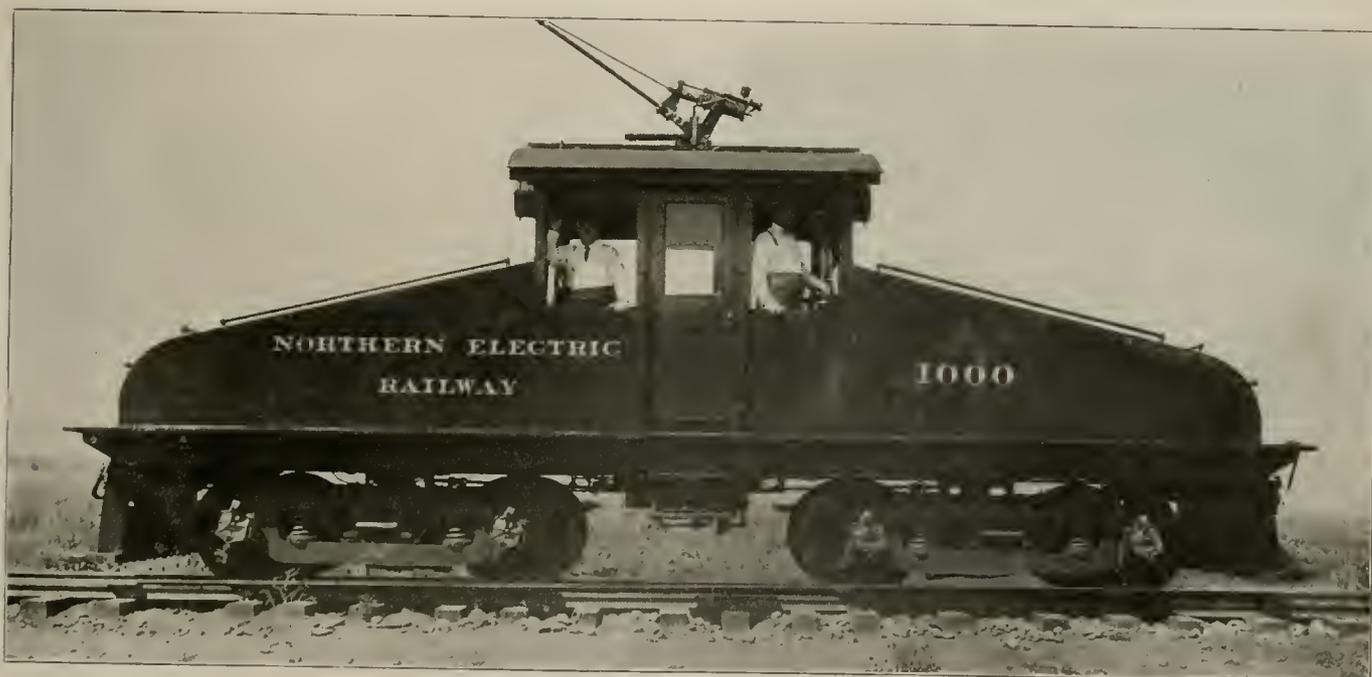

Northern Electric Railway—Standard 56-Foot Passenger Coach.

and motor equipment as the passenger cars. It is provided with General Electric type M control and Westinghouse schedule E T automatic air brakes. It weighs 32 tons and is regularly operated in freight service.

Material has been ordered for two steel-frame express

Hugh, Luther Company; 30 side-dump ballast cars; 20 flat cars of 30,000 pounds capacity each, and 30 box cars of 40,000 pounds capacity each. There have also been ordered recently 100 standard box cars to be used in freight service.

The equipment used in local service in Chico and Marys-

Northern Electric Railway—32-Ton Electric Locomotive.

locomotives of the type shown in one of the line drawings. The total weight of these equipments will be 41 tons each. The locomotives will be provided with Baldwin trucks, 36-inch steel-tired wheels, M. C. B. automatic couplers, Miner draft rigging, and Westinghouse 121 motors. Each car body is designed to carry a weight of 25 tons.

ville includes two California type cars, seating 40 passengers and weighing 24.7 tons each. These cars are equipped with four Westinghouse No. 93 motors and General Electric type M control. There are also in similar service four single-truck closed 28-foot cars and two double-truck 13-bench open cars, equipped with two G.E.-67 motors.

Traffic and Schedules.

The freight and passenger rates for the various services offered by the road are the same as those charged by the competing Southern Pacific Railroad. Passenger fares are based on a rate of three cents per mile. Eight passenger trains are run each way daily, which, with one freight train each way daily and four construction trains, comprise the regular service on the through line. In Chico, where there are eight miles of local track, a 15-minute headway is main-

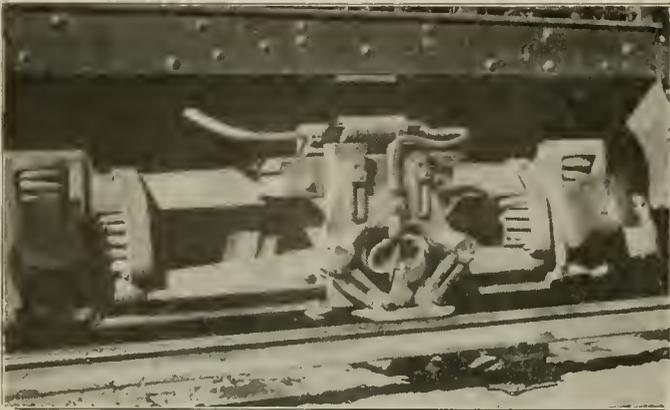

Northern Electric Railway—15-Ton Wrecking Car.

tained with four cars, and in Marysville a similar headway is maintained with two cars.

The passenger trains between Chico and Oroville make the run of 25 miles in 50 minutes and between Chico and Marysville, 48.8 miles, in 1 hour and 45 minutes. The competing steam line, which has a route four miles shorter than the Northern Electric, makes the run with no stops in 1 hour and 50 minutes. As soon as the new track of the Northern Electric is more thoroughly settled, the running time between Chico and Marysville will be cut to 1 hour and 15 minutes, or 35 minutes less than that of the limited steam trains.

The freight traffic at present, having had but a few

Northern Electric Railway—Method of Supporting Third-Rail Shoe and Connections.

months in which to be developed, amounts to the satisfactory total of from 15 to 20 carloads a day. The Northern Electric Railway interchanges freight with the Butte County (steam) Railway.

The car mileage for an average day in March of this year was 2,010 car-miles, made up as follows: Passenger cars on the interurban, 967.30; local in Chico, 540.72; local in Marysville, 124.80; freight mileage, 146; switching, 31.61, and construction, 200. The power used on this same day was 13,965 kilowatt-hours on the interurban lines and 1,256 kilowatt-hours on the city lines.

The dispatching of trains is handled by telegraph from a dispatching office at Chico. There is also a telephone circuit with instruments in the telegraph stations, which equipment

can be used in emergency. On an average there are issued in a day 45 train orders of the standard No. 19 and No. 31 forms.

The Wells Fargo Express Company maintains offices at the electric railroad station and handles its business with messengers on the regular cars.

Personnel.

The personnel of the Northern Electric Railway Company is as follows: President, Henry A. Butters; vice-president, Louis Sloss; general manager, A. D. Schindler; general superintendent, E. A. Dimmock; chief engineer, C. S. Compton; electrical and mechanical engineer, J. P. Edwards.

SECOND MEETING OF CENTRAL ELECTRIC ACCOUNTING CONFERENCE.

The Central Electric Accounting Conference held its second meeting at the Claypool hotel, Indianapolis, on June 1. There were present 19 officials, representing the following companies:

Columbus Delaware & Marion Railway Company; Dayton Covington & Piqua Traction Company; Dayton & Troy Electric Railway Company; Indiana Columbus & Eastern Traction Company; Indianapolis & Cincinnati Traction Company; Indianapolis Traction & Terminal Company; Indiana Union Traction Company; Indianapolis Columbus & Southern Traction Company; Lima & Toledo Traction Company; Scioto Valley Traction Company; Terre Haute Indianapolis & Eastern Traction Company; Western Ohio Railway Company.

Together with accounting representatives of the roads interested a number of representatives of traffic departments of the various lines were present on invitation and they discussed matters relating to the handling of freight and passenger business.

Checking Mileage Coupons.

In addition to further discussion of the plan of settlement of interline accounts, which was adopted at the first meeting of the conference at Dayton, O., on March 2, several other subjects were taken up. Among them was the method which is followed in checking Central Electric Railway Association and other mileage coupons. It was found that all roads check coupons daily, separating the collections by lines and making a recount of all coupons at the end of each month before forwarding them to the issuing lines.

Recording Interline Waybills.

The method of recording interline billing passing junction stations was considered. The discussion developed the fact that most lines have a system for recording interline waybills passing junction stations, using a book record. The general opinion of those who were present was that it is advisable to have a report of all interline waybills passing junction stations made in triplicate; a copy to be forwarded to the accounting departments of both the receiving and the forwarding line and a copy to be retained for the agent's record. It was decided to have a form embodying this arrangement printed and it will be adopted by a majority of the lines handling interline billing.

The handling of freight and express shipments from non-agency points was also discussed. The general practice of the roads is for conductors to make waybills for all shipments handled from stations where no agents are located. Some lines require the conductor to make a forwarded report covering all shipments handled and others require such report to be made by the next regular agent. In the latter instance the conductor turns over to the agent a copy of the waybills made. Other lines which do not require the conductor to make waybills follow the practice of steam roads and have the waybills for such shipments made by the next regular agent.

Freight Accounts.

There was a full discussion on the subject of freight accounting forms and methods. It was found that each road has different forms of waybills and reports, and that while

there was a similarity in some cases between the forms used by certain lines, the forms were entirely different. After the consideration of this subject it was the unanimous opinion of all who were present that it would be advisable for roads interchanging business to adopt uniform waybills and accounting forms as far as practicable, and on motion of W. F. Forse, Jr., assistant treasurer of the Indiana Union Traction Company, Anderson, Ind., a committee was appointed to obtain copies of all freight accounting forms in use on the different roads and to make a report at the next regular meeting of the conference recommending the best forms to be adopted for handling freight accounts. This committee is as follows:

R. A. Crume, auditor Dayton & Troy Electric Railway Company; Walter Shroyer, acting auditor Indiana Union Traction Company; H. A. Baymiller, freight auditor Toledo Urban & Interurban Railway Company; C. B. Baker, freight auditor Western Ohio Railway Company; M. W. Glover, auditor Indiana Columbus & Eastern Traction Company.

The hope was expressed that the committee may be able to investigate fully the necessities of the different lines and that it will succeed in preparing forms which will be acceptable and also adaptable to all conditions which may arise. The members of the conference were requested to forward to C. B. Baker, the secretary, freight auditor of the Western Ohio Railway Company, Lima, O., samples of all freight accounting forms in use on their respective roads, together with any suggestions which they desire to offer the committee in assistance of the work.

Interline Freight and Ticket Accounts.

In the discussion of the plan of settlement of interline freight and ticket accounts adopted at the Dayton meeting the fact was brought out that some lines are unable to have their reports made and forwarded by the date fixed in the agreement. The unanimous opinion was that it was not advisable to extend the date, but that all lines should endeavor to conform to the date and to forward their interline freight and ticket reports as soon after the 15th day of the following month as possible.

Interline Billing, Ohio and Indiana Roads.

As considerable freight and express is handled between Indiana and Ohio roads and a definite understanding was necessary in order that this business might be taken care of properly, arrangements were made for interline billing between the lines. The secretary was instructed to prepare the details of this interline agreement and to forward the agreement to the lines interested. The agreement will not interfere with the agreement for interline billing which is now in effect between Ohio lines. Up to the present time there has been no written agreement between the Indiana and Ohio roads for the interchange of interstate business.

Cash Fare Register.

On the invitation of J. W. Moore, roadmaster and chief engineer of the Indianapolis & Cincinnati Traction Company, Rushville, Ind., the conference examined a working model of a cash fare register which he has invented. The register presented a number of improvements and the explanation of Mr. Moore was very interesting to all the members.

W. L. Egly of the Egly Autographic Register Company of Dayton, O., addressed the conference on the subject of billing and his address indicated that he had given the subject much thought. This subject was referred to a committee to be handled in connection with the subject of freight accounting forms and methods.

As E. C. Spring, president and general manager of the Dayton Covington & Piqua Traction Company, invited the conference to visit West Milton, O., and offered the use of the club house at that place, it was decided that the next meeting of the conference will be held at Dayton, O., on July 13, 1907, when the invitation of Mr. Spring will be accepted.

PUBLIC UTILITIES LAW IN NEW YORK.

Governor Hughes of New York signed on June 6 the public utilities bill, following its passage by the legislature on June 5 over the veto of Mayor McClellan of New York City. The main features of the law as it affects street and inter-urban railways are given in the following abstract:

Two public service districts are created, the first including the counties of New York, Kings, Queens and Richmond and the second all other counties in New York state. There shall be one commission consisting of five members for each district. The commission in the first district shall have the powers conferred upon the rapid transit commission in 1891 and the acts amendatory thereto. The annual salary of each member of each commission shall be \$15,000, of counsel to commissions, \$10,000, and of the secretary, \$6,000.

The governor may remove any commissioner for inefficiency, neglect of duty or misconduct in office upon not less than 10 days' notice.

Every commissioner and every person employed is forbidden to solicit, suggest, request or recommend directly or indirectly to any common carrier, railroad corporation or street railroad corporation or to any officer, attorney, agent or employe thereof the appointment of any person to any office, place, position or employment. Every such corporation is forbidden and prohibited to offer to any commissioner, to counsel, to the secretary or to any person employed by the commission or by counsel any office or position or to give any free pass or transportation or any reduction in fare to which the public generally is not entitled, or free passage for freight or property, or any present, gift or gratuity of any kind. If anyone identified with the commission violates any provision of this section he shall be removed from office.

Power to Examine.

If a person subpoenaed to appear before a commission or commissioner fails to obey the command without reasonable cause or if a person shall without reasonable cause refuse to be sworn or examined or to answer a question or to produce a book or papers when ordered to do so or to subscribe and swear to a deposition after it has been reduced to writing, he shall be guilty of a misdemeanor and may be prosecuted in any court of criminal jurisdiction. If a person refuses without reasonable cause to answer "a legal pertinent question" or to produce a book or paper the commissions may apply to any justice of the supreme court, directing such person to show cause why he should not be committed to jail.

No person shall be excused from testifying or from producing books or papers upon the ground that the testimony or documents may contain incriminating matter, but no person shall be prosecuted, punished or subjected to any penalty for or on account of any act concerning which he shall under oath have testified or produced documentary offense; provided, however, that no person so testifying shall be exempt from prosecution for any perjury which may be committed in the testimony. Nothing herein contained is intended to give any corporation immunity of any kind.

After orders have been made by commissions application may be made for a rehearing and the commissions may grant such rehearing in their judgment. An application for a rehearing shall not excuse any corporation from complying with any order or operate to postpone enforcement thereof except as the commissions may direct.

Service and Facilities.

Every corporation performing the service of transportation of passengers, freight or property shall furnish such "service and facilities as shall be safe and adequate and in all respects just and reasonable." All charges made shall be just and reasonable and every unjust and unreasonable charge for any such service is prohibited.

Every common carrier shall file with the commission schedules showing rates. Unless the commissions order, no change shall be made in any rate which shall have been filed and published by a common carrier in compliance with this act, except after 30 days' notice. For good cause the commissions may allow changes in rates without requiring this notice and publication. Any common carrier shall not directly or indirectly by any special rate, rebate, drawback or other device or method charge a greater or less compensation for any transportation service, except as authorized, than it charges any other person or corporation for a like service. There shall be no undue or unreasonable preference, advantage or prejudice to any person or corporation or to any locality or to any particular description of traffic. Schedules of rates must be filed and published in accordance with the act by November 1, 1907. Free tickets or transportation may be given under certain familiar conditions.

A railroad corporation and a street railroad corporation shall not be required to interchange cars except on such terms as the commissions may direct.

Cars and Motive Power.

It is provided that railroad and street railroad corporations shall have sufficient cars and motive power to meet all requirements for the transportation of passengers and property which may reasonably be anticipated unless relieved therefrom by order of the commissions.

Every railroad and street railroad corporation shall upon demand issue either a receipt or bill of lading for all property delivered for transportation. No clause shall exempt such corporation from liability, loss or damage.

Examination and Reports.

Each commission shall have power to and shall examine railroads and street railroads and keep informed as to their general condition, capitalization, franchises and the manner in which their lines are conducted, not only with respect to the adequacy, security or accommodation afforded, but also with respect to compliance with the law. Each commission and commissioner shall have power to examine all books, records, contracts, documents and papers of any person or corporation subject to its supervision and to compel production thereof.

The form of annual reports required shall be prescribed. The commissions may also require corporations to file monthly reports of earnings and expenses. The annual report, covering the fiscal year ended June 30, shall be filed on or before September 30 of each year, but this time may be extended for a period not exceeding 60 days. Any corporation which fails to file its annual report within the time set or to make monthly reports, when required, within 30 days from the time required, shall forfeit \$100 for each and every day it shall continue to be in default. No other accounts except those prescribed by the commissions shall be kept, save those prescribed by or under authority of the United States.

To Investigate Accidents.

In its judgment each commission shall investigate the cause of all accidents which result in loss of life or injury to persons or property. Every common carrier, railroad and street railroad corporation is required to give immediate notice to the commission of every accident happening upon its line. Such notice shall not be admitted as evidence or used for any purpose against such corporation in any suit or action for damages growing out of the matter mentioned.

Each commission may investigate or make inquiry as to any act or thing done or permitted to be done by any such corporation.

Fares, Appliances, Etc.

Whenever either commission shall be of the opinion, after a hearing, that the rates or fares charged by any common carrier or railroad or street railroad corporation for transportation or that the regulations or practices of such corporation are unjust, unreasonable, unjustly discriminatory or unduly preferable, the commission shall determine the just and reasonable rates to be thereafter observed as the maximum to be charged for the service. Whenever the commissions shall be of the opinion that the regulations, practices, equipment, appliances or service of such corporations are unjust, unreasonable, unsafe, improper or inadequate the commissions shall determine upon changes to be made.

The commissions shall have power to require any two or more common carriers or railroad corporations, the lines of which form a continuous line of transportation or could be made to do so by the construction and maintenance of a switch connection, to establish through routes and joint rates, and in case this is not done the commission shall establish joint rates and declare the portion to which each carrier or corporation shall be entitled.

Improvements and Service.

If in the judgment of the commissions repairs, improvements or changes in the tracks, switches, terminal facilities or terminals, motive power or any other property or device used by any common carrier, railroad or street railroad corporation ought reasonably to be made or additions should be made thereto in order to promote the security or convenience of the public or employes, the commission shall, after a hearing, make an order directing such changes, and every corporation is required to make such changes.

If in the judgment of the commissions any railroad or street railroad corporation does not run trains or cars enough or operate motive power enough to reasonably accommodate the traffic, or does not run its trains or cars with sufficient frequency or at a reasonable or proper time with regard to safety, or does not run trains or cars upon a reasonable time

schedule the commissions shall have power to order an increase in the number of trains, cars or in motive power or a change of schedule.

Franchises May Not be Capitalized.

No franchise or any right under a franchise to own or operate a railroad or street railroad shall be assigned, transferred or leased, nor shall any contract or agreement affecting such franchise or right be valid unless the assignment or transfer shall have been approved by the commission. No railroad corporation or street railroad corporation shall purchase or acquire any part of the capital stock of any railroad or street railroad or other common carrier organized under the laws of the state unless authorized to do so by the commission; and except where stock shall be transferred or held as collateral security only with the consent of the commission, no stock corporation of any description other than a railroad or street railroad corporation shall purchase or acquire, take or hold more than 10 per cent of the total capital stock issued by any railroad or street railroad corporation or other common carrier organized under the laws of the state. Nothing in the law shall be construed to prevent the holding of stock heretofore lawfully acquired.

A common carrier, railroad corporation or street railroad corporation may issue stocks, bonds, notes or other evidence of indebtedness, payable at periods of more than 12 months after the date thereof when necessary for the acquisition of property, the construction, completion, extension or improvement of facilities, or for the improvement or maintenance of service or for the discharge or lawful refunding of obligations, provided that there shall have been secured from the commission an order authorizing such issue in a definite manner and stating that the capital to be raised is reasonably required for the purposes of the corporation. Such carrier or corporation may issue notes for proper corporate purposes, payable in periods of not more than 12 months, without such consent, but no such notes shall be refunded by any issue of stock or bonds or any evidence of indebtedness for more than 12 months without the consent of the commission having jurisdiction.

The commissions shall have no power to authorize the capitalization of any franchise or the right to own, operate or enjoy any franchise in excess of the amount (exclusive of tax or annual charge) actually paid to the state or to a political subdivision thereof as the consideration for the grant of such franchise.

The capital stock of the new corporation formed to merge the property of two or more other corporations shall not exceed the par value of the capital stock of the corporations involved, or such sum and such additional sum as may be actually paid in cash. No contract for consolidation or lease shall be capitalized in the stock of any corporation nor shall any corporation hereafter issue any bonds as a lien upon any such contract. Any street railroad corporation which shall violate any provision of this act or fail to comply with any order or requirement of the commission shall forfeit not to exceed \$5,000 for each offense.

It is provided that the new law shall go into effect on July 1, 1907.

Correction.

In the Electric Railway Review of June 1, page 718, in the article on the "Railway Track of the Past and Its Possible Development in the Future," an error is noted in the titles of Figures 2 and 3. Figure 2 was marked "Design for Rigid Permanent Way by Gustav Lindenthal." It should have been "Design for Rigid Permanent Way by J. W. Schaub." Figure 3 should have been "Railway Track in the Future—Design Proposed by J. W. Schaub for Track in the East River Tubes."

Traffic on the Chicago elevated roads for the month of May was large in spite of the unfavorable weather, and in every case shows favorable increases over last year. The South Side Elevated Railroad set a new high record for average daily passengers carried of 109,880, an increase of 13.09 per cent over 1906. The opening of the Englewood extension is principally responsible for the showing. The average number of passengers per day carried by the Northwestern Elevated Railroad was 94,204, a gain of 15.24 per cent, and by the Metropolitan West Side Elevated Railway 151,423, an increase of 10.70 per cent.

TURBO-GENERATING PLANT OF THE POTOMAC ELECTRIC POWER COMPANY, WASHINGTON, D. C.

The Potomac Electric Power Company, Washington, D. C., has recently built a new power house on the outskirts of the city, near Bennings Road Bridge. This interesting turbine installation, which develops a kilowatt for each 1.52 square feet of total floor area, was installed under the direct supervision of L. E. Sinclair, general superintendent of the Potomac Electric Power Company, and was designed and built by J. G. White & Co. of New York, to whom we are indebted for illustrations and data.

The general arrangement of the Potomac power station

Potomac Electric Power Plant—Exterior View.

is in many ways similar to a large number of the most modern plants except for a number of improvements in the disposition of the auxiliary machinery. The boiler room, which is arranged at right angles to the generating room, is 164 feet long by 180 feet wide; the turbine room is 164 feet long by 45 feet wide and the switchboard is located in a separate room 164 feet long and 15 feet wide. In the annex in which the switch compartment is located are also the offices for the engineer and the employes of the power house. The foundations rest on piles of the Raymond concrete construction, 30 to 40 feet long. The walls of the building are made of hollow concrete blocks manufactured by the Lake Stone Company, Washington, D. C. These, with the exception of the window and door lintels, are of a uniform size, 3 by 1 by 1 foot. All the wall and column footings are made of solid concrete, upon which is supported the superstructure of steel.

Boiler Room.

Provision has been made in the boiler room for 24 Babcock & Wilcox boilers, but at present only 16 are installed. The boilers are arranged in batteries of two, in four rows, forming two firing aisles, which are at right angles to the generating room. Four boilers provide steam for each turbine. Equalizing headers are installed, insuring against shut-down in case of accident to the piping system. The boilers are arranged in groups of eight to each one of the three 12 by 200 foot Webber reinforced-concrete chimneys, four boilers having one breeching in common. Each breeching is provided with an automatic damper-regulator.

The boilers are designed for a working pressure of 175 pounds per square inch. Each has a total water-heating sur-

face of 6,040 square feet. They are fitted with Babcock & Wilcox superheaters of the 2-loop type, each having a heating surface of 1,180 square feet, and capable of superheating to 150 degrees F. Roney stokers 12 feet 6 inches wide, having a grate area of 111.8 square feet, are installed. A Westinghouse simple engine is provided for operating the stokers of every two boilers by means of a weigh-shaft extending across the front of both.

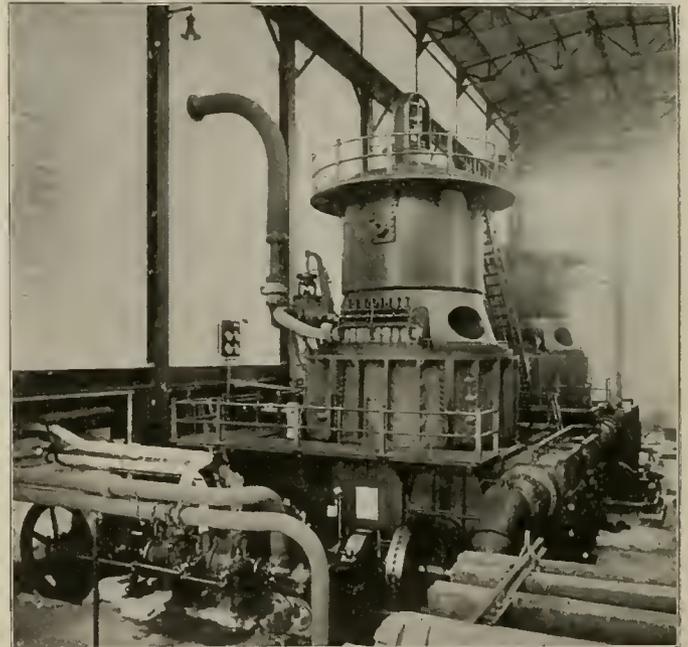

Coal and Ash-Handling Apparatus.

The coal will be fed to the stoker hoppers by gravity from steel coal bunkers suspended from the steel superstructure above the boilers. These bunkers have a capacity of 650 tons each and are filled by belt conveyors manufactured by the McGarlin Conveyor & Belt Conveyor Company. The conveyors have a capacity of 40 tons per hour. Reinforced concrete ash hoppers are installed in a similar manner between each end row of boilers and the boiler-room walls. These will have a capacity of approximately 50 cubic yards each.

Piping and Pumps.

Steel pipes and semi-steel flanges and fittings have been employed throughout the piping system. The Van Stone flange which is of the loose type is standard. The leads from all the boilers are 7 inches in diameter and are connected to the main header system by means of flexible bends as seen in the illustration of the main piping system presented herewith. The main steam header is 12 and 14 inches in diameter, depending on the number of boilers which discharge their steam into it, as is shown on the high-pressure piping plans.

An equalizer pipe 14 inches in diameter connects all the

Potomac Electric Power Plant—General View of Turbine Room, Showing Two of the 5,000-Kilowatt Units with Condensing Auxiliaries.

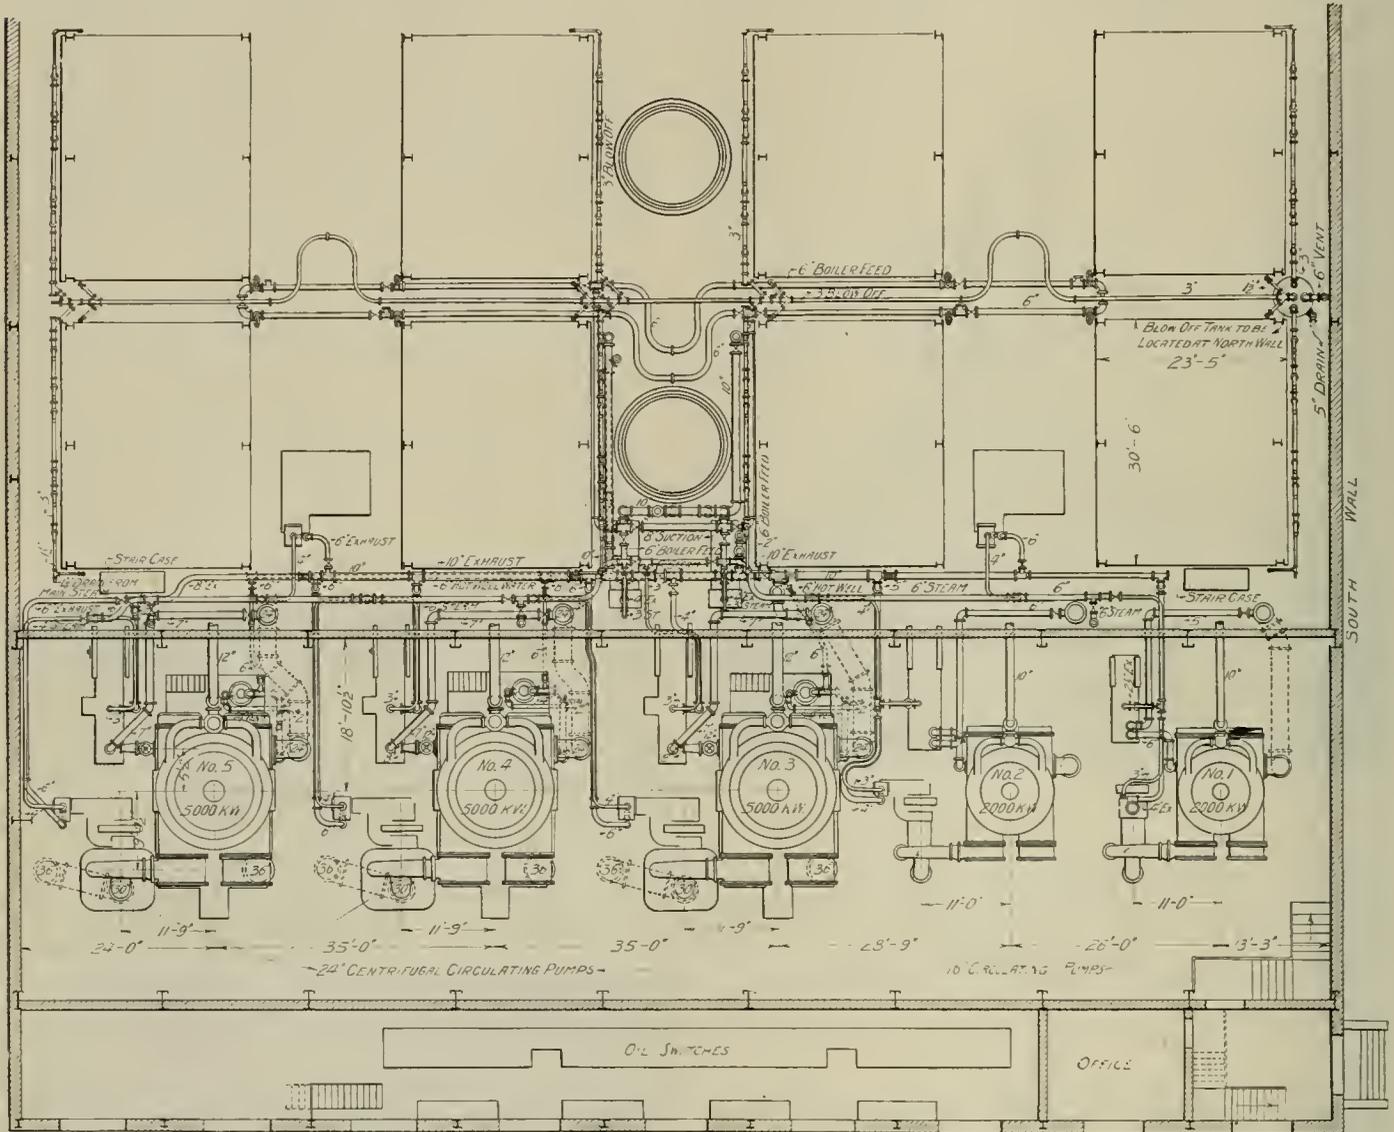

batteries of boilers. An examination of the illustration will show that regardless of where a break took place, under the most unfavorable conditions, not more than three boilers could be disabled at one time.

As the steam in normal operation in a superheated condition and a small amount of water passing to the turbines will cause no serious difficulty, it was not deemed necessary to install separators on the pipe line. To drain the pipes, however, a drip system was installed which is fitted with four 1¼-inch Squires steam traps, which are placed in the basement of the boiler room. Return water from these drips is passed into the feedwater heater.

The auxiliary header is all of 6-inch pipe. The main auxiliary header draws steam from the 14-inch header by taps at three points, and is provided with a drip system and two $\frac{3}{4}$ -inch taps. All the auxiliary piping as well as the blow-off and feed piping has been placed in the boiler-room basement, thus preventing the liability of accidents, and making it more accessible for repairs. Loss of heat is prevented by a covering of 85 per cent magnesia which is fitted to all the live steam piping.

Two Warren-Webster open feedwater heaters have been

direct-connected to a 15-horsepower General Electric three-phase 220-volt induction motor. The discharge from the hot-well is led to the feedwater heater. Laidlaw-Dunn-Gordon dry-vacuum pumps 12 by 25 by 18 inches, making 125 revolutions per minute, are installed to remove the air and vapor from the condensers. The vacuum pumps for the 2,000-kw. turbine are 10 by 22 by 18 inches, 125 revolutions per minute, and of the same type and make as the larger units. The step-bearing pumps are 9 by $3\frac{1}{2}$ by 10-inch Worthington duplex pumps, and a 30-gallon pressure storage reservoir has been provided

Potomac Electric Power Plant—General Arrangement of Turbines, Piping and Boilers.

installed designed to heat the feedwater from 80 degrees to 205 degrees F.

Pumps.

Two Epping-Carpenter horizontal duplex feed pumps 16 by $10\frac{1}{4}$ by 16 inches have been installed. These feed pumps, which are controlled by Ford feed regulators, discharge into a 6-inch ring header from which branches are carried to each boiler.

The circulating pumps for the condensers of the 5,000-kw. units are 24-inch Worthington centrifugal pumps direct-connected to a medium-speed Harrisburg engine with cylinders 12 by 14 inches, making 250 revolutions per minute. A 16-inch Worthington centrifugal pump and Harrisburg engine are provided for each of the condensers of the 2,000-kw. turbines.

The condensation from the condensers is handled by a vertical-shaft, 4-inch, two-stage Worthington turbine pump

to guard against failure of the pumps. Three are provided at present, but provision was made for installing another pump when the additional turbine units are added. The house pumps are $7\frac{1}{2}$ by 10 by 10-inch Epping-Carpenter steam pumps and the two auxiliary pumps are of the same manufacture, but are only 6 by 4 by 6 inches.

The valves on all the main lines are of Chapman manufacture and the 24-inch atmospheric relief valves on the turbines were furnished by Worthington.

The feed pumps, feedwater heaters, steam traps and the exciter units are located in a part of the boiler-room basement which is separated from the remainder by a hollow concrete-block wall.

Main Generating Units.

The foundations for the turbines are not built on piling as are the walls, owing to the arrangement of the circulating

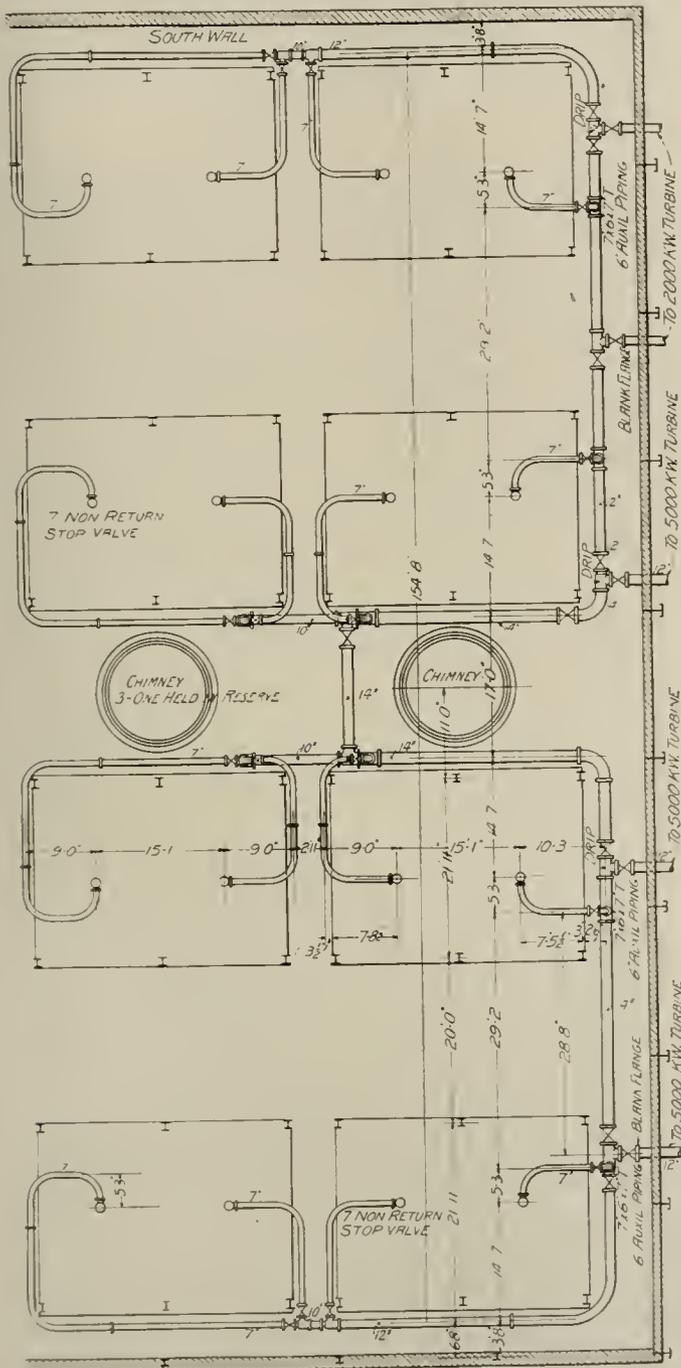

water conduit which passes through the turbine foundations and extends the entire length of the building. These conduits, which each have a cross-sectional area of 40.5 square feet, are constructed of concrete in which are embedded a large number of rails, thus uniting all the foundations, preventing the uneven settlement of the turbines and also distributing the load over a larger area. There will be eventually three

valve. The atmospheric relief pipe is taken out of the condensers instead of from one of the intermediate stages, as was the former practice as exhibited in the turbines at the Old Colony Street Railway plant in Providence.

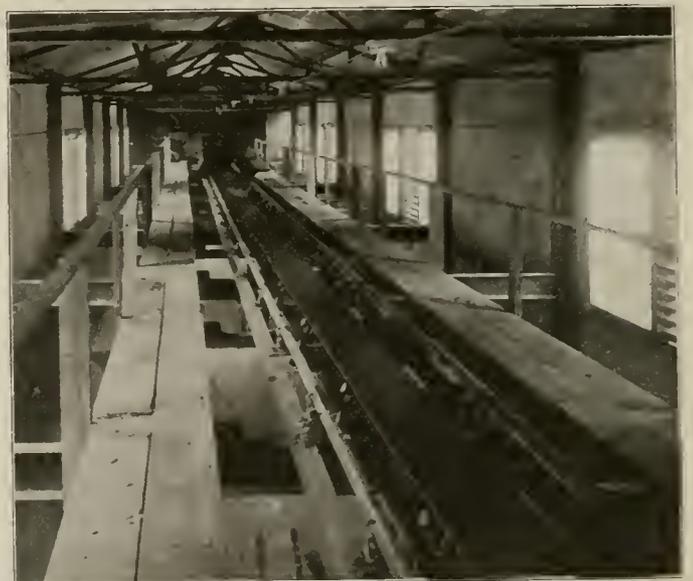

The generator room is served by a 50-ton traveling crane. There are two General Electric exciter units direct-connected to 12 by 15 Harrisburg engines running at 250 revolutions per minute. These are installed under the boiler room. A 1,600-gallon Turner oil filter and storage tank has been installed in the boiler-room basement for handling the oil supply.

Switchboard and Electric Wiring.

The electrical bay, as previously stated, is 15 feet wide and extends the entire length of the generating room. This annex is three stories high. In the first floor, which is flush with the generating floor, are located the manholes for the generator leads and the outgoing cables. These are run in double-duct tile conduits on the side of the wall, whence they lead by underground conduits to the various substations and to the generators. The field rheostats are also located in this room. At one end are located toilet and locker rooms and shower baths for the engine-room employes, the toilet,

Potomac Electric Power Plant—Plan of Main Steam Piping.

Potomac Electric Power Plant—View from Monitor over Boiler Room, Showing Coal-Handling Apparatus and Conveyor over Coal Pockets.

5,000-kw. Curtls turbines and two 2,000-kw. Curtis turbines, but at present only two of the 5,000-kw. turbines have been installed and the two 2,000-kw. turbines.

The turbines are of the vertical, base-condenser type. The generators are of the standard 4-pole revolving field turbo type designed for 25-cycle current at 6,600 volts. The speed of all the generators is 750 revolutions per minute.

The cooling surface in the surface condensers is 4 square feet per kilowatt. Each turbine has an atmospheric exhaust 21 inches in diameter fitted with an atmospheric relief

shower baths and lockers for the firemen being located in the east end of the boiler-room basement. The ceiling of this room is 9 feet 5 inches and above it is a gallery on which are located the oil switches which control the generators and outgoing feeders.

The main generator switchboard is found on the second gallery directly above that on which the oil switches are located. A division wall separates the entire switching compartment from the main generating room, but is provided at the upper switchboard gallery with large openings which afford a clear view of the generating-room floor.

The first attempts at turning the current into the new electrical overhead system of the New York New Haven & Hartford Railroad between New York and Stamford, Conn., are reported to have set up induced currents which seriously affected the transmission of messages on the telegraph and telephone wires within 50 feet of the track.

Twenty-four employes of the Cincinnati Traction Company who have been voted by their fellow-workers the most popular will be sent on a sight-seeing tour of the eastern cities during June at the expense of the company.—Third Rail.

PERSONALITY IN HANDLING EMPLOYEES.*

BY H. H. VREELAND, PRESIDENT NEW YORK CITY RAILWAY COMPANY.

The New York City Railway Company was employing several thousand men when I came to it, but I found that they were constantly changing. Practically the entire force would renew itself every two or three years. There were not 50 men who had been with the company five years. At that time, if an employe had committed a minor offense he would be laid off for a couple of days. No account was kept of the affair, and as soon as he was back at work the matter was forgotten. I heard repeatedly of division superintendents discharging men under them whom they had never seen; and the man was given no chance to defend himself.

It was in 1895 that our record system began working. The improved conduct of the men was wonderful. The knowledge that facts concerning their ability, and their disposition to make use of this ability, were placed on record, brought a new interest. The men were well aware that their errors were placed against them, but they also knew that statements relating to their good conduct and efficient service had space in the record.

The most marked effect of installing this system, an effect which has continued throughout its life, is in bringing out the staying qualities of the men. Before these personal records of the employes were started, as I have said, there were not 50 of them who had been with the company five years; now 50 per cent have been in the service that length of time. The gold bar on a motorman's or a conductor's sleeve is a common sight today.

Trials of Accused Employes.

A man would fight now to keep his record clean; while prior to the installing of this system the same man would have thought nothing of being suspended for a few days. Punishment by suspension is a final warning, occurring but once before discharge. The general system of suspension is a thing of the past among the forces of the New York City Railway Company.

If an employe is accused of misconduct or neglect he is brought up for trial. An opportunity is given him to secure all the witnesses possible, even if he has to take two or three days in finding them. When everything is ready, the division superintendent tucks the volume of the records containing this man's service under his arm and goes to the "court" room and holds the "trial." The division superintendent is both judge and jury in most cases; and as he has, in all probability, never seen nor heard of the man on trial, there is nothing to influence the decision but the actual facts in the case. If the employe is acquitted he is paid for all the time lost during the trial. Should he be found negligent to a certain extent, but not sufficient to cause his discharge, he is fined only for the time consumed by the hearing of the trial.

Sources of the Information.

The sources of our information, it may be said, are only two: the public in general and our officials in particular—rather a complete information bureau.

Often patrons of our lines will come to me, or write a letter, saying they had been riding with the same conductor every week-day morning for a number of months or possibly for two or three years. They had noticed at various times how courteous he was and careful to avoid all possible damage to the company's property. First of all, we would endeavor to find out whether this statement was above suspicion or if the person had been prompted to do this by the conductor. If it proved to be genuine, the statement which had been made, along with the informant's name, would be entered on the employe's page to whom it related.

In addition to this general information there are the complaints and commendations made by the officials of the company, as they come in contact with the employes.

It is the custom for the superintendent of a division, or his assistant, to see each man personally in reference to any charges which may be brought, in order to prevent the employe from being the victim of an unjust accusation. It also does away with any uncertainty in the employe's mind as to how he stands with the company. In this way, so far as is possible, an effort is made by the superintendent to keep in personal touch with his men and at all times to accord them a hearing.

Promotion Dependent on Good Record.

The New York City Railway Company never considers a man for promotion until he has been in its employ for five years. It takes that long to know a man. And this does not seem unreasonable when one considers the many

thousands of employes who are scattered over several hundred miles of tracks at all hours of the day and night.

Yet it is from the eligible men that we fill the higher positions, for it is our policy to take the men from the lower ranks and appoint them to the openings in the higher grades of the service, in preference to choosing outsiders to fill such vacancies. Whenever the vacancies occur the fact is made public on the bulletin board so that candidates may have an opportunity to file their applications. In determining their fitness for the position involved, their records are very carefully gone over. From the list of the apparently eligible ones those men are chosen who seem to give promise of most satisfactorily meeting all requirements. These are promoted on probation and if they prove their ability to perform the new duties they receive permanent appointments.

Records Open for Inspection.

Another cause which stimulates the men in their work is the fact that the records are always open for their inspection. They can find out at any time just what the company knows about them; and this in actual facts and not general impressions. We often have requests from the police and fire departments for information relating to men who have applied to them for appointments. Applicants for police and fire department service are more desirable when recruited from street railway ranks, for they are as a class very well conditioned and disciplined, and are accustomed to handling crowds and unusual situations arising in the busy streets.

These personal records are entered in volumes, approximately 11 by 15 inches, containing 800 pages each, closely ruled. These pages are indexed and a page is reserved for each man.

The first entry is that of the name, date of birth, date of appointment, the capacity in which he serves and the division to which he is assigned. Notations are then made in chronological order of any facts which are reported regarding the fidelity with which this employe's duties are performed; the violations of which he may be guilty; the regularity and punctuality of his attendance, and complaints and commendations made by the officials of the company, or received from outside sources. There are also recorded whatever disciplinary measures are adopted from time to time, the date of his promotion, or the reverse, and any information reaching us which throws light, either directly or indirectly, upon the man's habits, personal conduct and efficiency.

In the case of employes who remain in the service for a number of years, it is obvious that the records become somewhat voluminous. To facilitate their examination the use of colored inks has been adopted when making entries of a particular character.

On the first of each month statements are sent to me of the number of men hired and discharged. Those among the latter who have been with the company for more than a year will have their records sent along so that their standing during the period of their employment may be examined. This presents another safeguard against a man being removed from his place through any mistake or prejudice. This rule is carried out regarding the entire 15,000 employes.

This system is now employed by railroads controlling 90 per cent of the trackage laid in this country. The opinion is general that it has gone far to solve one of the problems which ever confronts the employer of great numbers of men—the ability to know them. To me, the use of this record is as great a benefit as it is to our men.

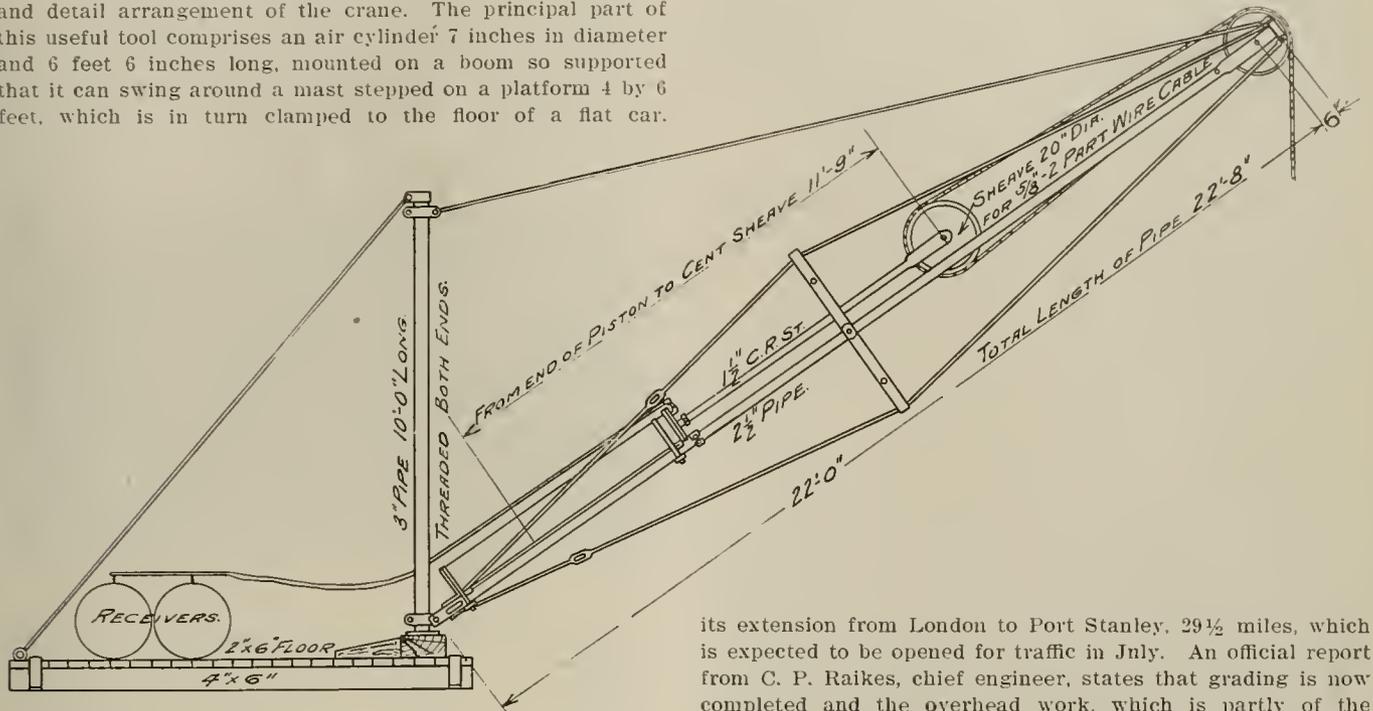

Cement Insulated Trolley Hangers.

S. H. Anderson, chief electrician of the Pacific Electric Railway, Los Angeles, Cal., has been experimenting with a novel type of insulated hanger for trolley construction. The variation from the present type of hanger consists in the use of Portland cement as an insulating compound. The outside or shell of the new type of hanger will not differ from the design now generally adopted. The interior stud, however, which supports the ear will be made in a die in the form of a spool with the threaded portion as an extension from the face of one end. This spool-shaped piece will be centered in the shell and the interior of the shell then be filled with Portland cement. Insulation will be provided by covering the stud with two or three coats of enamel baked on so that it will be unaffected by water. The cement which will replace the usual insulating material will therefore not be called upon to act as a dielectric, but only to perform the mechanical duty of retaining the hanger bolt in the position in the center of the shell. It is expected that this method of construction will effect a saving in first cost.

*Abstract of article in System.

AN AIR-OPERATED YARD CRANE.

The air crane shown in the accompanying illustrations was built in the shops of the San Francisco Oakland & San Jose Railway (Key Route), Oakland, Cal. It has been of considerable value in handling material in the general storage yards. The line drawing will serve to give the dimensions and detail arrangement of the crane. The principal part of this useful tool comprises an air cylinder 7 inches in diameter and 6 feet 6 inches long, mounted on a boom so supported that it can swing around a mast stepped on a platform 4 by 6 feet, which is in turn clamped to the floor of a flat car.

Key Route—Air-Operated Crane as Mounted on Flat Car.

Fastened to the end of the piston in the air cylinder is a 20-inch sheave, carrying a 3/8-inch wire cable, which passes over the top of a second fixed sheave at the end of the long boom.

By means of suitable tongs fastened on the free end of this wire cable and a supply of air from the motor-driven

EXTENSION OF THE SOUTHWESTERN TRACTION COMPANY.

The Southwestern Traction Company of London, Ont., which has had a line in operation between London and St. Thomas, 18 1/2 miles, for the past 12 months, is now completing

its extension from London to Port Stanley, 29 1/2 miles, which is expected to be opened for traffic in July. An official report from C. P. Raikes, chief engineer, states that grading is now completed and the overhead work, which is partly of the bracket type and partly double-pole span construction, is finished as far as Union, 26 1/2 miles. Sixty-pound rails are used throughout. The steepest grade is 4 1/2 per cent. A power house of 1,000-horsepower capacity is located at London, and contains 10,000-volt, 3-phase generators, operated by vertical compound inclosed engines, operating at 375 revolutions per minute. Three substations are now under construction. The equipment for the substations and the cars is fur-

Key Route—Air-Operated Crane Handling Track Material in Yards.

compressor mounted on the platform, it is possible to load and unload rails or other heavy supplies with comparatively little manual labor. Current for the operation of the air compressor motor is obtained from the trolley through a hook-stick connection. It is necessary to clamp the flat car to the track in some manner in order that the heavy weights at the end of the boom may be more steadily handled than would be the case if the platform were free to move.

nished by the Canadian Westinghouse Company, and the overhead and track equipment by the Canadian Electric Traction Company.

The original line to St. Thomas has three steel bridges with spans of 60, 120 and 180 feet. Six double-truck cars with a seating capacity of 44 are now operated on a 55-minute schedule, with a 5-minute layover at each end. Six new cars with a capacity of 54 passengers are now being delivered for

the new line to Port Stanley, on which a similar schedule will be maintained during the summer months. During the remainder of the year this section will be operated on a 2-hour headway.

Surveys are now being made for another extension from Lambeth to Delaware, six miles, and construction is to begin in August.

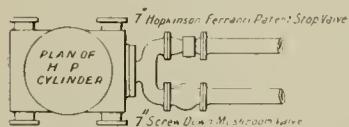

F. G. Rumball is president and S. W. Mower general manager of the Southwestern Traction Company, with offices in the Bank of Toronto chambers, London, Ont.

VALVES OF REDUCED DIMENSIONS.

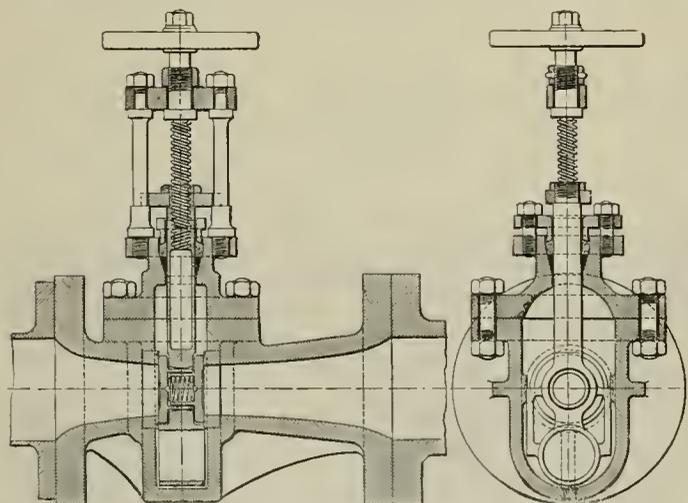

Mr. S. Z. de Ferranti has recently invented a stop valve for steam and fluids at any pressure, which is less than half the size and weight of the ordinary mushroom or straight-way valves. This valve has been perfected by J. Hopkinson & Co., Huddersfield, Eng. It has been demonstrated by a large number of practical experiments that the drop in pressure through a mushroom or gate valve of ordinary construction is about three pounds greater than that through the new valve.

To demonstrate this a test was made on a 17 by 34 by 36 inch vertical compound engine, piped to the boiler by a double pipe line, one branch of which was fitted with a screw-down globe valve, and the other with a Hopkinson-Ferranti valve. It was found that with the mushroom valve closed and the Ferranti valve open the initial pressure in the cylinder at full loading under the same conditions was three pounds higher than with the Ferranti valve closed and the mushroom valve open.

These results are accomplished by locating the valve at the throat of a Venturi tube. The principle made use of is that governing the flow of steam through converging-diverging nozzles. It has been found that in passing through the converging portion of the nozzle the potential, or heat energy, in the steam is converted

Hopkinson-Ferranti Valve—Arrangement of Valves During Test.

Hopkinson-Ferranti Valve—Sections Showing Construction of Valve.

into kinetic energy and in leaving through the diverging mouthpiece the kinetic energy is again converted into potential energy with practically no loss of pressure, provided the ratio of the pressure at the mouth to that at the throat of the converging nozzle is comparatively small.

Attempts have been made to use this principle for valves on large water mains, but it was found that the drop in pressure caused by eddies and friction in passing through a common gate valve was so great that little of the kinetic energy in the water was returned to the potential form.

To overcome the difficulty arising from even a slight amount of roughness or unevenness at the throat, the new valve is built so that the gate when raised to open the valve is replaced by a smooth continuous tube. When the valve is full-open a perfectly smooth passage is presented for the flow of steam.

The valve discs are so mounted that they are free to rotate and move. They wipe over the seats each time the valve is moved and thus keep themselves free from deposit and prevent the wearing of ridges in the valve seats.

An advantage presented by this valve is that it halves the possible leakage, since the circumference of the valve seats is only half that of an ordinary valve. The reduction in size also prevents warping under high superheat, and thus further reduces the leakage. As the valve is only half the diameter of an ordinary valve, it has but one-fourth the area and need only be moved half the distance of an ordinary valve. Therefore the work done in opening or closing the valve is but one-eighth that required for an ordinary valve of the same capacity. Owing to the form of the valve a graded opening is secured preventing any sudden rush of steam. This makes a by-pass valve unnecessary. The steady flow of steam through the nozzle of this type of valve tends to reduce considerably the vibration of steam pipes. A reduced loss of pressure on the pipe lines is also secured. The reduced size and weight makes the new valves cheaper to install and lessens the danger of valve chambers exploding.

A further important advantage secured by the use of these small valves is that the flanges of the valves can be made small enough and with a small enough bolt circle to connect directly with ordinary pipe flanges, thus avoiding the necessity of extra large flanges where the pipes are attached to valves.

IMPORTANT CONSOLIDATION DESIRED IN MASSACHUSETTS.

By petitioning the Massachusetts railroad commission for permission to consolidate, the Springfield Street Railway and the Western Massachusetts Street Railway have opened the way to a comprehensive service in the Berkshire and Connecticut valley regions. The completion of the western Massachusetts extension between Huntington and Lee, a distance of 20 miles, will close the last gap in a continuous line of electric roads extending completely across Massachusetts from end to end, making it possible to travel from New Bedford, Newburyport or Boston to Barrington, Pittsfield and Williamstown. This total distance of about 200 miles represents nothing remarkable at present in the way of through service, but the possibilities of a more centralized management suggest an important future for through service in Massachusetts.

If the petition is granted, which seems probable at this writing, the New York New Haven & Hartford Railroad will control electric roads extending throughout the western and central parts of the state as far east as Worcester. There can be little doubt that the welding of these local systems will result in generally improved physical conditions and enlarged through service. The varied topography of the country through which the interurban lines are operated adds greatly to their attractiveness for tourist travel, and the attention paid to this class of business in eastern Massachusetts at the present time warrants the belief that through cars between Boston and Pittsfield, certainly between Boston and Springfield, will not be delayed many years longer. Considering the developments in the middle west, and especially the distances traversed by through cars, these eastern projects look somewhat commonplace; but, when the nature of the country, the character of the travel, the lack of motive power and rolling stock standards, and the present separate managements in Massachusetts are taken into account, the possible gains from consolidation are seen to be of great public benefit. Com-

petition with steam railroads flourishes in the relatively short routes of eastern Massachusetts; how far this will extend westward is largely a matter of physical limitations to high schedule speed.

TEMPORARY HOODS FOR OPEN PLATFORMS.

At Scranton, Miss., where the Pascagoula Street Railway & Power Company's line is located, there are only a few days

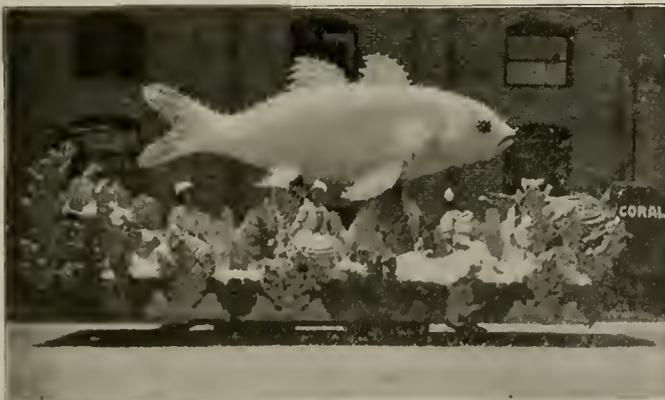

Car Equipped with Temporary Vestibule.

during the winter months that a closed cab is desirable. Therefore it is not considered profitable to provide vestibuled cars for operation during this short period. The cars are, however, fitted with temporary vestibules, as illustrated. These have been found very satisfactory. The attachment consists of a canvas hood, fitted with windows at the front and sides. This is fastened to the car by carriage buttons. A steel rod located at the front of the dash holds the canvas away from the controller and brake handles.

FIESTA FLOATS AT LOS ANGELES.

During April of this year the annual fiesta parade took place. In this celebration, fostered by the business and com-

Los Angeles Fiesta Float Built on the Platform of a 4-Wheel Motor Car.

mercial interests of the community, were a large number of especially attractive floats carried on single-truck motor cars. The accompanying illustration of one of these floats will serve to show how elaborate were the decorations for this event. As a substantial contributor to the welfare of the enterprise, the Los Angeles Railway Company furnished the railway equipment and car crows. Each float, of which there were some 50, was built upon the floor of a single-truck motor car, originally of the cross-bench open type. The decorating scheme

used this year included a series of floats illustrative of the various precious stones. A halftone engraving from a photograph of the float representing the coral is shown.

A ONE-MAN DRUM CARRIAGE.

As a general rule cable drums are moved about on common trucks which have no facilities for handling such cumbersome and heavy objects. Consequently the labor required in loading and unloading the drums from the trucks and moving them from place to place is much greater than it should be with a truck built especially for this purpose.

The accompanying illustration shows such a truck manufactured by John Ruscoe & Co., Limited, Manchester, England. It is built of steel and consists of an inclined plane with suitable bearing blocks for the spindle of the drum and a small crane with reduction gearing, by means of which the supports can be moved along the inclined plane. At the rear of the inclined plane are steel drop shoes which are let down during the process of loading and unloading, at which time the carriage stands on four legs, thus relieving the horse of any burden. It is stated that one man can easily load a 4-ton drum on this truck in four minutes and unload it in somewhat less time.

The framework is built to take drums up to 7 feet 4

A One-Man Drum Carriage.

inches in diameter and 3 feet 11 inches wide. The weight of the truck in proportion to the load which it carries is very much less than that of an ordinary truck used for this purpose, consequently one horse can easily pull a 4-ton drum when mounted on this carriage. Thus by reducing the number of horses and men required to load and move cable drums a saving of 60 per cent on the cost of trucking is said to be accomplished.

The traffic on the suburban electric lines out of Philadelphia showed a large increase last week on account of an increase in suburban fares on the Philadelphia & Reading Railway.

The Kokomo Marion & Western Traction Company has inaugurated Sunday excursion rates on its lines from Kokomo to Marion, Ind., and the first Sunday taxed the capacity of the road to the fullest extent. If the same patronage continues through the summer, the innovation will prove a good financial undertaking.

Results of tests of wooden poles for carrying overhead transmission wires were given in a paper submitted recently to the Institution of Electrical Engineers, London, by C. J. Wade. The tests proved the flexibility and recuperative power of wooden poles after severe deflections from the perpendicular, caused by abnormal stresses.

BOOK TABLE.

The Engineering and Electric Traction Pocketbook. By Philip Dawson. Fourth edition. London, 1906. Published by Engineering, 36 Bedford street, Strand, W. C., and New York, by John Wiley & Son, 43-45 East Nineteenth street. 1,053 pp., illustrated, 4½ by 6¾ inches. Leather. Price, \$5.00, net.

The subjects pertaining to electric traction engineering are very completely covered in this excellent volume, though naturally the contents are based more upon English and European practice than that of America. The book will, however, be of great value to traction engineers and many interesting and educational ideas may be gathered from it. This is especially true of the chapters on overhead construction, subway and track construction.

The first part deals with materials of construction for track and roadway, presenting many types of construction illustrating the best European and American practice. Valuable tables relating to track construction, and data for laying out curves and special track work are presented.

Chapter II deals with rail bonding and rail joints and presents the best types of bonds and joints found in service.

Chapter III deals with the overhead distribution system, many tables being presented for calculating feeders, etc., and a large number of cuts are used to illustrate the standard types of fittings and accessories used in overhead construction. Data are given of strength and insulation tests of strain and line insulators, which, no doubt, will be found of value.

Besides presenting a vast number of minor details, illustrating the mode of constructing and erecting pole lines and overhead work, tables and data pertaining to wooden and steel poles, giving the strength, weight, cost and standard specifications for poles, are given, with notes on their preservation. American engineers will find the material presented on the design of artistic trolley poles of especial interest and value, as American engineers have been rather lax in their attention to the artistic details of overhead construction.

Section 2 treats of the power station. In the first chapter the thermodynamics pertaining to the engine and boiler room is given, with notes on superheated steam and entropy and indicator diagrams. The theory and the design of the steam engine and the steam turbine are presented. Tables accompany the theory showing the steam consumption of engines and turbines under varying conditions during tests and in actual practice.

This section also deals with the powerhouse auxiliary, interesting notes being given on condensers, cooling towers, pumps, etc. The design of steam piping and piping auxiliaries is excellently treated.

Section 3 includes chapters on the design, construction and operation of steam boilers, considerable space being given to the design and care of auxiliaries, such as boiler settings, grates, safety valves, gauge columns, valves and blowoff cocks. Notes on superheaters, force draught systems, ash and coal conveyors, and details of water-softening plants are dealt with in separate chapters. Economizers, feed-water heaters, chimneys, the results of tests and data on the practical operation of representative boiler plants are presented with notes on the burning and properties of various kinds of fuels.

Section 4. The theory of electric generators and motors is briefly presented and tables showing the values of the units of electricity are given. A large number of illustrations, curve sheets and tables give the details of construction of generators and motors, as well as their characteristic curves under various conditions of operation. The value of insulating materials is given and many valuable notes on the care and management of dynamos, motors, motor-generators and rotary converters. Particular attention has been given to the subject of alternating-current generators, motors and transmitting apparatus, many illustrations and diagrams being used to show the various connections used for the polyphase transmission system.

Switchboards and electrical indicating instruments form

the subject matter of Section 5. The design of low and high tension switchboards is very completely covered in this section and the most improved forms of high-tension oil switch for local and remote control are illustrated. Various control systems are described, as well as electrical measuring instruments, synchronizers, lightning arresters, etc.

A very comprehensive treatment of gas engines, gas producers and accessories required in a gas engine installation is given in a very thorough manner in Section 6. As this is the first extended treatment of this comparatively recently introduced prime mover it will, no doubt, be of great interest and value to designing engineers.

The succeeding chapters deal in a very thorough manner with powerhouse buildings, storage batteries, surface and conduit systems, rolling stock and motors, train resistance, etc. An especially valuable part of the book is that which treats of the efficiency, maintenance and depreciation of electric railways.

Long-Distance Electric Power Transmission. By Rollin W. Hutchinson, Jr. New York, 1907. D. Van Nostrand Company, 13 Murray street. Cloth, \$3.00.

High-tension transmission lines are now becoming so numerous that a book treating of this subject is particularly timely and valuable. As a greater part of the long-distance transmission systems serve hydro-electric installations, the author has wisely included in this volume the laws of hydraulics dealing with the flow of water and the construction of dams, canals and flumes, besides introducing the theory and operation of turbines, impulse wheels and the auxiliary governing apparatus. A considerable amount of information is given on the proper gauging of streams, determining the probable minimum flow and the designing of dams, flumes, etc. A large number of cuts illustrate the various types of flumes, dams and canals usually employed, showing by half-tone reproduction from photographs of systems actually installed many details, such as devices for removing leaves and twigs from flume lines, methods of overcoming ice difficulties and methods of constructing and anchoring flume lines. Though most of the information given on construction, operation and efficiency of water wheels and water wheel governors is taken from the catalogues of the various manufacturers, it is collected in convenient form, which makes it of value to the busy engineer.

Various types of alternating-current generators are shown and described, including a few curve sheets showing the efficiency and characteristics of high-tension alternating-current generators and transformers. The major portion of the book treats in detail of high-tension switchboard and pole-line apparatus. Special chapters are devoted to high-tension oil and air brake switches, lightning arresters and synchronizing instruments. The effect of the power factor on the cost of transmitting power and the causes for low power factor are mathematically discussed, including also calculations on the most economical size of transmission wires and the relation of power factor to the capacity and inductance of the lines. This and other portions of the book require a knowledge of the calculus and considerable knowledge of electrical engineering is also assumed. Particular attention has been given to those details almost wholly neglected in previous works on electrical transmission, viz., the practical features and details of constructing pole lines. In this portion of the work calculations on economical pole-line construction are included, showing the electrical leakage with various pole spacings and its effect on the cost of power transmission. The chapters on transformers, motors and rotary converters are much the same as those chapters in most books on electrical engineering. The final chapters in the book describe some practical plants which are in actual operation, giving details of the architectural designs of the buildings, arrangement of the machinery, dams, etc., and include a few notes on the parallel operation of plants, regulation and cost of electrical power transmission.

PIPING AND POWER STATION SYSTEMS—XLII.

BY W. L. MORRIS, M. E.

City Water Connections to Boiler Feed Main—Class K 5.

If the power station has its own water supply the city water supply should not be connected with the boiler feed main. The pressure carried on a city main is not sufficient for boiler feeding. This necessitates joining the city water connection to the auxiliary feed main. Here the supply can be used under a low pressure without interfering with the regular boiler feeding. If the plant is run with city water only then this latter connection should be used, since it enables the operator to wash or fill boilers without running any pump.

Figure 283-(K 5—1) shows an auxiliary main arranged so that under ordinary conditions it will be supplied with city

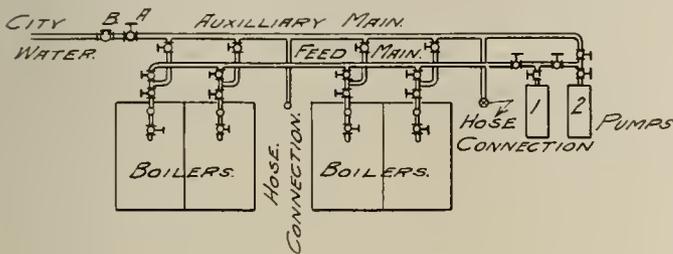

Figure 283-(K5—1).

pressure as far as the pumps, thus making this water available for wetting down ashes, etc. When pump No. 2 is supplying the auxiliary main with water under high pressure for operating turbine tube cleaners there will be no water at high pressure available as far as valve A. This, however, would not be a serious objection in most boiler rooms. To avoid damage to the low-pressure city lines, if an operator should start the pump without closing the valve, A, a check valve, B, should be fitted in the low-pressure main, as shown.

Feedwater can in an emergency be obtained by means of a fire hose if the city fire plugs are properly located. The use of fire hose is, however, poor practice, as it is troublesome to make the connections and shows that the city service has been overlooked.

City Water to Pump Suctions—Class K 6.

Plants which have city water available should have the city service connection of sufficient size to feed all the boilers. All continuously operated plants should have two separate feed pump suction, whether there are two different sources of water supply or only one. Plants having both their own and a city water supply should have the city water delivered directly to the pump suction, as shown in Figure 284-(K 6—1). It is not best to deliver the water into the suction well, since it may be found necessary to empty this well for making repairs.

The city connection may be made quite small, possibly one-third the diameter of the regular suction pipe. Water is delivered through the city lines under pressure, and such lines are too seldom used to justify a reduction of pipe line losses by the use of a large pipe. If a plant is operated entirely on city water there should be two separate city connections, as shown in Figure 285-(K 6—2). To provide this arrangement it may be necessary to use two meters. If two taps are not provided the plant might be without water if the city main to which it was connected should be shut off for repairs, or for any other cause. Figure 285 shows a power plant located at the intersection of two streets and connections made to two mains with two valves in the city mains between the connections. If there were but one valve, either A or B, then it would be necessary to connect with the city mains beyond another valve, as shown by the dotted lines in Figure 285.

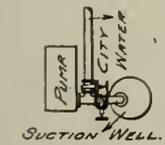

Fig. 284-(K 6—1).

This would necessitate the use of another meter, also shown dotted. By connecting to the mains in this manner water is obtainable whenever it is necessary to shut off the water on both sides of a city valve. The use of two meters permits a more accessible piping layout. It also affords means for repairing any part of the main and yet have one pump in service.

The most satisfactory piping layout is one with two separate suction lines from the pump to the water supply. A valve should be placed between these two suction mains to separate them whether water is obtained from two city or two private sources of supply.

If the suction is taken from two private sources, such as a pond and its tributary stream, they should be from two points which are as far from each other as possible. Thus, if the stream is muddy the suction can be taken from the pond, or, if the pond should be empty, the suction can be taken from the stream. If water is available from only one source, such as a small stream, which is not continuously available

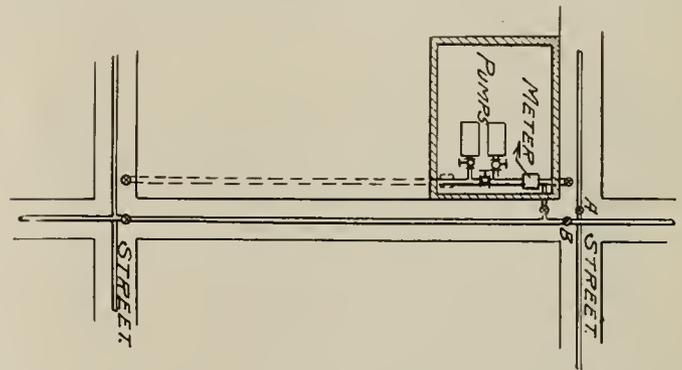

Figure 285-(K6—2).

either because of too little or too much water, which would oftentimes cause it to be very muddy, then another reserve supply is necessary, either in the form of a pond or an artesian well.

City Water to the Heater—Class K 7.

A plant operated entirely on city water should have a connection to the float controlling-valve if an open heater is used, in which case this would be a regular service connection. If the plant has its own water supply it will also have a low-pressure water service and a connection from this low-pressure service to the heater. To supply city water for emergency purposes it is ordinarily delivered to the low-pressure water mains which are connected to the heater.

If these mains are not properly laid out, necessitating their being entirely out of service when repairs are made, it will be more satisfactory as regards reliability to connect the city water directly to the heater. This connection can be a permanent pipe line or a temporary hose connection may be employed if a hose valve is attached to the heater. If the valve is of the proper size to fit fire hose, the water supply during periods of repairs can be taken from a fire hydrant.

City Water to Fire System—Class K 8.

The pressure carried on city water mains is generally low, about 20 to 30 pounds per square inch, and consequently when a large number of streams are taken from a fire hydrant this pressure is almost entirely lost in overcoming the friction in the pipes. Power stations are generally large and high buildings, necessitating the use of high pressure on the fire lines. If city water only is available for fire protection it should be connected to the fire pump suction, the water at such times not passing through the meter. This subject will be taken up more fully in "Fire Protection," Class M.

City Water for Priming Pumps—Class K 9.

Any water may be used for priming pumps, as the quantity used is so small that its quality is immaterial. Priming water should be taken from the city mains only where city

water alone is available, or in plants which have no storage tank to furnish water for this service.

City Water to Hydraulic Elevators—Class K 10.

Water which is suitable for boiler feeding is also suitable for hydraulic rams, etc. It would be necessary to remove any loose sand from the water for either service. If the plant is run with city water then the ram should be of such area that the lowest city pressure would operate it. The resistance of the ram stuffing box and the loss of head due to the velocity of flow are usually so great that the theoretical pressure under the ram should be twice that which is actually necessary to operate it. This subject will be taken up more fully in "Hydraulic Elevators—Class O."

City Water to Engine Journals—Class K 11.

City water instead of the regular station water would be used for cooling journals if the latter supply were too warm to be effective. Rather than use city water it would be more economical to use a greater quantity of the station water. If city water has a temperature of 50 degrees F. and the station water is 15 degrees warmer and the discharge from the journals has a temperature of 150 degrees F., then the city water is raised 100 degrees, whereas the station water is raised 85 degrees. This difference in practically all such cases is too slight to justify the use of city water.

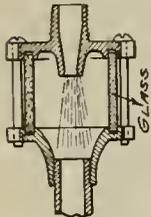

Fig. 286-
(K 11—1).

If city water is used exclusively then it should be discharged into a drip main located so that the water will drain into the heater. Funnels should be fitted so that the drip flow may be observed. If the heater is located too high to permit the use of a gravity discharge, the sights may be made air-tight, as shown in Figure 286-(K 11—1), permitting a back pressure on the engine journals, sights, etc. To avoid the loss of the air confined in the glass body such sights should be placed where there is the least pressure.

Another method of determining the flow is to use in addition to the regulating valve a three-way valve, one discharge being into the heater and the other into an open funnel connected to the sewer. To determine the amount of water flowing the valve can be turned to discharge into the funnel, and again placed in its normal position, thus turning the discharge into the heater.

City Water to the Damper Regulators—Class K 12.

If no other water constant pressure is available to operate the damper regulators city water may be used for this service. Especially is this true if the pressure is low, say about 30 pounds to the square inch. The use of boiler feed-water or steam condensation is extremely objectionable due to the destructive effect on the controller valves.

The working piston of a regulator should be of sufficient diameter and stroke to operate the dampers while under low pressure. The work of moving the damper must be done by one stroke, the return of the damper being effected by a counterweight. Therefore the capacity of the regulator cylinder must be twice that necessary to move the damper alone. If a force of 40 pounds is required to move the damper when in any position, then the effective capacity of the regulator cylinder should be 80 pounds, or twice this, which would be about 150 pounds pressure on the piston rod. If the lowest pressure on the water main from an overhead tank is 15 pounds, the regulator would require a piston about $3\frac{1}{2}$ inches in diameter, a much larger size than the manufacturers of regulators care to furnish. However, if constant and satisfactory service is desired low pressure must be used.

(To be continued.)

According to Power, at Columbus, O., where the water is excessively hard, a water-softening plant with a capacity of 30,000,000 gallons per day is being constructed.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Injury from Fall Due to Tobacco on Station Stairs.

Kaplowitz v. Interborough Rapid Transit Company, 103 New York Supplement, 721.—The supreme court of New York, appellate term, holds that a judgment for the plaintiff in this case should be reversed, and a new trial ordered, the evidence showing that, although there was much dirt upon the stairs, the plaintiff fell on a piece of tobacco, while there was nothing to indicate that the tobacco had been there a sufficient length of time to impute notice to the defendant. It says that the case did not come within the authority of *Cooley v. Trustees of N. Y. & B. Bridge*, 46 App. Div. 243, 61 N. Y. Supp. 1, as in that case it appeared affirmatively that "the occasion of the fall was a pile of dirt, composed of earth, banana peelings, cigar stumps, etc., situated on the fifth or sixth step from the bottom of the stairs, and about 3 inches in depth and 18 inches long," and it also appeared affirmatively that the defendant's servant had, previously to the accident, swept the dirt from step to step—an inference being deducible therefrom that the said servant was responsible for said pile of dirt which caused the accident.

Motorman Entitled to Rely on Orders from Starter.

Doe v Boston & Worcester Street Railway Company, 80 Northeastern Reporter, 814.—The supreme judicial court of Massachusetts says that according to certain evidence a motorman had been given by the starter a clear right of way for a certain run. Acting under this order he went forward and just before a collision the car passed around a curve at a speed estimated by the motorman and other witnesses as from 10 to 40 miles an hour. His declarations contained the further statement that he did not see the other car until it was in such proximity that a collision was inevitable. But while running rapidly and, unable to ascertain if the track was clear until he passed the radius of the curve, under the company's system of operating this portion of its railway it could have been found that this motorman's car had the right of way, and that he had no reason to apprehend that at the same time an eastbound car would be passing over the track at this place. When employed at his usual work and acting under the assurance or order of the person charged by the company with the duty of seeing that the track was clear between the points, the motorman had a right to presume that he could safely proceed. If the track was properly supposed to be clear, the jury could find that the rate of speed was not excessive, and that his conduct while operating the car in the ordinary way, as he appeared to have been doing, was not careless. It plainly could not have been ruled as matter of law that he was negligent, and this question was an issue of fact for the jury's determination.

Good Faith Required to Recover Transfer Penalty.

Nicholson v. New York City Railway Company, 103 New York Supplement, 695.—The supreme court of New York, appellate division, first department, holds that, under Section 105 of the railroad law of that state, which commands that a railroad shall carry for a single fare between any two points on its road "any passenger desiring to make one continuous trip between such points," a person in order to maintain an action to recover the statutory penalty of \$50 for a refusal to furnish a transfer must prove that he or she became a passenger in the first instance in good faith, and for the purpose of going to some point on the line to which he or she wished to be transferred. It says that it will be noticed that only a passenger who has been "aggrieved" can maintain an action to recover the penalty. The plaintiff was not "aggrieved." Indeed, she would have been disappointed, had she received the transfer demanded, because in that event the purpose of her taking the car would have been frustrated. The object of

the statute is to promote the public convenience. It is not to put money in an individual's pocket, unless such individual comes fairly within the provisions of the statute, viz., a passenger in good faith who has been aggrieved by the railroad company's refusal to give a transfer to some point on a connecting line to which he desires to go. Again, it says that the statute is not only limited to a passenger, but to one who desires to go to some point on the connecting line. The statute, therefore, by express provision precludes one from suing for a penalty who has no intent to go to a point on the connecting line, but who takes the car merely for the purpose of putting himself in a position to bring an action.

Demanding Second Fare Not Gross Negligence nor Creative of Excessive Charge.

Robinson v. International Railway Company, 103 New York Supplement, 588.—The supreme court of New York, special term, says that it is provided by Section 39 of the railroad law of that state that any railroad corporation which shall ask or receive more than the lawful rate of fare, unless such overcharge was made through inadvertence or mistake not amounting to gross negligence, shall forfeit \$50. The proof in this case revealed that after the plaintiff had paid one fare and the car had proceeded a short distance the conductor came in again and demanded his fare. It was quite apparent that whatever the conductor did relative to the second fare was done under the impression and belief on his part that the first fare had not been paid. The conductor was simply mistaken about the first fare, and the second fare was demanded through inadvertence or mistake. Such transaction did not amount to gross negligence. There was no proof whatever that the company asked or demanded more than 5 cents for a single fare of this plaintiff. The proof showed that what the conductor did was to demand two single fares of 5 cents each, not 10 cents for one single fare. If the conductor had demanded 10 cents for a single fare a case would have been made out of an excessive charge being made not through inadvertence or mistake. But the second demand for the 5-cent fare being made, under the mistaken belief that no prior fare had been paid for the ride, the provision of the statute did not apply, and the plaintiff's remedy was to recover the overcharge and damages resulting therefrom, not an action for the statutory penalty.

Ejection of Passenger with Expired Transfer Taken on Conductor's Assurance—Rules—Damages.

Nicholson v. Brooklyn Heights Railroad Company, 103 New York Supplement, 310.—The second appellate division of the supreme court of New York says that the jury were at liberty to find from the plaintiff's evidence that he demanded a transfer, which he noticed, upon receiving it, was so punched that the time limit indicated had already expired; that, upon calling this fact to the attention of the conductor and demanding another transfer, he was assured that it was all right; that at the intersection with the line which he desired to take he alighted, boarded the proper car, and tendered the conductor the transfer; that the conductor refused to take it, demanded his fare, and, upon his refusal to pay the fare, ejected him from the car.

It was not disputed that the defendant was bound to give the plaintiff a transfer entitling him to a continuous trip for a single fare, and that for its refusal to do this the plaintiff could have recovered the penalty of \$50 provided by statute. He could also recover any excess fare exacted of him, but it did not follow that he could knowingly board a car with a ticket, which, upon its face, did not entitle him to a ride, and recover for being ejected by a conductor who acted strictly within his duties. The act of the conductor in ejecting him was not wrongful or unlawful.

Passengers must know that conductors cannot dispense with the rules of the company, and, if they do not, the law charges them with such knowledge. The plaintiff knew that

the time indicated by the ticket within which he could be carried on the line to which he intended to transfer had expired, and he had no business to act upon the assurance of the conductor, or to expect that the conductor on the line to which he transferred could take his word in direct contradiction of the ticket. The plaintiff's ejection from the car was not consequent upon the wrongful act of the conductor who issued the transfer, but rather upon his own disregard of the defendant's rules, to which he, as well as the conductor, was subject. As well might the plaintiff recover if the conductor had refused to issue any transfer at all.

The actual damage resulting from such refusal, as a rule, would be measured by the value of the transfer, i. e., five cents. In order to compel obedience to the law requiring street surface railroads to give a passenger a continuous trip over connecting lines for a single fare, the legislature has provided a penalty; but the law does not contemplate that, in addition to that, the passenger may recover for indignities to which he voluntarily subjects himself.

Company Not Liable for Loss of Hand Baggage.

Sperry v. Consolidated Railway Company and another, 65 Atlantic Reporter, 962.—The supreme court of errors of Connecticut says that a suit case belonging to the plaintiff was handed to the conductor when she boarded a car. She took a cross seat near the middle of the car, and the conductor placed the suit case close to the forward end of the rear side seat. Later there was a change of conductors. The new conductor was not told to whom the suit case belonged. He saw an Italian sitting near it, and saw him walk off with it. The court affirms a judgment for the defendants.

To have entitled the plaintiff to a verdict, the court says, it was necessary that there should have been sufficient evidence before the jury to justify them in finding either that the defendants, or one of them, had accepted the baggage under a contract, express or implied, to carry and deliver it as common carriers, or that its loss was due to the negligence of the defendants, or one of them.

It is a matter of common knowledge that electric street passenger cars are never furnished, either in the manner in which they are constructed or in the way in which they are operated, with facilities and means to enable the companies themselves to take into their custody and control the baggage of passengers. The well-known facts that there are in such cars no places for the separate storage of baggage beyond the control of its owners, and that the duties of the conductor and motorman, who are the only agents of the company upon the cars, necessarily prevent them from taking charge of baggage, indicate that the companies do not assume control of such baggage as passengers may bring with them into such cars. When the carrier does not take full possession of the baggage, and it remains under the control of the passenger, the former, in the absence of special agreement, does not assume the common carrier's liability of an insurer, but becomes responsible only when it is shown that the carrier has failed to exercise reasonable care to protect from loss or injury such baggage or property as the passenger has the right to bring with him into the car.

In the present case the conductor was not requested to take the plaintiff's suit case into his charge, and the fact that he took it when it was handed to him, and placed it in the car within the sight and control of the plaintiff, manifestly for the purpose of assisting her, would not justify the inference that he assumed the custody of it.

Nor does the court think that there should have been submitted to the jury the question of whether the defendants exercised reasonable care to prevent the loss of the suit case. It says that it is true that this is ordinarily a question of fact for the jury; but, as in this case the evidence was clearly insufficient to sustain a verdict for the plaintiff upon that question, no error was committed in not submitting it to the decision of the jury.

News of the Week

Electric Railway Accidents.

Seven persons were injured in a derailment of a Fitchburg & Leominster Street Railway car on May 30, near Fitchburg, Mass. The cause is said to have been the spreading of rails on a curve.

A street car of the Birmingham Railway Light & Power Company collided with a train loaded with pots of molten metal at Birmingham, Ala., on June 5. The metal set fire to the car and it is reported that several persons were badly burned.

As a result of the rear-end collision on the line of the Cleveland Southwestern & Columbus Railway, near Elyria, O., on May 30, in which seven persons were killed and several injured, as reported in last week's issue of the Electric Railway Review, the motorman in charge of the car which caused the accident was indicted for manslaughter on June 4 by a special grand jury. W. O. Jackson of Springfield, O., inspector of the state railroad commission, is investigating the accident. It was stated that the two cars were running closer together than the rules permitted and that the motorman of the rear car was looking back and did not see that the car in front had stopped.

Chicago Traction Reorganization.

G. W. Wickersham and L. C. Krauthoff, attorneys for the Chicago Railways Company, have returned to New York without making announcement of the plan of reorganization. The committees representing stockholders of the North Chicago City and the Chicago West Division railroads, underlying companies, want to have the reorganization plan submitted to them before it is presented to Judge Grosscup and Prof. John C. Gray, the arbitrators. They have also demanded that the plan be submitted to them before the stocks of the roads included in the Chicago Union Traction Company are deposited with the Chicago Title & Trust Company in accordance with the terms of the ordinance. This deposit must be made by July 26.

Edward B. Burling, attorney for the committees representing the majority of stock of the North Chicago City and the Chicago West Division railroads, has sent a letter to Messrs. Krauthoff and Wickersham concerning the valuation of the properties of the various companies. The letter asks that certain assurances be given regarding the safeguarding of the interests of stockholders in the underlying companies.

The Illinois supreme court refused on June 5 to grant the petition for a rehearing of the Mueller case.

Brooklyn Subway Authorized.

The rapid transit commission on May 31 voted to authorize the construction of the Fourth avenue subway in Brooklyn. This action was made possible by the presence of Alexander E. Orr, president of the board, who arose from a sick bed to make up the necessary number of votes. The route extends from Chrystie street, Manhattan, across the new Manhattan bridge, and thence by subway through the Flatbush avenue extension and Flatbush avenue to Fourth avenue, and thence to Coney Island and Fort Hamilton. It will be a 4-track line to Fortieth street, Brooklyn. Beyond that two tracks will run to Coney Island and two to Fort Hamilton. The line will connect with the subway loop on the Manhattan side of the river. A resolution was adopted requesting the board of estimate to permit the advertising for bids for construction alone, instead of for construction and operation. It is estimated that the subway will cost about \$23,000,000.

The board of estimate held a meeting on Tuesday and complied with the resolution of the commission. The commission can now advertise for bids for the construction of the subway. As the new public utilities law, which legislates the commission out of office, goes into effect on July 1, it is doubtful if contracts can be let by the present board, but the plans will be in such shape that the new commission may proceed at once.

Hearing on Philadelphia Ordinance.

A hearing on the proposed Philadelphia Rapid Transit ordinance was held before a committee of councils on June 4. Francis Shunk Brown and ex-Judge Gordon made arguments in behalf of the plan of settlement. Mr. Brown said in part:

"It is unfair to compare Philadelphia with any other city, because conditions are nowhere near the same. This city contains 129½ square miles, St. Louis 60, Cleveland 34, New York 42 and Boston 40 square miles.

"Some of the opponents of this ordinance say that there should be a provision of 'no seat, no fare.' That is utterly absurd, and it is also a physical impossibility. Between 5 and 6:30 o'clock in the afternoon there are 100,000 people to be found in the district bounded by the Delaware river and Broad street, and Walnut and Arch streets. Of this number 85,000 are surface car riders. The Rapid Transit company manages to transport this number in an hour and half. It is a greater number than any standard steam railroad carries in a day. To give each of these 85,000 persons a seat would require 2,125 cars, with an individual capacity of 40. Each of these cars would be 36 feet long. To take care of these cars would require a terminal of monstrous size. Should such a terminal be built on Second street it would reach from Vine to Spruce streets, a width of 3,060 feet, and would contain 154 tracks extending back to Front street.

"The Brooklyn bridge congestion in New York, held up as the worst in the world, is not as great as the congestion in this city in the territory I have named. New York only carries 56,770 passengers between 5 and 6:30 o'clock in its congested center, to 85,000 in Philadelphia. To move this New York crowd 403 surface

cars are used, which carry 19,497 passengers, while the elevated and subway, with 92 cars, carry 37,273 riders."

Mr. Brown said that a ride of 25 miles can be secured in Philadelphia for 4 1-6 cents.

Labor Affairs.

The United Railroads of San Francisco has now extended its service to all of its lines that have been reconstructed since the fire, and although there have been occasional disturbances caused by the strikers, the situation continues to improve each day. On Friday of last week the company operated cars from 6 a. m. to 8:30 p. m. Over 200 cars were run, employing over 600 men. The company is now carrying over 150,000 passengers a day and it is stated that no difficulty is found in securing non-union men to operate the cars at 25 cents an hour. Three of the strikers have been arrested on the charge of having short-circuited the trolley and feed wires by throwing a chain over them.

The strike situation at Birmingham, Ala., has presented no important developments. The company is operating cars with non-union men on all its lines and there have been no serious disturbances. It was announced at the offices of the Birmingham Railway Light & Power Company recently that 61 of the former employees had returned to work. The strikers have suggested arbitration, but President Jemison of the company refused to arbitrate, stating that the stockholders were supporting him and that he did not care to employ union men. A general sympathetic strike, ordered by the Birmingham Trades Council for June 3, failed to meet with a very ready response.

The car men employed by the Shamokin & Mt. Carmel Transit Company, operating about 19 miles of track between Shamokin and Ashland, Pa., went on a strike on May 30. The service was completely tied up. The reason given by the men is that the management refused to allow the motormen to sit down while at work.

Indianapolis Meeting of the American Society of Mechanical Engineers.

The American Society of Mechanical Engineers held its spring meeting in Indianapolis, May 29, 30 and 31, in the palm room of the Claypool hotel. The attendance was the largest in the history of the association. Several sessions were held each day and abstracts of a number of papers on technical subjects were read and discussed. The subjects of the papers were: "Ball Bearings," by Henry Hess; "Air Cooling of Automobile Engines," by John Wilkinson; "Automobile Material," by Elwood Haines of Kokomo; "Railway Motor Cars," by E. D. Gray of the American Locomotive Company of Providence, R. I. At the concluding session, which was held at Purdue University, whence the members had been taken on an excursion by the Indianapolis & Northwestern Traction Company, papers were read on "Superheated Steam, or, in Other Words, the Economy of Steam Power," by S. L. Kneass of Philadelphia, H. H. Vaughn of Montreal and Professor Goss of Purdue University. These papers were generally discussed and proved of great interest to the managers of power houses. The members of the association visited the large industrial plants in Indianapolis and expressed themselves as highly pleased with the manufacturing enterprise of the middle west. Prof. F. R. Hutton, dean of Columbia University of New York, is president of the society. A commendable feature of the association meeting was that all papers presented before the convention were read by abstract and the general discussions which followed were made up of illustrations and points in the papers selected by the members about which to interrogate the writers.

Pittsburg & Butler to Handle Express.—It is reported that the Pittsburg & Butler Street Railway will soon establish an express package service to all points on its new line between Pittsburg and Butler, Pa.

American Society for Testing Materials.—The tenth annual meeting of the American Society for Testing Materials will be held at the Hotel Chelton, Atlantic City, N. J., on Thursday, Friday and Saturday, June 20, 21 and 22.

New York Public Utilities Bill Passed.—The New York senate concurred with the house on June 5 in passing the public utilities bill over the veto of Mayor McClellan of New York City, and Governor Hughes signed it on June 6. An abstract of the bill appears on another page of this issue.

Five-Dollar Bill for Carfare Unreasonable.—Justice Ott of Detroit, Mich., has given a decision that a rule of the Detroit United Railway that a conductor is not required to change a piece of money larger than \$2.00, when tendered by a passenger for carfare, is reasonable. The judge based his decision on a ruling of the New York supreme court, which held that the tender of a \$5.00 bill in payment for carfare was not reasonable.

Indiana Lines Must Install Interlocking Switches.—The Indiana railroad commissioners have decided that the half interlocking switches now used by the Indiana interurban lines at crossings with the steam lines are not a sufficient compliance with the law. The commission has notified the interurban companies that complete interlocking switches must be put in, towers erected and a man put in charge. This decision will necessitate the expenditure on the part of the interurban lines of many thousands of dollars.

Spokane & Inland Extends Service.—General Manager J. B. Ingersoll of the Spokane & Inland Railway, Spokane, Wash., has announced the extension of service south from Oakesdale to Garfield and Palouse, about 25 miles. Trains have been operating for some time from Spokane to Oakesdale, and on the branch from Spring Valley Junction to Rosalia. For the present, until the overhead work is completed, trains will run from Garfield to Palouse by steam power, although it is probable that this will be only for about 30 days. The distance from Spokane to Palouse is 76 miles and the

branch to Rosalia is five miles long. Three trains a day will be run from Spokane to Palouse, without stops between Spokane and Spring Valley Junction, the running time being three hours. The 40 stations between Spokane and Rosalia will be served by four trains a day in each direction. A handsome new station, similar to the one at Oakesdale, has been opened at Garfield, and a temporary station has been erected at Palouse.

Air Line Gives Bond.—President A. C. Miller of the Chicago-New York Electric Air Line Railroad on June 5 filed a bond for \$5,000 before Judge Windes to indemnify Theodore Nemoyer and other stockholders who have brought suits to annul a contract between the Air Line company and the Co-operative Construction Company which had agreed to build the road for the stock issue of the former. The court denied the motion of the plaintiffs for the appointment of a receiver and the issuing of a restraining order and ordered the defendant to answer the bill of complaint within 20 days.

United States Express Company to Operate over Detroit United Railway.—It is reported that the United States Express Company has signed contracts whereby it will handle all the express package business over the lines of the Detroit United Railway, the Detroit Monroe & Toledo Short Line Railway and the Toledo & Western Railway. It is also stated that the company has purchased the Electric Package Express Company, operating between Toledo and Cleveland over the Lake Shore Electric Railway, and that it will operate a through express service between Detroit, Cleveland and Toledo. The new deal becomes effective on July 1.

Oconomowoc Line Opened.—The new line of the Milwaukee Electric Railway & Light Company from Milwaukee to Oconomowoc, Wis., was opened for traffic on Monday of this week. Owing to a strike at the works of the St. Louis Car Company only one of the 10 new cars ordered for the line was put into service. This car will for the present be operated as a shuttle car between Waukesha Beach and Oconomowoc, connecting with cars from the city every hour. When the new cars arrive they will be put in service between the Public Service building and Oconomowoc, and will make the distance of 38 miles in 1 hour and 45 minutes, leaving each terminal every hour during the summer. The fare is 50 cents one way and \$1.25 round trip.

Power Plant Wrecked by Bursting Flywheel.—The power house of the Allegheny Valley Street Railway Company at Creighton, Pa., was badly wrecked on June 1 by a bursting flywheel of an engine. Early in the morning some of the employes noticed that the governor belt had slipped and that the engine was running wild. They notified Engineer Geiger, who hastened to the engine room to shut off the steam. As he was within a few feet of the engine the flywheel burst and he was struck by a section weighing several tons and crushed to death. One section of the wheel crashed through the brick wall of the building. The sides and roof of the building were damaged by other pieces of the wheel, which also broke pipe connections. Service on the lines to Tarentum was not resumed until 7 o'clock that night.

Governor Signs Pennsylvania Electric Railway Bills.—Governor Stuart of Pennsylvania on June 1 signed the so-called Homsher bill, which gives to electric railway companies the right of eminent domain, provided they first secure the consent of owners of 51 per cent of the property along the proposed route. The bill was opposed by the steam railroads and by many property owners. It is expected that the new law will give a strong impetus to the building of electric railroads throughout the state. The governor has also signed the Fahey bill, amending the street railway act of 1895. It provides that the consent of the local authorities of all cities, boroughs and townships of the first class and of the boards of road supervisors of townships of the second class be obtained before charters for new roads or extensions may be secured.

Coronado Tent City.—The Coronado Railroad of Coronado, Cal., has issued an attractive folder describing Coronado Tent City, which is owned by the company. The Tent City, as its name implies, is a resort for campers, fronting on both the Pacific ocean and San Diego bay. It is provided with furnished tents and palm cottages, which are rented to guests at a reasonable rate, and covers over two miles of ground, laid off into streets. Water supply and sewerage systems are provided and the resort contains nearly all of the conveniences of a city, such as restaurants, stores, telephones, etc. Facilities are furnished for nearly every form of summer amusement, including a large dancing pavilion and a concert band. The resort is reached by the electric cars of the Coronado Railroad, which has a line from San Diego, running through Tent City. The season lasts from June 15 to September.

Central Electric Railway Data Blanks.—W. F. Milholland, secretary of the Central Electric Railway Association, Traction Terminal building, Indianapolis, has recently mailed to each railway in the territory included by the association a set of blanks which it is especially desired to have carefully filled out and returned to the association office. One of these blanks is a lightning report that has been formulated by George Whysall, general manager of the Columbus Delaware & Marion Railway, Marion, O., chairman of the lightning arrester committee of the association. The blank calls for a very detailed report of the performance of the lightning protective apparatus used on high-tension and trolley lines in the generating plant or substation. The other blank is designed to furnish the lightning arrester committee with general information regarding the generating station equipment, substations, low-tension arresters, high-tension lines, trolley lines, overhead ground wires, track and rolling stock. It is desired to have these general data blanks filled out and returned immediately to the secretary and it is hoped that each manager will obtain a plentiful supply of the lightning reports, so that the effects of each storm may be reported in full.

Construction News

FRANCHISES.

Anniston, Ala.—L. H. Kaplan and associates have applied for a franchise to build an electric railway in this city.

Cleveland, O.—It is stated that the Everett-Moore interests of this city will ask for a franchise in East Ninth street, from Prospect avenue S. E. to Eagle avenue S. E., where the depot of the Electric Package is located. This will afford track facilities in East Ninth street, which at present, owing to the expiration of the Cleveland Electric Railway franchises, is without such service.

Ft. Worth, Tex.—The Northern Texas Traction Company has been granted a 30-day extension in which to complete laying its track on Houston street, from Tenth to and along Front street. This also applies to the operation of its cars.

Hughestown, Pa.—A franchise for the use of Parsonage street has been granted to the Pittstown & Avoca Street Railway.

Indianapolis, Ind.—The Terre Haute Indianapolis & Eastern Traction Company, which was incorporated last March to take over several interurban companies entering Indianapolis, has made formal application for an individual franchise to operate its lines in this city.

Knoxville, Tenn.—S. D. Divine, promoter of an electric railway in this city, has applied for a franchise to build a line to Chickamauga Park, Sherman Heights, Highland Park and other suburbs. The petition calls for a third track in Market street, the main thoroughfare of Knoxville, which it is said will be contested by the Chatanooga Railways Company. A franchise also was asked for a line in Sixth street to the top of Cameron Hill in Boynton Park.

Laurel, Miss.—The Gulf States Investment Company, which operates the electric lighting plant of this city, has applied for a street railway franchise.

Milwaukee, Wis.—The amended franchise passed last week by the council, giving the Chicago & Milwaukee Electric Railroad the right to operate its cars on Wells street, east to Second street, has been vetoed by Mayor Becker for the reason that it gives the company exclusive rights on Wells street. This is one of the main arteries by which the downtown district is reached with electric cars and the mayor claims that the wording of the franchise as passed, with its exchange privileges with the Milwaukee Electric Railway & Light Company on Grand avenue, whereby a loop would be formed on Sixth, Wells and Second streets and Grand avenue, would admit of a combination between the two companies in an agreement to control the street railway traffic of that section. As this would limit the entrance of other competing lines to this district, and, in the opinion of the mayor, work to the disadvantage of the best interests of the city, he urges such wording of the franchise as to allow of no combination of these interests for the exclusion of outside competing lines. It is stated that in view of the fact that the Chicago & Milwaukee Electric already has secured under its old franchise certain privileges on Sixth street and over the Sixth street viaduct which the mayor would now restrict, and has paid \$50,000 to the city toward the construction of the viaduct, President Frost is unwilling to grant any additional concessions to those already made in the amended franchise.

Montreal, Que.—The Montreal Park & Island Railway has been granted permission by the minister of railways to extend its line from Stony Point to Valois, Que. D. McDonald, manager, Montreal, Que.

Mt. Clemens, Mich.—William T. Cross has asked for a franchise for an electric or steam line on Spruce and Avery streets, which will connect with the new belt line at the Detroit city limits. If built the road will be on private right of way south from Mt. Clemens to the Detroit limits. It is stated that Capt. James Davidson of Mt. Clemens is interested.

San Angelo, Tex.—Col. J. H. Ransome of Hereford, Tex., has applied for a street railway franchise in this city.

San Diego, Cal.—The South Park & East Side Electric Railway Company, of which E. Bartlett Webster is the principal owner, has been granted a franchise and right of way to run its line from the eastern boundary of the city of San Diego, along El Cajon avenue, and through La Mesa Springs and El Cajon.

Sheridan, N. Y.—The Buffalo & Lake Erie Traction Company has applied for permission to run its line east and west through this city between the main road and the Pennsylvania tracks, crossing several north and south highways. A special meeting will be called to act upon the application.

Spokane, Wash.—The Spokane Traction Company has made application for permission to lay a track commencing at Garland avenue and Post street, in Monroe Park addition, connecting at that point with its main tracks, and from thence west on Garland to Madison street and north on Madison to Elgin avenue.

RECENT INCORPORATIONS.

Columbus (Miss.) Light & Railway Company.—Incorporated in Mississippi to build or acquire and operate an electric light and power plant in Columbus. Capital stock, \$300,000. Incorporators: William Baldwin, Walter Weaver and Charles F. Sherrod.

Lake Erie Fremont & Southern Railway.—Incorporated in Ohio to build an interurban electric line through Ottawa, Sandusky and Seneca counties, with a terminal at Tiffin, O., where it will connect with other interurban lines extending into the interior of the state. The line will serve as a feeder to the Toledo Port Clinton & Lakeside Railway and possibly will be merged with the latter road when completed, as the incorporators of the new company are closely identified with the Toledo Port Clinton & Lakeside Company. Franchises have been secured for a belt line at Fremont and about \$75,000 worth of bonds have been subscribed for by the people of that city and Fostoria. Work on the belt line is to be commenced at once and as soon as the financial arrangements have been completed work on the road between Fremont and Oak Harbor, where the new line diverges from the Toledo Port Clinton & Lakeside, will also be started. The building of this line, together with a proposed branch line to the state rifle range, will enable the Toledo Port Clinton & Lakeside to control a considerable amount of the passenger traffic from the southern and central portions of the state. The headquarters will be at Toledo. The incorporators are: H. F. Shunck, A. E. Klausner, Theodore Schmitt, William Miller and George W. Luckey, Toledo, O.

Portland (Ore.) Eastern Railway.—Incorporated in Oregon to build an electric railway from Portland to Mt. Hood, Ore. This is the corporate name for the Mt. Hood Railway & Power Company, which was organized some time ago for this purpose, by interests identical with the new company. Capital stock, \$5,000,000. Incorporators: E. P. Clark, Arthur H. Fleming, Los Angeles; Elmer B. Colwell, Robert T. Linney and C. W. Miller, Portland. A large portion of the surveys for the route already have been made by the former company.

Puget Sound International Railway & Power Company.—Incorporated in Maine to operate railways. Capital stock, \$500,000. Incorporators: John E. Rousmaire, Alvah K. Todd, Phillip L. Warren, Joseph F. Lovering, Benjamin Joy, Boston, Mass.; Charles M. Drummond, president; Gertrude M. Horne, treasurer; Josiah H. Drummond, Wilford G. Chapman, Portland, Me.

Springfield Beardstown & Quincy Railroad, Quincy, Ill.—Incorporated in Illinois to build an interurban line from Springfield to Petersburg, Chandlerville, Beardstown and Quincy, Ill. Capital stock, \$25,000.

TRACK AND ROADWAY.

Alamo, Tenn.—A meeting has been called for June 22 in the interest of a project to build an electric railway from Humboldt to Gadsden, Alamo, Maury City, Friendship, Stokes, Eaton, Brazil, Gibson Wells and to Humboldt again, completing the circuit.

Bahia Tramway Light & Power Company.—It is reported that New York interests, said to be allied with the Havana, Mexico City, Rio de Janeiro and other West Indian, Central and South American electric traction and lighting properties, have completed financial arrangements in Europe for the construction and operation of street railways in Bahia, Brazil. A lighting monopoly has been taken over and extensive water power rights have also been acquired. The development of the Bahia projects will entail an expenditure of nearly \$10,000,000. The company was recently incorporated in Maine, with a capital of \$3,500,000. There are also authorized \$7,500,000 of 5 per cent 50-year first mortgage bonds. An issue of \$3,500,000 of these bonds has just been sold in the London and Brussels markets. The New Yorkers interested in the company include: Percival Farquhar, William Lanman Bull and F. S. Pearson.

Barberton Doylestown & Orrville Railway.—We are advised by the Cleveland Engineering Company that the report that that company has the contract for building this line from Barberton to Orrville, O., is incorrect.

Buffalo Lockport & Rochester Railway.—This company secured the last of its right of way between Rochester and Lockport, N. Y., last week, when the condemnation proceedings for a strip of land in Niagara county were settled.

Burlington, Ia.—A company is being organized to make surveys and do the necessary preliminary work for an electric railway from Burlington to Bonaparte and West Point, Ia.

Calgary, Alberta.—It is announced that bids for the construction of the Calgary Electric Street Railway, to be built by the municipality at a cost of \$250,000, will be received soon after August 1 next. W. F. Thorold, city engineer.

California Street Cable Railroad, San Francisco, Cal.—This company is taking advantage of the strike, which has been in progress for the past month in San Francisco, to make some extensive repairs and improvements to its plant and tracks. The most important undertaking is the elevation of the track on California street, between Market and Sansome streets, about three feet. House-raising jacks have been placed under the steel ribs which form the cable bed, and the whole body has been raised while still embedded in the concrete.

Carlyle & St. Louis Railroad, East St. Louis, Ill.—It is reported that this company will soon let contracts for an extension of the East St. Louis & Suburban Railroad from Carlyle to Lebanon, Ill., 23 miles. Right of way is now being secured and surveys are being made. Thomas E. Ford of Carlyle, president.

Charlotte, N. C.—It is announced that the Charlotte Consolidated Construction Company has begun surveys for the proposed interurban electric line from Mt. Holly to Gastonia in Gaston county, via McOdenville and Lowell. W. L. Law, chief engineer.

Chicago Great Western Railway, St. Paul, Minn.—We are

officially advised by L. S. Cass, third vice-president, that recent reports that this company had decided to electrify its line between Rochester and Winona, Minn., were premature. The company has been making some estimates, but nothing definite has been determined.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—Three carloads of rails have been delivered at Michigan City, Ind., for the construction of the double-track line on Franklin street.

Chicago Waukegan & North Shore Railway.—This company has filed a mortgage in favor of the Central Trust Company of Chicago for \$1,500,000, to secure a bond issue for building the line from Waukegan, Ill., to Kenosha, Wis.

Cleveland & Indianapolis Interurban Railway.—It is reported that options have been secured on practically all the right of way for this line from Norwalk, O., to Bluffton, Ind. C. F. Jackson of Norwalk is interested.

Cleveland (O.) Electric Railway.—This company has made an agreement with the Cleveland Painesville & Eastern Railroad whereby it uses about 2½ miles of the latter's shore line tracks, starting at Collinwood and running west.

Columbia & Walla Walla Traction Company.—H. U. Wallace of the Wallace-Coates Engineering Company, Chicago, has been sent to Dayton, Wash., west of Spokane, by an eastern bonding company, which has under consideration the financing of the electric line from Dayton to Wallula, Wash., via Walla Walla and Milton. Mr. Wallace made a trip over the line recently surveyed for an extension to Pennewawa, on the Snake river, and made an inspection of the power facilities on the upper Tucannon, where there is a natural waterfall of 300 feet, capable of developing several thousand horsepower, which can be made available at a small cost. The right of way between Dayton and Wallula has been secured. The survey from Dayton to Pennewawa, 50 miles, is taken to mean that a connection with the Spokane & Inland Empire line from Spokane to that point is contemplated. J. W. Morrow of Waitsburg is general manager.

Covington & Southwestern Traction Company, Covington, Ind.—We are officially advised by William G. Ruhl, president, Chicago, Ill., that this company's proposed line from Covington to Crawfordsville, Ind., 52 miles, will be operated by steam motors. The entire line has been surveyed and grading has been completed from Covington to Coal Creek, 8.8 miles. Contracts are to be let for completing the road to Coal Creek. C. W. Leinbach, chief engineer.

Crawfordsville, Ind.—A new interurban traction line has been projected to connect Linden, New Richmond, Attica and Indiana Mineral Springs with Crawfordsville, Ind. The American Engineering Company of Indianapolis will survey the route and the company now being organized is to be incorporated this week. The new line taps a good farming community and the towns and cities to be connected are thriving and prosperous.

Denver & South Platte Railway.—H. W. Hartman, Denver, Colo., writes that the grading on this company's proposed electric line from Denver to Roxboro Park, 20 miles, was started on May 20 and is now in progress from Englewood to Littleton, Colo. The type of overhead construction has not been decided. Power will be purchased. Joseph Osner of Denver has the grading contract. Other contracts, excepting those for ties and rails, are still to be let. William E. Hughes, president, Continental Trust Company, Denver; T. B. Doan, vice-president; T. J. Milner, chief engineer, Majestic building, Denver. The permanent trustees of the company will be chosen later.

Dunnville Wellandport & Beamsville Railway, St. Catherines, Ont.—This company has been organized to build a line from Lake Erie to Lake Ontario, about 40 miles.

Illinois Traction Company, Champaign, Ill.—The Illinois railroad and warehouse commission has decided that this company must build at its own expense an overhead crossing over the tracks of the Chicago & Alton Railway at Iles Junction, Ill., on the proposed belt line around the city of Springfield. The commission has also decided in favor of a grade crossing at Main street, Jacksonville, Ill., where the electric railway tracks will cross those of the Chicago Burlington & Quincy, Chicago & Alton and Chicago Peoria & St. Louis railroads. The traction company is to bear one-fourth of any extra expense that may accrue.

Indianapolis Newcastle & Toledo Electric Railway, Newcastle, Ind.—This company is reported to be surveying a line from Newcastle to Muncie, Ind.

Inland Power & Electric Company, Spokane, Wash.—It is reported that this company will build a power plant at Albeni Falls on the Pend d'Oreille river, and an electric railway from Spokane to Newport, Wash. Fred Goddard of Spokane is interested.

Jackson (Mich.) Consolidated Traction Company.—B. F. O'Mara, superintendent, is making preparations for several improvements to the lines in Jackson this summer. Rails are being shipped for relaying the tracks on Francis and Ganson streets and Stewart avenue.

Knoxville (Tenn.) Railway & Light Company.—Within a short time this company will double-track the Broadway line from Central street to the city limits. The Clinch street line is being extended and the Fifth avenue line is being double-tracked. J. H. Drake, chief engineer.

Lake Erie & Youngstown Railroad, Youngstown, O.—Engineers are now at work on the surveys of this company's proposed 60-mile line between Youngstown and Conneaut, O. The line will pass

through Andover, Kinsman, Burgh Hill, Canfield and Church Hill. George Todd, Jr., Youngstown, chief engineer.

Lebanon Highland & Mt. Olive Railway, Lebanon, Ill.—This company will build a 40-mile electric line between Lebanon and Mt. Olive, Ill., with a branch from Highland to Maryville. Edward Lentz is interested.

Lebanon Valley Street Railway.—It is stated that this company is planning a 6-mile extension of its line from Avon to Schaeffers-town, Pa. C. H. Smith, superintendent, Lebanon, Pa.

Lewiston Augusta & Waterville Street Railway, Lewiston, Me.—It is reported that this company will in the next few weeks let contracts for 50 miles of 70-pound A. S. C. E. rails, 5,000 ties and 1,000 cedar poles. The Fred S. & A. D. Gore Corporation of Boston, Mass., has the contract for building the company's three proposed lines, from Auburn to Mechanic Falls, Me., nine miles; from Sabattus to Gardiner, 20 miles; and from Augusta to Waterville, 21 miles. John R. Graham of Bangor, Me., is president.

Litchfield (Conn.) & Torrington Street Railway.—Surveys are now being made and financial backing secured for this company's proposed line between Torrington and Litchfield, Conn., via Lake Bantam, about eight miles. W. F. Dowd, president, Litchfield; T. H. McKenzie, secretary and treasurer, Southington, Conn.

Mattoon Shelbyville Pana & Hillsboro Railroad, Charleston, Ill.—Civil Engineer A. N. Fisher and a corps of assistants are making a new survey of this proposed line from Mattoon to Hillsboro, Ill., 60 miles. The new survey parallels the Cleveland Cincinnati Chicago & St. Louis Railway for most of the way. It is announced that financial arrangements have been made for beginning construction. W. R. Patton of Charleston, president.

Minneapolis Rochester & Dubuque Traction Company, Minneapolis, Minn.—The first grading work on this road was started last week about two miles south of Minneapolis. A 35-horsepower traction engine, a grader and a large number of teams are employed. The road is projected to extend from Minneapolis to Dubuque, Ia., and several franchises have been secured. Robert Baldwin, chief engineer.

Monroe, Mich.—H. C. La Flamboy of Detroit is promoting a line from Monroe to Dundee, 15 miles. A franchise in Dundee and seven miles of right of way have been obtained.

Nashville (Tenn.) Interurban Railway.—John A. Pitts, counsel of this company, which is building a line from Nashville to Mt. Pleasant, Tenn., 60 miles, has filed a mortgage to the Trust Company of America of New York, as trustee, to secure an issue of \$1,500,000 first mortgage 30-year 5 per cent gold bonds. Construction work was begun last week at Franklin. The Interurban Company of New York, of which Patrick Hirsch is president, has the general contract for building and equipping the line. A subcontract for grading has been let to James B. Smith. H. H. Mayberry, president, states that contracts for the entire line will be let within two weeks. D. A. Proctor, chief engineer.

New York, N. Y.—Sealed bids will be received until June 13 by the New York rapid transit commission for the construction of the section of Route No. 9, the bridge subway loop in Delancey street, from the Bowery to Norfolk street.

Niagara St. Catharines & Toronto Railway, St. Catharines, Ont.—This company has completed its 7-mile extension between Thorold and Fonthill and is now constructing another 5-mile extension from Fonthill to Welland, Ont. E. F. Seixas, general manager, St. Catharines, Ont.

Northern Electric Railway, Chico, Cal.—This company has commenced laying rails south from Marysville, Cal., on its extension toward Sacramento. A short delay will occur while the bridge across the south channel of the Yuba river is being completed, but it is believed that construction trains may be run to Sacramento by August 1.

Northern Texas Traction Company, Ft. Worth, Tex.—H. T. Edgar, vice-president and general manager, is quoted as follows: "Reports that our company will apply to the city council of Cleburne for a franchise to build an interurban line into that place from Ft. Worth are not correct. No decision has been reached as to final action on the matter of routes between the two places. Four different lines are now under consideration, and not until we make a selection and know where we will want to enter Cleburne, will a franchise be asked for. We do not contemplate placing in operation a city line at Cleburne, and when we ask for permission to use certain streets there, it will be only for an interurban."

Omaha & Council Bluffs Street Railway, Omaha, Neb.—Construction was begun last week on the extension from Thirty-sixth and Ames avenues west to Fortieth streets, and thence north to Grand avenue, three-fourths of a mile.

Ottumwa, Ia.—It is reported that W. W. Cummings of Ottumwa has been awarded a contract for grading an interurban road from Ottumwa to Hockins, Ia.

Owingsville, Ky.—The Kaufman-Shaw Construction Company of Dayton, O., proposes to build an electric line from Salt Lick to Owingsville, Ky., and on to Carlisle and Cincinnati. It is stated that work will begin this month.

Pacific Electric Railway, Los Angeles, Cal.—This company has been granted permission to construct a viaduct across Los Angeles street, connecting with the rear of the Huntington building at Sixth and Main streets, so that the Long Beach and other interurban cars running out East Ninth street may enter the depot from the rear and upon the same floor as at present.

Panhandle Electric Railway & Power Company.—Thomas W. Payne of Detroit, Mich., A. J. Smith of Spokane, Andrew Coolin of Priest River, Harry H. Wallace and John R. Jones of Spokane, have organized a company to build an electric line in the Priest Lake country, northeast of Spokane. The project will be carried out by eastern capital. The power will be generated at a plant to be constructed below the outlet of Priest Lake, in the Priest river valley. A flume is planned from the lake to a point down the valley where the greater power can be obtained. The lake will be turned into a reservoir, so that the flow can be equalized throughout the year. The line will tap timber belts and mining districts, giving heavy tonnage.

Pittsburg & Westmoreland Railway, Pittsburg, Pa.—It is announced that this company is ready to let contracts for the construction of a 6-mile single-track line. James Bryan, chief engineer, Park building, Pittsburg, Pa.

Pittsburg (Pa.) Railways Company.—It is reported that the directors have authorized the construction of a line from Canonsburg to Castle Shannon, Pa., to cost \$750,000.

Portland (Ore.) Railway Light & Power Company.—It is reported that it has been decided to build a spur line from Gladstone Station to Gladstone Park.

Puebla Atlixco & Metepec Electric Railway, Puebla, Mex.—J. A. McNaught, who is promoting this electric line from Zocalo through Puebla, Las Fabricas, Santa Clara, Coyoacan and Atlixco to Metepec, Mex., about 30 miles, is now completing his plans and expects to let contracts in a short time for the construction work. R. Martinez Carillo of Puebla is president and Mr. McNaught is vice-president and general manager.

San Antonio (Tex.) Traction Company.—This company has ordered the rails for its 1½-mile loop line in Alamo Heights and within the next two weeks will let contracts for its construction.

St. Joseph & Nodaway Valley Railway, St. Joseph, Mo.—It is reported that this company has combined with the promoters of the St. Joseph Belt & Interurban Railway and will build an interurban line from the St. Joseph city limits to Graham, 40 miles, while the latter company will build the line inside the city. Surveys have been completed to Graham and practically all the right of way has been secured in Andrew and Nodaway counties. It is not yet announced when construction will begin. The following directors have been elected: I. R. Williams of Savannah, Mo.; D. L. Bartlett, Dr. John S. Logan, John Townsend, David E. Heaton, S. S. Brown, John A. Duncan, Louis Huggins and Lucien J. Eastin of St. Joseph; C. W. Spicer, Jr., Fillmore; and Thomas E. Fleming, Graham. Several of these are directors of the Belt & Interurban Company.

St. Joseph (Mo.) Light Heat & Power Company.—It is reported that E. W. Clark & Co. of Philadelphia, who control this company, propose to organize a new company to build an extension from Lake Conrary to Atchison, 17 miles. The project will require an issue of \$175,000 of bonds.

St. Joseph Savannah & Northern Interurban Railway, St. Joseph, Mo.—An official of this company states that it is proposed to begin construction in about 90 days on the line from St. Joseph to Savannah, Mo., and that financial arrangements have been made. It is proposed to enter St. Joseph over the tracks of the St. Joseph Railway Light Heat & Power Company. E. W. Clark & Co. of Philadelphia, owners of the St. Joseph company, have taken half of the \$300,000 bond issue and local banks the other half.

San Diego (Cal.) Electric Railway.—This company proposes to build about six miles of extensions to its city lines this year, besides some already under construction. The National City & Otay Railway, operated by this company, is being converted from a steam to an electric line and the overhead work is completed between San Diego and Chula Vista, nine miles.

Seattle-Tacoma Interurban Railway.—Merle J. Wightman of Tacoma, who holds franchises in both cities for the line from Tacoma to Seattle, has applied for a permit to begin construction at once in Seattle. Mr. Wightman states that \$2,000,000 of bonds have been disposed of in New York.

Springfield Wilmington & Cincinnati Electric Railway.—This company has acquired the property of the Springfield & Xenia Railway Company. The new company will extend the line now running from Springfield to Xenia, O., to Wilmington and Cincinnati, O., making a total length of 160 miles of road.

Steubenville Mingo & Ohio Valley Traction Company, Steubenville, O.—This company has commenced the work of rebuilding its interurban line through Mingo, O. J. W. Marsh, superintendent.

Texas Traction Company, Dallas, Tex.—An official report from this company states that about 30 miles have been graded on the line from Sherman to Dallas, 63 miles. The route includes Howe, Van Alstyne, Anna, Melissa, McKinney, Albin and Richardson. There are now eight construction camps and grading is in progress over the entire route. At McKinney, where the power house will be located, a siding about half a mile long is being built to facilitate the handling of the electrical machinery. The dam for the power house is being completed and ground has been broken for the building. The overhead construction will be of the catenary type. The Fred A. Jones Company of Dallas has the general contract. The equipment for the power house and five substations will be furnished by the General Electric Company. J. F. Strickland, president; F. A. Jones, chief engineer.

Toledo & Ft. Wayne Electric Railway, Ft. Wayne, Ind.—Engineer David Spindler has started with a corps of surveyors

to locate this company's proposed line from Bryan, O., through Hicksville and Marysville to Ft. Wayne, Ind.

Toronto & York Radial Railway, Toronto, Ont.—The recently completed extension of this company's line from Newmarket to Jackson's Point, Ont., has been formally opened. W. H. Moore, Toronto, general manager.

Toledo Wabash & St. Louis Railroad, Toledo, O.—This company, recently incorporated to build an electric railway from Toledo, O., to St. Louis, Mo., in four sections, via Ft. Wayne, Indianapolis and Terre Haute, has begun grading between Neapolis and Maumee, O., on the first section, which will extend from Toledo to Defiance. The Atlantic Construction Company has the contract and subcontracts have been let to H. E. Roch and George Shoemaker. The company is also considering the advisability of letting another contract for the grading between Neapolis and Liberty Center. A contract for concrete work has been let to C. W. Ryan & Co., including culverts and abutments. C. D. Whitney of Toledo, president.

Tulsa (I. T.) Street Railway.—This company began operating cars over its new 2-mile street railway line in Tulsa on May 27. C. H. Bosler, president.

United Cities Traction Company, Ft. Smith, Ark.—It is announced that all of the right of way for the line from Ft. Smith to Muskogee, I. T., has been secured and that work will begin at once. It is stated that \$100,000 will be expended in Ft. Smith, Ark. A line is to be built for freight transfer traffic from Ft. Smith, Ark., to Ft. Smith, Okla., 4½ miles. Contracts have been let. Ira L. Reeves of Muskogee, president.

Utica Southern Railroad, Utica, N. Y.—The New York railroad commission has consented to an issue of a first mortgage for \$750,000 for the construction of the line from Clinton to Waterville, N. Y., 26 miles. Frank H. Baxter, chief engineer.

Vallejo (Cal.) & Northern Railroad.—Surveys are now being made near Woodland, Cal., for this company's proposed line, which will connect Vallejo with Cement, Suisun, Cordelia, Winters, Woodland and Sacramento.

Washington Railway & Power Company, Vancouver, Wash.—Ground was broken on May 30 for the construction of this company's proposed street railway system in Vancouver. Rails have been received for seven miles of road. Franchises have been secured in the city and county, and it is proposed to build an extensive system of electric railways radiating from Vancouver, including lines to Washougal and Proebstel. Walter H. Moore of Portland is president and Arthur Langguth is secretary and has immediate charge of the construction work.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—Rapid progress is being made on the construction of the line between Olean, N. Y., and Bradford, Pa., via Rock City, and it is expected that cars will be running by June 10. W. R. Page, president, is quoted as saying that the proposed line to connect Bradford, Pa., with Carrollton, N. Y., will be pushed forward to completion as soon as the line now under construction from Olean to Salamanca, N. Y., via Allegany, is completed. Mortimer Silverman, electrical engineer.

Winona Interurban Railway, Winona Lake, Ind.—S. C. Dickey, general manager, announces that the Ft. Wayne extension will be built at once. It was thought after the recent defeat of subsidies at several township elections that the project might be abandoned, but the farmers have subscribed the desired amounts and contracts will be let as soon as specifications are prepared.

Wichita (Kan.) Railroad & Light Company.—This company has just completed an extension to Wonderland Park.

POWER HOUSES AND SUBSTATIONS

Austin (Tex.) Electric Railway Company.—This company has announced that it is in the market for a 300 to 350 kilowatt, 500-550-volt direct-current railway generator, direct-connected to a compound condensing engine.

Detroit Jackson & Chicago Railway, Detroit, Mich.—This company, formerly the Detroit Ypsilanti Ann Arbor & Jackson Railway, has made a contract with the Commonwealth Power Company to furnish the power required for operating its lines west. Substations are now being constructed at Chelsea and Grass Lake, which will be equipped with step-down transformers, converters and necessary switchboard apparatus. These changes will do away with the substations at Lima Center, Michigan Center and Francisco. It is expected that the service will not only be better, but that it will also be more economical. The power will be received at the substations from the Commonwealth's power plant at Lyons, Mich., at which point the company has a dam.

Rockland Thomaston & Camden Street Railway, Rockland, Me.—This company has announced that it will make an addition to its plant by the installation of a 200 or 300 kilowatt, 2,080-volt 125-cycle single-phase generator and engine. The company is in the market for either a direct-connected or belted unit. A switchboard and all the accompanying instruments complete will also be purchased.

Washington Water Power Company, Spokane, Wash.—This company is building a steam turbine generating station in which a 3,000-kilowatt Curtis turbine will be installed. It is said the turbine will be ready for operation by September, 1907. The company is now operating two hydraulic power stations, aggregating 20,000 horsepower.

Personal Mention

Mr. E. F. Davis has resigned as superintendent of the southern division of the Brooklyn Rapid Transit Company, Brooklyn, N. Y.

Mr. Warren S. Hall, heretofore general manager of the Lehigh Valley Transit Company, Allentown, Pa., has been elected vice-president of the company.

Mr. Everett F. Kyle, formerly superintendent of the Norwalk (Conn.) lines of the Consolidated Railway Company, has resigned to engage in other business at Cuylersville, N. Y.

Mr. R. N. Barrows has resigned as purchasing agent for the Washington (D. C.) Railway & Electric Company, to become sales agent at Richmond, Va., for the Atha Steel Casting Company of Newark, N. J.

Mr. William K. Glenn, who resigned recently as master mechanic of the Tacoma (Wash.) Railway & Power Company, has been appointed superintendent of the Portland (Ore.) Railway Light & Power Company.

Mr. H. W. Mann has resigned as electrical engineer of the Pueblo & Suburban Traction & Lighting Company of Pueblo, Colo., to take a similar position with the Northern Colorado Power Company at Lafayette, Colo.

Mr. Robert O'Brien, heretofore superintendent of the Claiborne street line of the New Orleans Railway & Light Company, has been appointed division superintendent of the company, with headquarters in New Orleans, La.

Mr. L. K. Burge, whose appointment as general superintendent of the Lake Shore Electric Railway and all properties controlled by that company was announced on May 23, by letter from General Manager F. J. Stout, while Mr. Burge was attending the meeting of the Central Electric Railway Association at Indianapolis, as reported in the Electric Railway Review of May 25, was born on May 13, 1874, at Lafayette, Ind. He attended the public schools and completed his education at Stockwell College. In 1896 he moved to Toledo, O., and accepted a position as conductor. He worked as conductor and motorman until 1900, when he was appointed assistant dispatcher of the Detroit Monroe & Toledo Short Line Railway, Monroe, Mich. Later in the same year he was made chief dispatcher of the same line and also had charge of the electrical equipment in substations. In May, 1903, he was appointed superintendent of the Sandusky division of the Lake Shore Electric Railway, was later superintendent of the Norwalk-Cleveland division, and superintendent, and now becomes general superintendent of the entire system, with the right to take up direct with heads of departments all transportation matters. Mr. Burge will have his headquarters at Norwalk, O.

L. K. Burge.

Mr. Hugh Cook, formerly assistant engineer of the Youngstown & Ohio River Railroad at Youngstown, O., has been appointed chief engineer and superintendent of construction of the lines on Long Island, which the Stanley interests of Cleveland are building.

Mr. T. F. Grover, heretofore general manager of the Trinidad (Colo.) Electric Railroad, has been appointed manager of the Terre Haute, Ind., properties of the Terre Haute Indianapolis & Eastern Traction Company, succeeding Mr. C. T. Mordock, resigned to accept another position.

Mr. A. W. Q. Birtwell, assistant treasurer of the Houston (Tex.) Electric Company, has resigned to become connected with the treasury department of the Northern Texas Traction Company, Ft. Worth, Tex. He will be succeeded by Mr. H. L. Harding, heretofore chief clerk in the office of the treasurer.

Mr. Edward Gaffney has been appointed superintendent of the eastern division of the Chicago South Bend & Northern Indiana Traction Company, with headquarters at Elkhart, Ind. He will have supervision over the interurban line between Goshen and Mishawaka and over the Goshen and Elkhart city lines.

Mr. J. M. Bramlette, general superintendent of the Michigan United Railways, with headquarters at Kalamazoo, Mich., has been appointed general manager of that company, succeeding Mr. J. R. Elliott, vice-president and general manager. Mr. Elliott will retain the office of vice-president. Mr. Bramlette has been connected with the Michigan United Railways since the spring of 1906, before which date he was general manager of the Philadelphia & Western Railroad, then under construction. Previous to that

time he was for 10 years general manager of the East St. Louis (Ill.) Railway.

Mr. Reese Davis, for the past three years roadmaster of the Mexico City Electric Tramways Company at Mexico City, has accepted a similar position with the Consolidated Railway Company's local and suburban lines in Hartford, Conn. Mr. Davis was formerly roadmaster of the Connecticut Railway & Lighting Company's local lines in Bridgeport, Conn.

Mr. Charles H. Copley, formerly manager of the Bellows Falls & Saxton's River Street Railway at Bellows Falls, Vt., and more recently engaged on the construction work of the new line of the Consolidated Railway between Rockville and Stafford Springs, Conn., has been appointed superintendent of this company's local lines in Norwalk, succeeding Mr. Everett F. Kyle, resigned.

We are officially advised that the report in last week's issue of the Electric Railway Review that Mr. C. E. Flynn had resigned as second vice-president and general manager of the Conneaut & Erie Traction Company, Erie, Pa., to be succeeded by Mr. B. E. Walker, now superintendent, is incorrect. Mr. Flynn, who is a director and large stockholder in the company, is simply giving up the active management.

Mr. W. N. Stevens has resigned his position as mechanical engineer of the southern properties controlled by Ford, Bacon & Davis of New York City, effective on June 1. Mr. Stevens was formerly chief assistant mechanical engineer of the Manhattan Railway and Interborough Rapid Transit companies of New York, and for a number of years has been engaged in the design and construction of power houses and other buildings for electric railway and lighting properties.

Mr. John Powers, who recently resigned as superintendent and electrical engineer of the Sterling Dixon & Eastern Electric Railway, Sterling, Ill., as reported in the Electric Railway Review of May 25, has accepted a position with the Milwaukee Electric Railway & Light Company, instead of going to the Galesburg Railway & Light Company, as previously reported. The Milwaukee and the Sterling companies are both controlled by the same interests. Before leaving Sterling to take up his new duties Mr. Powers' former associates on the Sterling Dixon & Eastern presented him with a handsome Masonic watch charm as a token of their regard.

Mr. W. H. Simms, general superintendent of the Philadelphia & Western Railroad, which was recently opened for traffic from Philadelphia as far as Strafford, Pa., is an experienced steam railroad operating man. He was born near Bath, Somersetshire, England, and attended private and public schools. His railroad experience embraces that of freight brakeman, conductor, fireman, engineer, station master and passenger trainmaster. From 1888 to 1901 he was passenger trainmaster in charge of the Philadelphia division of the Pennsylvania Railroad, and from 1901 to 1906 was head station master at Philadelphia, in charge of the Broad street and West Philadelphia stations of the same road.

Mr. L. F. Loree of New York City, president of the Delaware & Hudson Company, was on June 1 elected president of the United Traction Company of Albany, N. Y., and the Hudson Valley Railway of Glens Falls, N. Y., to succeed the late David Willcox. Both companies are controlled by the Delaware & Hudson Company. Mr. C. S. Sims of Albany, general manager of the Delaware & Hudson, was also elected vice-president of both companies, succeeding Mr. Abel I. Culver, resigned. Mr. Loree was born on April 23, 1853, at Fulton City, Ill., and has had a long experience in the engineering department of several steam railroads. From January 15, 1896, to January 1, 1901, he was general manager of the Pennsylvania Lines West of Pittsburgh, and from January 1 to June 1, 1901, fourth vice-president of the same lines. From June 1, 1901, to January 1, 1904, he was president of the Baltimore & Ohio Railroad, and from January 1 to October 4, 1904, he was president of the Rock Island Company of New Jersey. He was elected to the presidency of the Delaware & Hudson Company following the resignation of David Willcox, in April of this year. Mr. Loree and Mr. Sims have also been elected directors of the Schenectady Railway Company, in place of Mr. Willcox and Mr. Culver.

Mr. R. C. Taylor, superintendent of motive power of the Indiana Union Traction Company, Anderson, Ind., has been appointed chairman of the "Standardization" committee of the Central Electric Railway Association, to succeed Mr. W. H. Evans, who has tendered his resignation because of leaving the central territory to become master mechanic of the International Railway Company of Buffalo, N. Y. Mr. Taylor has been a member of the committee and another member will be appointed in a short time to take his place. Mr. Taylor has been connected with the Indiana Union Traction Company as superintendent of motive power since December 1, 1906, and has since that time been prominently identified with the committee work of the Central Electric Railway Association. He is also chairman of the committee on "Lighter Cars for Interurban Service." He has had a long and varied experience as a mechanical engineer and before taking his present position was for three years mechanical engineer of the Brooklyn Rapid Transit Company at Brooklyn, N. Y., and for four years master mechanic of the Twin City Rapid Transit Company of Minneapolis, Minn. Mr. Taylor has patented or applied for patents on several railway devices, including an electric block signal system, air brake apparatus for multiple-unit trains, brake hanger for railway car trucks, multiple-unit control for surface cars, electric heating system for electric cars and combined electric and hot water heaters for electric cars. A portrait and descriptive sketch of Mr. Taylor were published in the Electric Railway Review of December, 1906, page 1011.

Financial News

Capital Traction Company, Washington, D. C.—This company has authorized the issue of \$6,000,000 of 5 per cent bonds, of which \$4,000,000 will be issued now. Of this amount \$600,000 will be used to pay off floating debt and \$1,080,000 to retire outstanding bonds.

Chicago City Railway.—The directors declared on June 1 a quarterly dividend of 1½ per cent, or a 6 per cent annual basis, comparing with the previous rate of 9 per cent per annum. This is in accordance with the understanding that the company will not be able to pay as much in dividends under the new ordinance. The 9 per cent rate was established in 1901.

Cincinnati Newport & Covington Light & Traction Company, Covington, Ky.—A meeting of stockholders will be held in Jersey City on June 15 to ratify the lease of the property to the Columbia Gas & Electric Company.

Coney Island & Brooklyn Railroad.—Gross earnings for the quarter ended March 31 were \$308,487, as compared with \$322,460 in 1906. Operating expenses were \$287,535, as compared with \$261,533, leaving net earnings of \$20,952, as against \$60,627 in the corresponding quarter of last year. The deficit after the payment of fixed charges was \$57,145, as compared with \$15,914.

Eastern Ohio Traction Company, Cleveland.—Albert E. Aiken, James T. Ross and F. A. Pease have completed their appraisal of the property. They value it, figured in divisions, at \$1,601,800, and state that, operated as an entire system, \$50,000 should be added to the value as figured in divisions.

Gainesville Whitesboro & Sherman Railway, Gainesville, Tex.—Mortimer M. Elkan of Macon, Ga., has instituted proceedings in the United States circuit court at Sherman, Tex., against this company, on the ground that the road is indebted to him for \$7,629.78 for work done in grading.

Ithaca (N. Y.) Street Railway.—It is announced that A. H. Flint & Co. of New York have purchased control of this road.

Jackson Ann Arbor & Detroit Electric Railway Company.—This company, of which control, it is announced, has been purchased by the Detroit United Railway, has arranged to establish an electric road extending from Jackson, Mich., to Detroit, and from Wayne to Northville, and has acquired the Detroit Plymouth & Northville Railway, now in operation from Wayne to Plymouth and Northville, and also the Jackson & Ann Arbor Railway, extending from Grass Lake to Dexter, Mich., a distance of 20 miles. The company has authorized an issue of \$1,500,000 bonds, of which \$1,000,000 will be used to complete the construction into Detroit and for other purposes, and \$500,000 will remain in the treasury. The company has \$1,900,000 capital stock, of which \$400,000 is 6 per cent cumulative preferred.

Louisville & Eastern Railroad Company, Louisville, Ky.—This company has filed a trust deed to secure an issue of \$2,000,000 first mortgage 5 per cent bonds, due in 50 years.

Louisville (Ky.) Railway Company.—This company has authorized an issue of \$500,000 of 6 per cent notes, redeemable at any time from 1905 to 1910. The proceeds will be used in purchasing new equipment and in the construction of an extension to Bardstown. Of the entire issue \$300,000 notes have been placed and the balance will not be sold until the money is needed.

New York New Haven & Hartford Railroad.—Stockholders ratified on May 31 the absorption of the property of the Consolidated Railway Company. Charles S. Mellen, the president, said that from July 1, 1903, to May 21, 1907, there was expended for capital improvements, extensions and investments \$157,000,000. Of this sum \$97,750,000 was invested in securities of other companies and \$37,000,000 was expended for real estate, new equipment, second, third and fourth tracks and the electrification of the New York division.

Ohio Electric Railway, Cincinnati.—The nominal \$100,000 capital of this company will be increased to \$16,000,000, divided into \$8,000,000 of 5 per cent preferred stock and \$8,000,000 common stock. It is now stated that this company will acquire the Schoepf-McGowan properties in Ohio which are not controlled by the Ohio Traction Company.

Pittsfield (Mass.) Electric Street Railway.—This company has filed a trust deed to the Berkshire Loan & Trust Company of Pittsfield, as trustee, to secure an issue of \$100,000 bonds.

Rhode Island Company, Providence.—This holding company, controlling the New York New Haven & Hartford Railroad electric railways in Rhode Island, will absorb the Providence & Burrillville Street Railway, Woonsocket, and the Columbian & Woonsocket Street Railway.

Dividends Declared.

Chicago City Railway, quarterly, 1½ per cent.
Consolidated Traction Company, Newark, N. J., 2 per cent.
Rochester Railway & Light Company, preferred, quarterly, 1¼ per cent.
South Side Elevated Railroad Company, Chicago, quarterly, 1 per cent.
Twin City Rapid Transit Company, Minneapolis, preferred, quarterly, 1¼ per cent.

Manufactures and Supplies

ROLLING STOCK.

Oklahoma City Railway, Oklahoma City, Okla., expects to be in the market in a short time for a number of cars.

Birmingham Railway Light & Power Company, Birmingham, Ala., has ordered four cars from the St. Louis Car Company.

Ogden Rapid Transit Company, Ogden, Utah, placed an order some time ago with the St. Louis Car Company for two cars, delivery on which will be made this month.

Owosso & Corunna Electric Company, Owosso, Mich., we are officially advised, expects to place orders for considerable new equipment during the next 30 to 60 days.

Washington Water Power Company, Spokane, Wash., is reported to have placed an order with The J. G. Brill Company for 17 semi-convertible cars, to have a seating capacity of 48 passengers each.

San Diego Electric Railway, San Diego, Cal., is in the market for one combination parlor and observation car. Wicker chairs are preferred to fixed walkover seats and the car is to be mounted on interurban trucks, equipped with 4-motor G67 equipment and air brakes.

Mexico Santa Fe & Perry Traction Company, which was reported in the Electric Railway Review of June 1 as to be in the market for rolling stock in about 30 days, is asking prices on six passenger cars, one party car, one express car, one work car, one line car and one electric locomotive. The passenger cars will be 52 feet in length over all and weigh from 30 to 32 tons each. S. L. Robison, president and general manager, Mexico, Mex.

Aurora Elgin & Chicago, as reported in the Electric Railway Review of May 25, has placed an order with the Hicks Locomotive & Car Works for two passenger cars. These will have a seating capacity of 58 passengers, will weigh 80,000 pounds and have a wheel base of 6 feet 6 inches. The cars will have a total length of 52 feet 10½ inches, will be 8 feet 8 inches in width and will be 13 feet 8 inches in height from track to trolley base. The body of the cars will be of wood and the underframe of steel. The equipment will include Westinghouse air brakes, electric heating and headlights and Hale & Kilburn seats.

San Diego Electric Railway, San Diego, Cal., as reported in the Electric Railway Review of May 18, expects to build at its shops during the present year 50 cars for interurban service. A number of cars have already been constructed and at the present time material has been ordered for 20 double-truck open-end cars of the California type. The company has practically completed and is now reconstructing for the National City & Otay Railway six large open-end motor cars of the California type, 51 feet long over all; also a number of trailer cars. The company is now contemplating the erection of 10 additional cars somewhat similar in type.

Spokane & Inland Empire Railroad, Spokane, Wash., has just received from The J. G. Brill Company eight cars for use on the Coeur d'Alene & Spokane Railway. Two of the cars are combination smoking and baggage cars, with a seating capacity of 56 passengers and finished in mahogany with rattan seats, two are passenger coaches, with a seating capacity of 66 passengers, finished in mahogany with plush-covered seats, and two are observation cars, with a seating capacity of 75 passengers. The cars are 57 feet in length. These will be put into service as two three-car trains, each equipped with eight 100-horsepower motors, geared to 65 miles an hour.

Northern Electric Company, Chico, Cal., is building six passenger and baggage cars at its own shops and has ordered material for two steel-frame express locomotives. The locomotives will weigh 82,000 pounds each and will be equipped with Baldwin trucks, Miner draft rigging and Westinghouse motors. The specifications for the passenger and baggage cars are as follows:

Weight	80,000 lb.	Height, from rail to roof.....	12 ft. 2 in.
Length, over all.....	56 ft.	From rail to floor.....	4 ft.
Width, over all	9 ft. ¼ in.		
Over steps	9 ft. 3 in.		

Special Equipment.

Trucks	Baldwin	Conplers	Gould radial
Wheels	Schoen	Seat material	Pantasote
Journal boxes	Symington	Seats	Hale & Kilburn
Air brakes	Westinghouse		

SHOPS AND BUILDINGS.

Chicago (Ill.) City Railway.—This company has purchased the southeast corner of Princeton avenue and Seventy-eighth street, 299 by 246 feet, and the southwest corner, 299 by 254 feet, as a site for proposed new car houses, adjacent to the company's present extensive main car storage houses and shops.

Cincinnati (O.) Traction Company.—This company will soon begin the construction of a new car house on Vine street and will enlarge the present Vine street car house.

Evansville Suburban & Newburg Railway, Evansville, Ind.—Plans have been prepared by Harris & Shoppell for a new station to replace the present office and freight depot at Fifth and Main streets, Evansville. The plans call for a 2-story building, to be

of brick and stone construction, with ground dimensions of 50 by 69 feet.

Indianapolis & Western Traction Company, Indianapolis, Ind.—The contractors expect to have the new \$8,000 interurban station at Greencastle, Ind., completed and ready for use by next week. The station is located on the corner of Seminary and Indiana streets, near De Pauw University.

Niagara St. Catharines & Toronto Railway, St. Catharines, Ont.—It is stated that extensions are to be built to this company's car houses at Niagara Falls, Ont., and St. Catharines.

Rhode Island Company, Providence, R. I.—It is reported that this company has prepared plans for a \$325,000 fireproof car house, to be erected on the site of the present South Providence car house, which is to be dismantled. The proposed building is to be 700 feet long on Thurber's avenue, with frontages of 163 feet on both Broad street and Prairie avenue.

San Diego (Cal.) Electric Railway.—This company is now completing an addition to its power house for a paint shop to accommodate six cars.

Southwest Missouri Railroad, Webb City, Mo.—This company has just completed its new car house in East Joplin, Mo. This is a concrete structure, 64 by 225 feet, and is built in the mission style of architecture.

Syracuse (N. Y.) Rapid Transit Company.—General Manager C. Loomis Allen is reported to have staid that work on the extension through Park, Pond and Spring streets will be started by August 1. Other work to be undertaken this year includes the extension of the Stolp avenue line and the double-tracking of the South Salina street and the Solvay lines.

Washington Baltimore & Annapolis Electric Railway, Baltimore, Md.—The contract for the construction of the terminal station at Baltimore has been awarded to J. Henry Miller. The building will front 78 feet on Liberty street, 100 feet on Marion street, and 60 feet on Park avenue, and is estimated to cost about \$49,000. The building will contain two floors, besides a basement, and will be designed for three additional floors if necessary.

Worcester (Mass.) Consolidated Street Railway.—It is stated that work will be started immediately on the new car house near the present car house on Market street, Worcester, to cost \$75,000. Contracts have been let to the Eastern Bridge & Structural Iron Company for the iron and steel construction and to F. W. Mark for the building and equipment. The building will be of brick and steel construction, 97 by 210 feet, and two stories high.

TRADE NOTES.

Gould Coupler Company and Gould Storage Battery Company have moved their general offices from 1 West Thirty-fourth street to 341-347 Fifth avenue, New York.

Blood & Hale, Boston, Mass., have been appointed New England representatives of the Western Electric Company of Chicago. They will handle only generators of large size for use in railway, power and lighting service.

D. J. Carson, who has been with the American Brake Shoe & Foundry Company for the past two years, in charge of the New York office, has been appointed manager of the American Mal-leables Company, effective June 1, 1907.

C. C. Chappelle, who for the last two years has represented the Westinghouse Machine Company in Denver, on May 1 assumed the position of western sales manager, with general charge of the company's business in Chicago and all the territory west.

Dodge & Day, engineers, Philadelphia, Pa., have opened a branch office in the United States Realty building, 111 Broadway, New York, N. Y., in charge of Robert T. Lozier, who has for a number of years been associated with electrical industries.

Wesco Supply Company, St. Louis, Mo., has opened a new branch office at Birmingham, Ala., in charge of W. W. Moore, who is an electrical engineer and has for several years managed the apparatus department of the company, with headquarters in St. Louis.

W. H. Judson Company, Portland, Ore., has been incorporated with a capital stock of \$250,000 for the purpose of manufacturing rolling stock for both steam and electric operation. The officers are: W. H. Judson, president; G. F. Martin, vice-president; M. Wilson, secretary. The company expects to erect its own plant and foundry.

Northern Engineering Works, Detroit, Mich., has recently shipped to the Denver & Rio Grande a second 3-motor electric traveling, 15-ton Northern crane of special construction, for use in the roundhouse of that company. The crane uses alternating-current equipment, and is designed to run on an overhead track having a considerable curve.

Railway Safety Appliance Company has been incorporated in the state of New Jersey with a capital stock of \$150,000 for the purpose of manufacturing a safety appliance to prevent the spreading of rails. The incorporators are: J. F. Rogers and J. R. Streeter of New York City; E. T. Thomas and C. H. Bowne of Brooklyn, and Charles H. Haight of Jersey City, N. J.

H. M. Byllesby & Co. have been retained as consulting engineers for the Sioux Falls Light & Power Company of Sioux Falls, S. D. A water power, with a head of about 80 feet, is to be constructed on the Big Sioux river at this point. They have also been retained as consulting and operating engineers for the

Flathead Valley Water Power Company of Kalispell, Mont. The company's water power is situated at Big Fork, Mont., on the Big Fork river, having a head of about 105 feet. This development is to be added to and the capacity of the plant is to be greatly increased.

Manning, Maxwell & Moore, 85 Liberty street, New York, have prepared plans for the erection of a storage warehouse in Jersey City, N. J., to be two stories in height and to have ground dimensions of 110 by 260 feet. The building will be located opposite the freight office of the Central Railroad of New Jersey and will be of brick and steel construction, with concrete floors. Each floor will contain 40,000 square feet of space. The building will be equipped with a 20-ton electric traveling crane and a hydraulic elevator, designed especially for handling heavy machinery and tools. It is the intention of the company to keep in hand a large amount of its products to meet the demand for prompt shipment.

Western Electric Company announced on April 15 to their southern customers that it had installed at 230 Lee street, Atlanta, Ga., a complete stock of general electrical supplies and had established there a supply organization for taking care of its southeastern trade. The company has contemplated doing this for some time, and the proximity of a complete stock of Western Electric Company supplies will doubtless be gratifying to southern customers. The construction of the new Atlanta plant of this company, located on the Central of Georgia Railroad, close to the city, has only recently been completed. The building has 60,000 square feet of available floor space and with sidetracks and modern interior equipment the plant is peculiarly well adapted for the rapid and economical handling of the company's heavy stock.

Power Specialty Company, New York, reports recent sales of 120 Foster superheaters, aggregating 42,000 horsepower. These superheaters are to be installed in Babcock & Wilcox, Stirling, Edge Moor, Heine, Franklin, Atlas and other boilers, including a number of return tubular boilers. The above include a large number of repeat orders following the successful operation for from one to five years of initial installations. Among many others such successive orders have been received from: Solvay Process Company (three), International Harvester Company (three), James S. Kirk & Co. (two), Stone & Webster Engineering Corporation (six), Hartford Electric Light Company (four), Philadelphia Electric Company (three), Tennessee Copper Company (three), United States Navy Department (nine), Quincy Market Cold Storage Company (three), American Smelters Company (three), Electric Company of America (seven).

H. W. Johns-Manville Company, New York, had a large and interesting exhibit at the convention of the National Electric Light Association, which was held in Washington this week. Probably the most notable feature of its exhibition was the "Victor" combination meter, a variety of forms of which were shown, including switchboard, portable and automobile types. These instruments possess the unique feature of giving a simultaneous reading of volts, amperes, watts and horsepower on one dial. "Victor" meters have been on the market for almost two years and have met with continued success. The instruments are manufactured at the new instrument plant of the company in Brooklyn, N. Y., which is one of the best equipped of its kind in the country. Among other devices exhibited by this company should be mentioned "Noark" subway and service boxes of one, two and three pole construction, and 250, 600 and 2,500 volt capacity. These boxes are absolutely water-tight, being designed and tested to withstand a pressure of 25 pounds per square inch without leaking, and are therefore suitable for the most severe conditions. A complete line of "Noark" national standard fuse blocks and accessories, as well as line material devices, also were shown. The company distributed samples of the well-known "J-M" friction tape. Another feature worthy of mention is "Transite" asbestos fireproof doors for high-tension transformer and switch compartments. These doors are designed for the protection of apparatus from short-circuiting; also to prevent persons from coming in contact with the live parts. They are made of "Transite" asbestos fireproof lumber, a material which is said to possess the unique features of being fireproof and at the same time an excellent insulator.

ADVERTISING LITERATURE.

Templeton, Kenly & Co., Chicago.—Simplex jacks for car and track work are briefly described and illustrated in a pamphlet which also quotes prices.

Electric Service Supplies Company, Philadelphia.—An elaborate pamphlet regarding a telephone apparatus for railway use has just been issued by this company and contains full information with illustrations of the various kinds of telephone apparatus adapted to railroads.

Chase-Shawmut Company, Newburyport, Mass.—This company has just issued circulars and miniature bulletins covering the following of its special lines: Shawmut ground connection clamps, extended terminal fuses, pocket test lamps, Boston cable clips, red E solder paste and porcelain cut-out blocks.

Lee, Higginson & Co., Boston.—In a bulletin dated June 1, 1907, this firm offers for sale bonds of lighting and traction companies as follows: North American Company, Puget Sound Power Company (Wash.), Madison River Power Company (Mont.), Houston Electric Company (Tex.), Butte Electric & Power Company (Mont.), Dallas Electric Corporation (Tex.) and Whatcom County Railway & Light Company (Wash.).

Gunn, Richards & Co., 43 Wall Street, New York.—The underlying principles in determining foundry costs are considered in a

pamphlet just issued by this company, which is prepared to examine establishments of this and other sorts, and arrange a systematic, complete and coherent plan for finding costs.

Newport News & Old Point Railway & Electric Company.—This company has issued a very interesting and attractive folder which contains maps and illustrations that will be found especially useful by those who attend the Jamestown exposition. The company's lines connect Newport News with Old Point Comfort.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1058 describes the Winona Interurban Railway, being a reprint from November, 1906, issue of the Electric Railway Review. Bulletin No. 1603 contains the official duty tests of pumping engines Nos. 1, 2 and 3 at Bissell's Point pumping station, St. Louis waterworks, together with illustrations of the various standards of Allis-Chalmers pumping engines. Bulletin No. 1513 is descriptive of the Christensen portable air compressor, manufactured by this company.

Railroad Supply Company, Bedford Building, Chicago, Ill.—Section No. 1 of Catalogue No. 7 has just been issued by the signal department of this company. The catalogue, when its several sections are complete, is expected to show the company's full line, which includes materials and supplies for single or double track steam or electric railway signal systems and devices to provide protection for highway crossings and other points. Section No. 1 is devoted to crossing signal poles, warning signs, vibrating bells, etc.

Shoemaker & Casparis, Newcomerstown, O.—This firm is exclusive sales agent for the Shoemaker automatic elevators for elevating and screening sand and gravel. A special machine for loading run of bank gravel for ballasting without screening, which is made with 3-foot capacity buckets, it is stated, will load 1,500 to 2,000 cubic yards of gravel per day, but five men being required for its operation. The standard 24-inch bucket machine has loaded 10 cars, five with sand and five with gravel, in four hours, employing six men. The construction of the machine and the screening device are described in a pamphlet.

THE NATIONAL CROSSING SIGNAL.

The essential requirements of a good crossing signal are that it shall, without fail, announce the approach of a train under all conditions of service. As the factor of reliability in such apparatus is an important one considerable weight should be given to any crossing signal installation that has the fewest possible parts and these of substantial construction. Such were the fundamental conditions that were observed in the design of a new signal just

National Crossing Signal—Post, Lamps, Bell and Sign as Furnished with Each Installation.

placed on the market by the National Railway Signal & Manufacturing Company of Wheaton, Ill.

The accompanying illustrations will serve to show the general appearance and detail construction of the new signal equipment as it has been installed, and commendably withstood the very severe service on the Aurora Elgin & Chicago Railway. The simplicity of the various parts will be appreciated. The essential elements of an installation comprise a 12-inch gong and a bank of incandescent lights mounted on a crossing signal post, as shown in one of the accompanying illustrations; a contact-making device, also illustrated, and a relay which governs the making and breaking of the various circuits. The contact-making devices for both trolley and third-rail use are illustrated. It should be noted that the making

and breaking of the circuits which operate the signals are performed at the contact device and no arc takes place in the relay under any conditions. This feature makes the National signal particularly well adapted for lines carrying high voltages.

By tracing the circuits shown in the diagram the principle of the signal movements is apparent.

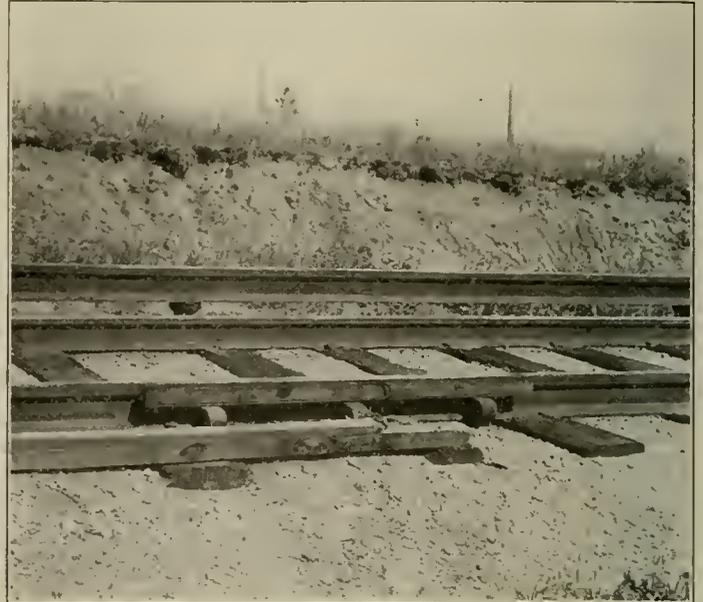

When a train enters a block from either direction, the bell

trolley. This second circuit-closing energizes the coils of the relay, raises a contact-closing armature, and completes a holding circuit from a permanent ground connection through the armature contacts, relay coils, resistance, lights, and bell to the trolley, causing the bell to continue ringing until the trolley wheel passes the next contact at crossing.

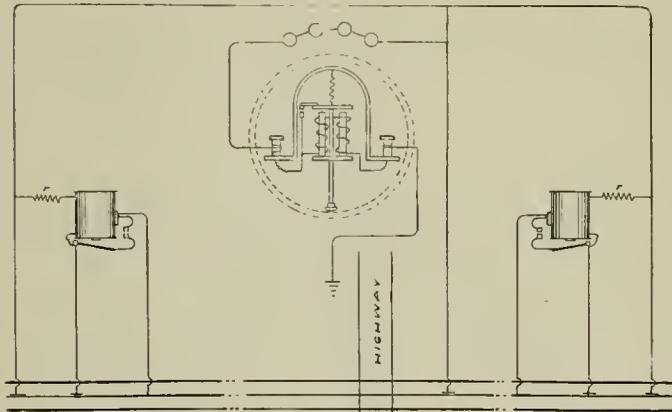

Third—When trolley wheel bridges the contact at crossing, to

National Crossing Signal—Relay and Case as Mounted Near Contact Maker.

National Crossing Signal—Spring-Supported Contact Maker as Installed on the Aurora Elgin & Chicago Railway.

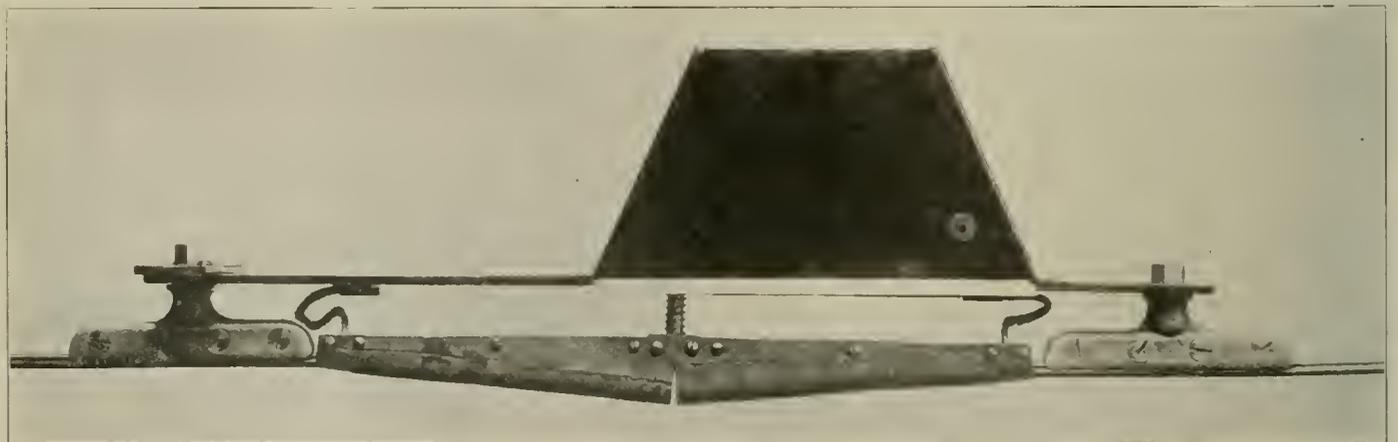

National Crossing Signal—Diagram of Circuits for Single-Track Movement, with Trolley Contacts.

silence the signal, the connection is such as to send an impulse of same polarity as that of grounded circuit at the relay, through a conductor of practically no resistance as compared with the relay coils and relay resistance. This de-energizes the relay coils, breaking the connection to ground at the relay while a current is passing through the low-resistance shunt caused by the car bridging the crossing contact. Thus any arcing at relay contact points is obviated.

Fourth—Leaving the highway crossing, the car makes two final contacts at the remote end of the block. The first (or inner) contact sends an impulse to the contact connected with the armature of the second (right-hand) relay; thence through the winding of the coils, the resistance, the lights, and the bell, to the trolley, energizing the relay coils, raising the armature, and closing the connection to the permanent ground. The second (or outer one) of the final contacts, bridged immediately afterward, de-energizes the second relay just as the first was de-energized, letting the armature drop and breaking the connection to permanent ground without any arcing at the relay contacts.

The trolley contact-maker has proved reliable and efficient, being strongly constructed, durable, placing no obstruction in the

National Crossing Signal—Switching Device Attached to Trolley Wire Without Cutting.

begins ringing, and continues to ring until car passes the highway crossing. This is accomplished as follows (see diagram, tracing diagram from left to right):

First—The trolley wheel throws the contact switch, which bridges an insulated contact at entrance to the block, completing a circuit through the bank of lamps and bell to the trolley.

Second—The wheel immediately throws another contact, completing a circuit through relay coils, resistance, lights and bell to

path of the trolley wheel, and giving sure, positive contact at high speeds. The rail contact-maker, which is used for third-rail lines, is strong and durable, being supported on heavy springs which are clamped to the base of the running rail. The bell, a continuous-current vibrator, is non-arcing and weather-proof. It requires no delicate adjustment, and is of a type that proves efficient on circuits of voltage as high as 500 or 600. The relays, as has been stated, are non-arcing. They are inclosed in wood boxes.

The street railway manager must take things as he finds them. His best hope of reducing the cost of motive power lies in making the most of the station which he already has. The elimination of some of the uncertain and careless features which induce waste is the duty of the hour, no less than a practical search for new types of machinery. To enumerate the weak spots of power plant operation in detail would transcend the limits of these columns, but a few suggestions may be included as significant. We need to know more definitely how many and what sort of men are required to operate given capacities of generating and auxiliary machinery. There is no lack of judgment on this question obtainable on the basis of personal opinion; but who has attempted to investigate this question by striving to hold the other factors constant which comprise the cost for power, meanwhile varying the labor? "Impracticable," says someone at once. Is it?

The power plant is still in a process of evolution and no man can tell when the development curve of generating machinery will flatten. The selection of equipment appears to require even broader knowledge today than previously. Coming down to specific instances one finds that the range of choice is limited by many uncertainties. The manufacturing companies are putting much of their best thought upon the turbine question, but who is bold enough to say that this interesting prime mover is as yet capable of eventually driving the reciprocating engine from the field in general practice? The gas plant is entering the field, rather slowly in large sizes, but does it not show that these new prime movers have yet to win their place, so to speak, when reciprocating engines continue to be ordered in large plants? Perhaps it is no sign of weakness in our knowledge of power plant economy that we are still somewhat in the dark as to the clearly defined limits of each type of prime mover, but it is certain that the publication of operating results, including the record of shut-

downs, the cost of repairs and the opinions of men in the power house close to the metal, is one of the most enlightening things which could be done in cases where the value of a given equipment is questioned.

Considerable interest has recently been shown in the high-potential line insulator. Several new designs have been proposed, each of which takes into account the desirability of having the smallest possible amount of still air space, combined with the necessary creepage surface. The possible breakdown of insulators from their creepage distance being shortened by an accumulation of dust also is considered and a shape is given the material so that an ample proportion of the surface will be washed clean by rain. These several fundamental requirements in insulator design must be recognized in planning insulators for any high-potential service. There are still other and more severe conditions imposed on the insulating medium of a high-potential line built parallel with or close to a large body of water. Elsewhere in this issue Sidney Sprout, electrical and mechanical engineer of the Ocean Shore Railway, San Francisco, Cal., describes in detail the various severe conditions which an insulator must meet to be satisfactory for use on the proposed transmission line of this railway which parallels the Pacific coast for 80 miles between San Francisco and Santa Cruz, Cal. Some of the severe conditions to be expected on this 33,000-volt line and which warranted very careful tests of insulators under actual operating conditions were as follows: Salt fogs, with trade winds from the ocean during the foggy season; spray; and dry seasons of from four to six months and a proximity to a country road, with the attendant dust. No other transmission line, within the knowledge of the engineers, had been operated under similar conditions at more than 11,000 volts pressure; and, in fact, a line parallel to the proposed route for some miles had experienced a considerable number of burnouts from insulators becoming coated with dust from the highway and salt from spray and fogs. The author of the paper tested under the most severe

conditions many insulators of some eight types of manufacture. His conclusions should be considered as valuable. In summing up the result of his experiments he states that the most satisfactory insulator is one which has few still-air spaces and exposes a large proportion of its surface to the action of the wind and rain. A study of the results also leads to the suggestion that a satisfactory insulator for such severe service could be made of several pieces of porcelain or glass, shaped something like the present insulator tops, and placed one below the other.

SPECIAL SERVICE FOR FACTORIES.

It would seem needless to point out the value of special trolley service in connection with large factories if it were not for the fact that opportunities of this kind are sometimes overlooked by managements which are otherwise progressive. Observation of a recent case in which a double-track trolley line passing a plant employing some four or five thousand persons provides little if any extra service at morning, noon or night, suggests the importance of looking carefully into industrial establishments for possible traffic. In many cities the value of providing extra service for factories is well appreciated, and even in small towns where the schedule calls for a limited number of cars during the greater part of the day, it will often be found that a considerable number of extras are operated for the benefit of shop employes.

One of the advantages of this service from the railway company's standpoint is that the older or off-season cars can often be used to handle the business. The factory employes do not demand the luxuries of equipment so much as the furnishing of transportation. In the winter season, except in very cold weather, open cars can be pressed into service for these factory runs, depending, of course, upon the general distribution of travel required, the location of transfer points and the situation of the industrial plant with respect to main lines of transit. Trailer car service finds a special field of usefulness in such cases. In Schenectady the local railway company has a special terminus at the electrical works, and three times a day the road reaps the benefit of a large amount of extra travel, which would otherwise be lost. Special smoking cars are run for the benefit of shop employes, and, while but a small percentage of the industrial army which daily mobilizes at this immense plant is carried by the local railway company, the business in itself is most impressive in volume.

The provision of special service for factories in very large cities is a much more complicated problem than in a town where one or two great mills provide the bulk of the employment. Just as in the load curve of the large station the influence of the fluctuations of a single line is small in proportion to the total variations, so in the community of many industrial plants it is difficult to observe the traffic influence of any single establishment upon the schedule as a whole. When these large industries are widely scattered, and when there is no strictly defined industrial residential area, about the only thing that can be done is to increase the frequency of service past each plant and fall back upon the transfer points as distributing agencies.

The encouragement of travel to and from factories in smaller cities is a much more definite matter. Here is a good chance for co-operation between the street railway management and the factory executives. There ought not to be much difficulty in the way of ascertaining accurately the residence districts of the bulk of the employes, and planning a car service which will accommodate the maximum number of persons working in a given plant. In these large establishments many workers walk to their homes or use the bicycle at morning and night, but the institution of a frequent trolley service in the rush hours enables many to live in pleasanter districts than would otherwise be the case, and encourages riding in bad weather or in cases of tardiness from those who would ordinarily depend upon their own exertions. Com-

panies will usually go to great lengths to secure baseball traffic twice a week, but in the industrial field is an opening which lasts the year through, and which occurs twice and often thrice daily.

ECONOMIZERS AND STEAM AUXILIARIES.

In the past two or three years a large number of power houses of medium size have not been equipped with economizers. The reasons for this lie partly in the economizer and partly in the fact that some engineers believe nearly the same economy can be obtained in a non-condensing plant, using the exhaust for heating the feedwater, or a condensing plant in which the auxiliary exhaust is used for heating the feedwater, as in one in which condensers and economizers are installed.

These conclusions are, in part, supported by the performance of several English plants having Willans engines which are operated non-condensing. In many stations the condensers and air pumps get very little attention and the economizers are entirely neglected. This neglect is the cause of the poor showing made by so many plants fitted with condensers and economizers and is the basis of the prejudice existing in the minds of so many managers and designing engineers. A further reason why economizers are sometimes omitted is that they necessitate a larger investment in the plant and take up considerable room. The latter can be overcome in most cases by installing the economizers over the boilers if sufficient ground area is not available, and the additional investment required should not be an obstacle to companies which have not reached the limit of their borrowing capacity; for, if money can be borrowed, it is evident that the saving of 10 per cent which economizers will yield on their investment will pay the interest on their cost and leave a good margin for the operating company. To produce a saving of 10 per cent, however, the economizers must be of ample size, properly installed, and receive careful attention, for without careful attention to the scraping mechanism, an economizer is useless.

Most of the failures of economizers and the prejudice against them is due to neglect alone, and such prejudice and opinions based on these failures are unjust, not only to the makers of economizers, but to the designing engineers who advocated their installation. There is an important feature, however, which is sometimes overlooked in the design of condensing plants in which economizers are not fitted, because exhaust steam from auxiliaries is available for heating the feedwater. The arrangement which is generally overlooked is that of passing the exhaust from the auxiliaries into the low-pressure cylinder of a steam engine or one of the later stages of a steam turbine and using an economizer for heating the feedwater. The advantage of such an arrangement is especially commendable in plants equipped with condensing steam turbines. This will be clear when it is remembered that steam will generate as much power in a steam turbine when working between atmospheric pressure and the pressure in the condenser, as it will when working between 150 pounds gauge and atmospheric pressure. The large number of exhaust steam turbine plants which have been so successfully installed in the past two or three years proves the truth of these statements. This arrangement taken in conjunction with economizers will show a positive saving of at least 10 to 20 per cent, depending upon the conditions.

To illustrate this case, assume a power plant of 14,000 kilowatts capacity, fitted with Curtis steam turbines, water tube boilers, dry and wet vacuum pumps, circulating pumps, mechanical stokers and forced draft. All the auxiliaries are assumed to be steam driven.

Assuming a load factor 50 per cent, the output of the station would be about 7,000 kilowatts. The steam consumption under these conditions probably would be about 19.5 pounds

per kilowatt-hour; hence, about 135,000 pounds of water would have to be evaporated for the main engine alone, or say 150,000 pounds including the auxiliaries. In this case the auxiliary exhaust would be just sufficient to heat the feedwater from 80 to 205 degrees F. Now, since a low-pressure turbine can generate a kilowatt-hour on 50 pounds of exhaust steam, the auxiliary exhaust would be sufficient to generate 300 kilowatts in the main units or, in other words, produce a saving of about $4\frac{1}{2}$ per cent in the coal bill. To this must be added the saving due to the economizer alone, which amounts to 8 per cent of the coal used if the temperature of the flue gases is reduced from 550 to 300 degrees F. The combined saving, therefore, would be about 12.5 per cent.

As a matter of fact the actual saving would be somewhat greater than this, as the additional steam in the low-pressure stages of the turbines would materially increase their economy on light loads and thus further reduce the steam consumption. The point which we wish particularly to emphasize is that some engineers probably consider that the saving of 8 per cent effected by the economizers alone is not sufficient to warrant installing them at the present money rates; but, were the plan here suggested followed, the saving of 12.5 per cent might be an inducement to make the extra outlay for the economizers.

CONTRACTS WITH EXPRESS COMPANIES.

In making contracts with express companies electric railways must take into consideration the fact that their own business of handling freight in less than carload lots frequently competes with the facilities afforded by express service. Managers of electric railways are constantly on the lookout for new sources of revenue, but they cannot afford to divide the income from their own business of hauling package or other light freight. So far, therefore, as the express business is valuable, it is of benefit, as it may supplement the freight business which has previously been secured.

Between the express business as it is conducted on contract with steam railways and with electric railways there is a wide difference. It is a difference, however, which the future development of electric railways may affect materially. Either for long or short hauls on a steam railway the delivery of freight requires more time than the delivery of express. The value of the express service on steam railways lies in the saving of delay in delivery, and in the insurance which is assumed where the articles transported are of great value. On electric railways, however, as they are now managed and owned, the difference in time of delivery, owing to the comparatively short mileage of each company, is of hours, not days. On some roads this time advantage is so short that it does not warrant introduction of the express service, which involves terminal expense at points where the express company maintains wagons for delivery of packages. The process of evolution naturally effects an increase in the facilities of individual roads through the construction of extensions, the merger of interests and the formation of traffic alliances. These changes open the way for improved freight service, supplemented by the introduction of express service.

Recollection of the rapid development of freight business on electric roads is an indication of the future possibilities of express service. No long memory is required to recall the early doubts which were expressed regarding the prospects of profitable freight business on electric roads. To doubt its possibilities now would be to deny the facts which have proved the importance of this traffic to many interurban lines. The Inter-Urban Railway, Des Moines, Ia., according to the statement of H. H. Polk, president and general manager, at the last meeting of the Iowa Street and Interurban Railway Association, derives 30 per cent of its gross revenue from freight traffic. The express business will probably eventually reach a growth beyond that which is foreseen at this early day.

For electric railways which conduct a freight business or enter into contracts with express companies it is most important that all of the expenses which properly belong to that branch of the traffic be separated, so far as possible, from those that are chargeable to other departments. The danger of considering revenue from freight or express business as extra profit and the unwisdom of a failure to allocate properly the expenses pertaining to such business was recognized by P. P. Crafts, general manager Iowa & Illinois Railway, in his instructive address before the Iowa Street and Interurban Railway Association, Clinton, Ia., in April, this year. As Mr. Crafts properly stated, the failure to charge the freight revenue with a percentage of such expenses as belong in part to the freight business, and with all other expenses which are caused by this traffic, "deceives the manager as well as his stockholders."

As the motive of both freight and express business is profit, the proof that the business is not transacted at a loss, or at undue expense in proportion to the revenue, is of vital necessity.

SMOKE—PREVENTABLE AND NON-PREVENTABLE.

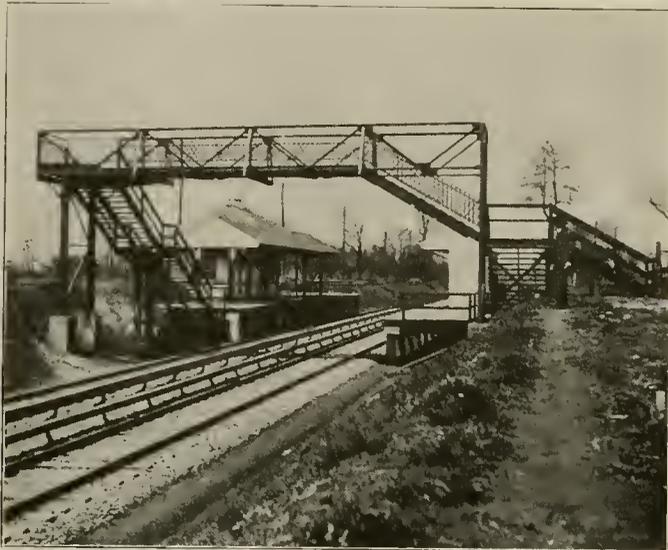

From time to time we have published in these columns discussions and editorial comments on smoke prevention. In such discussions the term smokeless combustion has been used merely in a relative sense, as absolutely smokeless combustion can only be obtained under certain conditions which are hopeless of attainment in railway and lighting plants. In such plants, the load is of a fluctuating character, varying at times from practically no load to full load in very short intervals of time, and with the exception of small plants where it is feasible to carry the peaks by storage batteries, the changes in the demand for power must be met by varying the number of boilers in operation and by checking or forcing the fires. The inevitable result of these conditions is a certain amount of smoke, depending upon the suddenness of the changes of load.

The conditions necessary for smokelessness are that the volatile gases distilled from the coal should be mixed with sufficient air for complete combustion, and when mixed, raised to a sufficiently high temperature to ignite them. This implies the coking method of firing, whether by hand or by mechanical stoking, and it is absolutely impossible to fulfill these conditions where the demand for steam fluctuates rapidly. The reasons are evident, for when the fires have been low, and a sudden demand for steam comes, the only method available to generate steam rapidly is to crowd in a large quantity of green coal and increase the draft. For this purpose a coal containing large quantities of volatile matter which is easily driven off is absolutely necessary, and as under the suddenly changed conditions, it is impossible to burn all the gases completely, some smoke will inevitably result. A similar condition arises when it is necessary to check the fires suddenly, as then the decreased air supply is no longer sufficient to completely burn all the gases given off, and again the result is unpreventable smoke.

It must be remembered that the term unpreventable is applied only in a relative sense. In the large modern stations of today, a sufficiently great storage battery capacity to provide for the peaks of the load would be out of the question, as are likewise large heat storage tanks and flywheels. A certain amount of unpreventable smoke is therefore a necessary evil, though the amount of smoke can be very materially reduced by proper management, and can be entirely eliminated in plants having a constant load. It would therefore be far wiser and more farsighted if municipalities would confine their energy and aggressive legislation to preventing the needless and avoidable smoke made by plants and factories having a uniform load rather than to interfere constantly with and among the electric lighting and railway companies.

THE PHILADELPHIA & WESTERN RAILWAY.

The Philadelphia & Western Railroad Company was incorporated in 1901 with the object of building an electric railway from the western terminus of the Philadelphia Rapid Transit Company at Sixty-third and Market streets, Philadelphia, to Parkesburg, a distance of 44 miles. The eastern

Philadelphia & Western—Typical Station with Overhead Footbridge.

division of the line, 11.8 miles, from Sixty-third and Market streets to Strafford, is now completed and in operation.

Territory Served.

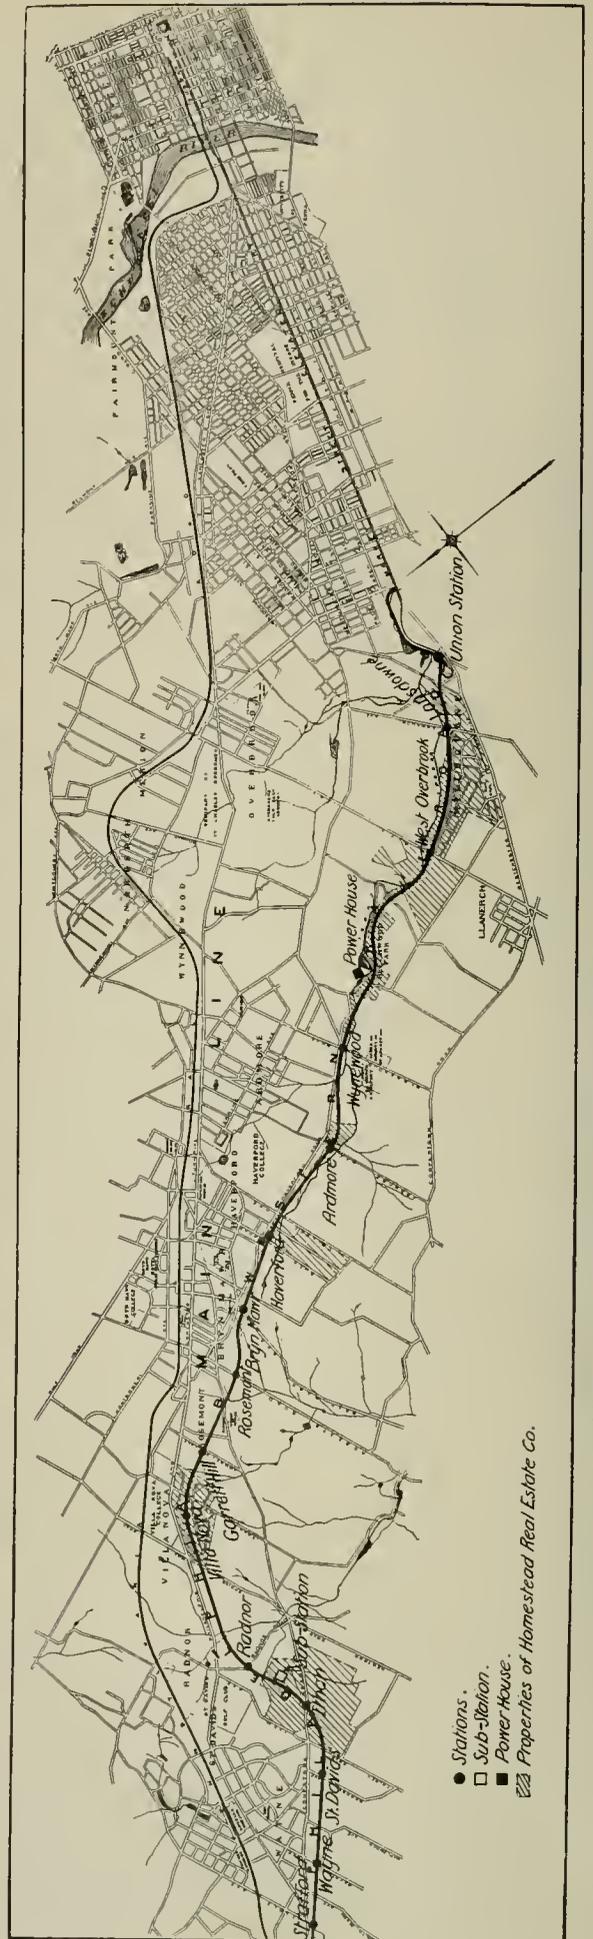

The preliminary work in connection with this involved unusual difficulties in the matter of securing rights of way, and the company was obliged to invest over a million dollars

Philadelphia & Western—Track Layout at Bryn Mawr.

in real estate not required for railroad purposes. All homesteads which will be traversed between Philadelphia and Parkesburg have been acquired and the route located. Between the city terminus and Strafford, which is a station on the main line of the Pennsylvania Railroad, the Philadelphia & Western parallels the Pennsylvania, being from 1/4 of a mile to 1 1/4 miles south of it for a greater part of the distance. This suburban territory heretofore has been served by the Pennsylvania.

Within a few miles of the railroad are located the sum-

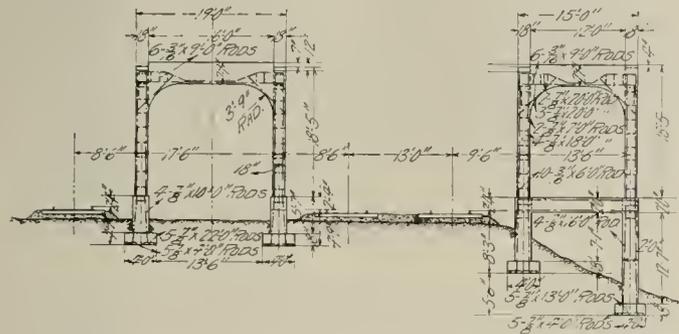

Philadelphia & Western—Map Showing Roadway and Location of Philadelphia Terminal.

mer homes of a great many of the wealthiest families of Philadelphia, and the Philadelphia & Western was obliged to condemn rights of way through a number of these country estates. The total land acquired by the company not needed for strictly railroad purposes is about 800 acres, one of the largest tracts being that of the Joseph H. Childs and Joseph H. Childs, Jr., estates near St. Davids, comprising 150 acres; a tract purchased from the Villa Nova College, 102 acres; and the estate of John Ashhurst. On this last tract is Ellwood Hall, a house built in 1682, at which Washington and La Fayette were frequently entertained.

Personnel.

The real estate interests of the company are handled by the Homestead Real Estate Company, the officers of which are: President, George J. Kobusch; vice-president, L. M. Downs; and secretary and treasurer, Thomas Newhall. The officers of the Philadelphia & Western Railroad Company during construction were:

Philadelphia & Western—Concrete Structures for Overhead Crossings at Beechwood Park Station.

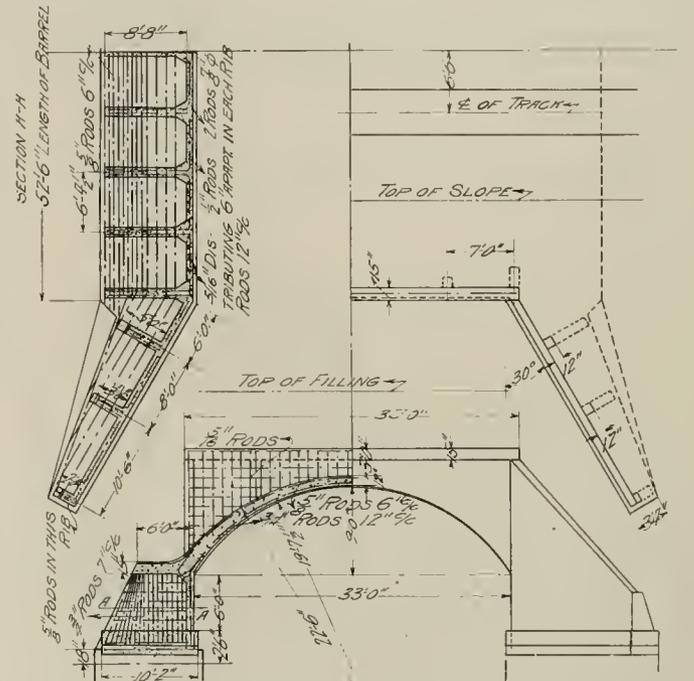

President, George J. Kobusch; vice-president and chief engineer, W. R. Molinard; treasurer, L. M. Downs; secretary, William Darling. The operation is in charge of W. H. Simms, general superintendent.

Track and Roadway.

The eastern division of the road is double-tracked throughout and all extensions will be made double-track when built. It is the intention eventually to have four tracks. Except in a very few instances, constituting not over 1 per cent of the total distance, the right of way is 100 feet wide. The line being design d for high-speed operation, the elimination of all grade crossings was considered essential and bridges or

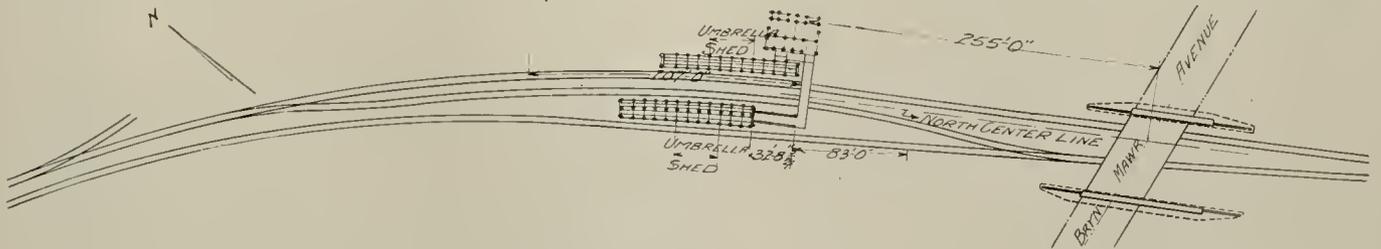

crete. The bridge floors are reinforced with steel rods of 15,000 pounds tensile strength, the rods being of round commercial high-carbon steel, which was considered to give a larger factor of safety than would be the case with other rods.

The maximum grade on the line is 2½ per cent. The sharpest grade is near the Ithan substation. The maximum curvature is 5 degrees. To come within the limit of grade development a number of large cuts and fills were necessary. The largest embankment is 1,850 feet long and 64 feet high

Philadelphia & Western—Reinforced 33-Foot Concrete Arch Through High Embankment.

on a 1½ to 1 slope. On account of the nature of the soil it was necessary to build retaining wing walls at the ends of the embankment for protection from sloughing. At this point also it was necessary to change the location of the highway. There is one rock cut just west of the power house which is 600 feet long and 40 feet in maximum depth, involving the removal of about 20,000 cubic yards. On the whole line there was required the excavation of about one million

Philadelphia & Western—Track Layout at Bryn Mawr Station, Showing Long Cross-Over Between Double Tracks.

viaducts were built at 32 points in the 11.8 miles of the eastern division. One is for a crossing with a trolley line, one for a crossing at the Philadelphia Rapid Transit Company's yards near the terminal station, and the other 30 are mostly at highways, although there are a few of these which are over roads on the private estates which are traversed.

Of the bridges where the railroad is carried over the highway, there are 15 of steel and two of concrete. There are 11 public highway bridges overhead and four overhead bridges for private crossings. The railway bridges conform to Pennsylvania standard for two consolidation locomotives coupled with an additional loading of 5,000 pounds per square foot. All bridges have solid floors, and the abutments are of con-

cubic yards, and the fill practically balances this amount. The principal arch runs through this fill. One of the larger arches is at Cobb's Creek, just west of the power house. These arches are each 30 feet in width. Culverts are very numerous, and these are built entirely of reinforced concrete.

Farnham Third Rail.

The working conductor adopted was the "Farnham" protected third rail. This rail, as shown in one of the accompanying illustrations, is of "U" section, weighing 40 pounds per yard, and is located in the position shown. The center of the bearing surface, which is at the bottom of the third-rail structure, is 3½ inches above the track rail and 27

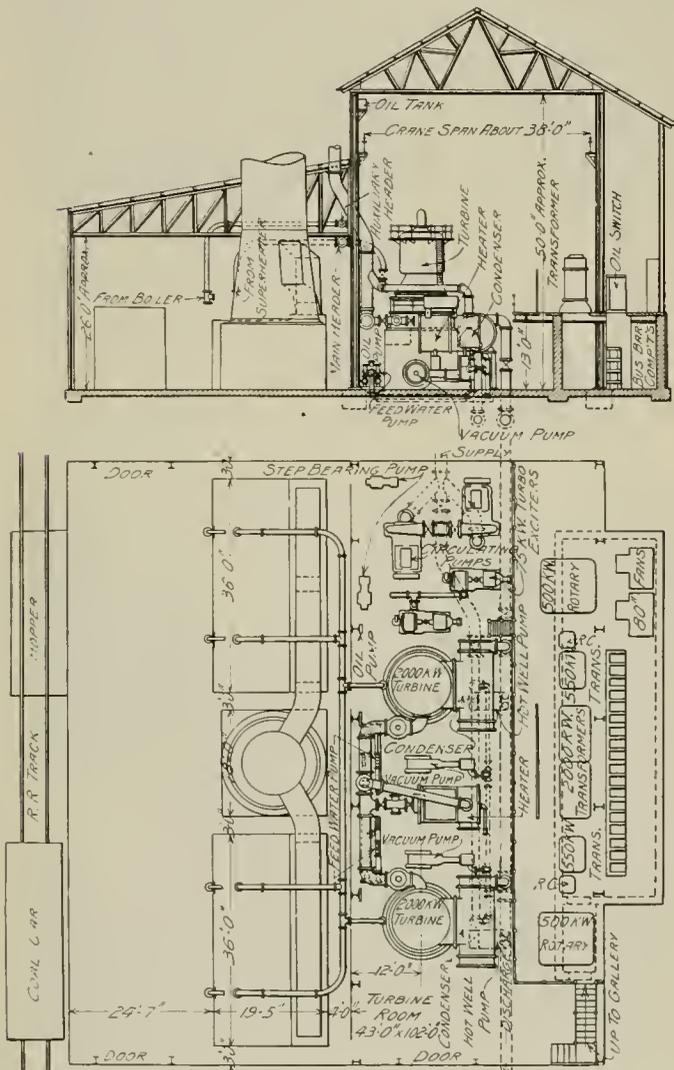

inches outside of the track gauge line. This rail has the same head surface as a 75-pound "T" rail and is low in carbon. It is calculated to have 800,000 circular-mils equivalent copper conductivity, and this is thought to be sufficient for the present traffic. In case it is necessary to increase the conductivity of the third rail the U-shape of the rail provides space for the introduction of a copper conductor which will be thoroughly protected by the steel rail.

The running rails are of 85-pound section and the roadway is entirely ballasted with rock ballast, which the company was able to obtain from a quarry near Ithan. Both rails are bonded with two 400,000-circular-mil protected bonds at each joint. The bonds were furnished by the Mayer & Englund department of the Electric Service Supplies Company.

Stations.

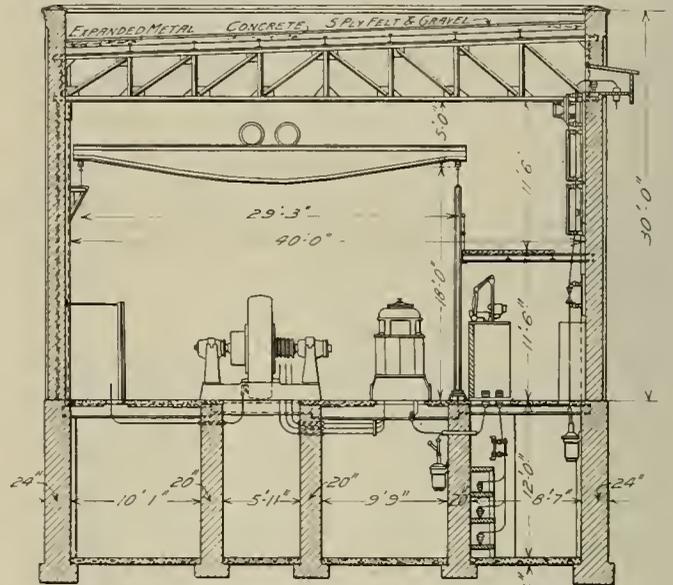

The stations upon the line beginning from the union station which forms a connection with the Market Street Ele-

pany. At several points on the line the capacity of the tracks has been increased by the use of an arrangement shown upon the plans of the station for Bryn Mawr. In this case a third track is interpolated for use as a storage and loading track. The general arrangement of stations is clearly shown in the accompanying views from photographs, and this ar-

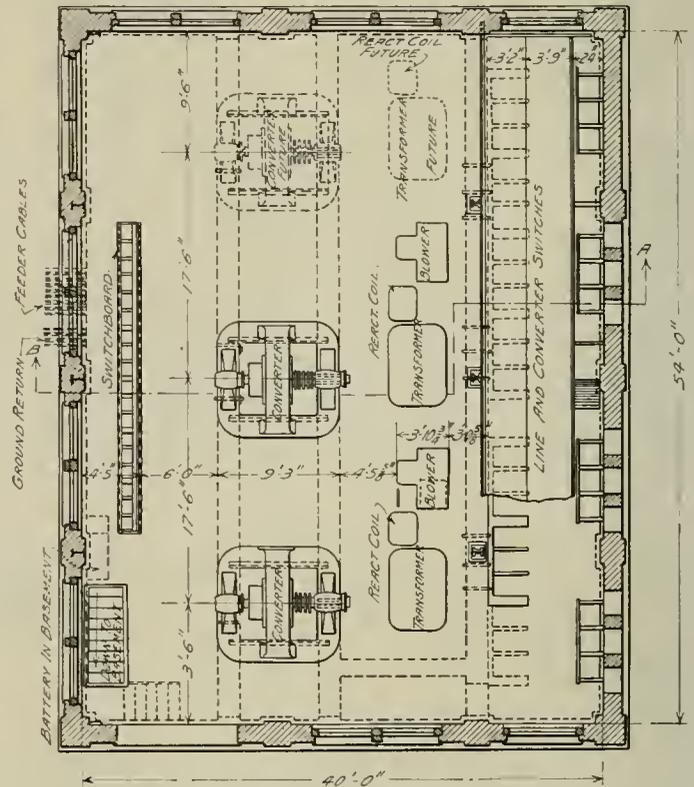

Philadelphia & Western—Sectional Elevation and Plan of Power Station, Showing Disposition of Machinery.

vated Railway, are Beechwood Park, Ardmore Junction, Ardmore, Haverford, Bryn Mawr, Rosemont, Garrett Hill, Villa Nova, Radnor, Ithan, St. Davids, Wayne and Strafford. Of these Bryn Mawr, Villa Nova, Ithan and Wayne are express stations. The power house is located at Beechwood Park, and a substation at Ithan. The schedule contemplated for passenger trains provides for 10-minute intervals during the time of heaviest traffic and for a speed of 23.2 miles per hour. The line will be equipped with a block signal system similar to that adopted for the New York Central electrified zone, which is being installed by the General Railway Signal Com-

SECTION B.A.

Philadelphia & Western—Sectional Elevation and Floor Plan, Showing Disposition of Substation Apparatus.

angement indicates the care which has been taken in the avoidance of grade crossings.

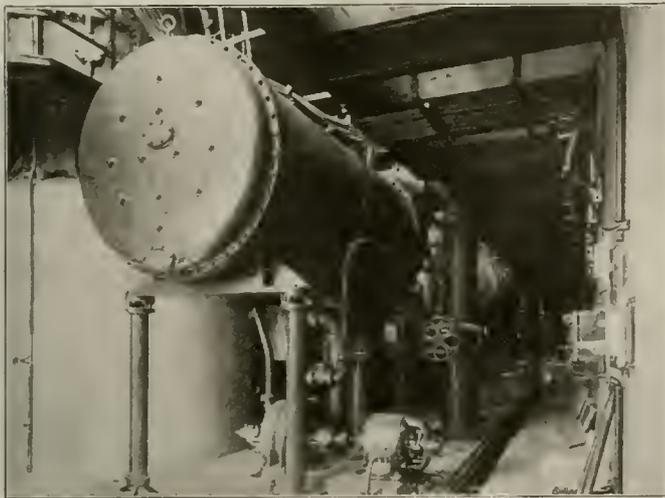

Power House and Substations.

As stated, the power house is located at Beechwood Park, about three miles from the Market street terminns, and the rotary converter substation between Radnor and Ithan is about two miles from the western terminus of the eastern division.

The site of the power house is at a level considerably lower than the level of the tracks and alongside the building

is erected a steel trestle upon concrete columns, upon which cars loaded with coal may be placed for dumping into hoppers which lead directly to the coal supply in the boiler room.

The boiler equipment consists of five 500-horsepower double-drum Heine safety boilers. It is the intention to in-

Philadelphia & Western—Auxiliaries at Base of Turbines in Power House.

crease this number to eight, as the completion of other sections of the road indicates the necessity therefor. Connected with these are Foster superheaters operating at 200 pounds working pressure and designed to afford 150 degrees of superheat. The stack is of steel, 160 feet in height and 13 feet in diameter.

The operating equipment of the power house includes

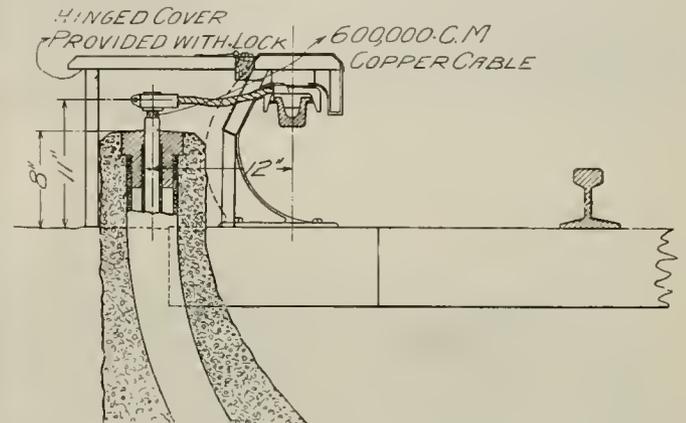

Philadelphia & Western—Exterior of Power House.

two 2,000-kilowatt Curtis turbo-alternator units generating at 2,300 volts. These are of the three-phase 25-cycle type. There is also located at the power house a substation equipped with two 500-kilowatt General Electric rotary converter units. The transformer equipment at the main station provides for stepping down to 435 volts for the rotary converters, and stepping up to 19,000 volts, which is the present transmission potential. It is the ultimate intention to raise this transmission potential to 23,000 volts. The exciters are

General Electric 125-volt machines, direct connected to Curtis turbines. Worthington surface condensers are provided for the main generating units. Cochrane feedwater heaters, Worthington circulating pumps and Buffalo Forge blowers also form a part of the equipment. The accompanying plan and section of the power house indicate clearly the arrangement of the units and their capacity.

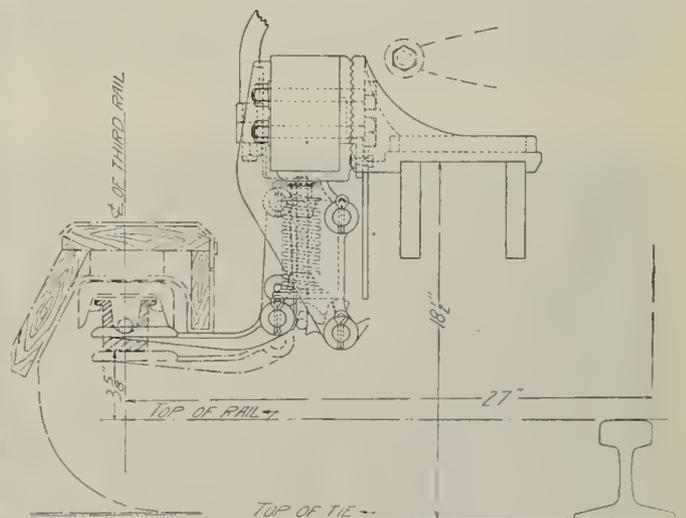

The building is of steel fireproof construction with a concrete roof. It is provided with a 25-ton overhead crane hav-

Philadelphia & Western—Method of Attaching Third-Rail Cables at Highway and Other Crossings.

ing a span of about 38 feet. The accompanying views from photographs will supplement the line drawings as to the general appearance of the power house and its equipment.

The substation at Ithan is equipped with two 500-kilowatt General Electric rotary converters with transformers for reducing the potential from 19,000 to 435 volts. This building, as shown in one of the engravings, is a very neatly designed structure intended to be in keeping with the general high character of the architecture which prevails in the vicinity. It is constructed of buff brick with white enamel wainscoting. In the basement is located a heating plant and

Philadelphia & Western—Sectional View, Showing Third-Rail Detail and Location.

the station is also provided with a 10-ton traveling crane furnished by Maris Brothers, Philadelphia.

Transmission Line.

The transmission line is constructed in an especially substantial manner. The poles are set 7 feet in the ground after being thoroughly tarred for a distance of 8 feet from the lower end, and the hole is then filled with a mass of concrete, which is rounded up at the top around the pole with

Philadelphia & Western—Typical Under Crossing with Highway.

Philadelphia & Western—Substation, Showing High-Tension Wire Entrance and Strain Tower.

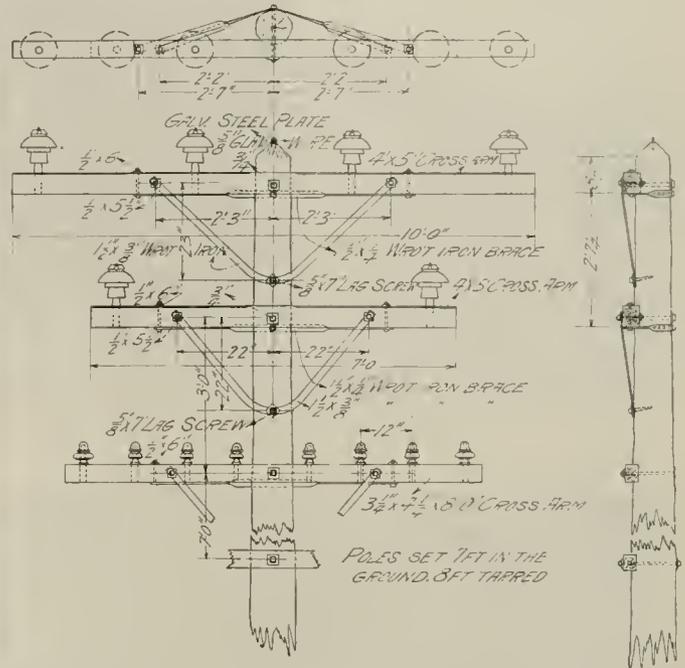

Philadelphia & Western—Interior of Power House, Showing Curtis Turbines, Switchboard and Transformers.

a view to afford drainage away from the pole, and thus materially increase its durability. The crossarms are 4 by 5 inches in section, bolted to the pole with 3/4-inch bolts and braced vertically with 1 1/2 by 3/8 inch wrought-iron braces. The horizontal braces are of 1/2 by 1/4 inch wrought iron, held to the pole by 5/8 by 4 inch lag screws. The upper arms for the transmission line are 10 feet in length and the lower

shop, carpenter shop and various smaller rooms which are used for a blacksmith shop, winding room, storeroom, line tools, mechanics' room, motormen's and conductors' room, and superintendent's office. The building is 330 feet 9 inches from center to center of end walls and each bay is 54 feet

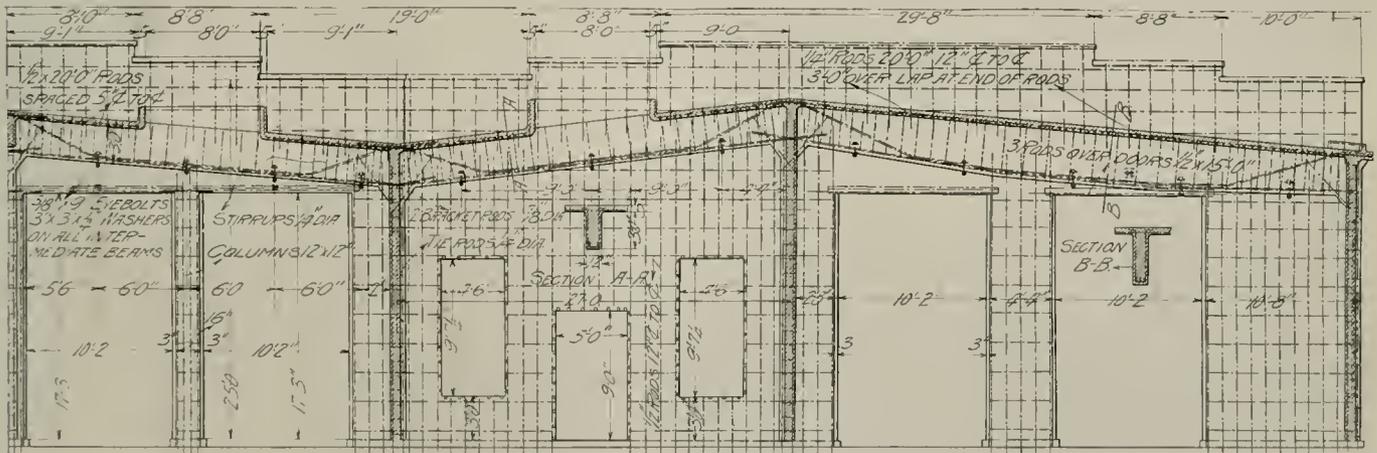

Philadelphia & Western—Interior View of Rotary Converter Substation.

Philadelphia & Western—Detail Dimensions of Pole—Top Construction.

7 feet, while still lower are located arms for telephone and signal wires. An interesting feature is found in connection with the protection afforded highway crossings from possible damage by the high-tension wires. On each side of every highway crossing two poles are set in concrete, as previously described, and the copper wire between these double sets of poles is tied at every 6 feet to a steel wire of high

in width. The bays used for the storage and pit purposes are unobstructed save by a single line of columns down the middle, spaced 15 feet 9 inches apart. The general construction of the pits is shown in one of the accompanying engravings. A passageway affords connection between adjacent pits. The pits are entirely of concrete, the rails being supported on I-beams which are covered with concrete. The

Philadelphia & Western—Details of Reinforcement in Concrete Car House and Shops.

tensile strength. The same construction is employed at other places where it is necessary to carry the high-tension transmission lines over foreign wires.

Car Houses and Shops.

The building devoted to car barns and shops is located a short distance west of the union station. The building is entirely of concrete construction and is subdivided into three bays, two of which afford pit and storage facilities, while the other is subdivided into a machine shop with two pits, paint

capacity of the barn is 24 cars, which embraces the present equipment. All cars are provided with a bow trolley for use when in the barn.

All wires for lighting purposes are carried in pipes with switches at convenient points for turning on the current by sections, and the pits are lighted by incandescent lamps placed 5 feet apart, staggered.

Provision is made for future extension of the building. The reinforcing beams are ended in a projection at the ends of the roof beams. This projection is so built that it

Philadelphia & Western—Concrete Car House and Shops.

Philadelphia & Western—Interior of Car House.

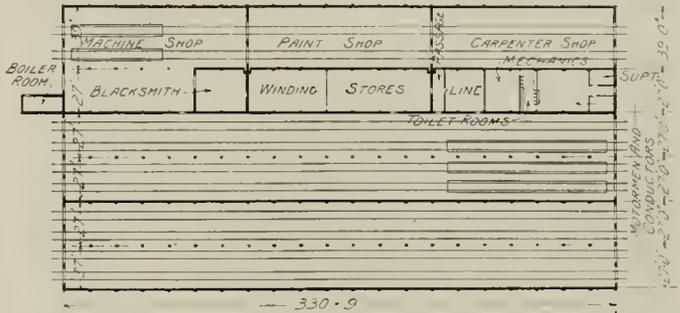

Philadelphia & Western—Multiple-Unit Train of Two Cars as Operated.

can easily be broken to expose the ends of the steel tie rods to enable connection to be made with the rods which will form the reinforcement of the roof of the extension. All partitions in the building are of concrete and the skylights are of wire glass. The building is heated by the "Sturtevant" system, guaranteed to maintain an even temperature of 70 degrees under all circumstances of weather. The building is provided with a traveling crane, which is suspended on concrete beams which have each been tested to 10 tons, and

trict, the company has acquired near the location of the power house a large tract of land which will be used for park purposes and is known as Beechwood Park. This is divided into two sections, one of which will be inclosed and devoted wholly to amusements such as are ordinarily a part of the equipment of pleasure resorts of this nature. The attractions will be grouped around a hollow square, which is outlined by a board walk 32 feet in width and covering an area of 340 feet in length by 200 feet in width. This is fronted toward the railroad station by an administration building, an engraving from a photograph of which is shown herewith. The lighting will be made an important feature, more than 1,500 electric lights being used upon the administration building alone. Within the grounds the buildings are profusely provided with incandescent lamps and general

Philadelphia & Western—Construction Details of Inspection Pit Tracks.

Philadelphia & Western—Floor Plan of Shops and Car House.

thus enables the picking up of an entire car weighing 42 tons.

The machine and repair shops are well equipped with modern tools, and the comfort of employes is sought in modern lavatory arrangements and a locker room containing 60 lockers.

Rolling Stock.

The company has received from the St. Louis Car Company 24 passenger cars which are examples of the best con-

illumination is provided by arc lamps along the various promenades.

The second section of the park will be for the free use of picnic parties, ample tables and seating facilities being provided. This portion of the park is heavily wooded, a grove which occupies it having given its name to the locality. The amusement feature of the enterprise is operated by the Beechwood Park Amusement Company, of which E. E. Downs is president and manager; Frank H. Libbey, treasurer;

Philadelphia & Western—Entrance to Beechwood Park—Amusement Resort.

struction in cars for heavy electric service. These are 51 feet 3 inches long over all and are equipped with four General Electric 75-horsepower motors and type-M multiple unit control. They are thoroughly lighted by 14 incandescent lamps on each side, spaced 2 feet 6 inches apart, and each vestibule also contains two incandescent lamps. Additional lighting is provided by three inclosed arc lamps for each car.

Beechwood Park.

In addition to the fact previously stated that the road is designed to serve a large and well populated suburban dis-

Donald W. Libbey, secretary; and Horace S. Meese, assistant manager. The park was opened to the public on May 30.

The Philadelphia & Western Railroad has recently been reorganized in order to permit the admission of new interests and to plan for expansion. In pursuance of this plan the property was sold under foreclosure on May 20. George J. Kobusch of St. Louis disposed of the principal part of his holdings to a new syndicate, and the Philadelphia & Western Railway was organized to acquire the property. The new officers are: President, George R. Sheldon; vice-president, Thomas Newhall; secretary and treasurer, Davies Murdoch.

THE VALUE OF STRAIGHT AIR BRAKES.

BY INSPECTOR.

In the past 12 or 13 years the air brake has come into almost universal use on electric cars, both interurban and urban. It has practically superseded all other forms of power brake.

The straight air brake system comprises a motor-driven compressor, supplied with current from the trolley circuit, a reservoir, brake cylinder, an automatic governor, which starts and stops the motor-driven compressor at the desired minimum and maximum pressures, the engineer's operating valves, the necessary pressure gauges, switches, fuses, etc.

On double-track cars on city lines when operated by the handbrakes, a schedule of 8 to 8½ miles per hour was once considered about the best speed that could be maintained with safety. Since the advent of air brakes many roads have, after installing them, increased the average speed to from 9½ to 12 miles per hour, with an equal degree of safety, thereby effecting a great saving in operating expense. The increased speed per hour means fewer cars, fewer total car-hours and fewer accidents due to the motormen having more perfect control of the cars or trains they operate. There should be fewer accidents, also, due to the fact that fewer cars now furnish the same service formerly requiring more cars.

Cost of Air Brakes and Maintenance.

Due to keen competition between the several firms now manufacturing air brakes the cost of the apparatus has reached a figure which justifies their use on cars which have been many years in service. In other words, if the car is in a condition to warrant the supposition that it still has three years of service left in it, it would be a good investment to install air brakes on such car, as the increased mileage that could then be made by the car, with safety, would justify the expenditure. The life of the air brake apparatus is as yet an unknown quantity, the writer having in mind several roads on which apparatus has been in service 12 years, and is still giving good service; in fact, to date the writer knows of no air brake apparatus having been discarded due to being worn out.

Regarding the care and maintenance of air brakes the cost for the first three years is purely nominal. The cost for repair parts, during this period, should not exceed 1 per cent of the initial cost per year. During the second period of three years the cost should not exceed 2½ per cent of the initial cost of the apparatus. The cost thereafter should, of course, be somewhat higher on account of wear and tear, and the continually increasing long life of the apparatus. These estimates are based on the supposition that proper care be given the apparatus from its date of installation.

The motor-driven air compressors of the latest design have few oiling places, the bearings being oiled by rings carrying the oil up to the bearing from an oil cellar. The crank-shaft and its bearings are usually lubricated by what is commonly called the "splash system." Therefore the oiling of the compressor is a matter of filling the crank chamber and the oil cellars with oil once in about every 30 days. The compressor should be thoroughly overhauled, cleaned, etc., at least once in each six months.

The engineer's valves also require attention. During the last few years the sliding type of valve has come into quite general use, the advantages of this type being that the wear on the valve tends to improve and perfect its seat. These valves should be lubricated at least every 30 days and should be overhauled at intervals of four months, the working parts cleaned with gasoline and lubricated when reassembled with lubricating oil for bearing parts, except the valve seat, for which tallow from an ordinary tallow candle is, to the mind of the writer, the best and longest wearing lubricant. The automatic governor also should receive some atten-

tion. Where the old type of electric governor is used it should be kept free from dust and dirt, rust, etc., and the contacts kept free from scale. This should be done at intervals of at least every three months.

The tendency of the times, however, seems to be to use a governor of a mechanical type. Its cost of maintenance is said to be lower, and it requires less attention, having no magnet coils to burn out. All its parts are of a size and design affording long life and a surety of action not found in the automatic governors of the electrical type.

The brake cylinders require very little attention, occasionally requiring new leathers and oiling about once a year.

The principle point in the care of air brake apparatus is oiling, overhauling and cleaning at regular intervals. If these things are done properly the cost of keeping up the apparatus will be found to be very low.

On some railway systems a book record is kept of each car, showing the dates on which work is done on trucks, motor equipment, air brakes, etc. By this method the shop superintendent can tell at a glance whether or not the various apparatus are receiving the care and attention they require. Some roads use a card index system; others a large form which usually is kept in a case with a glass front so that it can be referred to at frequent intervals.

Air Brakes on Single-Truck Cars.

Many railway companies are now placing air brakes on cars of the single-truck type. The writer has in the past few years heard many opinions expressed by various street railway officials as to whether or not the move is a wise one. In his judgment, based on 10 years' experience in the operating department of various street railway properties, cars of the single-truck type having a length of body of 20 feet 6 inches over corner posts up to 22 feet over corner posts placed on any type of truck and in a condition to warrant an estimate of five years of service or more, should be equipped with air brakes for various reasons, viz., the average speed can be increased from 1½ to 3 miles per hour, due to quicker stops, and to the fact that brakeshoes can be so adjusted as to permit the shoe to be well away from the wheel when the car is running free. With handbrakes shoes are usually adjusted so neatly that there is more or less friction when the car is running at any speed, either slow or fast. The motorman being enabled to make quick stops will avoid many accidents which, when operating with the handbrake, he would be unable to do.

Another point in favor of the air brake on all types of cars is the fact that a company having its cars so equipped is less liable to have juries give verdicts against it—so-called "sympathy" verdicts. If it can be proved in open court that the company has adopted the most improved type of car-controlling apparatus, which we must admit is a power brake, the juries are more likely to give the company the benefit of any reasonable doubt before assessing damages.

Straight Air Brakes on Trains.

On interurban railways operating trains of not to exceed three cars the straight air system, in the judgment of the writer, is preferable to the automatic system on account of lower initial cost, the greater degree of flexibility and the simplicity of the apparatus as a whole. On trains of two or three cars the response of brakes when application is made is quick enough for all general purposes. There is, however, an element of chance in the operation, as to parting of trains, etc. This can be overcome. A type of emergency valve, similar in design to the plain triple valve, which, when installed in connection with the straight air brake system, takes care of emergency conditions, is now on the market. Should the reservoir line break, hose burst or train part this valve becomes operative and the brakes on each car are set to emergency automatically. This emergency valve can be so installed as to give the conductor on either motor cars or trailer cars a chance to stop the train by installing

vent valves in each car easy of access to the conductor. A vent valve can also be installed in the cab in such a manner that when emergency arises the motorman may open the vent valve and secure a quick or emergency stop instead of the regulation service stop. Therefore for interurban railway operation the straight air brake system with the emergency feature added seems to be the ideal method of control under stated conditions, since it accomplishes requirements under ordinary service, and has at the command of the operator a reserve force or reserve power to be brought into play when the occasion demands.

A TEST OF INSULATORS FOR AN EXCEPTIONAL SERVICE.

BY SIDNEY SPROUT, ELECTRICAL AND MECHANICAL ENGINEER OCEAN SHORE RAILWAY.

The Ocean Shore Railway follows the shore of the Pacific ocean for nearly 80 miles between San Francisco and Santa Cruz, Cal. One of the first problems that presented itself to the engineers making plans for the electrical equipment of this road was that of determining the type of insulator that would give the most satisfactory service on the 33,000-volt transmission line, which it was planned to use for the distribution of power to the various substations from the power house.

Exceptional Conditions.

The problem of selecting an insulator for 33,000-volt operation would not, under ordinary circumstances, be at all difficult, but the conditions in this particular case made the question one to which it was necessary to give a good deal of time and attention before any definite conclusion could be

conditions at over 11,000 volts. (7) An 11,000-volt line which would be paralleled for some 14 miles had had a great deal of trouble from burnouts caused by the insulators becoming covered with a coating of dust and salt.

After consulting the officials of the Big Creek Power Company relative to their experience in operating this latter-mentioned 11,000-volt line, it was decided to establish a testing station at a place called Yellowbank, about 10 miles from Santa Cruz, where they reported that they had had a number

Insulators for Exceptional Service—Near View of Testing Box, Showing Insulator and Dust Bag.

of burnouts caused by the insulators becoming coated with dust from the highway and salt from spray and fogs.

Testing Station.

The station as illustrated was built at this place in the fall of 1905, and samples of different types of insulators were placed on the insulated crossarms on the pole outside of the station. An 11,000 to 440-220-volt transformer was placed on a pole outside of the station, power being supplied from one leg of the three-phase, 11,000-volt, 60-cycle transmission line of the Big Creek Power Company. Eight 2½-kilowatt, 5,700-6,600 to 110-220-volt transformers were placed inside of the station and connected as shown in the diagram, giving a test voltage ranging from 6,600 to 55,000 volts.

Plan of Testing.

When this station was built the plan was to test the insulators on the poles under the natural climatic conditions, but by the time the station was completed the rainy season had commenced, so that the station was closed up and tests suspended until the following summer. Meanwhile the insulators were left on the poles.

When the tests were resumed the following summer it had been decided that instead of allowing the insulators to stand for a long enough time to be coated with dust and salt, under the natural conditions, it would be more advisable to test them under artificial conditions resembling the natural conditions as closely as possible. For this purpose the testing box shown in the illustrations was built just outside of the station. This box was provided with a hinged door in the side. A compressed air sprayer was provided for spraying the insulator with a finely divided salt spray closely resembling the heavy fogs which come from the ocean. A cheese cloth bag of dust from the highway shaken at the windward end of the testing box was found to be a very efficient way of covering the insulators with dust. An electric

Insulators for Exceptional Service—Testing Box and Transformer House.

reached. These conditions are, briefly: (1) Heavy salt fogs from the ocean. (2) Salt spray which is carried by the wind for considerable distances, in certain places where the waves beat upon a rocky coast. (3) Yearly dry seasons of from four to six months, during which time the highways become very dusty and the insulators are not washed off. (4) The proximity of the transmission line to the county road for practically its whole length. (5) The trade winds blowing from the ocean for months during the dry foggy season. (6) The fact that no line had been operated under similar climatic

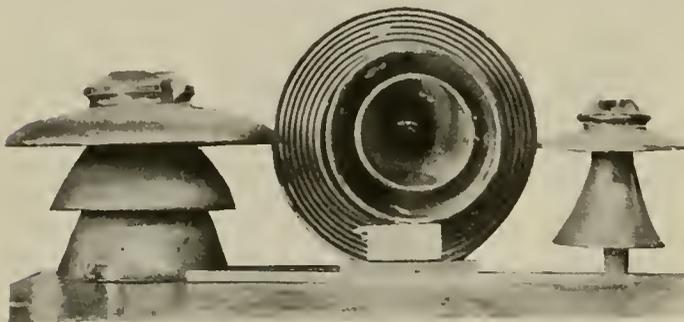

fan was provided for the purpose of blowing the dust and salt spray on the insulators under test, but it was found that the wind, blowing from practically the same direction all of the time, made its use unnecessary.

Results of Tests.

Before beginning the actual tests on the insulators it was necessary to make several changes in the arrangement of the transformer leads in order to prevent cases of sparking and abnormal static discharges. The results of the tests in detail were as follows:

60,000-Volt Porcelain Insulators.

Three on pole for eight months. Well coated with dust and salt on under surfaces and petticoats. Insulators in

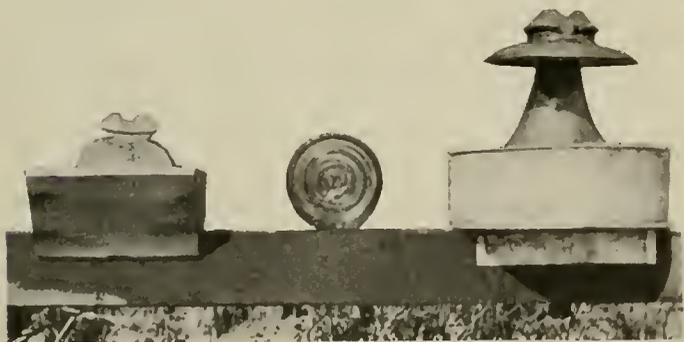

Insulators for Exceptional Service—9 and 16 Inch Porcelain Insulators.

parallel, as shown in diagram. Eight transformers thrown on for 10 minutes. No effect.

Connection to the top of insulator from one side of transformer and around the bottom of second petticoat from other side. Then 56,640 volts was thrown on without results. Wire was then moved from bottom of second petticoat to just under corrugated top. Tested for 10 minutes. No effect.

60,000-Volt, Corrugated Top, 16-Inch Insulator.

Insulator was put in the testing box and 56,600 volts thrown on with no effect. When heavy spray from side of box was turned on, current arced over. Spray was turned on the under sides of the petticoat with transformers off, and

Insulators for Exceptional Service—Glass and Porcelain Insulators with Fog Bowls.

then as fast as they were thrown in, the circuit-breakers came out. Some dust was shaken on the insulator, and after it had dried off the insulator stood the test all right. When covered with dust and subjected to a test voltage of 35,700, duration five minutes, and heavy fog from spray at end of box for five minutes until water was dripping from the petticoats, there was no effect except slight snapping sound. A heavy spray from side of box caused current to arc over immediately.

Insulator manufactured by the Locke Manufacturing Company was cleaned and put in testing box. Test voltage of about 55,000 volts was thrown on; salt spray was turned on insulator from the side of the box but with no effect. After turning spray under the petticoats and getting insulator wet all over the current arced over as soon as thrown on.

Foggy Weather.

Insulator very wet from the fog of the previous night; drops of water were dripping from all petticoats. Eight transformers thrown on and a decided static was both audible

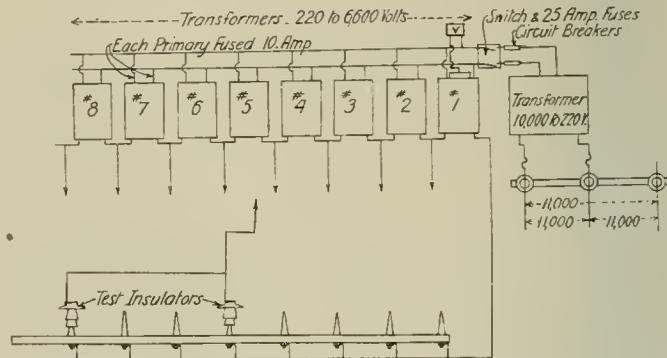

and visible. Dust shaken in the box had no effect on the insulator.

60,000-Volt, Smooth Top, 14-Inch Insulator.

Insulator manufactured by the Thomas Insulator Company. Had been in the station all winter. Well covered with dust and also covered with moisture from fog. Was put in the testing box and tested up to 55,000 volts. No results. A thin wire was then connected to the pin and wrapped around the petticoat No. 2 at point "a" (section) and 55,000 volts thrown on. No results aside from a barely visible static at joints. Wire was then moved up to the point "h" and tested with 55,000 volts without results other than an increase of the static. The end of the wire on the top of the insulator was then brought in contact with the top of the insulator at point "c," two inches from the edge, and the static increased a good deal. It was noted here that visible static discharges jumped from the bottom of petticoat No. 3 to the wire around No. 2, a distance of 1 inch instead of following the 7 inches of dust-covered surface between the two points. The thin wire was next put around petticoat No. 3 at the point "d," about one inch from the bottom, and the wire on top restored to position "e"; 55,000 volts were thrown on. Current arced over the surface between the points "e" and "d," a distance of 14 inches.

Nine-Inch Top, 35,000-Volt, Porcelain Insulators.

Had been on crossarm without disturbing. Coating of dust and salt accumulated by eight months' exposure to the weather. Put on the insulated crossarm in the testing box. Four transformers caused a heavy static discharge over the insulator. Not visible but made evident by a snapping sound. Five transformers increased the snapping. Six transformers,

Insulators for Exceptional Service—Sketch Showing Test Rack and Step-Up Transformer Connections.

test voltage 42,000, 20 minutes. During the first few minutes static flashes were visible on the surface of the under petticoat from the top down, but these gradually disappeared until only the snapping was heard. Seven transformers were tried; test voltage, 48,720; 20 minutes. Decided flashing on under side to top petticoat and on top of bottom one for first few minutes, and then only an occasional flash. Eight transformers; voltage, 55,200; 30 minutes. The current arced over the insulator after a few seconds, throwing the breakers. When thrown on again only occasional flashes were visible for the rest of the time.

Similar insulator had been inside of the station for eight months. Was well covered with dust. Seven transformers; 48,300 volts; 20 minutes. Small bluish flashes near cemented joint for first few minutes. Eight transformers; 55,200 volts; 15 minutes. Slight increase in flashing. At the end of 15 minutes salt spray was turned on insulator and current arced over at once.

Same insulator; test voltage, 56,160; 8 minutes. Insulator well covered with dust before transformers were thrown on. Immediately current arced over the insulator and breakers came out. After putting the breakers in three times they stayed in for the rest of the test, blue flashes around the cemented joint being visible for the first few minutes.

Same insulator; test voltage, 35,700. Salt spray turned on insulator from end of testing box. No effect. Heavy spray turned on insulator from side of box. Current arced over, throwing breakers. Salt spray turned under the petticoat. All of the insulator wet. Breakers would not stay in.

A 9-inch insulator well covered with dust and wet from the fog was tested with 35,000 volts. Arced over immediately, but stood up all right with 27,000 volts.

Similar insulator. Covered alternately with salt spray and dust until muddy all over. Tested with 27,000 volts. Current arced over immediately, standing up all right with 20,000 volts.

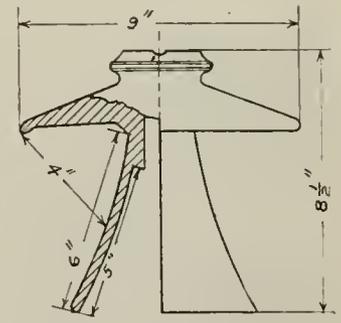

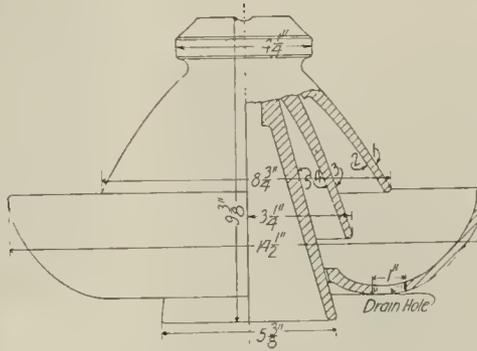

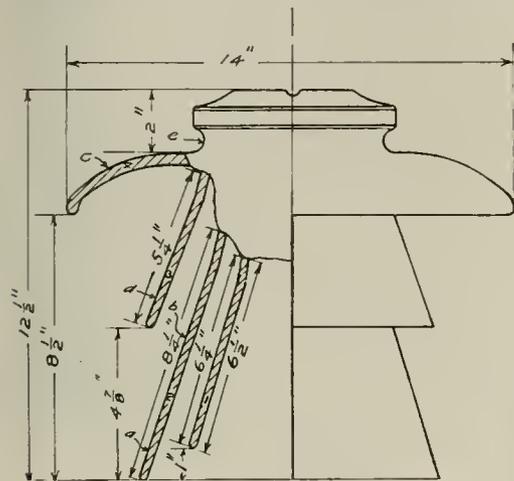

A 9-inch insulator of the Locke No. 409 type was put in the testing box with a special galvanized iron fog box and spray and dust put on it from end of testing box. The under side of the flat top was about as free from dust as the under side of its single petticoat.

Fresh Water Tests.

The 9-inch insulator was wet with the moisture from the fog of the previous night on top and on outside of petticoat. Under side of top was just a little moist and under side of petticoat was covered with a very thin film of moisture, barely noticeable when rubbed off with the finger. Voltage, 35,000. Moisture of the night before on it. No effect beyond a faint static discharge near the cemented joint. A heavy fresh water spray was turned on the insulator from one side and a little above. After a few seconds the current arced over. With transformers on again, the spray was turned on from the end of the box and from above at an angle of about 45 degrees, but the insulator stood up all right, even when the spray was made so heavy that the water ran off of the top in streams almost continuous to the crossarm.

Kern Type Insulator.

An insulator of the Kern type, manufactured by C. S. Knowles, was wiped clean and tested with 55,000 volts, salt spray being turned on it, but it stood up all right until the spray was turned under the petticoats.

Insulators for Exceptional Service—Three Types of Porcelain Insulators Subjected to Various Tests.

Same insulator. Well covered with moisture from fog of night previous. Test voltage, 35,000. Very heavy static flashes on the surface of the insulator. Not heavy enough to throw the circuit-breakers.

Porcelain Fog Bowl Insulator.

This insulator was of special design, the idea being to make use of the advantages obtained from the fog box and at the same time by making the fog box of porcelain and supporting it on the under petticoat instead of the crossarm to reduce the sparking distance required to the fog box. The several parts of this insulator were not cemented together. The insulator was wiped clean and mounted on a piece of 1-inch iron pipe. Test voltage of 35,100 volts thrown on. After five minutes no effect. Salt spray turned on from end of box for five minutes. Water dripped from all of the petticoats. No effect. With the transformers off dust was shaken on the insulator until the moisture was dried off and the outside of the insulator was white with dust. On raising up the top petticoat its under side was found to be practically free from dust. Test voltage, 35,000. No effect.

Insulator again covered with dust. Test voltage, 56,600. After five minutes, no effect. Spray turned on from end of box. Very small amount of spray caused the current to arc over through the drain holes in the porcelain fog bowl.

Salt spray turned on this insulator from the top of the box at an angle of 45 degrees caused the current to arc over at 56,000 and 35,000 volts. Spray was turned on a 60,000-volt insulator, well covered with dust from the top of the box, but to no effect. Fog bowl wet from fog. Water dripping from petticoat. Eight transformers thrown on. No effect. Dust shaken in box. No effect.

Porcelain Fog Bowl and 9-Inch Fog Box Insulators.

The porcelain fog bowl insulator and the 9-inch insulator in its galvanized iron fog box were left in the testing box over night and became well covered with moisture. On the

porcelain fog bowl insulator the moisture was heaviest on surface "3" (see illustration) and light on surfaces "2," "4" and "5." On the 9-inch fog box insulator the under side of the top and petticoat showed very little moisture.

Tested both insulators to 35,000 volts. No result. Middle petticoat then removed from the porcelain fog bowl insulator. No result.

About 55,000 volts were thrown on the 9-inch fog box insulator. No result. Porcelain fog bowl insulator arced over at 55,000 volts when the middle petticoat was removed. With all petticoats on there was no effect.

Nine-inch insulator covered with a thin film of moisture stood about 48,000 volts, but arced over at about 55,000 volts.

Creeping Distance.

On the surface of a clean, dry petticoat 35,000 volts formed an arc at a distance of 3.25 inches; 57,000 volts formed an arc at a distance of 5.50 inches.

Conclusions.

From careful observations of the tests, briefly outlined, the following conclusions were deduced:

First: Under the climatic conditions as defined, any insulator used for 33,000 volts or over, i. e., any insulator used within the limits of size manufactured at present, would have to be cleaned every third or fourth year. It is doubtful if even a very considerable increase in size would be of any advantage.

Second: The use of the so-called "fog boxes" would afford a temporary relief on small insulators and increase the

time between cleanings. On the larger insulators, i. e., insulators for over 20,000 volts, the fog boxes would not be of any advantage owing to the fact that the distance between the boxes and the petticoats of the insulator would have to be so large that it would afford no protection from dust and spray. The expense of fog boxes also would be prohibitive on larger size insulators.

Third: Of the three causes of trouble, namely, salt spray, dust and fog from the ocean, the latter is of minor consequence, and any transmission line away from the combined influences of the first two would meet with comparatively little trouble.

Fourth: The most satisfactory insulator for the conditions stated above is one having as few "still air" spaces as possible, i. e., an insulator exposing a large proportion of its surface to the action of the wind. An insulator having as flat a top as practical to manufacture in the size desired. An insulator having one long petticoat, or, if necessary to get the required surface, two long petticoats, although the latter has the objection of providing a "still air" space between the two petticoats, reached neither by wind nor rain and difficult to clean.

Fifth: The results and conclusions suggest the possibility of an insulator for very high voltages being made up of several pieces of porcelain or glass shaped something like the present insulator tops and placed one below the other.

Acknowledgment is due to W. G. Vincent, Jr., assistant electrical engineer, Ocean Shore Railway, for assistance in performing these tests.

THE NEW STEEL CARS OF THE HUDSON COMPANIES.

BY HUGH HAZELTON.

The plans of the Hudson Companies, which are building a double set of tunnels from Cortlandt street, New York, through Jersey City and Hoboken to Christopher street and thence by Sixth avenue to Thirty-fourth street, New York (The Electric Railway Review, November, 1906, page 893), have been generally discussed in the technical press, but little has been said about the rolling stock to be used. In designing the cars for this service the engineers have had three requirements constantly in mind:

First—The car must be absolutely fireproof.

Second—Doors must be arranged so that passengers may enter and leave with least delay.

Third—The weight must be kept as low as is consistent with safety.

Fireproof Materials.

In order to make the car absolutely fireproof unusual precautions have been taken. The entire car body is made of steel, including doors, roof and headlining. The floor is made of "monolith" cement, laid on steel, with $\frac{1}{4}$ -inch finish of carborundum cement, which is used as a substitute for maple strips. The seat cushions and backs are covered with a metal fabric instead of with rattan. All insulated wires are covered with an asbestos braid and are placed in iron conduit pipes. The magnet coils of the control equipment

Hudson Companies Cars—Interior View, Showing Seats and Stanchions.

are insulated with mica and asbestos, in place of the usual covering of cotton tape.

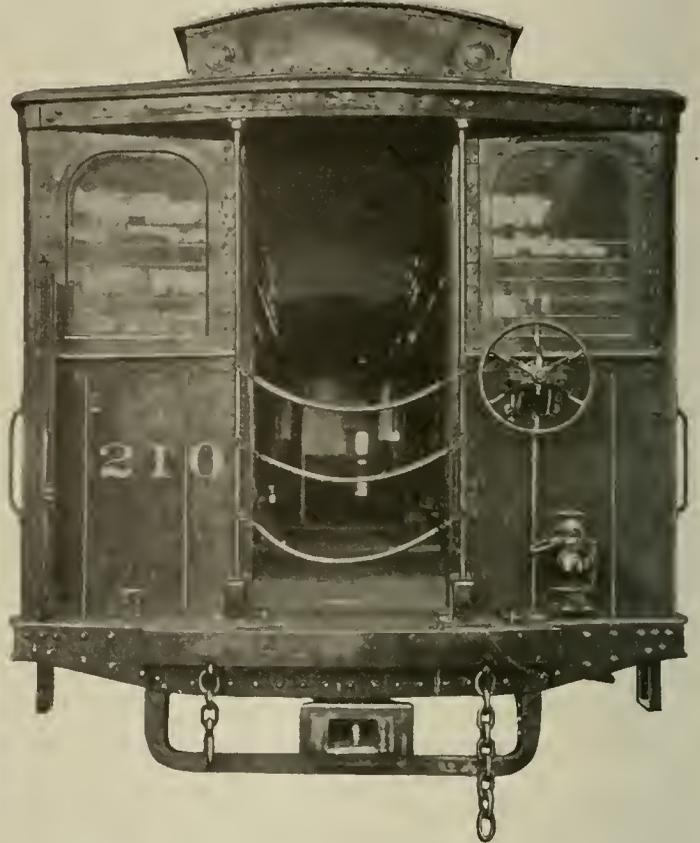

Arrangement of Doors.

In order to facilitate rapid movement of passengers, the car is designed as indicated in the illustration, with wide center doors, side seats, and an unobstructed passageway between the car platforms and the interior of the car. This arrangement minimizes the time of station stops without sacrifice

of carrying capacity. At the terminals the cars will discharge passengers on one side to an incoming platform and will receive passengers on the opposite side from a special outgoing platform. These provisions are particularly necessary owing to the density of traffic and the close headway of trains during the rush hours.

Reduction in Weight.

In a local service like that of the Hudson Companies the stations are from one-third to one-half mile apart, and a large percentage of the power for operating the cars is required for their acceleration. For this kind of service it

Hudson Companies Cars—End View of Completed Car.

is particularly desirable to minimize the weight of the cars as much as considerations of safety will permit. The problem which presented itself to the engineers of the Hudson Companies was to design a steel car with center doors and of the least possible weight.

The type of construction used on Interborough subway steel cars was at first considered, but was not found applicable on account of the decision to use center doors. The unbroken side of the Interborough car below the window sill forms a plate girder about three feet in depth. To introduce a center door in a car of this type would have made it necessary to cut the girder in two, and no satisfactory way was found to frame around the door without adding materially to the weight.

The use of drop frame girders at each side of the car below the floor line was also considered, but as such girders are limited in depth by clearance requirements to 16 inches or 18 inches, it would have been necessary to make them of heavy sections which would have added materially to the weight of the car.

Truss Frame.

The truss frame as illustrated herewith was finally designed as the best solution of the problem. This truss frame is arranged in five panels, the center door occupying the middle panel. As the depth of this truss is about seven

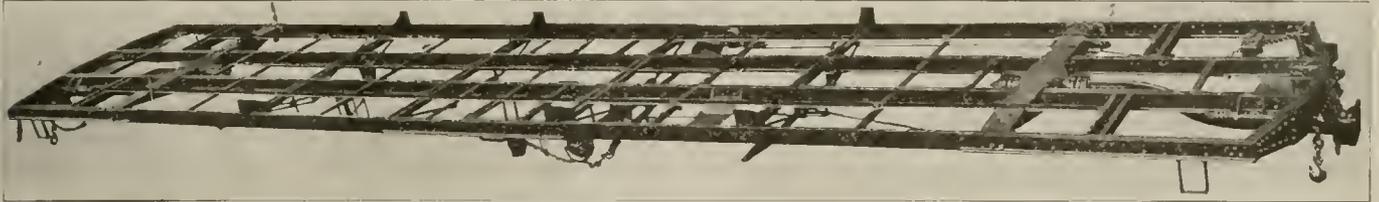

feet, it follows that its weight, for a given strength, is much less than that of any girder or truss construction which can be placed below the car floor. The bottom chord of the truss is a 6-inch channel carried below the door sills and extending from end to end of the car. The top chord is a similar channel placed above the doors and extending the length of the car. The vertical members of the truss frame are 8-inch channel posts spaced at uniform distances, and placed between pairs of windows. Below the window sills these posts are braced by diagonal members to the bottom chord. Above the window sill the posts are reinforced by angle irons and plates, which arch over the pairs of windows and are riveted to the top chord. At the center door the top and bottom

timbers, and if the buffer timber of one car is forced up over that of the adjacent car, it will be stopped by the steel castings before damage is done to the end of the car.

Side Sheathing and Car Roof.

The sheathing of the ends and sides of the car consists of steel plates 1/16 inch thick. These plates are riveted to the truss frame after the latter is in place, and none of the rivets which hold the truss frame together pass through the sheathing. Therefore the plates may be removed for repairs without disturbing the truss frame.

The roof is made of 1/16-inch steel plates, coated on both sides with lead. The roof plates are supported by angle

Hudson Companies Cars—Underframe, Showing Sills, Connections and Reinforcement.

chords are reinforced by bulb angles, and similar bulb angles are riveted to the bottom chord below the end doors to furnish additional support for the car platforms. The truss frame is designed to carry the entire weight of the car with full passenger load with a fiber stress not to exceed 12,000 pounds per square inch in any member.

Underframe.

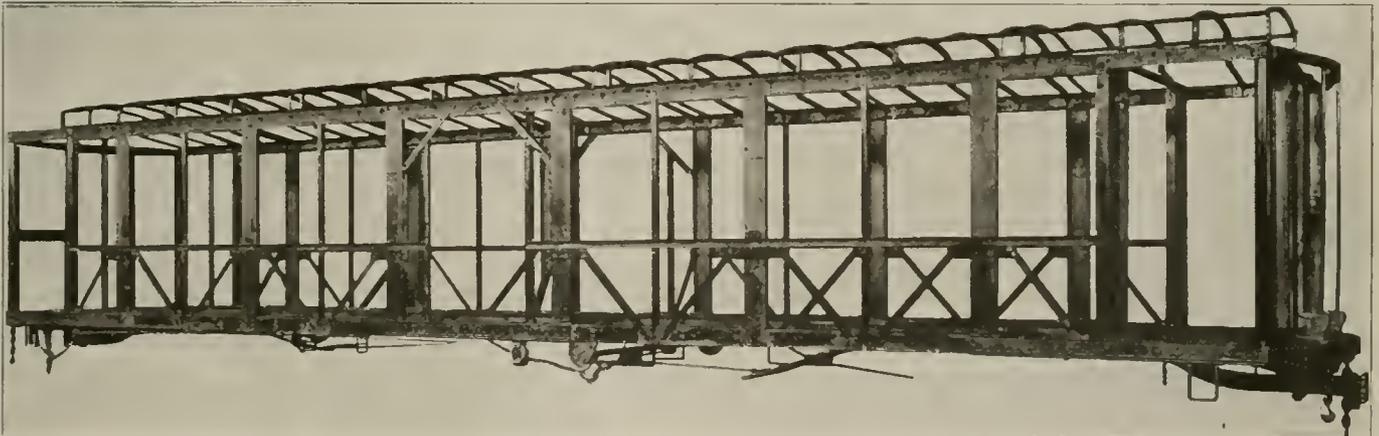

The underframe of the car is shown in an accompanying engraving. The side sills are made of the 6-inch channels already described as a part of the truss frame. The center sills are 6-inch I-beams, which run from end to end of the car. The needle beams are composed of angles with truss rods and turn-buckles. The attachment of the needle beams to the

irons bent to conform to the shape of the roof and spaced about 14 inches apart. The plates are secured in place by 1/4-inch rivets with heads soldered, and all seams between plates are lapped and soldered.

Interior Finish and Monolith Floor.

The headlining and side panels on the interior of the car are of steel 1/32 inch thick, and all window guides and post covers are made of steel plates pressed to the required shapes.

The floor is made of "monolith" cement, laid on galvanized "Keystone" iron, which securely holds the cement down to the metal. The top surface is coated with a layer of cement containing about 30 per cent of carborundum.

Hudson Companies Cars—Body Framing, Showing Holes for Application of Sheathing.

side sills is made by means of bent plates, which serve also to stiffen the posts against side pressure.

End Sills.

The end sills in this design have been made unusually strong in order to distribute the strains due to impact to the center and side sills. Attention is called to the shelf angle which is secured to the end sill for the support of the drawbar. This shelf angle furnishes a stronger support than the sector bar usually employed for the purpose.

To prevent the telescoping of car platforms in the event of a collision, two heavy steel castings, shown in the side view, have been riveted to the ends of the center sills. These castings extend about eight inches above the top of the buffer

This forms a hard wearing surface, and the sharp particles of carborundum prevent slipping.

Seats.

The longitudinal seats are provided with partitions, as illustrated. These partitions consist of steel plates which extend from the seat cushion to a height a little above the shoulder of a seated passenger. The top edge of the partition is finished with a 1-inch pipe bent to a graceful curve. These partitions are high enough to form a support to the passenger and thus obviate the disagreeable effect due to the sudden starting and stopping of trains.

The Hale & Kilburn Manufacturing Company, which is furnishing the seat cushions and backs, has developed for

the Hudson Companies' cars a metal fabric which is to be used as a covering in place of rattan. The frames of the cushions are made of pressed steel, and the seats are, therefore, fireproof throughout.

Vertical Hand Rods.

A vertical hand rod is located at each of the seat partitions; this rod extends from the seat to the ceiling fixture which supports the hand strap rod. The vertical hand rods furnish convenient supports for standing passengers.

Sliding Doors.

Steel sliding doors are provided at the sides of the car and in the vestibuled ends. Each door is supported on a ball-bearing hanger which runs on a track above the door. A piece of rubber hose is attached to the edge of the door to prevent the possibility of pinching the fingers of passengers when the door closes.

The doors are being furnished by Hale & Kilburn Manufacturing Company, and the ball-bearing hangers by the Pitt Car Gate Company.

Door-Operating Mechanism.

The doors are operated by air cylinders controlled by

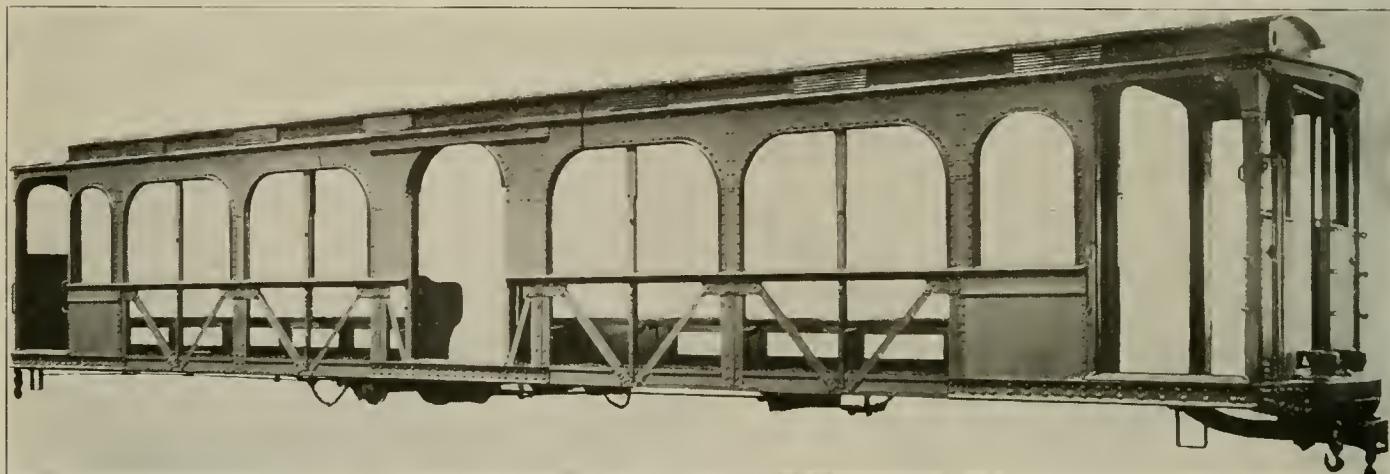

tem, each car is provided with four emergency lamps, which are supplied from a 60-volt storage battery on each car. In case the power goes off the line, the emergency lamps continue to be lighted from the battery.

Storage Battery.

The storage battery consists of 30 cells having a discharge rate of $1\frac{1}{2}$ amperes for eight hours. The battery is placed in series with the six circuits of five lamps each, and the four emergency lamps are connected across the terminals of the battery. The four 60-volt lamps take nearly the same number of amperes as the 30 lamps in the main lighting system, so that the battery normally "floats" on the line. The storage batteries are furnished by the Gould Storage Battery Company.

Destination Signals.

The destination signals are placed above the ceiling of the vestibule at each end of the car. Each signal consists of a stationary lamp surrounded by a cylinder containing four segments of glass of different colors. This cylinder may be turned from the vestibule by the guard or motorman. The lamp is accessible from the vestibule by means of a hinged door at the bottom of the cylinder. A fixed lens is placed

Hudson Companies Cars—View of One Side of Car, Showing How Sheathing is Riveted to Framework.

the guard. The piston has a stroke of about 15 inches, and in order to increase the movement to equal the door travel a rack and pinion is used. The mechanism is so arranged that the door moves up to the end door post, but does not strike against it.

The air cylinders are connected by pipes to air valves, which are located at the ends of the car. The guard opens and closes the doors by operating these air valves. This door-operating mechanism is supplied by the Burdette & Routree Manufacturing Company.

Door Signal.

To prevent the starting of the train before all doors are closed, it is proposed to provide an electrical signal wire throughout the train, with a bell or indicating lamp in the motorman's cab, and with contacts at each door so arranged that every door must be closed before the motorman receives the signal to start.

Car Lighting.

Each car is equipped with thirty 10-candlepower incandescent lamps, two of which are placed above each vestibule. Switches are provided so that the current may be transferred from the two vestibule lamps, in the end occupied by the motorman, to the two lamps in the destination signals. As the cars are to be operated exclusively in tunnel service, the 30 lamps will be lighted continuously.

In addition to the 30 lamps in the regular lighting sys-

tem, each car is provided with four emergency lamps, which are supplied from a 60-volt storage battery on each car. In case the power goes off the line, the emergency lamps continue to be lighted from the battery.

Drawbars and Air Brakes.

The drawbars are of the radial type, designed for clearances with cars on a 90-foot radius curve. The drawbars are made of 85-pound bent rails with Van Dorn couplers.

The cars are equipped with Westinghouse automatic air brakes. The type of brake is designated as Schedule A. M., which includes the following features:

- Quick recharge of auxiliary reservoir.
- Quick service application of brake.
- Graduated release of brake cylinder pressure.
- High-pressure emergency application.
- Electro-pneumatic operation of triple valves.

This air brake equipment is intended especially for the class of service required of Hudson Companies cars, and is of the latest and most improved design.

Each car is supplied with air by a Westinghouse D-2-E.G. motor-driven air compressor, which has a piston displacement of 20 cubic feet of air per minute. In addition to the air brakes, each car has a complete system of independent hand brakes.

Headlights.

Two oil headlights are placed on the front end of the forward car in a train, and two similar lanterns are placed at the

rear end of the rear car, showing red, to serve as "tail" lights. These lanterns are also furnished by the Adams & Westlake Company.

Heaters.

The heaters are of the panel type placed below the seats. The heater coils are arranged in two circuits, which, at 600 volts, take 7 amperes and 14 amperes, respectively. The heaters are furnished by the Consolidated Car Heating Company.

Control Equipment.

The latest type of Sprague-General Electric multiple-unit control has been adopted, and a number of improvements have been made in the materials used for insulation to render them fireproof. For example, in the contactor and reverser coils mica and asbestos have been substituted for cotton tape, and all insulation in molded forms has been made of fireproof material.

The control equipment on each car includes a current limit relay which provides automatic acceleration of the train

Tires, $5\frac{1}{4}$ inches, M. C. B. tread.

Axles, hammered steel, $4\frac{3}{4}$ inches at center, $5\frac{3}{4}$ inches at wheel seat.

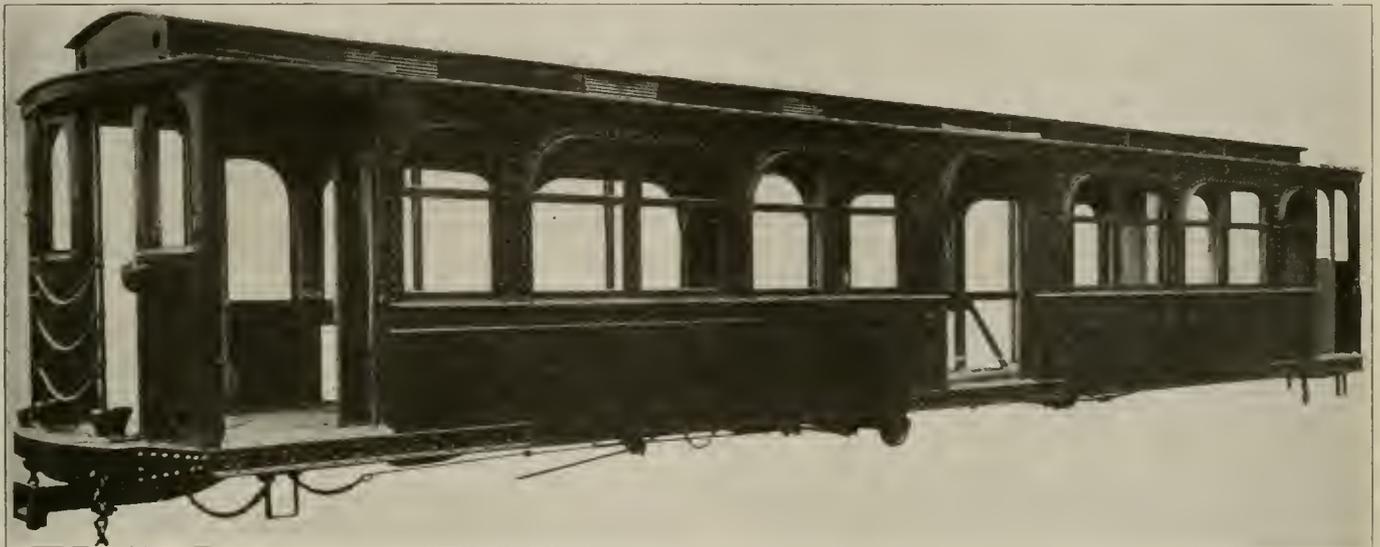

The wheels are of solid steel, forged, and were made by the Standard Steel Wheel Company.

Motors.

Each car is equipped with two 160-horsepower motors furnished by the General Electric Company and of the type known as G. E. No. 76. This motor has been specially designed for the Hudson Companies' service, but follows closely the design of the G. E. 66, a motor which has given such good service on the Manhattan Elevated. In the G. E. 76 motor the armature speed has been reduced and improvements have been made in commutation.

Contact Shoes.

The contact shoes are of the hinged type, similar to those used in the subway cars of the Interborough Rapid Transit Company. The shoe is pressed down on the contact rail by

Hudson Companies Cars—Body with Sheathing in Place.

with predetermined current in the motors. This relay, however, does not prevent manual operation of the master controller at less than the predetermined current if desired.

The motor circuit is protected by a copper ribbon fuse with magnetic blowout, and, in addition, by a circuit-breaker with tripping and resetting coil. The circuit-breakers in all of the cars in the train may be set or tripped by means of a switch located in the motorman's cab of each car.

A bus line cable is installed on each car which will connect the contact shoes of all cars in the train. The bus line cable prevents loss of current when passing through cross-overs.

Trucks.

The motor and trailer trucks are of the M. C. B. type, and were built by the Baldwin Locomotive Works. The motor trucks have the following general dimensions:

Wheel base, 6 feet 6 inches.

Wheel diameter, $34\frac{1}{4}$ inches.

Tires, rolled steel, $5\frac{1}{4}$ inches, M. C. B. tread.

Axles, hammered steel, 6 inches diameter at center, $6\frac{1}{2}$ inches at wheel seat.

The wheels have cast-steel spoked centers and rolled steel tires, held on by double retaining rings. One wheel on each axle has an extended hub, upon which is shrunk the driving gear.

The general dimensions of the trailer truck are:

Wheel base, 5 feet 6 inches.

Wheel diameter, 30 inches.

springs which give a tension of 15 pounds.

Contact-Shoe Fuses.

An inclosed fuse protected by an asbestos lined wooden box is located directly above each contact shoe. The fuse base is mounted on springs in order to reduce the vibration, and thereby prolong the life of the fuse link. Each fuse is designed to carry 650 amperes continuously.

General Dimensions.

Some of the controlling dimensions of the car are:

Length, 38 feet $2\frac{3}{8}$ inches over body posts; 48 feet over buffers.

Width, 8 feet 10 inches over corner posts.

Height, 12 feet rail to roof.

Height of drawbar, $29\frac{3}{8}$ inches.

Truck centers, 33 feet.

Truck wheel base, motor truck, 6 feet 6 inches; trailer truck, 5 feet 6 inches.

Wheel diameter, motor truck, $34\frac{1}{4}$ inches; trailer truck, 30 inches.

The cars above described were designed and built under the direction of L. B. Stillwell, consulting electrical engineer, and F. M. Brinckerhoff, who has followed the details of this work and to whom many of the novel features are due.

Fifty cars have been ordered for the initial operation of the Hudson Companies tunnels. Forty of the car bodies are being built at Berwick by the American Car & Foundry Company and 10 car bodies at McKees Rocks by the Pressed Steel

Car Company. The writer is indebted to the latter company for several of the photographs which illustrate this article.

The first one of these cars is at present being equipped with electrical and air brake apparatus. The 50 cars are to be ready for operation in September, and it is expected that the line between Hoboken and Sixth avenue, New York, will be opened for passengers a few weeks later.

ANNUAL MEETING OF THE NEW YORK STATE ASSOCIATION.

J. H. Pardee, secretary, 611 West One Hundred and Thirty-seventh street, New York City, has announced the program of the twenty-fifth annual convention of the Street Railway Association of the State of New York, which will be held at Hotel Champlain, Lake Champlain, New York, on June 25 and 26.

The first session will be held at 10 a. m. on Tuesday, June 25, and following the address by the president and the reports of the executive committee, secretary, treasurer and committees, the following papers will be read: "Some Phases of Electric Railway Accounting," by J. C. Collins, secretary Rochester Railway Company; and "Existing Shop Practice in Central New York," by W. H. Collins, general superintendent Fonda Johnstown & Gloversville Railroad.

At the Wednesday morning session papers will be read as follows: "Recent Improvements in Motors and Control," by G. H. Hill, railway engineer General Electric Company, and Clarence Renshaw, railway engineer Westinghouse Electric & Manufacturing Company; "Relation Between Maintenance of Way and Equipment," by W. R. W. Griffin, superintendent Rochester & Eastern Rapid Railway Company; "Power," by S. B. Storer, Niagara Lockport & Ontario Power Company.

The afternoon session on Wednesday will be devoted to unfinished business and the election of officers.

The following entertainments have been arranged: Tuesday afternoon, excursion to the far-famed Ausable Chasm. Wednesday afternoon, ball game between railway and supply men. Many short trips can be made to points of interest on Lake Champlain.

Mr. W. Caryl Ely will act as toastmaster at the banquet, which will be held at 7:30 o'clock on Tuesday evening. Banquet tickets will be provided for members, associate members, guests and the ladies. Each allied member will receive one banquet ticket. Extra banquet tickets will be sold at \$5.00 each.

Mr. E. S. Fassett, Albany, N. Y., chairman of the entertainment committee, will arrange for hotel accommodations upon request.

No provisions have been made for a general exhibit of appliances and apparatus by allied members, but any exhibit will be welcomed and arrangements for space can be made directly with Hotel Champlain or Mr. E. L. Brown, manager, 1354 Broadway, New York.

The Empire State Gas and Electric Association has arranged for a meeting at Hotel Champlain on Thursday, June 27, and has extended to this association a cordial invitation to attend.

Arrangements have been made with the Trunk Line Association for a special rate of a fare and one-third on the certificate plan. Hotel Champlain is on the Delaware & Hudson Railroad and can also be reached by Lake Champlain boats.

Further information will be gladly furnished by J. H. Pardee, secretary, 611 West One Hundred and Thirty-seventh street, New York.

An experimental railroad for testing signaling devices, materials used in track construction and different types of motor cars for railroad use, has been built by the railway department of the German government. The road is double-tracked and the line is oval in form, having a length of 5,760 feet.

SCHOOL OF RAILWAY ENGINEERING AND ADMINISTRATION AT THE UNIVERSITY OF ILLINOIS.

The University of Illinois, Urbana, Ill., has established a School of Railway Engineering and Administration which will afford specialized training in all branches of steam and electric railway work. The purposes of the new school and the details of the various courses to be offered are fully described in the University Bulletin, from which the following extracts have been taken:

In the employ of the railroads of the country there are approximately 12,000 persons who are classed as officials. Of this number a considerable proportion occupy positions whose powers and duties require the possession of more than average ability, and such positions must always prove attractive to ambitious men.

Ever since such graduates have been available the railroads have recruited many of the men for their engineering departments among the graduates of technical schools; and the success of these men has amply justified the procedure here as in other fields of industry. The rapid growth of railway organizations, with the attendant increase of responsibility resting upon those in their service, has made more necessary a proper preliminary training for all branches of this work; and each year has seen an increase in the number of men selected for this service from our engineering schools.

Within recent years there has developed a tendency—now quite marked in some railways—occasionally to select men for higher executive positions from the departments of maintenance of way and of motive power instead of taking them, as heretofore, almost exclusively from the traffic and operating departments. This tendency not only renders more urgent the necessity of special training, but, on the other hand, makes more attractive the service in the engineering departments.

There are many reasons why similar specialized preliminary training should prove equally desirable for those who expect to enter the non-technical departments of railways, where, in the administrative positions, responsibilities are frequently greater; and it is probable that here, as in the engineering departments, efficiency and the chances of ultimate success would be furthered by such training. It is only recently, however, that there has been available in this country any except the most elementary and limited education in preparation for commercial work, and where courses of commerce have been established in our universities they have been usually arranged without reference to railway work.

All these considerations point toward the desirability of special recognition of the needs of railways and of prospective railway employes in our educational institutions. Accordingly, there has recently been established at this university a School of Railway Engineering and Administration whose function it is to co-ordinate the various facilities of the university so as to provide specialized training for all branches of railway service and to otherwise further this work. In developing this plan there has been created in the College of Engineering a new department of railway engineering; and the department of economics of the College of Literature and Arts has added to its business courses one in railway administration.

It is the purpose of this school to provide courses of training which shall prepare men to become efficient workers in the financial, traffic and operating departments as well as in the engineering departments of both steam and electric railways.

At present there are offered the four following courses:

1. Course in railway civil engineering.
2. Course in railway electrical engineering.
3. Course in railway mechanical engineering.
4. Course in railway administration.

The main object of these courses is to provide a thorough training in theory and general principles amply illustrated and fixed by practice. It is recognized that this preliminary training can be completed only in actual practice, and that its chief service must be to develop the ability to economically acquire information and to accurately apply it.

The courses in railway civil engineering and railway mechanical engineering are intended primarily for those who expect to enter the service of steam roads in the departments of maintenance of way and of motive power; while the course in railway electrical engineering is arranged for those who will find employment in electric railways or in the service of steam roads with electrified lines. Each course occupies four years.

The course in railway administration aims to prepare men for service in all departments of railway work, other

than the engineering and the legal. For these lines of work, of course, technically trained engineers and lawyers are required. The course is four years in length, and is framed so as to give wide knowledge and training in the specific matters which relate to the organization and operation of all departments of railway administration, while at the same time giving the student a liberal education.

Railway Civil Engineering.

For the work of the course in railway civil engineering there is available all the equipment of the department of civil engineering. This, in addition to the cement and the road materials laboratories, comprises a complete collection of the usual field instruments. The proximity of three steam railways and of one electric road provides opportunities for field work and for demonstrations from practice.

Railway Electrical Engineering.

In addition to the well-equipped electrical engineering department laboratories, in which railway engineering students do their preliminary laboratory work, the railway department owns a 200-horsepower electric test car. This car, of the interurban type, was designed especially for experimental work and was built in 1905. It is equipped with four 50-horsepower direct-current motors and with the Westinghouse multiple control system. The car is supplied with recording voltmeters, ammeters and wattmeters, and with auxiliary measuring and recording devices by means of which there is automatically made a graphical record of voltage, current, power, speed, acceleration, time and curvature. The possession of this car renders possible a great variety of experimental work.

By the courtesy of the Illinois Traction System, whose lines are at present operated between the cities of Danville, Urbana, Champaign, Decatur, Bloomington, Springfield and St. Louis, the department is enabled to operate this car on their lines and obtains by their co-operation in other respects exceptional opportunities for giving instruction, and for investigating the technical problems of electric traction.

Railway Mechanical Engineering.

Three railroads enter Urbana and Champaign, the Illinois Central, the Wabash and the Cleveland Cincinnati Chicago & St. Louis railways; the division shops of the last also being situated here. With the three railroads mentioned the department enjoys most cordial relations, and it can depend upon continuing to receive from them the same assistance and co-operation that have hitherto been extended.

Opportunities for shop and road tests have been freely given and throughout the year numerous locomotive and train resistance tests are made both for instructional purposes and for the information of the railroads. To facilitate this work there was designed and built in 1900 a dynamometer car which is owned jointly by the university and the Illinois Central Railroad. This car is equipped with all the apparatus necessary for carrying on train resistance experiments as well as with auxiliary apparatus used during locomotive tests. During the seven years in which it has been in service this car has been operated over the entire Illinois Central system, in the establishment of tonnage ratings, as well as on the lines of the Central of New Jersey, the Baltimore & Ohio, the Cleveland Cincinnati Chicago & St. Louis and the New York Central railways. On this last road it was used in the preliminary train resistance tests made to provide information for the electrification of the New York City terminal, in which connection it was also used for competitive tests between steam locomotives and electric motor cars at the works of the General Electric Company at Schenectady, N. Y. In all this work the car has been operated by students of the railway engineering department.

The department owns also a complete New York air brake equipment for engine, tender and five cars. In addition to the special apparatus here mentioned, the students of the railway course have open to them the advantages of the mechanical engineering laboratory in which they are given their preliminary instruction in experimental work.

Railway Administration.

For the study of railway administration there is on hand an excellent collection of books and pamphlets on railroad matters, both theoretical and practical. Moreover, the list of railroad journals, technical, legal and administrative, taken by the library is very complete. These are supplemented with the financial and other reports of railroads and government publications relating to railroads.

The department also has at the disposal of students for practice various calculating machines, including one of the electrical tabulating machines used in the preparation of the last census, which are coming more and more into use in handling the freight accounts of great railroad systems.

HOW THE CINCINNATI TRACTION COMPANY AIDS ITS EMPLOYEES.

R. E. Lee, general superintendent of the Cincinnati Traction Company, has furnished us with the details of the system whereby 24 employes of the company who are the most popular, according to the vote of their fellow-employes, will be given a trip to eastern cities. The plan is as follows:

There is an association of the employes, known as the Street Railway Employes' Mutual Protective Association. This association is not connected in any way with labor unions. It is a very strong organization, having about 1,800 members, consisting entirely of employes of the company. Each year the association gives an outing for the purpose of raising funds to be placed in the sick relief fund. The proposed trip is a popularity contest among the employes, the purpose of which is to increase the interest among the members, thereby increasing the sale of tickets. There will be sold this year approximately 90,000 tickets at 10 cents each. The expenses of the outing and the trip to the east for the 24 successful contestants is paid out of the fund derived from the sale of tickets for the outing.

The company is not interested in the matter except to assist in making the outing successful. The company, however, aids the association financially, donating \$700 per month to its sick relief fund.

This association is a splendid organization, managed entirely by employes, no officer of the company being eligible to hold an official position in the association. It pays \$800 death benefit and \$7.50 per week sick benefit.

The income of the association is derived from the payment of \$3.00 per year dues and \$1.00 death assessment from each member. The average expense to each member is about \$9.00 per year. At this low rate it is therefore necessary for the association to obtain funds from other sources to make it self-sustaining, hence the giving of this annual outing, which, as a rule, nets about \$4,000 to \$5,000 per year. That, in addition to the assistance given by the company, has placed the association on a very sound financial footing. At the present time there is about \$26,000 in the treasury.

It is the idea of the company that this association is mutually beneficial to the employes and the company.

The outing given by the association is usually the largest outing held in Cincinnati. It is attended by about 30,000 to 35,000 people each year.

Hyde Park, Muskogee Electric Traction Company.

Hyde Park, the amusement park owned by the Muskogee (I. T.) Electric Traction Company, is situated on a point of land formed by the junction of the Arkansas, Grand and Vertergris rivers, about 5½ miles from Muskogee. This point was chosen for a park site about two years ago on account of its natural advantages for the purpose, and since that time the company has established a modern amusement resort that attracts an average attendance of 3,000 persons a day, from May to November.

The park contains 76 acres of land, much of which is wooded, and the large amount of water frontage offers excellent facilities for boating and bathing. The principal attraction of the park is the casino, which seats 1,600 persons. Here theatrical entertainments are given throughout the season, consisting of vaudeville specialties, alternating each month with a repertoire company. Afternoon and evening performances are held. The other amusements include a skating rink, figure eight, "shoot the chutes," and a pool and billiard hall. Cold drinks and refreshments are served. All of the concessions are leased. Adjacent to the amusement park is a baseball park controlled by the company.

The company operates 12 cars of the Narragansett and California types, on a headway of 15 minutes in summer. A uniform fare of five cents is charged. Excursions are conducted from time to time during the summer and when special attractions are offered.

PIPING AND POWER STATION SYSTEMS—XLIII.

BY W. L. MORRIS, M. E.

City Water to Pressure Oil Tanks—Class K 13.

Water is frequently used to raise cylinder oil from its storage tank through pipe lines into the lubricators. Almost any supply will perform this duty satisfactorily. If engine oil is being put under pressure by means of water it is quite essential that a fairly uniform pressure be maintained. If the station has a gravity water storage tank, then a more uniform pressure is obtainable by connection to the storage tank than can be had by using city water.

City Water for Drinking Purposes—Class K 14.

Drinking water supply is a service that cannot be dispensed with, and though every other service is supplied from the station pumping system it is generally necessary to use the city water for drinking. It may be that the station water is cleaner and, in fact, may "sparkle," but yet it may have properties which affect the employes of the power house, more particularly if they are accustomed to city water. Considerable time would be saved if a drinking place were located near the firemen and another convenient for the engineers.

These pipe lines should be of galvanized iron carried underground and exposed to the heat of the building as little as possible. In all probability this piping connection can be installed without passing the water through the large station meter. This will require paying the regular water rate. By making proper provision in this regard but little time and water are lost when an operator goes for a drink. If a pipe runs 100 feet or more through a hot room the station employes are apt to let the water run for a considerable time until sufficient cold water has been wasted to cool the hot pipes. Drinking water is as important in a power plant as the feedwater for the boilers, and should be given the fullest consideration.

City Water to Other Buildings—Class K 15.

Whether the water for the different shops, barns, etc., is to be taken through the power station meter depends largely upon how complete an accounting system is employed. Ordinarily it is much more satisfactory to have a separate record of the water used in the power station and that used in the shops, and if sprinkling cars are operated possibly a separate record also of the water used for this service. If the city water department will not install so many small meters they can be installed by the consumer and placed in separate buildings. This permits calibrating them and using them as a check on the main meter.

Artesian Water to Pumps and Water Tanks, Class L—1 and 2.

The use of artesian wells is not as general as the advantages accompanying their use warrant. The question of water supply should be the first to receive consideration in deciding upon a site for a power station. The cooling facilities can, as a rule, be more easily provided than a suitable water supply. A surface water supply, such as a creek or stream which gives ample water for 9 or 10 months and runs dry a month or two, is of little use as a source of water, since it is necessary to provide some other source of supply for the remaining portion of the year.

The cost of raising water, say 100 feet, from a driven well is not excessive if the pump is motor-driven. In this case the pump discharges against a 50-pound head. Allowing for friction, each theoretical horsepower costs but approximately one-half cent per hour if the plant is equipped with compound condensing engines. One thousand horsepower of capacity, assuming a steam consumption of 20 pounds of steam per horsepower per hour, would require 20,000 pounds of water per hour, or 333 pounds per minute. If this is raised 100 feet, the theoretical work done is at a rate of approxi-

mately 33,300 foot-pounds per minute, or one horsepower. If the efficiency of the pumping plant is 50 per cent the actual horsepower delivered to the pumps will have to be twice the theoretical, thus making the cost of pumping the water required by 1,000-horsepower plant for one hour about one cent. This is assuming that the water is allowed to discharge into a cooling pond in which the loss by evaporation is equal to the water required for feeding the boiler.

At the cost just estimated for the 1,000-horsepower plant the cost of pumping 1,000 gallons of water would be 4.166 mills, a cost which is much lower than that for which any waterworks system can sell water. The cost of repairs and depreciation must be added to these figures. Regarding the capacity of a deep-well pump, it should be borne in mind that it should be at least twice the normal load capacity; that is, if 333 pounds of water are required per minute, the pumps should not have a capacity of less than 666 pounds per minute. This additional capacity is required to permit the storing of water for emergency purposes or to supply the plant while repairs are being made. Motor-driven pumps can have a stroke of 24 inches, but to have a long life they should not make over 35 strokes per minute, which would require a 5-inch water cylinder to supply the 1,000-horsepower capacity as stated.

In determining the size of the deep-well pumps required, the capacity of the plant upon which the capacity of the pump is based should not be the average horsepower as determined from the horsepower-hours daily output of the plant. For, a plant may have engines of 2,000-horsepower capacity, but develop only 20,000 horsepower-hours in 20 hours; in which case the pump should have an hourly capacity sufficient for 2,000 horsepower, this being twice the average output. Ordinarily the pump should have a capacity equal to the steam machinery installed, and some system of water storage should be provided—one of considerable capacity, so that if the deep-well pump should be out of service for two or three days no shortage of water will be encountered.

If the condensers discharge into a cooling pond this pond would be of ample capacity, since it would ordinarily have 10 square feet of cooling surface for each pound of steam condensed per hour. A drop in the water level of one foot would therefore furnish sufficient water to supply the plant for 62 hours or three days. This does not include seepage losses, a waste which must be considered when determining the capacity of pumping machinery. If the pond is built in clay or lined with clay, the seepage loss will be quite slight. There are many storage ponds constructed on ground 20 feet or more above that surrounding them, which are used to store the rain and melted snow which fills them during the early spring for use during the summer months. Water stands in these ponds with but little drop of level, this drop being caused more by evaporation than by seepage.

It may be desirable to put in an overhead tank to supply the low-pressure mains, but this is of no practical use for a reserve water supply for boiler feeding unless the plant is exceedingly small. For instance, a plant of 1,000 boiler horsepower would require a tank of about 40,000 gallons capacity to run 10 hours. Forty thousand gallons is equivalent to 5,000 cubic feet or a tank would be required 10 by 25 feet, weighing 65 tons when filled with water. If there is no cooling or other pond where water can be stored, then a cistern may be constructed in the ground, the sides and bottom being finished with cement concrete, much the same as a cement floor or sidewalk.

If water from the city waterworks is available a large storage tank is not so essential, but if in any case a storage tank must be provided it should be in connection with the deep-well pump, so that the latter can be discharged continuously for a long period without being compelled to work in unison with the other pumps. The deep well is generally located a considerable distance from the plant and by using storage tanks of five hours' capacity of the deep-well pump, it

will avoid starting or stopping the pump except at long intervals. If an induction motor is used, started by a switch in the engine room, and the storage tank is located where it can be seen from the power house, a telltale must be provided so the operator can ascertain when the reservoir is filled. The device shown in Figure 287 (L 1-1) permits the deep well and storage tank to be located at some distance from power house. The standpipe in the power station has

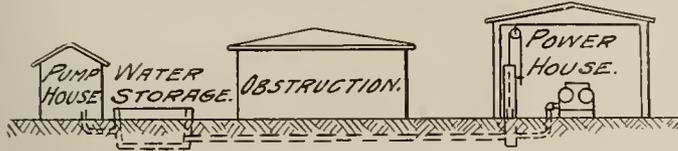

Figure 287 (L 1-1).

a telltale attached, which can, if desired, be fitted with an electric high and low water alarm, brought into contact by the telltale. The automatic high and low water alarm should require little or no attention. This form of telltale is the most approved automatic indicator, since it has no work to do but make and break the bell circuit, which notifies the attendant to open or close the pump motor switch. This requires possibly one-half minute of the attendant's time every five hours or so. The connection from the storage system to the power house should be of ample size, say twice the size of the pump suction, in order to insure the water level in the telltale being approximately the same as that in the cistern. As there would be no appreciable pressure on it, such a line of piping could, in almost every case, be constructed of sewer tile. Tile pipe would not be desirable if the cistern water level were above the ground level.

To insure the telltale showing correctly a small pipe, say one inch, may be laid in the same trench with the pump suction and be used merely to operate the telltale, thus permitting the use of a smaller metal suction pipe. An ideal power station arrangement is secured if the storage cistern or pond is built upon a hill high enough so that the water from the cistern will be under sufficient head to serve the low-pressure water service in the power house, shops, etc. The feed pumps taking this water under pressure would avoid the difficulties caused by air, etc. The pressure corresponding to an elevation of 20 to 25 feet is generally sufficient for any service other than boiler feeding.

It is quite immaterial where the storage tank is located. If the desired head is obtainable by placing the storage tank

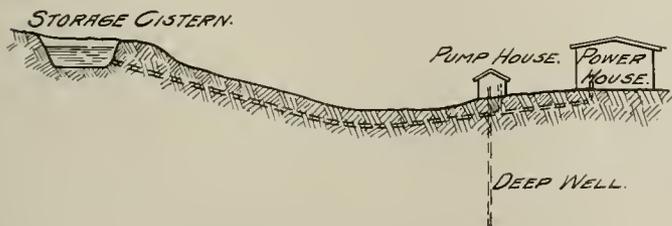

Figure 288 (L 1-2).

500 feet or perhaps more from the power house, it would be better practice than to maintain a pump in operation simply for supplying the low-pressure system. A power station which has its storage cistern located on a hill is shown in Figure 288 (L 1-2).

(To be continued.)

During the present month a hundred miles or more of new Interurban line is expected to be put in operation in Indiana. These lines include a division between Amo and Plainfield by the Indianapolis & Danville Traction Company, a line between Evansville and Rockport by the Evansville & Eastern Traction Company, a line between Crawfordsville and Indianapolis by the Indianapolis Crawfordsville & Western Traction Company, and a line between Henryville and Scottsburg by Louisville & Southern Indiana Traction Company.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Rights Acquired with Filing of Instrument of Appropriation.

Ft. Wayne & Southwestern Traction Company v. Ft. Wayne & Wabash Valley Traction Company, 80 Northeastern Reporter, 837.—The supreme court of Indiana holds that the instrument of appropriation filed by the plaintiff with the clerk of the circuit court on March 29, 1901, was a seizure and an appropriation of the land therein described, and that all damages resulting from the taking and construction of the railroad at once accrued and vested in the owner, Aaron Dukes and wife, as a personal claim against the plaintiff, which claim did not pass to the Ft. Wayne & Wabash Valley Traction Company by the deed of Dukes and wife on April 1, 1907. And, the record failing to disclose any assignment of said claim by Dukes to the Ft. Wayne & Wabash Valley Traction Company, said company, for want of interest in the subject matter of the action, had no standing in court, and its exceptions to the report of the appraisers should not have been entertained.

Track Repairers Not Put in Class of Their Own.

Indianapolis Street Railway Company v. Kane, 80 Northeastern Reporter, 841.—The supreme court of Indiana says that it is unacquainted with any rule of negligence that puts track repairers in a class of their own. In this case the trial court gave to the jury an instruction to the effect following: "The complaint charges that the plaintiff was in the employ of the defendant, and when injured was working as a common laborer in and about the work of repairing and constructing the defendant's tracks; that, when a person hires himself to a railroad company to do repair work, such person assumes all those risks as are ordinarily incidental to that kind of work, and he cannot rely wholly upon his employer to make the working place safe." The instruction as given was a modification by the court of one requested by the company, by inserting the word "wholly" in the last clause, so as to make the instruction state that a servant employed to do repair work cannot wholly rely upon his employer to make the place safe. The company insisted that such a servant cannot rely upon his employer at all in this respect. But the supreme court does not think that there was any error in making the modification stated. It says that it is the duty of a servant in any situation or class of employment to observe care, in proportion to the apparent or known dangers of the place, to preserve his own safety; but it is inaccurate to say, as requested by the company, that one employed to do repair work can, under no circumstances, find any measure of excuse in reliance upon the master to keep the working place safe. The servant may certainly rely upon the master not to negligently or maliciously invest the working place with new, unusual and unexpected dangers.

Liability Under Ordinance as to Bridge Building.

North Braddock Borough v. Monongahela Street Railway Company, 66 Atlantic Reporter, 152.—The supreme court of Pennsylvania says that the defendant, by the acceptance of a borough ordinance and in consideration of the privileges granted, engaged to build a new bridge and to reconstruct an old one. The ordinance also stipulated that the defendant should build the approaches to the bridges, but did not specifically state how or in what manner these were to be constructed. Embankments were necessary, and these were constructed of sufficient height, supported laterally by concrete retaining walls, running back an average of some 40 feet from the abutments of the reconstructed bridge, with an average height of about 20 feet. These walls were adequate so far as they extended, but they did not extend along the entire embankment. Beyond where the retaining walls stopped the required support was obtained by enlarging the embank-

ment at the base. This extended it beyond the limits of the street, and was an encroachment upon private property at the side. The defendant left the work in this condition, and, upon its refusal to construct the retaining walls any further, the borough proceeded to finish the work and brought this action to recover therefor.

In affirming a judgment for the plaintiff the court holds that no other conclusion was warranted than that the parties were contracting for the kind of approaches that would be suitable under the improved conditions of the avenue. Adequacy of surface could only be secured in one of two ways, either by extending the base of the embankment beyond the limits of the street, or, if the base was to be restricted to the street limits, by building a retaining wall for lateral support. While it was true that the plaintiff had the right to acquire by condemnation the private property adjoining for purposes of the bridge, it had not acquired it, had taken no steps looking to its acquisition, and nothing in the ordinance gave reason to suppose that such proceeding was contemplated. Under such circumstances it was idle to contend that the embankment, as built, was full compliance with the defendant's obligation. It was not denied that the continuation of the retaining wall was necessary to meet conditions as they existed. It could, therefore, be fairly and legitimately required of the defendant under its contract.

Moreover, the court holds that it was not correct to say as a matter of law that, because at the time the contract was made the avenue had no surface sewerage system, no obligation rested upon the defendant to construct sewer drops. This contract was made in contemplation of certain proposed changes in the street, and it was to be construed accordingly. The obligation of the defendant was to so construct the approaches as to meet the end in view. The only question with respect to the sewer drops was whether they fell within the common intent and understanding. In deciding this, regard was to be paid to the object to be accomplished and the method of construction. In the state of the evidence with respect to the matter it was a question for the jury.

There was no acceptance of the work by the plaintiff; and, if incomplete and unfinished, nothing short of such acceptance would constitute a waiver.

Riding on Inside Running Board Outside of Bar.

Harding v. Philadelphia Rapid Transit Company, 66 Atlantic Reporter, 151.—The supreme court of Pennsylvania says that the witnesses on the plaintiff's side, who saw the accident in which he was injured, said in general terms that when the two cars passed each other the running board of the one on which the plaintiff stood was crowded and several men jumped, fell or were pushed or brushed off. A witness for the defense testified that as the cars passed, a man on the plaintiff's car extended his hand, grasped the other car, and was thrown backwards against the men behind him, including the plaintiff. This was the most plausible account that was given, and apart from it there was nothing to show that the plaintiff on the approach of the car did not lose his nerve and jump or fall from the car.

Under the circumstances there was no presumption of negligence on the part of the defendant, but even if it had been clearly shown, it would have been altogether immaterial. The plaintiff was riding voluntarily in a place of manifest danger, and in so doing he assumed all the risks of the situation. It is settled law that it is contributory negligence which will bar recovery to stand on the platform, or the running board of a car, when a place can be reached inside. And it is equally clear that one who takes a position of manifest and imminent danger assumes the risk of his position, whether he could have got a safer place or not.

It was argued by the plaintiff that he was not warned by the conductor of the danger of his position. But the lowered bar was sufficient warning in itself. It was noticed that the running board on that side was a place of danger, and that

passengers were not expected, nor, so far as the company could control the situation, permitted, to use it, even for the limited purpose of getting on or off the car for which the running board is intended.

The alternative offered by the plaintiff of having to wait for another car, and thus being late in getting home, was no justification.

In any other country than this, the plaintiff would have been forcibly prevented from getting on the car at all, after the number of passengers had reached the limit of safety or even of convenience.

To attempt the enforcement of such a regulation here would certainly lead to continual quarrels and breaches of the peace. A reasonable amount of concession, therefore, to the American's impatience of control and confidence in his own ability to take care of himself should not be visited with punishment by the infliction of penalties on the company for the passenger's own fault.

It must be definitely recognized that one who undertakes to ride on the running board outside of a lowered bar is negligent per se (by the act itself), and cannot recover for injuries incident to his position, whether he could have got a safer position or not.

Open or Defective Car—Floor Trapdoors and Inspection.

Cameron vs. Citizens' Traction Company, 65 Atlantic Reporter, 534.—The trapdoor in the floor of a car, used for access to the machinery beneath, was standing open when a woman boarded the car. It was unobserved by her. She proceeded toward a vacant seat, and, as the car started, stepped into the opening, sustaining injuries which were made the basis of a claim for damages, judgment for which is affirmed by the supreme court of Pennsylvania. The court holds that when the company negligently left the trapdoor open while passengers were entering the car, and after it was in motion, it was answerable for all the consequences that ensued in the natural course of events. An unprotected opening in the floor was dangerous, whether the car was at rest or in motion; and it was no excuse for the company that this danger was increased by its own act in starting the car.

In another case, Jordan vs. St. Louis & Meramec River Railroad Company, 99 Southwestern Reporter, 492, the St. Louis court of appeals holds that the collapse of the floor of a street car beneath a passenger who is simply walking on it, resulting in an injury, is evidence of negligence on the doctrine of *res ipsa loquitur* (the matter speaks for itself). It is a mishap of an extraordinary character, to an appliance within the exclusive control of the railroad company, and one that is not likely to happen in the absence of negligence on the part of the company's employees. This court considers this one of the clearest cases imaginable for the application of the maxim. The giving way of the floor of a car under a passenger's ordinary tread is more cogent evidence of bad management than the collision of two cars, which is held to bespeak negligence.

Complaint was made in this latter case of a refusal to grant an instruction requested by the defendant to this effect: That if the jury believed from the evidence that the car was inspected on the day it was sent out for business, and was found in a safe condition in respect of the cover, then the allegation regarding the negligence of the defendant in maintaining the cover was not sustained by evidence, and the verdict should be for the defendant. But the court says that it would have been error to give that charge. It said nothing about the character of the inspection, but simply stated that, if the car was inspected and found to be in good condition, the plaintiff could not recover. Such a charge would make any inspection, however superficial, conclusive against the defendant's liability. It would seem that an inspection which left the inspector satisfied that the cover was in good order must have been careless, for it was nearly or quite certain that it was not in good order.

News of the Week

Chicago Committee Will Accept Reorganization Plan.

The committee of stockholders of the North Chicago City Railway and the Chicago West Division Railway, underlying companies of the Chicago Union Traction Company, has decided to approve the plan for distribution of the Chicago Railways Company stock which will be decided upon by Judge P. S. Grosscup and Prof. John C. Gray. This approval will remove the obstacle to the acceptance of the new ordinance.

Judge Grosscup expressed his willingness to formulate the final plan of reorganization independent of any suggestions that may be submitted and using the plan which will be submitted by L. C. Krauthoff and George W. Wickersham, representing the New York interests, merely as a guide. John F. Bass, a member of the protective committee, said that the representatives of the underlying stockholders believed that the ordinances should be accepted at once.

Increases of Wages.

The Nashville (Tenn.) Railway & Light Company has announced a new scale of wages for its motormen and conductors of 16 to 20 cents an hour, according to the length of service, in place of the present rate of 15 to 18 cents. The increase affects about 400 men.

The Municipal Traction Company of Cleveland, O., has increased the pay of its motormen and conductors from 24 to 25 cents an hour.

The Worcester Consolidated Street Railway and its employes have reached an agreement on a new wage scale, providing for a minimum rate of 20 cents an hour, with an increase of ½ cent an hour every six months for two years and 1 cent an hour at the end of the third, fourth and fifth years. Service stripes will be given at 5-year intervals, with a bonus of five cents a day for each stripe after the first.

Temporary Receivership for Air Line.

The Chicago-New York Electric Air Line Railroad Company was in the hands of a receiver for about nine hours last Sunday, June 9. Judge Sanborn of the United States district court at Chicago appointed George F. Hull of Indianapolis receiver for the company late on Saturday night on the petition of William E. Webster and Andrew J. Krel of Indianapolis, representing 36 stockholders of the company. The petition set forth that the officers of the company are financially irresponsible for the undertaking and that the company plans to construct an electric railroad between Chicago and New York at a cost of \$250,000,000, whereas, as the complainants assert, such a road would cost \$750,000,000.

The receiver's bond was fixed at \$40,000 and a representative took charge of the company's offices in the Majestic building, Chicago, at 1 o'clock Sunday afternoon. Attorney Wood of the company declared the bond insufficient and appeared before Judge Kohlsaat at 9 o'clock that evening. The judge ordered the receiver to vacate temporarily because of the insufficiency of the bond and ordered a hearing for Monday morning. At the hearing it was decided that the federal courts in Illinois had no jurisdiction in the case and the bill was dismissed.

Report on Municipal Ownership.

The full report of the commission on public ownership and operation of the National Civic Federation, a work upon which for more than 18 months 25 expert accountants, engineers, economists and other specialists have been engaged, is now being sent to press. This report will contain all of the data gathered abroad and in America, and upon which the commission will have based its conclusions.

The investigation embraced the four leading public utilities, gas, water, electric lighting and power and street railways. Examinations were made of 29 private and public plants in America and 24 in Great Britain. Among the American cities visited were Cleveland, Chicago, Philadelphia, Wheeling, Detroit, Indianapolis, Richmond, Atlanta, South Norwalk, Syracuse, Allegheny, New Haven and Norfolk. The inquiry abroad included the leading private and public undertakings of Great Britain and Ireland. Examinations were made in the following cities: Glasgow, Newcastle-on-Tyne, London, Liverpool, Norwich, Manchester, Birmingham, Dublin, Leicester and Sheffield.

The keenly analytical character of the work of this investigation only a study of the full report of the commission can indicate. Some idea of the scientific methods employed may be had from the fact that schedules of questions prepared by noted engineers and economists were followed in the case of each plant and system examined. These schedules disposed of the questions under several general heads, as follows: (a) Historical and general, (b) supervision of municipalities, (c) public supervision of private companies, (d) franchises of private companies, (e) organization, (f) political conditions, (g) labor, (h) character of service and plant, (i) financial matters, (j) capital stock and bonds, (k) assets, (l) liabilities, (m) receipts, (n) expenses, (o) profit and loss.

Several days were personally devoted by the experts upon each plant examined, and in some cases weeks were consumed.

The commission's full report will appear in two main divisions. The first part is intended for popular reading; the second will include the reports of the experts, which will be of especial interest to accountants, engineers, managers of public utility corporations, city officials, members of legislative committees, and all who are interested in municipal ownership and franchise. The second part will also show in the case of each American and foreign plant examined to what extent the experts agreed. Thus will be provided

technical information of the correctness and impartiality of which no question can be raised.

Advance orders may now be sent to E. A. Moffett, secretary, 281 Fourth avenue, New York, N. Y. But a limited edition will be printed, and no copies will be available after the edition is exhausted. The price is: Part 1, Volume I (about 500 pages), paper, \$1.00; cloth, \$2.00. Part 2, Volumes I and II (about 1,000 pages each), \$8.00.

Strike Threatened in Detroit.

Several hundred of the motormen and conductors employed by the Detroit United Railway, at a midnight meeting on Monday of this week decided to refuse the offer of the company for an improvement in working conditions without an increase in wages and declared in favor of a strike within 48 hours unless the company agreed to arbitrate a wage increase, with 25 cents an hour as a minimum and 30 cents as a maximum. They are now receiving 23, 24 and 25 cents an hour.

Since the carmen voted in favor of a strike on May 27 a number of conferences have been held between F. W. Brooks, general manager of the company, and International President W. D. Mahon and other officers of the union in the effort to reach an agreement, and the result of the conferences was submitted to a mass meeting of the men on Monday night. The company refused to grant the demands of the men for a wage scale of 28 cents an hour, with time and a half for overtime, but agreed to a number of improvements in working conditions, especially in regard to the tripper system. The principal concessions offered by the company were: No employe shall be permitted to run a tripper more than one day in seven; no regular employe, compelled to run after midnight, shall be required to report until his regular time on the following day; free transportation on the company's suburban and interurban lines; in cases of men discharged all of the evidence in the case, including the employe's record, shall be submitted to the trial board; on swing runs employes shall receive a full hour's pay for time under an hour and shall be paid for the time spent in waiting at the barns up to 20 minutes.

The declaration to strike was made without a formal vote by the more radical younger men, after a riotous meeting, and is said to be contrary to the wishes of the majority.

Preliminary Report of the United States Geological Survey.

The United States geological survey has just issued a preliminary report on the work being done by the boiler division of the fuel-testing plant at St. Louis, Mo. This department has taken up the scientific study of steam boiler performance and has been conducting tests to verify the theory of steam boilers developed by Mr. John Perry, a distinguished electrical and mechanical engineer of England. As far as the experiments have been carried out by this department the conclusions reached from the study of Mr. Perry's theory have been entirely confirmed. No doubt the work done by this department, and results which have been obtained in the experiments, will in the course of time make astonishing changes in the design of boilers. To quote the report:

"The nature of boiler efficiency has suggested that stationary boilers ought to be made to do from 10 to 20 times as much work per unit of heating surface as they do now. This great increase in capacity is to be attained by subdividing the heating surface and water streams more finely and by allowing less restriction of the water inside the boilers, and by using high forced and induced draft to put a large mass of gases through the boiler at a very high speed.

"Mr. Perry's theory and the survey's verification of it will result in placing the steam boiler on a fairly secure mathematical basis, the same as generators and motors are now on. Thus far the experiments check out the theory excellently. The theory and results will be embodied in a special bulletin to be published in two or three months, to be followed by later bulletins as the work proceeds."

Mr. Walter T. Ray, assistant engineer, acting under the supervision of Prof. L. P. Breckenridge, engineer in charge of the boiler division of the United States geological survey fuel-testing plant, has been studying the mathematical theory of steam boilers and of heating absorption, and has somewhat extended Mr. Perry's theory. This work is of extreme importance to the engineering profession and especially to electric railway and lighting plants which depend for their power primarily upon steam boilers, and it is to be hoped that the fuel-testing department will receive the hearty co-operation and assistance of all engineers and manufacturers who are in a position to render any assistance.

Legislation Affecting Electric Railways.

Connecticut.—Governor Woodruff has sent to the senate a bill providing that before a new electric railway company shall lay any tracks or an existing company additional tracks plans shall be submitted to the state railroad commission with a petition for its approval, which can be given only after a full hearing of the parties concerned. The commission is to have full authority to prescribe the limits within which land shall be acquired by condemnation. In a message accompanying the bill the governor says: "Charters dissimilar in structure have been granted to street railway companies for a number of sessions. In some of them extremely wide powers, and even irrelevant powers, have been granted. It is my opinion that a general law should be passed under which street railway companies can construct and operate with ample powers and not be dependent upon special grants of privilege from the general assembly."

New York.—By refusing to take it from the railroad committee the senate has practically killed the Wagner bill, which provided for a 5-cent fare over lines operated by one company, within the limits of a municipality. The special object of the bill was to prevent the Brooklyn Rapid Transit Company from charging two 5-cent fares to Coney Island. Senator Grady's motion to dis-

charge the committee from further consideration of the bill was lost by a vote of 14 to 31. Some of the adverse votes were based on the idea that the bill would work a hardship on many companies, while others held that the situation should be handled by the public utilities commission, which is to assume its duties on July 1.—The Dowling loop bill, which provided for an elevated loop connecting the Manhattan terminals of the Brooklyn and Williamsburg bridges, was practically defeated on June 5, when the assembly refused to concur in the senate amendments.

Pennsylvania.—Governor Stuart on June 7 signed the Kennedy bill prohibiting street railway companies from charging more than a 5-cent fare within the limits of second-class cities. The law took effect at once and the Pittsburg Railways Company immediately issued an order to its conductors to charge only five cents within the city limits. However, there was no reduction in fares for passengers to the outlying towns, as another fare was charged outside of the city. The principal effect of the new law is to reduce the fare after 12 o'clock at night within the city of Pittsburg from 10 to 5 cents.

Increased Fare in Lorain, O.—The Lorain Street Railroad has announced that it will discontinue its present practice of selling eight tickets for a quarter and will hereafter charge a straight 5-cent fare.

Bion J. Arnold on Chicago Traction.—In an address to the graduates of Armour Institute of Technology, Chicago, on June 13, Bion J. Arnold said that when the reconstruction of the traction properties is completed Chicago will have the best street railway system in existence. Mr. Arnold spoke of this as the electrical age.

Limited Service from Hartford to Springfield Proposed.—It is reported that the Consolidated Railway Company of New Haven, Conn., is considering the feasibility of operating limited express cars between Springfield, Mass., and Hartford, Conn., cutting down the running time from 1 hour and 50 minutes to 1 hour and 20 minutes.

May Contest Public Utilities Law.—New York press dispatches quote a member of the rapid transit commission as authority for the statement that suit will be brought declaring that the public utilities law is unconstitutional, as the city of New York has no voice in the appointment of the commission for the first district, but must bear the expense.

Milwaukee Public Service Building Exempt from Local Taxation.—The Wisconsin state tax commission has given an opinion that the Public Service building of the Milwaukee Electric Railway & Light Company is exempt from local assessment because it is principally devoted to the operation of the street railway and should therefore be taxed by the state.

Evansville & Eastern Line Opened.—The formal opening of the extension of the Evansville & Eastern Electric Railway to Rockport, Ind., was celebrated on June 6, when a party of city officials and leading business men made a trip over the line in special cars. The company's line now extends from Evansville to Rockport, via Newburg, Yankeetown and Hatfield, 21 miles. W. H. McCurdy, president.

Plans for Through Service Between Cleveland and Detroit.—In regard to the reports that the Lake Shore Electric Railway and the Detroit United Railway would soon institute a through limited service from Detroit to Cleveland by way of Toledo, about 180 miles, President E. W. Moore of the Lake Shore Electric Railway writes that this service has not as yet been definitely arranged, although they have the matter seriously in mind.

Opening of Oneida Railway.—C. Loomis Allen, vice-president and general manager of this company, announces the opening of the Oneida Railway between Utica and Syracuse over the electrified West Shore on Saturday, June 15, 1907. Electric trains will leave Utica at 9:30 a. m., and will return in time for lunch, which will be served in Utica upon arrival. A description of this work was published in the Electric Railway Review for November, 1906.

Ft. Dodge Des Moines & Southern Line Opened.—The first passenger car was operated over the new line of the Ft. Dodge Des Moines & Southern Railway from Boone to Des Moines, Ia., on June 8, carrying a party of officials and business men. The construction of the line was described in the Electric Railway Review of May 25, page 672. Regular service was started on Monday, June 10, and a 2-hour service is given between Des Moines and Boone.

Worcester Polytechnic Institute.—The week beginning on Sunday, June 9, was commencement week for the Worcester Polytechnic Institute. The annual commencement lecture was by Prof. A. S. Richey, the subject being "The Electric Railway"; this was delivered on Tuesday evening. On Thursday the commencement address was by Charles F. Scott, consulting engineer Westinghouse Electric & Manufacturing Company, on the subject, "Some Aspects of Electrical Development."

Indiana Decision on Steam Road Crossings.—The Indiana supreme court has decided that the evidence of civil engineers to the effect that it is possible to substitute an overgrade or an undergrade crossing for a grade crossing of an interurban railroad and a steam railroad does not sufficiently establish that it is practicable to make the substitution as provided by Section 5 of the law of 1903, especially where the expenses of such a change would be very great. The case was filed by the Pittsburg Cincinnati Chicago & St. Louis Railway against the Indianapolis Columbus & Southern Traction Company for the purpose of compelling the interurban company to build an overhead crossing where the interurban tracks and

those of the steam line cross just south of Indianapolis. The lower court held that overhead tracks at the point named were impracticable and gave judgment, the supreme court affirming. The decision is of considerable interest to Indiana interurban lines.

Cases Against Milwaukee Company Dismissed.—Two cases against President John I. Beggs of the Milwaukee Electric Railway & Light Company for violation of a city ordinance which prohibits leaving cars standing on the tracks at night have been dismissed on motion of the city attorney. It was stated that since Mr. Beggs was arrested on April 20 the company has made arrangements for storing all of its cars and that there is no object in continuing the cases.

Columbus Council Prohibits T-Rail.—The Columbus (O.) city council on June 10 passed an ordinance prohibiting the use of the T-rail by street or interurban railways on improved streets in the city, and providing for the use of grooved rails of weight and pattern approved by the board of public service. In unimproved streets the T or other form of rail may be used, but grooved must be substituted when the streets are improved. This step follows a long controversy in regard to the comparative merits of the two forms of rail and a vigorous campaign for the T-rail made by the electric railways.

Interurban Railway Mileage in Indiana.—According to reports made to the Indiana state board of tax commissioners the interurban mileage of 1907, as compared with that of 1906, shows a considerable development of the interurbans in the state. Aside from the increase in the first main track mileage from 1,334.49 miles to 1,545.85 miles, and the increase in the sidetrack mileage from 52.84 miles in 1906 to 65.17 miles in 1907, the interest lies in the increase in the mileage of the second main track, which indicates double-tracking. In 1906 there were only 29.94 miles reported to the board for assessment, and this year the mileage so reported is 52.77 miles.

Philadelphia Ordinance Approved.—The joint committee on street railways and finance of the Philadelphia councils has reported favorably the new franchise plan. The principal changes in the ordinance as submitted are: Provision for a proper adjustment of track and equipment around the city hall in case the city or any company shall desire to build a subway under Broad street; the representation of the city in the board of directors has been changed from the president of the board of city trusts and public education to two representatives, to be selected by councils for terms of four years each. It was thought this was a better plan, as citizens who might be in closer touch with the needs of the city could thus be secured.

Joint Through Traffic Agreement.—The Chicago South Bend & Northern Indiana Railway Company, the Southern Michigan Railway Company and the Winona Interurban Railway Company have agreed upon a schedule whereby they will be able jointly to compete successfully for freight between St. Joseph, Mich., and Warsaw, Ind., via South Bend. The agreement provides for a through service between the points named. The plan includes an agreement with the Graham & Morton Transportation Company to handle passengers and freight traffic to and from Chicago across Lake Michigan. It is believed that the arrangement will develop a very popular excursion traffic between the points named and Chicago by the lake route.

Company Responsible for Incivility of Employee.—Justice Gildersleeve of the appellate term of the New York supreme court on June 8 handed down a decision against the Interborough Rapid Transit Company, holding that it is the duty of guards employed on cars operated by common carriers to accord courteous and respectful treatment to passengers and to protect them from insults and assaults. The decision further states that a common carrier is liable for damages to a passenger for injury to his feelings caused by incivility of its employees. The decision upholds a verdict of a municipal court awarding \$750 damages to A. J. Danziger, who sued the company on account of rough treatment and insulting language from a guard on the elevated road.

San Francisco Strike Dying Out.—The strike of the carmen employed by the United Railroads of San Francisco, which has been in progress for several weeks, appears to have almost come to an end. The company is now operating all of its lines and last week 225 cars were running. The company on June 5 discharged a large number of men who have been working under temporary contracts and is replacing them wherever possible with residents of San Francisco. A few acts of vandalism have been reported, but there have been no serious disturbances for two or three weeks. President Calhoun has issued a statement that the company will not recognize the existence of the carmen's union and that it will continue to operate its cars with men who voluntarily seek service with the company. It is stated that many of the strikers have returned to work.

Complaint Against Rate of Fare in Lincoln, Neb.—City Attorney Stewart of Lincoln, Neb., has filed a complaint with the state railroad commission against the four traction companies operating in the city of Lincoln, the Lincoln Traction Company, the Omaha Lincoln & Beatrice Railway, the Citizens' Railway and the Capital Beach & Milford Railway. The bill states that the Citizens' Railway charges five cents cash fare for a ride within the city and sells six tickets for a quarter and 10 tickets for a quarter, good for school children, whereas the other companies charge a straight 5-cent fare, which is declared unjust and unreasonable. The commission is asked to require the other companies to establish the rate of fare now charged by the Citizens' company and also to require each of the companies to issue transfers good on the lines of the other companies within the city.

Construction News

FRANCHISES.

Bay City, Mich.—The Detroit Bay City & Western Railroad, which proposes to build an interurban electric line between Bay City and Caro, has been granted a franchise to operate its line in this city. A franchise also has been granted to the Bay City & Port Huron Railroad to operate its interurban line in Bay City.

Chehalis, Wash.—George W. Gregory, Seattle, Wash., has applied for a 50-year franchise to build an electric railway in this city. The line will commence at the north end of First street and proceeding south on Main street to Market, to West and on West to First street again, will form a loop. It is believed that this may be part of an interurban system which eventually will connect Chehalis with Centralia. In connection with its street railway system the company also will operate an electric light plant and water system.

Chicago.—The local transportation committee of the city council on June 13 approved most of the provisions of an ordinance permitting the Chicago Milwaukee & St. Paul Railway to electrify a line north of Wilson avenue, to be operated in connection with the Northwestern Elevated Railroad. Amendments provide for a station at the city limits and for a 5-cent fare into the city; also that no third rail shall be used except on the elevated structure.

Cloverdale, Cal.—A franchise has been applied for by the Sonoma & Lake County Electric Railway to enter Cloverdale with its interurban road. Construction is to begin at once.

Colorado Springs, Colo.—Eugene B. Sweeney, St. Louis, Mo., is seeking a franchise to build an electric interurban line between Colorado Springs and Denver. Right of way has been secured in Denver to the intersection of Colfax avenue with the Rio Grand tracks. From this point it is stated the line will proceed to the heart of the city, where its depot will be located, over the tracks of another line, possibly the Lakewood & Golden. Mr. Sweeney is quoted as saying that his company will expend about \$2,000,000 on the work, but will not seek an entrance in Colorado Springs until the line has been built to within 25 miles of the city. A fare of \$1.50 is promised by the new company between Denver and Colorado Springs, as against the present rate of \$2.25. It also promises to make the run in 1 hour and 45 minutes, as against the present 2½-hour run.

Corning, N. Y.—The Corning & Painted Post Street Railway has applied for a franchise to double-track its line through Corning. If the franchise is granted the company will slightly change its present route in order to eliminate the curve at the ball grounds.

Crookston, Minn.—It is reported that W. A. Martin is interested in a local street railway system in Crookston and that franchise privileges are now being sought.

Decatur, Ill.—The Decatur Sullivan & Mattoon Transit Company has refused to accept the franchise recently granted by the city because of the requirement that the company shall build an expensive subway under the Illinois Central tracks.

Dubuque, Ia.—A franchise has been granted to the Eastern Iowa Traction Company to enter Dubuque with its interurban line. The terminal will be located on Seventh street.

Fruitvale, Cal.—The Oakland Traction Consolidated Railway has secured a franchise to build and operate an electric railway in this city. W. F. Kelly, general manager, Oakland, Cal.

Ishpeming, Mich.—The Marquette County Gas Light & Traction Company has applied for an extension of its street railway and lighting franchises from July 11, 1921, to July 11, 1936.

Mound City, Ill.—The Southern Illinois Traction Company, Cairo, Ill., has been granted a franchise to enter this city on Fifth street, thence through Walnut to Main and up Main to East First street, where it will turn west toward Mounds. The company proposes to build a line through the Southern Illinois coal belt from Murphysboro to Johnson City by way of Carbondale and Herrin.

Phoenixville, Pa.—A franchise has been granted to the Philadelphia Interurban Electric Railway to construct and operate an interurban line in this city. Right of way has been secured between Pottstown and Phoenixville and work will be started immediately. The line must be in operation inside of two years.

Puyallup, Wash.—An amended franchise granting the Puget Sound Electric Railway permission to build a trestle over the Northern Pacific tracks at Indiana avenue, this city, was passed by the city council on June 5.

Richmond, Ind.—The deadlock between the Terre Haute Indianapolis & Eastern Traction Company and the city authorities at Richmond continues without immediate hope of a settlement. The chief contention is over the question of transfers. The franchise offered by the city provides for a general transfer system between the local and interurban cars within the city limit. It further provides that the interurban cars shall stop within the city limits upon signal at all crossings to receive and discharge passengers. The same provisions are incorporated in a franchise offered to the Dayton & Western Traction Company now being operated by the Terre Haute Indianapolis & Eastern Traction Company. The officials of the traction company state that the

provisions are unreasonable and will never be accepted by the company. They ask that the transfer provision and the stopping of cars at crossings be eliminated.

Syracuse, N. Y.—The Syracuse Rapid Transit Railway has applied for a franchise to double-track its line in Burnet avenue to Eastwood, which is said to represent the first step to reach East Syracuse. It is stated that the company also will ask for permission to build a double-track line through Clark street, to its present tracks in Manlius street, and to double-track Manlius street to the end of the present line. The Syracuse & Chittenango Railway, which proposes to build an electric line from Syracuse through East Syracuse to Chittenango, N. Y., will apply for a franchise to construct its tracks through Second street in East Syracuse.

Terre Haute, Ind.—Hugh J. McGowan of Indianapolis, president of the Terre Haute Indianapolis & Eastern Traction Company, has reached an agreement with the city officials in regard to the terms of a contract by which the company is to be given a new franchise. The company agrees to build a modern and commodious interurban passenger station within three years and to expend not less than \$850,000 during 1907 and not less than \$400,000 during 1908 for permanent improvements and equipment. The city reserves the right to regulate the street car schedule and all interurban cars except limited cars shall stop upon signal at least once in every six blocks within the city. The company is to relay its tracks on Wabash avenue within 15 months. The fare will remain at five cents. This contract must be passed upon by the city council before the franchise becomes valid. The contract is, in effect, a modification of the franchise of the Terre Haute Traction & Light Company, which was leased in March of this year by the Terre Haute Indianapolis & Eastern. The franchise is to expire in 1952.

RECENT INCORPORATIONS.

Akron Canton & Youngstown Railroad, Akron, O.—Incorporated in Ohio to build and operate an electric interurban line in Summit, Stark, Portage and Mahoning counties, with terminals at Akron and Youngstown. Capital stock, \$20,000. Incorporators: Z. W. Davis, Isaac H. Taylor, William Simpson, H. B. Steward and M. L. Rackle.

Centralia & Sandoval Railroad, Centralia, Ill.—Incorporated in Illinois to build an electric railway from Centralia to Sandoval. Capital stock, \$2,500.

Clarksdale Covington & Collierville Interurban Railway, Memphis, Tenn.—The Lake View Traction Company, which recently was incorporated under the laws of the state of Maine to build local street railways in Memphis and Clarksdale with an interurban system between these two points, has been incorporated under the laws of Tennessee with the above title. This was done for the purpose of facilitating the acquiring of right of way, sites for power houses, parks, etc., by condemnation proceedings when they cannot otherwise be obtained, which, under the interurban laws of the state of Tennessee, cannot be done by a company incorporated under the laws of another state. The line will operate in Memphis and Clarksdale and afford connection with the towns named in the title. Capital stock, \$50,000, with the privilege of increasing as necessary. The incorporators are: R. F. Tate, Memphis; W. A. Gage, G. W. Agee, J. S. Robinson, Dudley S. Weaver, H. E. Craft, W. E. Willett, A. Walsh, W. A. Percy, E. Manigan, M. J. Roach, Walter Goodman, I. D. Block, L. Sambucetti, R. B. Nebhut, H. D. Minor, C. F. Farnsworth and W. C. Knight.

Denver & Greeley Railroad, Greeley, Colo.—Incorporated in Colorado to build an interurban electric line from Greeley to Longmont, Loveland, Johnstown, Hillsborough, Ft. Collins, Windsor, Severance and Eaton, with an extension later to Denver. Surveys for the location of the line will be started at once. For a portion of the distance the road will run between the Colorado & Southern on the west and the Union Pacific on the east, traversing the St. Vrain coal fields to Hillsborough, with a branch from Hillsborough to Ft. Collins on the south and west and to Greeley on the north and east. Capital stock, \$50,000. Incorporators: John C. Mosher, president; E. J. Decker, first vice-president; George M. Huston, second vice-president; Mayor Frank J. Green, H. H. Hake, Greeley, Colo.; J. D. Houseman, J. F. Church, John S. Flower, Max Straus, James Williams, H. G. Clark, Denver, Colo. It is announced that J. D. Houseman, who has supervised the building of several interurban lines in St. Louis and the west, will be general manager of the new company and have direct charge of its construction. It is estimated that the road, when completed, will cost about \$1,000,000.

Open River & Navigation Company, Pendleton, Ore.—Incorporated in Oregon to construct and operate steam and electric lines and power plants and operate steam and sailing vessels. It is stated that most of the route for that portion of the road to be built first, from Simmons Landing to Holdman on the Columbia river, 16 miles, has been surveyed and nearly all the right of way secured. The territory to be served is in the great northern wheat belt, and it is estimated that 20,000 tons of wheat will be made tributary to the line by this route. It is thought that eventually the line will be extended to Pendleton, about 35 miles. Capital stock, \$250,000. Incorporators: E. W. McComas, G. A. Hartman and C. E. Curry, the latter manager of the Northwestern Warehouse Company at San Francisco. J. N. Teal, Portland, Ore., is attorney for the company.

Paris & Northern Traction Company, Paris, Ill.—Incorporated in Illinois to build an electric railway in Edgar and Vermillion coun-

ties, from Paris to Ridge Farm and Brocton, Ill. Capital stock, \$5,000. Incorporators: F. L. Kidder, L. L. Caninne, John J. Cummings, J. E. Parrish, Paris, and George E. Fair, Chrisman, Ill.

Quitman Valdosta & Thomasville Electric Railway & Power Company, Quitman, Ga.—This company has applied for a charter to build a 50-mile interurban line from Valdosta to Blue Springs, Quitman and Thomasville, Ga. Capital stock, \$30,000. Incorporators: H. L. Young, J. D. Wilson, J. W. Oglesby, Sr., R. C. McIntosh and others.

Swannanoa Valley Railway, Black Mountain, N. C.—Incorporated in North Carolina to build an electric interurban railway from Asheville to Swannanoa Station, Black Mountain and other points in the Swannanoa valley. Incorporators: F. T. Meriwether, Ed S. Caldwell, P. R. Moale, Hugh L. Barbee, J. M. Chiles and W. R. Whitson.

Wisconsin & Northern Minnesota Railway.—Incorporated in Wisconsin to build an electric line from Superior, Wis., to Duluth, Minn.

Wisconsin Midland Railway.—Incorporated in Wisconsin to build a 2½-mile electric line from Chester to Waupun, Wis. Capital stock, \$30,000. Incorporators: Thomas R. Mercein, Charles Schley, Ralph M. Friend, Earle C. Juneau, Milwaukee, Wis.; De Witt C. West, Beaver Dam.

Yankton Southern Railway, Yankton, S. D.—Incorporated in Oklahoma to build an electric railway from Yankton, S. D., to a gulf port. Incorporators: Fremont Hill, Jesse Lowman, Thomas B. Paxton, Alfred Hill, John W. Warrington, William Cooper Procter, Robert J. Gamble of Cincinnati, and William J. Faulte and Isaac Piles of Yankton.

TRACK AND ROADWAY.

Americus (Ga.) Street Railway.—This company has obtained a franchise in Americus and proposes to build a 4-mile street railway system, to cost about \$150,000.

Anderson (S. C.) Traction Company.—It is announced that the new interurban line from Anderson to Belton, S. C., 10 miles, will be completed and put in operation by July 1. The trestle over Broadaway creek was finished last week and the final work is being done on the construction of the line. J. A. Brock, president.

Auburn & Northern Electric Railroad, Auburn, N. Y.—It is announced that this company has plans about completed for the extension of its line from Auburn westward to Seneca Falls and that work will be started in the near future. Its recently built line to Port Byron will be formally opened at an early date.

Bellingham, Wash.—It is reported that C. D. Wyman of the Stone & Webster Engineering Corporation is in this vicinity to make a final decision on the route of the Seattle-Bellingham interurban line and other lines radiating from Bellingham, which this company proposes to build. Several routes have been surveyed.

Birmingham (Ala.) Railway Light & Power Company.—The stockholders have authorized a bond issue of \$35,000,000, a part of the proceeds of which will be used in making extensions and improvements.

Boston (Mass.) Elevated Railway.—President W. A. Bancroft has announced that plans will be filed in two or three weeks for the company's proposed subway extension to Cambridge. The report of Consulting Engineer William B. Parsons, recommending four stations, has been received.

British Columbia Electric Railway, Vancouver, B. C.—This company expects to build during the next two years about 60 miles of electric railway from Westminster to Chilliwack, B. C. James Milne, general superintendent.

Brooklyn (N. Y.) Rapid Transit Company.—Two tracks of the reconstructed line to Brighton Beach, which was rebuilt to eliminate a number of grade crossings, were opened for traffic on June 10. The work on this line was described in the Electric Railway Review of December, 1906, page 968. The cost of the improvements was about \$2,000,000, of which half was borne by the city. The company also expended about \$500,000 for the erection of 10 new brick stations and other improvements. It was announced that the other two tracks will be in operation in about two weeks. During the progress of the reconstruction the Brighton Beach trains have used the tracks of the Long Island Railroad.

Chester (Pa.) Traction Company.—The contract for the rebuilding of this company's 70-foot span bridge at Waterville has been let to the Belmont Iron Works, Philadelphia, Pa.

Columbus (Ind.) Street Railway & Light Company.—This company has resumed the construction of its extension to East Columbus, Ind., work upon which has been held up by an option on the property. It is expected to complete the extension in about a month.

Consolidated Railway, New Haven, Conn.—It is announced that the proposed extension from Great Barrington to Canaan, Mass., will be built this year and that a number of bad curves between Great Barrington and Pittsfield will be eliminated.

Corning Keuka Lake & Ontario Railroad.—Governor Hughes of New York has signed a bill validating the charter of this company, which was incorporated in 1905 to acquire the property and franchises of the Sodus Bay & Corning Railroad, a steam road, which completed its grade between Savona and Keuka and for several miles toward Lake Ontario.

Cortland & Auburn Railroad.—The New York railroad com-

mission has granted this company permission to issue a first mortgage for \$1,000,000. The company proposes to build from Cortland to Auburn, N. Y. W. L. Weber of Philadelphia, chief engineer.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—Official advice from this company states that the Mansfield division, from Seville, O., on the southern division, to Mansfield, 44.24 miles, has been surveyed for the entire distance. The line will pass through Seville, Le Roy, West Salem, Oak, Nankin, Ashland and Mansfield. Grading is in progress from Mansfield to West Salem and the overhead work from Mansfield to Ashland. The Cleveland Construction Company is the principal contractor. F. T. Pomeroy, president; Roberts & Abbott, chief engineers, Cleveland, O.

Danville, Ind.—It is reported that Philadelphia capitalists are interested in a project to build an electric line from Danville to Rockville, Ind., and that John O. Kain has been engaged in preparing profiles. Incorporation papers are to be filed in a few days.

Enid (Okla.) Street Railway.—This company has opened for traffic a new line between the Rock Island and Frisco depots, about a mile long. Several miles of track has been laid and construction is now in progress on a line to the park northwest of Enid.

Hamstead & Manchester Railroad.—It is stated that an extension to this company's line from Reisertown, Md., to a connection with an extension of the Hanover & McSherrystown Railroad in Pennsylvania is under consideration. If built a through electric line from Hanover to Baltimore will be afforded.

Indiana Columbus & Eastern Traction Company, Columbus, O.—It is reported that the line between Columbus and Springfield, O., is to be rebalasted this year and new ties laid. The work of grading the London cut-off is now almost completed and the placing of rails will begin in a short time. The cut-off will save five miles between Columbus and Springfield, and will leave London off the main line. A car will be run on the spur, however, for the accommodation of passengers. The tracklaying of the cut-off and the ballasting of the road will be done by John T. Adams of Columbus, who is now engaged on a number of contracts for the company.

Indianapolis Newcastle & Toledo Electric Railway, Newcastle, Ind.—It is reported that this line from Indianapolis to Newcastle, Ind., will soon be ready for ballasting. The grade work is rapidly nearing completion, and the heaviest part of the work will be completed within two weeks. The heaviest part is the fill west of Newcastle, across the Blue river valley, and work on this is progressing satisfactorily. Rails and ties have been distributed along the right of way, and as soon as the grade is completed these will be laid. Machinery is being placed in the power house and the prospects are that cars will be running by the first of November.

Interstate Electric Railway.—Ernest D. Martin of Kansas City, Mo., has filed 21 right of way contracts for land south of St. Joseph, Mo., for the proposed line from St. Joseph to Kansas City, via Dearborn and Liberty.

Lake Shore Electric Railway, Cleveland, O.—It is reported that nearly all the bridges on the Sandusky-Fremont branch are completed, and between Erlen and Sandusky there remains but four miles of track to be completed. Grading on the Fremont end of the line is being hurried and it is expected that cars will be running between Fremont and Sandusky by July 4.

Lexington (Ky.) & Interurban Railways.—It is reported that this company has decided to construct its proposed road from Lexington to Nicholasville, Ky., at an early date. J. P. Pope, chief engineer.

Louisville & Northern Railway & Lighting Company, New Albany, Ind.—This company, which recently surveyed a line from New Albany to West Baden and French Lick, via Paoli, again has its engineers in the field to make the final location. As soon as this is finished the company expects to let contracts for the construction of the line. It is the intention of the company to build the line in sections. The first will be from New Albany to Floyd Knobs, five miles north, which will be a junction point for the Paoli line and the proposed line to Corydon, which has also been surveyed, both lines using the same route through the knobs with a grade not to exceed 3 per cent. The Paoli line will use the street railway which is controlled by the Louisville & Southern Indiana Traction Company to reach Louisville, the two companies being closely allied.

Macon Americus & Albany Electric Railway, Macon, Ga.—It is reported that the American Engineering Company of Indianapolis, Ind., has been awarded the contract for the preliminary engineering on this road, which is to connect the cities named in the title. G. H. Binkley, chief engineer.

Mexico Santa Fe & Perry Traction Company, Mexico, Mo.—H. D. Ahlhandt, treasurer, writes that this company will build an electric railway from Mexico to Perry, Mo., 25 miles, via Molino and Santa Fe. Surveys have been completed and matters are being arranged so as to enable contracts for the entire road to be let within 30 days. S. L. Robinson of Mexico, president; C. O. Thon, Belleville, Ill., chief engineer.

New Orleans (La.) Railway & Light Company.—This company is making a number of important improvements and extensions to its city lines. Girder rails are being laid on Carondelet street, the tracks on Broadway are being moved from the side to the center of the street, five blocks of new track are to be built on Villere street, and the rails in Royal street will be replaced by girder rails.

New York Auburn & Lansing Railroad, Auburn, N. Y.—We are

advised that the type of soldered bond to be used on the 36 miles of third rail now being built by this company, from Auburn to Ithaca, N. Y., has not yet been decided.

Northern Texas Traction Company, Ft. Worth, Tex.—It is announced that the work of enlarging and double-tracking the bridge over the Trinity river in Dallas, Tex., will be completed by August 1.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—Vice-President Gurdon W. Wattles and General Manager W. A. Smith have announced to the Commercial Club of Council Bluffs that the extension to the Iowa School for the Deaf will be built this year and that construction will probably begin within a month, or as soon as the company finishes with the work on the city lines that must be done before the streets in question can be paved by the city.

Paris (Ill.) Traction Company.—It is announced that this company will extend its lines to Champaign, Ill., as soon as financial arrangements can be made. The road will pass through Chrisman, about 13 miles north of Paris, Edgar, Brocton, Hume, Metcalf and Ridge Farm. F. L. Kidder is president.

Philadelphia Valley Forge & Suburban Railroad.—This road, recently incorporated in Pennsylvania, is one of several electric lines forming the Valley Forge System of railroads, which, when completed, will be about 30 miles long. The Philadelphia Valley Forge & Suburban division will extend from Philadelphia to Fairview, about six miles. Edward W. Johnson, secretary, writes that this system will be a high-speed third-rail electric line, extending from Philadelphia to the borough of Phoenixville. It will pass through the village of Valley Forge and will be constructed entirely on private right of way, fenced in and without grade crossings. L. Knowles Perot, president; Edward W. Johnson, secretary and treasurer. Principal office, 2129 Land Title building, Philadelphia.

Pentwater, Mich.—A. Gifford of Pentwater is president of a company which proposes to build a line from Ludington to Grand Rapids, by way of Pentwater. The right of way is being cleared preparatory to commencing construction work.

Portland & Northern Railroad, Portland, Me.—William M. Sturges, general manager and chief engineer, Preble house, Portland, Me., writes that surveys for this company's third-rail line, which will extend from Portland to Bridgeton, Me., 40 miles, are completed from Portland to Raymond, 14 miles. The line will start at Morrill's Corners in Portland, and pass through Windham, Raymond, Casco and Naples to Bridgeton. Sturges & Co., Scranton, Pa., have the contracts for grading, etc. Contracts for power houses, cars, steel rails, electrical equipment, etc., are to be let. Howard Winslow, president, Portland; S. O. Hancock, vice-president, Casco; H. L. Forhan, treasurer; L. Barton, secretary; William M. Sturges, chief engineer and general manager, Portland, Me. All communications should be addressed to W. M. Sturges at Portland.

Rainier Electric Company, Portland, Ore.—This company has been organized to build an electric railway from Portland to Rainier, Ore. Capital stock, \$25,000. Alexander Sweet, Carleton Lewis and W. C. Morris are interested.

Rochester Syracuse & Eastern Railroad, Syracuse, N. Y.—The New York railroad commission has authorized an increase of the common stock from \$3,500,000 to \$6,000,000, which will make the total capital stock of the company \$8,500,000. The company proposes to build an electric railway from Rochester to Syracuse, N. Y. The first section, from Rochester to Lyons, 36 miles, has been in operation for several months and construction is now in progress from Rochester to Port Byron, 21 miles.

San Diego (Cal.) Electric Railway.—A franchise has been granted by the city council for the Point Loma line and the company is preparing to begin construction within a few days. The line, which will be owned by the Point Loma Electric Railway Company, but will be built and operated by the San Diego company, extends from Winder and India streets, San Diego, through Roseville, Carlson canyon and Point Loma to Ocean Beach.

San Francisco, Cal.—It is reported that Richard Hotaling, W. M. Rank and their associates have made a deal with a Baltimore syndicate by which an electric railroad system is to be built in Marin, Sonoma, Napa and Lake counties, with ferryboat connection with this city. The deal includes the purchase of the Petaluma & Santa Rosa Railway. The undertaking involves an expenditure of between \$10,000,000 and \$15,000,000. Hotaling, Rank and their associates already have a terminal on Richardson's bay, just across from Sausalito, and they have made surveys from it to San Rafael, thence to Novato and Napa, and thence to Lakeport. The proposed road will embrace an extension of the Petaluma line northward into the Healdsburg & Cloverdale country. Ultimately it will be extended into Lake county.

San Francisco Vallejo & Napa Valley Railway, Napa, Cal.—It is reported that 900 tons of rails and other material have arrived for the construction of the road from Napa to St. Helena, Cal., 11 miles. The present shipment of rails will be used on the section from Napa to Oakville, 12 miles, which has been graded. This company is a subsidiary of the Vallejo Benicia & Napa Valley Railroad, which now has a line in operation from Vallejo to Napa, 17 miles, organized to build the extension to St. Helena. C. H. Wallace, chief engineer.

Sand Mountain Electric Company, Albertville, Ala.—John L. Ray, president of the Albertville Realty Company, writes that this company proposes to build an electric railway from Scottsboro to Gadsden, Ala., 55 miles, via Gadsden, Alabama City, Attalla, Fenton, Boaz, Albertville, Short Creek and Langston. Contracts are

to be let for power plant, dams, flumes and transmission lines. E. O. McCord, president.

Southwest Missouri Railroad, Webb City, Mo.—The contract for the construction of the 650-foot steel-frame viaduct which this company will build over the junction of the Missouri Pacific and the St. Louis & San Francisco railroads for the use of its proposed interurban line, has been let to the Midland Bridge Company, Kansas City, Mo. The structure will be located about 2½ miles from Joplin and will rest upon concrete abutments. A. H. Rogers, president, Webb City, Mo.

St. Helens Public Service Company.—This company has filed suit against the state of Washington to appropriate a right of way for a flume and dam on the Toutle river to supply power for its proposed electric line from Portland through Cowlitz, Clarke and Skamania counties. Dr. H. W. Coe of Portland, Ore., is reported as interested in the company.

St. Louis Terre Haute & Quincy Traction Company.—E. E. Barclay of Springfield, Ill., secretary, and B. F. Darnell of St. Louis, Mo., right of way man, were in Quincy, Ill., recently in the interest of the company and expressed their intention of applying soon for a franchise to enter the city. The company proposes to build from Terre Haute, Ind., to St. Louis and Hannibal, Mo., but the present intention is to build from Terre Haute to Quincy, via Taylorville, and to extend the line later. Surveys are being made. Charles H. Lawrence is chief engineer.

Texas Traction Company, Dallas, Tex.—A contract has been let to the Southwestern Bridge Company for the erection of 12 bridges on the line between Dallas and Sherman, Tex.

Topeka (Kan.) & Southwestern Railway.—This company has purchased all the property of the Topeka Eskridge & Council Grove Railway, which proposed to build from Topeka to Council Grove, Kan., and will build the line. It is proposed to use Strang gasoline-electric motor cars. W. L. Taylor, president.

West Penn Railways, Pittsburg, Pa.—Construction work on this company's proposed extension from Footedale to Brownsville, Pa., 9½ miles, will be started in about two weeks and will be ready for laying the rails about November. The Crossan Construction Company, Philadelphia, has a contract for grading and masonry work.

Western Massachusetts Street Railway, Westfield, Mass.—Surveys have been completed for an extension from Huntington to Lee, Mass., to connect at Lee with the Berkshire Street Railway. H. C. Page, general manager, Springfield, Mass.

Winona Interurban Railway, Winona Lake, Ind.—It is stated that the Warsaw-Peru extension is to be completed by January 1. The route includes Mentone, Chili, Gilead and Akron, and is 44 miles long. The first 10 miles out of Peru has been in operation for some time and work is to begin at once at the Warsaw end on the construction of the remainder. The rails, ties and other material have been contracted for and much of the material is already on the ground. A double-track viaduct 80 feet long is to be built in Warsaw and the Pennsylvania tracks will be crossed overhead and the New York Chicago & St. Louis tracks by a subway. The final survey for the line from Warsaw to Ft. Wayne has been started. S. C. Dickey, general manager.

York County Traction Company, York, Pa.—Dodge & Day, engineers and constructors, Philadelphia, have commenced work on the extension from York to Hanover, Pa., about 20 miles. A large force of men is at work and rapid progress is being made.

POWER HOUSES AND SUBSTATIONS

Birmingham (Ala.) Railway Light & Power Company.—It is announced that this company has authorized a bond issue of \$35,000,000, a part of the proceeds of which will be used to erect a power house at a cost of \$1,500,000. Other extensive improvements will be made to the properties of this company.

British Columbia Electric Railway Company, Vancouver, B. C.—It is stated that this company has recently let contracts for the construction of a tunnel 400 feet long, 14 by 9 feet in area. The tunnel is to be driven through solid granite. A contract was also let for two 64-inch steel pipe lines, 1,200 feet long, and two wooden pipe lines, 800 feet long and 60 inches in diameter. A contract was let to the Pelton Water Wheel Company for a 10,000-horsepower impulse wheel and a contract was awarded to the Canadian General Electric Company for one 5,000-kilowatt generator, three 2,500-kilowatt step-up transformers, 2,000 to 20,000 volts; three 1,000-kilowatt step-down transformers, 20,000 to 2,000 volts. Contracts are to be let in about a week for a 150 by 40 foot granite extension to its power house at Lake Buntzen, also for the erection of a reinforced concrete transformer building, 75 by 35 feet.

Freeport (Ill.) Railway Light & Power Company.—It has been announced that this company will erect a new power house and improve its lighting and street railway service in the near future.

Illinois Traction Company, Champaign, Ill.—It is announced that this company is about to make extensive improvements to its generating plant at Bloomington, Ill., by the addition of a number of boilers and the erection of a new stack. It is stated that Stirling boilers will be installed.

Terre Haute Indianapolis & Eastern Traction Company.—This company is installing a boiler and steam turbine in its power house at Spring Lake, Ind. The latter is located on the old Indianapolis & Eastern line.

Personal Mention

Mr. C. F. Richardson has been appointed superintendent of the Lincoln (Ill.) Railway & Light Company, to succeed Acting Superintendent Thorp.

Mr. Daniel Franciscus has been appointed superintendent of the Carlisle & Mt. Holly Railway at Carlisle, Pa., succeeding Mr. C. Fallor, resigned.

Mr. J. Jordan, heretofore superintendent and park manager of the Cleveland Painesville & Eastern Railroad, Willoughby, O., has been appointed general manager.

Mr. William McGee of Pittsburg, Pa., has been elected president of the Cincinnati Toledo & Detroit Short Line Railway of Toledo, O., to succeed Mr. J. M. Morgan of Toledo, resigned.

Mr. Thomas Lowry, president of the Twin City Rapid Transit Company of Minneapolis, Minn., who has been in the southwest during the winter and spring, has returned to Minneapolis.

Mr. J. M. Bramlette, general superintendent of the Michigan United Railways Company, with headquarters at Lansing, Mich., has been appointed general manager of the company, as announced

J. M. Bramlette.

in last week's issue of the Electric Railway Review, to succeed Mr. James R. Elliott, who will, however, retain his position as vice-president. Mr. Bramlette has had a long experience with electric railway companies in various capacities. He was born in Louisville, Ky., October 24, 1861, and began his railway career in 1890 with the Sprague Electric Company of St. Louis at the time the Lindell Railway was being electrified. In the latter part of 1890 he entered the service of Thomson & Houston, who were engaged in the work of electrifying the lines of the Union Depot Railway Company, where he remained until February, 1891, when he accepted a position with the East St. Louis Railway at East St. Louis. He remained with this company 11 years, serving successively as master mechanic, claim agent and assistant superintendent. In 1902 he was appointed general manager of the St. Louis & Belleville Railway and the St. Louis Belleville & Suburban Railway, which operated two double-track electric lines between St. Louis and Belleville. Early in 1903 these roads, together with the city lines of the East St. Louis Electric Railway, the Mississippi Valley Transit Company and the Collinsville Caseyville & East St. Louis Electric Company were merged, and Mr. Bramlette was appointed general superintendent of the combined properties, now known as the East St. Louis & Suburban Company. In May, 1905, he was appointed general manager of the Philadelphia & Western Railroad at Philadelphia, Pa., where he remained one year, resigning in May, 1906, to become general superintendent of the Michigan United Railways Company's extensive interurban system, with entire charge of its city properties in Kalamazoo, Jackson and Lansing, and its interurban lines operating between Battle Creek and Kalamazoo, Battle Creek and Jackson and between Lansing and St. Johns—comprising in all about 200 miles of track. Mr. Bramlette's present appointment as general manager was effective on June 1.

Mr. Joseph D. Crafton has been appointed superintendent of the United Railways Company of St. Louis, Mo., succeeding Mr. James F. Davidson, resigned. Mr. Crafton has been heretofore chief clerk to Mr. Davidson.

Mr. R. L. Koehler of Wilkesbarre, Pa., has been appointed superintendent of the Northern Electric Street Railway of Scranton, Pa., and Mr. J. C. Meixell of Camden, N. J., has been appointed superintendent of transportation.

Mr. George S. Binkley, formerly chief engineer and construction manager of the Monterey (Mexico) Railway Light & Power Company, has been appointed manager of the Douglas Copper Company's mining properties at Sonora, Mexico.

Mr. Samuel B. McLenegan, heretofore superintendent of the Los Angeles (Cal.) Interurban Railway and the Pacific Electric Railway, has been appointed to a similar position with the Central California Traction Company, Stockton, Cal.

We are officially advised by Mr. A. R. Moore, president and manager of the Escanaba (Mich.) Electric Street Railway, that no successor has been appointed in place of Mr. A. L. Gillette, who recently resigned as superintendent and electrical engineer to accept a similar position with the Sterling Dixon & Eastern Electric Railway, Sterling, Ill. The office of superintendent has been abolished and the office of general inspector and storekeeper has

been created, to which position Mr. D. P. McRae, formerly conductor, has been promoted.

Mr. L. H. Kidder, who has heretofore been connected with the Westinghouse Electric & Manufacturing Company, has been appointed superintendent of motive power of the Pittsburg & Butler Street Railway of Pittsburg, Pa., and the Butler Passenger Railway of Butler, Pa.

Mr. G. J. Anderson, for the past eight years assistant to General Manager P. F. Sullivan of the Massachusetts Electric Companies, has resigned to become associated with the Electric Bond & Share Company, New York City. Mr. Anderson will be secretary to the vice-president of the company.

Mr. F. J. Stout, general manager of the Lake Shore Electric Railway, Norwalk, O., has been appointed a member of the "Standardization" committee of the Central Electric Railway Association, in place of Mr. R. C. Taylor, who has been appointed chairman, to succeed Mr. W. H. Evans, resigned.

Mr. Samuel McRoberts, treasurer of Armour & Co., Chicago, has been elected president of the Illinois Tunnel Company, which operates the Chicago subway, to succeed Mr. Albert G. Wheeler, resigned. Mr. W. J. C. Kenyon, who also represents Armour interests, has been elected general manager of the company.

Mr. George R. Sheldon of New York has been elected president of the Philadelphia & Western Railway Company, which has been formed as a reorganization of the Philadelphia & Western Railroad. The other officers elected are: Vice-president, Thomas Newhall; secretary and treasurer, Davies Murdoch.

Mr. Henry W. Frund, heretofore for many years manager and director of the Vincennes (Ind.) Light & Power Company, has been appointed manager of the Salisbury & Spencer Railway of Salisbury, N. C., in charge of the electric railway between Salisbury and Spencer, and the gas and electric properties in those towns.

Mr. J. H. Brennan, superintendent of the Sidney division of the New South Wales Government Tramways, Sidney, Australia, in company with Mr. John Mitchell of Auckland, New Zealand, is making an exhaustive study of the prominent electric railway systems of the United States, with especial regard to their methods of reinforced concrete construction.

Mr. Wesley Wentworth, for the past year and a half general superintendent of the Houston Electric Company at Houston, Tex., has resigned, effective at once, to devote his attention to business matters in the east. Mr. Uriah Foss, whose title will be superintendent of transportation, has been appointed to succeed Mr. Wentworth. Mr. Foss formerly held a similar position with the Connecticut Railway & Lighting Company at New Britain, Conn.

Mr. L. F. Loree, whose portrait is presented herewith, was on June 1 elected president of the United Traction Company of Albany, N. Y., and the Hudson Valley Railway of Glens Falls, N. Y., to succeed the late David Willcox, as previously reported in the Electric Railway Review. Mr. Loree was born at Fulton City, Ill., on April 23, 1858, and entered railway service in 1877 as assistant in the engineering corps of the Pennsylvania Railroad. He remained with the Pennsylvania for two years and was for a time connected with the engineering departments of the United States army and of the Mexican National Railway. He then returned to the Pennsylvania Railroad and held various positions in the engineering and operating departments. From January 15, 1896, to January 1, 1901, he was general manager of the Pennsylvania Lines West of Pittsburg, and from January 1 to June 1, 1901, fourth vice-president of the same lines. From June 1, 1901, to January 1, 1904, he was president of the Baltimore & Ohio Railroad, and from January 1 to October 4, 1904, he was president of the Rock Island Company of New Jersey. He was elected to the presidency of the Delaware & Hudson Company following the resignation of David Willcox, in April of this year. Mr. Loree's headquarters are in New York City.

L. F. Loree.

Obituary.

Charles K. Stearns, who has been assistant engineer in the electrical department of the Nantasket branch of the New York New Haven & Hartford Railroad, died recently. He was about 44 years of age and was a graduate of the Massachusetts Institute of Technology. He also was a member of the American Institute of Electrical Engineers and of the American Society of Mechanical Engineers and for some time past has acted as consulting engineer for a number of street railways.

Financial News

American Railways Company, Philadelphia.—An issue of \$2,500,000 of 5 per cent bonds has been sold to Bioren & Co., E. C. Miller & Co. and Newburger, Henderson & Loeb of Philadelphia. The bonds are dated April 1, 1907, and will mature on April 1, 1917, but are subject to call at 102 at any interest period. They are secured by a deposit of \$1,475,000 out of a total of \$1,500,000 stock of the Altoona & Logan Valley Electric Railway, Altoona, Pa., and \$1,975,000 out of a total of \$2,000,000 stock of the Scranton (Pa.) Railway.

Birmingham (Ala.) Railway Light & Power Company.—Stockholders authorized on June 8 a bond issue of \$35,000,000. This issue will be used to refund outstanding bonds and to provide for extensions and improvements.

Chicago Electric Traction Company.—A decree of foreclosure and sale was entered in the United States circuit court at Chicago on June 11. The upset price is \$300,000. The road operates 30 miles of track from Sixty-third street and South Park avenue, Chicago, to Morgan Park, Blue Island, West Harvey and Harvey. It has been in the hands of a receiver since June 13, 1900.

Chicago Subway Company.—J. Ogden Armour and interests affiliated with him are now in control of this company. Samuel McRoberts, treasurer of Armour & Co., has been made president of the Illinois Tunnel Company, the operating company, succeeding Albert G. Wheeler. Mr. McRoberts was also elected a director to succeed P. A. Valentine, and Mr. Armour was made a member of the board. W. J. C. Kenyon, vice-president and general manager of the union stockyards, Omaha, was elected general manager of the tunnel company. An active campaign for development of the property will be undertaken.

Metropolitan Street Railway, Kansas City.—Gross earnings for the six months ended May 31 were \$3,943,639.

Northwestern Elevated Railroad, Chicago.—It is expected that a block of first mortgage 4 per cent bonds will be sold in order to complete the payment for construction of the Ravenswood extension.

Oneida (N. Y.) Railway.—Notice is given that stockholders of this company will vote on June 22 on a recommendation to increase the capital stock from \$15,000 to \$2,000,000. The company has electrified and will operate a third-rail line between Syracuse and Utica, N. Y.

Philadelphia & Easton Railway, Doylestown, Pa.—The property of this company was purchased at foreclosure sale at Doylestown on May 31, for \$100,000, by Carroll R. Williams of Philadelphia, on behalf of the bondholders' committee.

Philadelphia & Western Railway.—This company has been organized as successor of the Philadelphia & Western Railroad, which was foreclosed recently. An issue of \$20,000,000 bonds will be authorized, of which \$4,000,000 will be outstanding and \$16,000,000 will be reserved for permanent improvements and extensions. There will be \$600,000 preferred stock and \$3,400,000 common stock. The directors are: George R. Sheldon, Randolph Rodman, James H. Brewster, Jr., Thomas Newhall, William H. Sims, W. Robinson Molinar and Joseph S. Clark. The officers are: President, George R. Sheldon; vice-president, Thomas Newhall; secretary and treasurer, Davies Murdoch.

Sheboygan Heat Light & Traction Company.—The property of this company has been merged with the Milwaukee Northern Railway, which is under construction.

Trenton Lakewood & Atlantic Railway, Trenton, N. J.—John M. Dickinson was appointed receiver of this property at Trenton, N. J., on June 5, in the suit instituted by Peter Schlicher.

Whatcom County Railway & Light Company, Bellingham, Wash.—This company has canceled the \$300,000 authorized issue of preferred stock, of which \$220,000 was outstanding. The \$750,000 outstanding common stock remains unchanged.

York County Traction Company, York, Pa.—This company has acquired \$1,087,000 of its 5 per cent bonds out of a total of \$1,213,000 outstanding. The remaining \$126,000 will be called at 110 and interest. It is reported that the payment of these bonds is preliminary to the organization of a holding company and the creation of a new mortgage.

Dividends Declared.

- Boston Suburban Electric Companies, preferred, quarterly, 75 cents.
- Continental Passenger Railway, Philadelphia, 6 per cent.
- Interborough-Metropolitan Company, preferred, quarterly, 1 1/4 per cent.
- Interborough Rapid Transit Company, quarterly, 2 1/4 per cent.
- Lynchburg (Va.) Traction & Light Company, 1 1/2 per cent.
- Mhattan Railway, New York, quarterly, 1 3/4 per cent.
- Maryland Electric Railways, Baltimore, 2 per cent.
- Portland (Ore.) Railway Light & Power Company, preferred, quarterly, 1 1/4 per cent.
- Puget Sound Electric Railway, Tacoma, Wash., preferred, 3 per cent.
- Roanoke (Va.) Railway & Electric Company, 3 per cent.
- Union Traction Company, Philadelphia, 2 1/2 per cent.
- United Traction & Electric Company, Providence, quarterly, 1 1/4 per cent.

Manufactures and Supplies

ROLLING STOCK.

Interstate Railways Company, Philadelphia, Pa., is reported to be in the market for 25 double-truck cars.

Rio de Janeiro Tramways Company, Rio de Janeiro, Brazil, S. A., has placed an order for one double-truck car.

Wetzel & Tyler Railroad Company, New Martinsville, W. Va., is in the market for two second-hand cars, ready for service.

British Columbia Electric Railway Company, Limited, Vancouver, B. C., expects to build 15 city cars, 6 large interurban cars and 3 shunters.

Toledo Port Clinton & Lakeside Railway, Toledo, O., has ordered five 36-foot flat cars of 50,000 pounds capacity from the Hicks Locomotive & Car Works.

Bayou Teche Railway Company, New Orleans, La., under construction, is in the market for 12 to 14 double-truck cars. F. A. C. Perrine, president, 60 Wall street, New York, N. Y.

Texas Traction Company, Dallas, Tex., has ordered 25 cars from the St. Louis Car Company, in addition to the 15 interurban cars reported in the Electric Railway Review of May 11.

East Shore & Suburban Railway, Richmond, Cal., has ordered two double-truck cars from the St. Louis Car Company, and, it is reported, will be in the market for a few more in the near future.

Cedar Rapids & Iowa City Railway & Light Company, Cedar Rapids, Ia., is figuring on 25 stock cars, 5 box cars and 5 flat cars. These are for steam railway service and will be of 60,000 pounds capacity.

Dimitri Lichatschiff, machinery agent, Odessa, Russia, is asking prices on double-truck cars for electric service. The cars must provide for first and second class below and for third class above and be of the latest type and construction.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y., the operation of which will begin early in the year of 1908, has placed an order with the Cincinnati Car Company for twenty-five 60-foot interurban passenger coaches. Joseph B. Mayer is president and J. C. Calisch is general manager.

Public Service Corporation of New Jersey, Newark, N. J., as reported in the Electric Railway Review of May 18, has placed an order with the Cincinnati Car Company for 200 large semi-convertible double-truck cars. The delivery of these cars is to begin on October 1, 1907, and extend into the first six months of 1908.

Whatcom County Railway & Light Company, Bellingham, Wash., as reported in the Electric Railway Review of June 1, has placed an order with the Jewett Car Company for two single-truck cars for June, 1907, delivery, and with its own shops for one double-truck express car for August delivery, and one locomotive for July delivery. The specifications call for the following details:

Passenger Cars.

Utah Light & Railway Company, Salt Lake City, Utah, is in the market for 62 double-truck cars. In the Electric Railway Review of March 16 this company was reported as contemplating the purchase of 50 double-truck cars for city service.

Mexico Santa Fe & Perry Traction Company, mentioned in the Electric Railway Review of June 8 as being in the market for new cars, should have had Mexico, Mo., for the address of Mr.

S. L. Robison, president and general manager, instead of Mexico, Mex.

Houston Electric Company, Houston, Tex., as reported in the Electric Railway Review of May 18, has ordered 10 semi-convertible passenger cars from the St. Louis Car Company for October delivery. The cars are to measure 28 feet long, 8 feet 9 inches wide, and 9 feet 6 inches high, inside measurements.

SHOPS AND BUILDINGS.

British Columbia Electric Railway, Vancouver, B. C.—This company is building an addition, 68 by 400 feet, to its car house at Vancouver.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—It is reported that the board of public works of Michigan City, Ind., has approved the plans for a terminal station.

Evansville (Ind.) & Eastern Electric Railway.—Ground was broken last week for a new car house at Hatfield, Ind.

Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich.—At a recent meeting of the directors it was decided to rebuild at once the car sheds at Muskegon that were burned last spring.

Indiana Columbus & Eastern Traction Company, Columbus, O.—This company and the Columbus Delaware & Marion Railway of Columbus, O., have leased property in the rear of the present interurban station on West Gay street, Columbus, for erecting additional freight station facilities.

Pacific Electric Railway, Los Angeles, Cal.—It is announced that as soon as the work of double-tracking this company's line from Arcadia to Monrovia is completed, construction work on its proposed new waiting station at Monrovia will be started. The building probably will be ready for occupancy about November 1 next.

Portland (Ore.) Railway Light & Power Company.—Architects and engineers are now engaged in perfecting the plans for the new 7-story central station and office building, to be erected on the block bounded by First, Second, Pine and Ash streets, and it is expected that the work of tearing down the present buildings occupying the site will be started within 90 days.

Scranton (Pa.) Railway.—President J. J. Sullivan has announced that work will begin shortly on the new car house and shops that are to be built on a site that was secured some time ago.

Springfield (Ill.) Consolidated Railway.—Construction has been started on the new car house just south of Iles Park, Springfield, and it is expected to complete it by fall. The building will be of brick and concrete construction and will be 216 by 120 feet, to accommodate 45 cars. The building will be fireproof, and it is estimated will cost about \$45,000.

Warren (Pa.) Street Railway.—This company is reported to have decided to build a new car house at Warren, to replace the one that was destroyed by fire last year.

TRADE NOTES.

Browning Engineering Company, Cleveland, O., has increased its capital stock from \$500,000 to \$850,000.

Allis-Chalmers Company, Milwaukee, Wis., announces the removal of its office in Seattle, Wash., to 115 Jackson street, where G. W. Pulver, district manager, is in charge.

Otto E. Faich, Jr., who has been chief engineer of the Pacific coast department of the Otis Elevator Company, has opened offices at 850-852 Monadnock building, San Francisco, Cal., as consulting, electrical and mechanical engineer.

Carl A. Strom, formerly with the Bucyrus Company, South Milwaukee, Wis., has been appointed mechanical engineer of the steam shovel and dredge department of the American Locomotive Company, with headquarters at Richmond, Va.

W. H. Cowell has been elected secretary and treasurer of the Wellman-Seaver-Morgan Company, Cleveland, succeeding A. D. Hatfield, resigned. Mr. Cowell is from Sault Ste. Marie, where he was formerly associated with W. M. Sawyer, president of the Wellman-Seaver-Morgan Company.

Ridgway Dynamo & Engine Company, Ridgway, Pa., has reorganized its sales department. H. A. Otterson, heretofore assistant superintendent, is now sales manager, with R. C. Eccleston as assistant. This department will control all the agencies and advertising of the company.

Anguera Lumber Company, Chicago, whose business heretofore has been almost exclusively the furnishing of building material to steam railways, is now specializing on lumber for street railways and interurban lines. The company has offices in Seattle, Wash., Hattiesburg, Miss., and Poplar Bluff, Ind.

Joseph Dixon Crucible Company, Jersey City, N. J., on May 31 held a special meeting of its directors to take action on the death of John A. Walker, vice-president and treasurer of the company. George T. Smith was elected vice-president; George E. Long, treasurer; and Harry Dailey a director and secretary.

B. F. Sturtevant Company, Boston, Mass., advises that the Boston Elevated Railway Company, Lincoln power station, Boston, and the Wood Worsted Mills, Lawrence, Mass., have recently placed repeat orders with them for new metal-to-metal fuel

economizers, a special form having been furnished in the case of the Boston Elevated Railway Company to meet that company's particular requirements.

C. C. Chappelle, who for the last two years has represented the Westinghouse Machine Company in Denver, on May 1 assumed the position of western sales manager, with general charge of the company's business in Chicago and all the territory west.

American Car & Foundry Company, St. Louis, Mo., on June 12, it is reported, placed a contract for the construction at Gary, Ind., of the largest plant in the United States devoted to the manufacture of steel passenger and freight cars. It is stated the plant will occupy a site of 170 acres and will have a capacity of 125 to 150 cars a day.

Thomas H. Simpson has been elected president of the Michigan Malleable Iron Company, Detroit, to succeed the late William C. McMillan. Mr. Simpson, who has been treasurer and general manager of the company, still retains the duties of treasurer. Philip H. McMillan continues as vice-president and George M. Black as secretary.

Johnson-Kennedy Electric Company, Cincinnati, O., has been organized by Claude Johnson, who has been connected with the Creaghead Engineering Company for the past 10 years. The new company is capitalized at \$10,000 and has quarters at 244 East Fifth street, where it will conduct a general electric supply business. J. M. Kennedy, president and treasurer; Claude Johnson, vice-president and general manager.

Central Inspection Bureau, New York City, maintains an organization for consultation, tests and inspection in the matter of railway, bridge and builders' equipment, iron, steel and lumber. The general offices are located at 17 State street, New York, and branch offices are maintained at Philadelphia, Detroit, Macon, Ga., and Middletown, Pa. The officers are: H. A. Clark, president; John E. Cobang, vice-president and treasurer; and T. C. Ashenfelter, secretary.

Arnold Company, Chicago, has added to its engineering staff J. E. Moore, who for the past five years has been electrical engineer for the city of Davenport, Ia. After graduating from Purdue University Mr. Moore became connected with the Sprague Electric Company, where he was engaged in electric railway installation and operation. Later he entered Princeton University, doing advanced work in electrical engineering, and in 1899 received the honorary degree of doctor of science.

Conley Frog & Switch Company, Memphis, Tenn., incorporated in March with \$200,000 capital stock, has purchased three acres of land, on which to erect a steel and concrete building, 70 by 200 feet. It will be equipped with pneumatic tools for the manufacture of crosses, switches, switchstands, rail braces, etc. The plant will be operated by electricity and will probably be completed by August 1. J. E. Conley, president; B. S. Randle, vice-president; Frank J. Callahan, secretary-treasurer.

R. E. Coleman has been appointed assistant superintendent of the American Brake Shoe & Foundry Company, with jurisdiction over all its works. His headquarters will be at Mahwah, N. J. Mr. Coleman has been superintendent of the company's East Buffalo (N. Y.) plant. He came to Buffalo from Chicago about 10 years ago to take charge of the Depew works of the Union Car Company and has been with the American Brake Shoe company several years. Nathaniel McAfee succeeds Mr. Coleman as superintendent at East Buffalo.

Arthur O. Einstein, until recently sales manager for the Chicago branch of the Manhattan Electrical Supply Company, has opened an office and storeroom as electrical manufacturers' agent at 103 West Adams street, Chicago, where he will carry in stock the goods of manufacturers represented by him. He at present represents the Trio Manufacturing Company of Rock Island, Ill., which manufactures knife switches and inclosed fuses, and other lines will be added by him as fast as possible. Mr. Einstein has had 12 years' experience as traveling salesman through the central states and has a large circle of acquaintances.

Yale & Towne Manufacturing Company, New York City, exhibited at the conventions of the Master Car Builders' and Master Mechanics' associations, now being held at Atlantic City, the following: Portable electric hoists equipped with graduated speed controllers for careful handling of material and close adjustment of parts, when assembling or placing in machines; 20-ton triplex chain block, enabling one man to lift a 20-ton load; 1-ton triplex, duplex and differential chain block in operation under service conditions; quick speed chain blocks for rapid handling of light loads; overhead I-beam trolleys for use with hand and electric hoists; crane models and photographs of installations. The representatives of the company in attendance at the conventions are: F. A. Hall, E. J. Ford, H. E. Dickerman, William Hazleton, R. T. Hodgkins and C. W. Beaver.

Ohio Brass Company, Mansfield, O., announces that manufacturers of overhead line material have recently made an arrangement with the manufacturers of bare copper wire to adopt a standard cross section for grooved wire, which will be known as the American standard grooved wire. This arrangement is to go into effect in the near future. The advantages of such an arrangement are obvious. Heretofore, wire manufacturers have all held to different shapes of cross section for grooved wires, making it impossible for the manufacturers of line material to design standard types of ears and clamps to exactly fit the various shapes of grooved wire. Under the new regulation it will be possible to standardize these devices to fit accurately the American standard grooved wire. While wire manufacturers will be able to furnish the shapes of wire hitherto made, the American standard

grooved wire will be furnished unless other sections are specifically ordered. The Ohio Brass Company further announces that it will furnish clamps and ears designed for the American standard, unless otherwise specified.

Dodge & Day, engineers, Philadelphia, Pa., have opened a branch office in the United States Realty building, 111 Broadway, New York, N. Y., in charge of Robert T. Lozier, who has for a number of years been associated with electrical industries.

Wesco Supply Company, St. Louis, Mo., has opened a new branch office at Birmingham, Ala., in charge of W. W. Moore, who is an electrical engineer and has for several years managed the apparatus department of the company, with headquarters in St. Louis.

ADVERTISING LITERATURE.

The **Yale & Towne Manufacturing Company**, 9 Murray Street, New York.—A novelette just issued, entitled "The Ghost and the Burglar," emphasizes the efficacy of the renowned Yale lock.

Electric Service Supplies Company, Philadelphia, Pa.—A leaflet describes a specially designed truss pin, made of malleable iron, japanned or galvanized as desired, manufactured by this company for high-tension and feeder work.

Allis-Chalmers Company, Milwaukee, Wis.—Leaflet No. 2031 A contains illustrations of the American Blower Company's self-oiling engine, type E, double cylinder, direct connected to electric generator, built by the Allis-Chalmers Company.

Goldschmidt-Thermit Company, New York.—An interesting pamphlet has just been made public by this company regarding fire brick molds for welding locomotive frames by the Thermit process and contains much valuable data regarding welding, presenting also several excellent illustrations from photographs.

Green Fuel Economizer Company, Matteawan, N. Y.—This company has just issued a 16-page pamphlet discussing the philosophy of artificial drying of brick and tile and other ceramic products, in general and specifically, by means of the Green three-quarter housing bottom horizontal discharge fan. The pamphlet will repay study by those who are interested.

Buckeye Engine Company, Salem, O.—The Buckeye electric blue-printing machine manufactured by this company is the subject of an interesting pamphlet entitled "The A B C of Blue Printing." The pamphlet is gotten up in a manner calculated to hold the reader's attention throughout and contains a long, yet partial, list of users of the Buckeye electric blue-printing machine.

Chicago Pneumatic Tool Company, Chicago, Ill.—A catalogue of Chicago giant rock drills and kindred appliances has just been issued and is now being mailed. The book gives a complete description of the various appliances, which are illustrated by half-tone engravings. A portion of the catalogue is devoted to rock drills and an interesting description of the method of lubrication used in the Chicago giant is also presented. Several pages are devoted to Franklin motor compressors.

Knecht Bros. Company, Cincinnati, O.—A very neat pamphlet has just been received describing the Knecht friction sensitive drill for drilling holes up to 9-16 inch. The machine has a number of unique features and it is claimed that "more holes for less money" are made than by any other similar machine. The pamphlet describes the entire apparatus and equipment in detail, together with specifications. A motor drive manufactured by this company for running the drill, which it is prepared to furnish when required, is also described.

Union Electric Company, Pittsburg Terminal Warehouses, Third and Carson Streets, S. S., Pittsburg, Pa.—Following the merger of this company and the General Railway Supply Company, announcement of which was contained in a previous issue, the first edition of the company's general catalogue, comprising 400 pages, makes its appearance. It is a complete up-to-date reference book of standard electrical supplies for power, lighting, telephone, railway and marine use, confining the selection to the best grades and eliminating duplication wherever possible. The catalogue is copiously illustrated and contains full price lists regarding all of the electrical supplies handled by the company.

Westinghouse Machine Company, East Pittsburg, Pa.—The storage battery department of this company has developed in a vast degree within recent years. From the beginning this company has been an advocate of the pure lead plate formed by the electrolytic or "Planté" process for both positive and negative. The Westinghouse positive plate has shown from the start a remarkably long life. The early Westinghouse negative exhibited the usual tendency toward shrinkage in capacity, but after years of study and experimentation this fault has been overcome and the present negative plate, in addition to indefinitely long life, has the very desirable function of maintaining its initial and rated capacity and is practically indestructible under normal conditions of battery service, and even when in use under the most abusive electrical conditions. The Westinghouse positive and negative plates are made of purest lead, without tin, antimony or other alloy, the grid having the density of rolled lead. The active material is formed from the lead itself by the "Planté" process with sulphuric acid electrolyte. The entire subject of the Westinghouse storage batteries is covered in a most thorough manner in the handsome pamphlet just issued by this company, which contains also illustrations of the various types of storage batteries manufactured by the Westinghouse Machine Company, as also data and illustrations regarding the Westinghouse hoosters, regulators and switchboards and the Westinghouse portable batteries.

PEROLIN—A DUSTLESS SWEEPING COMPOUND.

Announcement has just been made of recently completed arrangements by which the H. W. Johns-Manville Company, the well-known asbestos firm, with branches in all the leading cities, has acquired the exclusive sales agency for Perolin throughout the United States. Perolin is a remarkable product that is said to solve the important problem of preventing the dust and dirt nuisance in public buildings, stores, factories, schools and homes.

Dustless Sweeping Compound.

In the past various indifferent and unsatisfactory methods have been devised for this purpose. The most common method is to use sawdust, sand or salt mixed with crude oil or kerosene. All of these are ineffective, most of them are highly combustible, and, instead of cleaning the floors, leave them in an unsatisfactory condition. Wet sawdust to a certain extent allays the dust, but it leaves the floor muddy. Oily compounds assist in laying dust, but leave the floors, carpets and rugs soiled. Oiled floors are condemned by the Fire Insurance Underwriters' Association because of the added fire hazard.

Perolin is an ideal fireproof floor cleaning compound because, instead of laying the dust, it absorbs it. It draws the dust from cracks and crevices in the floors and from carpets and rugs. It is a powerful disinfectant, destroying the disease germs that are common with dust; leaving the air pure and wholesome, and the floor absolutely clean.

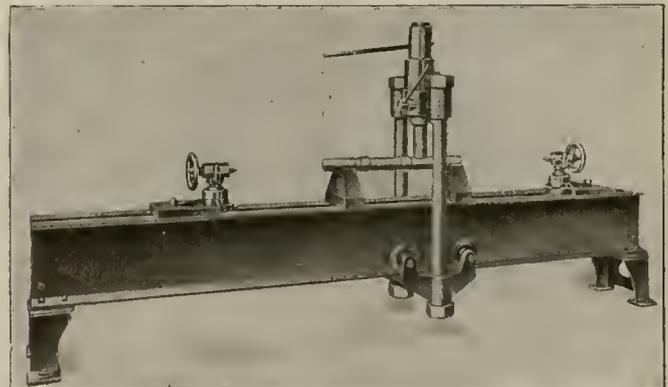

Sixty-five per cent of all diseases are said to be caused by dust infection. A test was recently made in one of the Chicago hospitals, to ascertain the number of living germs floating in the air, before and after ordinary sweeping, and then after sweeping with Perolin. Before sweeping the room it was found that 96 bacteria settled on a plate in four minutes. Immediately after sweeping a similar test showed over 3,000 bacteria. A test was then made by thoroughly sweeping the room with Perolin, and only 45 bacteria were found on the plate.

This compound will not only absorb the dust caused by sweeping, but it will also clean, brighten and preserve carpets, rugs and floorings, and save curtains, tapestries, pictures and furniture from becoming soiled and discolored.

Perolin was invented over 50 years ago by a German chemist. It has long been a standard article throughout Germany, and its success there led to its introduction into the United States. This success is reported to have led to a number of imitations, which, however, lack the peculiar characteristics of the genuine article.

AN IMPROVED AXLE STRAIGHTENER.

Bent car axles and motor axles are frequent causes of annoyance and expense. Bent axles carrying pinions demand immediate attention, as the life of the gears is not only seriously impaired by running for even a few hours with a bent axle, but there is also great danger that the motor shaft will be broken or at least seriously sprung. Considerable expense is involved in renewing or straightening axles by ordinary means. Though they can be

Columbia Axle Straightener.

straightened in an indifferent manner by home-made screw-power presses, the results are in general very unsatisfactory, as it is not easily possible to get a sufficiently great force to take out a short kink in a heavy shaft; and further, in most cases considerable risk of permanent damage is involved in straightening the shaft.

Realizing the large field of usefulness for a simple and efficient axle straightener of moderate cost, the Columbia Machine Works & Malleable Iron Company, Atlantic avenue and Chestnut street, Brooklyn, New York, has introduced the Columbia axle straightener, a general view of which is shown in the accompanying illustration.

This axle straightener has incorporated in it many important improvements over similar devices of the past. Several unique and very desirable features have been used in its construction. As will

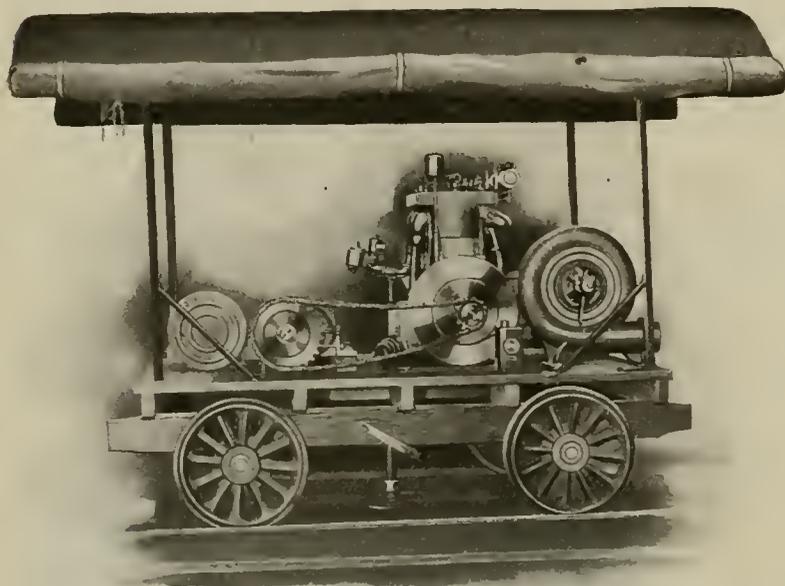

be noted, it consists of a heavy bedplate of double I-beam section, upon which are mounted two center heads for holding and testing the shaft. These center heads are of unique design in that they are provided with springs inside of them, which take up the pressure at the ends of the shaft and thus avoid the necessity of removing them from the shaft centers while the axle is being straightened. This point is of great value, as it often happens that a mechanic operating an ordinary straightener will neglect to remove the heads, which, without this spring arrangement, means that the centers will be bent or broken. The improvement will therefore be appreciated. Two blocks are mounted on top of the bedplate so that they can easily be moved to any desired point and serve as the fulcrums of the shaft when straightening it.

The straightening force is applied by means of a hydraulic plunger controlled by a small hand-operated pump, which gives the operator perfect control over the force applied and the distance through which it is applied, making it possible to perfectly straighten shafts, no matter how badly they may be bent. An improvement which will also be appreciated is the provision which has been made for rapidly moving the plunger back and forth when running free. For this purpose a short lever is provided, which works in a rack on the plunger, permitting the height to be rapidly adjusted with a minimum amount of manual labor. The height can be adjusted for any size axle or gear up to 28 inches in diameter. The straightening plunger and frame, when not in use, are supported on four wheels resting on the lower flanges of the bedplate. This permits the straightening jack to be easily moved from one end of the bedplate to the other.

WELDED RAIL BONDS.

In the construction and maintenance of tracks for electric railways there is hardly any subject of greater importance than that of the joining of rails so that the electric current may have a free and unobstructed return path to the power house. The proper installation of a copper bond, with the necessary cross section to satisfactorily carry the return current is the first step toward the economical transmission of power for the operation of electric cars.

During the past few years many improvements have been made in the types of bonds that are commonly used until now they have reached a stage of perfection which makes them capable of withstanding the strains and vibrations to which they may be subjected. And yet many of the bonds now in use have proved short-lived because of the failure to provide a method for making a proper connection between the heads of the bonds and the steel rails. This connection should be strong mechanically, as well as elec-

Copper Welded Rail Bonds—Power Car.

trically, and if this is accomplished the ideal condition for safe and economical operation of cars will be obtained.

The Electric Railway Improvement Company, 6005 Carnegie avenue, Cleveland, O., claims to have succeeded in bringing about this ideal condition through the use of its electric brazed and its copper welded bonds. When these bonds are installed properly the temperature of both the copper bond and the steel rail are raised to a point where a perfect molecular union, or weld, is made. This is done by electric brazing, whereby an alloy inserted between the copper and the steel is brought up to a requisite heat by the employment of current from the trolley wire, or by the use of molten copper. The latter is known as the "copper welding" process.

The bonds furnished by this company can be made in any desirable size and type for use on the flange, ball or web of a rail.

The apparatus used in installing bonds on railways where current can be supplied consists of a small car with steel wheels, wooden platform and a canopy top. The equipment consists of a 15-kilowatt rotary converter, a step-down transformer, switches,

controller and other essentials for safe and convenient operation. The rotary, provided with a clutch and a chain drive, is used as a motor for the propulsion of the car. Bonding clamps, used in the electric brazing process, are attached to either side of the car in such a way that they may be brought quickly into position for work. A small melting furnace is provided at the rear of the car for use in connecting cross bonds. A screw jack located under the car makes it possible to turn and run the car from the track without delay.

In the copper-welding process two small cars equipped with

Copper Welded Rail Bonds—Furnace Car.

a portable copper-welding plant are provided. These, as shown in the illustrations herewith presented, are known as the power car and the furnace car. The power car carries a gasoline engine, a fan blower, which supplies the forced draft for the furnaces, and a 2-horsepower motor, which supplies current for the rail grinder. The engine is connected to the car axle by a clutch and chain drive and is used in propelling the car. Where electric current is available the gasoline engine can be replaced by a motor.

The furnace car is equipped with six melting furnaces, a sheet steel fuel bin and storage bins for bonds, molds, etc. The molds used in the welding of bonds are of a graphite mixture and vary in size, according to the section of the bond and rail to be used.

The Electric Railway Improvement Company now has a large number of cars in use in applying bonds on new railways and a number in rebonding city and interurban lines that have been in operation for several years. The cost of applying bonds, either by the brazing or the welding process, is said to be cheaper and the bonds more durable than by any other process known. If desired such cars can be leased for a long term of years.

AUTOMATIC TROLLEY GUARD.

One of the most frequent causes for accidents at crowded steam railway crossings is the stopping of a car on the railroad tracks, owing to the trolley wheel having jumped off the wire, while the conductor is ahead giving the signal for the motorman to proceed. Another source of danger, delay and expense is caused by the trolley jumping off when passing through subways, resulting in broken poles and wheels. Various schemes have been devised from time to time to obviate these difficulties. None of these has been entirely successful. Some crude devices consisted of wire nets stretched above the trolley wire and connected to it. These would keep the current on the car when the wheel left the wire, but did not prevent the wheel from striking the guy wires and possibly breaking the pole, or possibly losing the wheel after leaving the guard. Further, these home-made devices as a rule were not entirely reliable, as the wheel often missed

the protective netting and the car consequently would be left helpless.

These difficulties have been carefully considered and eliminated in the automatic trolley guard, manufactured by the Automatic Trolley Guard Company, 391-393 Ellicott square, Buffalo, N. Y. This guard consists of aluminum-coated steel sheets, made in strips eight feet long and bent by machinery into the form shown in the accompanying engraving. The strips are rigidly supported by hangers placed every four feet. These hangers are made of galvanized T-iron, bent to the proper shape. One side of each is cut and turned in to support the metal sides or strips which are riveted to it. The two sheets forming the guard project up to force the wheel on the wire, but leave the top entirely open for locomotive exhaust. The trolley is rigidly centered by special clamps bolting to the top of the T-iron hanger, as shown.

The separate sections of the guard are firmly fixed together by overlapping about 2½ inches and passing rivets through the sides and hanger, thus making the sections substantially one

piece. This construction makes the guard rigid for its entire length and thus obviates any difficulties that might be experienced from more flexible construction. The guard being made of solid metal affords constant contact. This eliminates any objections that might be experienced with lighter construction through the arcing severing the strands so that they would loosen, thus weakening the entire construction, and perhaps becoming entangled with the trolley pole.

The unique and special feature of this guard which, other than its strong construction, commends it to use is the form of the protection. By reference to the illustration it will be noted

Latest Design of Automatic Trolley Guard.

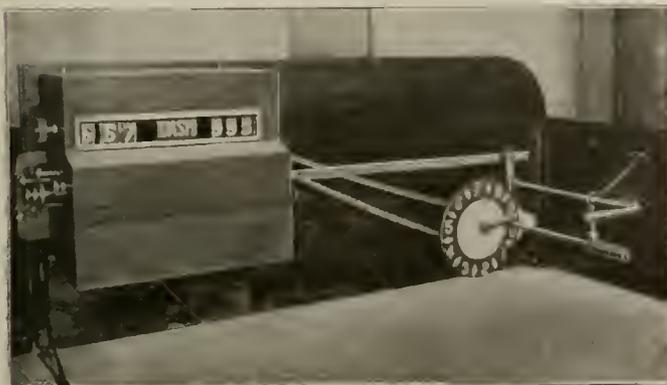

that should the trolley wheel jump the wire it will immediately make contact with the guard sides, and by reason of the form of these immediately be replaced on the wire. Thus the guard not only at all times maintains contact between the overhead wire and wheel, but it also acts as a retriever in reseating the wheel on the wire. There are many locations where these guards are of special advantage, such as railroad crossings, curves and power houses.

MOORE FARE REGISTER.

A fare register embodying in its design entirely new features has recently been patented by Otto N. Moore, 5650 East Washington street, Indianapolis, Ind. Several interesting and advantageous features were sought and are said to have been obtained in this new type of register.

New Principles.

The first and probably most interesting feature is the new mechanical movement with which cash fares up to \$9.95 can be registered on a single line. The mechanical motion for doing this is composed of four parts. As a whole it is very strong and does

Moore Fare Register—General View of Register, Dial and Rods.

not include in its make-up any springs. A movement suitable for a smaller register recording fares up to \$1.00 also has been perfected. This smaller size machine as ready for use is about 10 by 3 3/4 by 12 1/4 inches in dimensions. The larger size of machine is illustrated by the accompanying engraving. It is worthy of note that the inventor of this new design of recording movement has been able to perfect his product so that it will accurately count and add fares of so many denominations. The ordinary single register as now used has a capacity for registering only from 5 to 60 cents, inclusive, or 12 classifications, while the Moore register is designed to register 199 classifications. It should be noted that this machine not only registers through this wide range, but it also totals any number of cash fares between the same limits.

When operating long roads or over complicated track rights it would seem that the feature of providing for the registration of

fare in 199 denominations would be especially valuable, since it would do away with any necessity for the conductor carrying cash fare slips and being called upon to punch and issue them. The use of this register thus eliminating cash fare slips, provides a printed statement of the total amount of cash that a conductor must remit to his company at the end of any one period, and this total is obtained, not by a series of computations, but by only one subtraction.

Method of Operation.

Each conductor and inspector is provided with an individual key, which, when inserted in the register, unlocks the mechanism so that the fares may be rung up. The turning of the key automatically sets the conductor's or inspector's number and the key cannot be withdrawn from the register until the printing mechanism has been operated. Thus it is seen that the proper individual is charged with each operation of the machine. On a dial at the left of the case the train numbers are set, reading from 1 to 999, inclusive.

A very important addition to the recording part of this register is the provision for printing initials, by means of which a code may be utilized so that divisions of fare may be recorded in almost any way desired—either at fare limits, in town or by an arbitrary division of mileage. This valuable feature affords a means for obtaining the correct number of passengers and earnings originating on any definite portion of the run and thus determining the value of the trackage between any stated limits.

Each time that a cash fare or a ticket is rung up the machine registers it in the "total number of fares" column as one fare. Thus it is seen that the total number of passengers carried over the route or any portion thereof can be obtained by a simple subtraction. A column also is provided on the record of the register showing, in a similar way, the number of tickets.

City Fares.

In the design of this register provision has been made to account for city fares on interurban cars without the use of a second register, as is quite commonly required. The city fare recording section works independent of the balance of the register and may, by a simple operation, be interconnected with it so that each time

Conductors No.	Train No.	Division Initial	Total No. of Fares	Total No. of Tickets	Total No. City Fares	Total Cash	
						Dollars	Cents
60	320	AA	672	078	849	413	15
60	320	BB	639	066	838	367	90
60	320	CC	613	050	838	354	60
60	329	CC	613	050	838	354	60
60	329	BB	593	041	838	348	00
60	329	AA	575	034	832	336	40

Moore Fare Register—Portion of Record Sheet.

a fare is registered one city passenger is also registered. As ordinarily used the number of passengers on an inbound car at the time of crossing city limits will be rung up by the conductor on the city fare section. He will then interconnect the city fare section with the balance of the register, so that each time a fare is received while the car is on the city tracks, the register will add the fare collected to the cash column and one passenger will be added to the "total number of city fares." The register can be left thus interconnected until the city limits are reached on the outbound trip. Then, by reversing the simple process, the two parts may be disconnected and the balance of the trip made without interfering with the correct number of city fares.

Cash Column.

An unlimited number of fares can be rung up and totaled in the cash column, the minimum fare being five cents and the maximum \$9.95. In this feature the Moore register becomes especially effective. While the scope of the device is so much broader than the ordinary types of register the clerical work necessary to obtain the value of the cash fares is reduced to a simple subtraction. This eliminates entirely the tedious process encountered with some other types of registers.

Printed Record.

The accompanying illustration shows the operation of the register for one round trip on which it was desired to determine the earnings by divisions. It will be noted that the line of figures opposite AA were obtained at the starting terminal and those at CC at the turning terminal. The readings at the division point between terminals are on the lines opposite BB. In obtaining this record the conductor, before starting, set the letters AA and turned the handle of the printing mechanism, making an impression shown by the bottom line of the table. At the division point he set the letters BB and again turned the printing handle, obtaining the second line from the bottom. Had there been more division points this latter operation would have been repeated at will.

On the return trip the conductor reset his train number and operated the register as he did on the outbound trip, the results being shown in the reproduction.

Inasmuch as this register deals in totals it easily is seen that

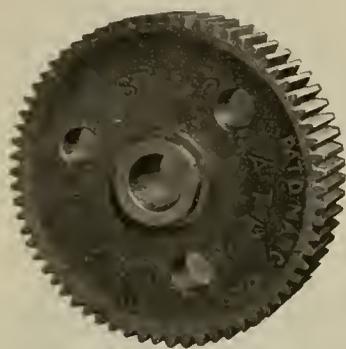

by subtracting the quantities in the line AA from those in the line BB there is obtained a total for each column, including as it does the total number of fares, tickets, city fares and cash. If it is desired to get these totals for any division or for the entire run of the car they easily are obtained by subtracting the readings opposite the key letters of the first terminal from those opposite the key letters for another terminal.

It will be noted that the total performance of the car, as shown in the accompanying record, was as follows: Conductor No. 60; train outgoing No. 329; returning No. 320; total number of fares on round trip 97, outgoing 38, returning 59; total number of tickets, round trip 44, outgoing 16, returning 28; total number of city fares 17, outgoing 6, returning 11; total cash, \$76.75, outgoing \$18.20, returning \$58.55. It should be noted here that if it were not desired to obtain the readings at division and terminal points only two lines of figures would then appear on the printed record and from these, by a simple subtraction, the totals for the round trip would be obtained.

Register Operation.

In operating the register after it has been set to the desired point on the dial, the fare is rung up by moving a handle attached to a rod just over the setting rod. When this handle is pulled down the register rings up a cash fare; when the handle is pushed up a ticket received is recorded. A shield marked "tickets" takes the place of the cash shield. When a ticket is being rung up and while the cash fare is being set by the conductor a "not registered" shield shows to the passengers until after the recording operation is completed.

There are two hands on the setting dials. One hand sets the register from 5 cents to 95 cents, inclusive; the other hand sets the register from \$1.00 to \$9.00. Therefore, in setting the machine

"Titan" Gear Standard for Public Service Corporation of New Jersey.

"Titan" Gear Tested on Public Service Corporation of New Jersey Car No. 1024.

Worn-Out Gear, Ordinary Cut Tooth.

for amounts over \$1.00 it is necessary to set both hands. The setting rod is connected with these hands through the medium of a pin clutch. The setting rod has a longitudinal movement of about one-half inch. When pressed forward it engages the "cents" hand; when pulled backward it engages the "dollars" hand. In the operation of setting the hands to the desired amount it is not necessary to set them in any regular order. The dollars hand may be set first, or vice versa. They also may be turned in either direction while being set.

The accumulators, printing mechanism and setting mechanism are built in units; that is, in a separate frame, and can be removed from the main case, or the frame of the register, be examined and oiled and returned without disturbing any of the mechanism. Also, when a machine once is put together any intelligent workman will be able to keep it in order. If through accident the accumulators, printing mechanism or setting mechanism should become damaged, the damaged parts could be removed and other standard parts inserted, after which the machine would be ready for use.

One of the Moore fare registers has been operated about 12,000 times and is said to have made no false indications or shown appreciable wear. This device herein described is built on thoroughly mechanical principles. The parts are all of standard design and a large per cent of the gear wheels may be bought in the open market, so that the problem of repairs, if necessary, should not be a troublesome one.

United States Express Company Contracts with Electric Lines.

F. W. Brooks, general manager of the Detroit United Railway, has confirmed the report, as published in last week's issue of the Electric Railway Review, that a contract has been entered into with the United States Express Company by the so-called Detroit United Lines, which comprise the interurban lines of the Detroit United Railway, the Rapid Railway system, the Detroit Jackson & Chicago Railway and the Detroit Monroe & Toledo Short Line Railway, whereby the business of the express company will be handled over the lines named. In many features the contract is similar to that generally made between the steam railway and the express company, differing in the fact that the compensation is based, in the main, on tonnage.

The company's view of the matter is that its lines are available for such use as the public may properly make of them, and in entering into the contract above referred to it has been enabled to secure for its patrons a service very much desired.

"TITAN" STEEL MOTOR GEARS.

Some recognition of the principle upon which the deacon built his "One-Hoss Shay" seems to have prevailed in the development of the "Titan" steel motor gear manufactured by the Atha Steel Casting Company, Newark, N. J. While the delay and expense of removing worn-out gears, and consequently wheels which have become well established in their seat upon the axle, is only an incident, it is, nevertheless, an exceedingly important incident in the maintenance of electric railway equipment. The time lost and the expense entailed in pressing off wheels to replace gears and the expense and the labor involved in applying new and removing old gears was evidently an important consideration which led to the introduction of a gear which should wear at least as long as any car wheel is liable to wear. It is claimed that "Titan" gears will outwear from three to five cut gears, that their teeth will not break out in ordinary usage, and that they will not work loose on the axle. One railroad man, whose line is operated under the severest conditions, and whose long experience should make him an authority on such matters, states that "Titan" gears will give from 300,000 to 500,000 miles' service, which is a longer distance than most car wheel manufacturers are willing to guarantee their wheels to run. The economy involved in an operation of this kind is at once apparent. It is not necessary to disturb the fit of wheels upon the axles, as the gear can be removed at a time when it is necessary to apply new wheels or a new axle. The operating department has, in addition to the saving of expense in removing a worn-out or broken gear and applying a new one, the satisfaction of keeping the car in continuous service for a much greater period.

The material of which these gears are made is manganese steel of such a hardness that it is incapable of being worked by

tool steel. All finished surfaces, such as the teeth and hub fit, are accurately ground to templates. Notwithstanding the hardness of the material, it is said that its toughness is so great that test pieces have been bent cold to an angle of 180 degrees without showing a fracture. In the process of manufacture the gear is cast solid, including the teeth, and a special machine grinds the periphery of the teeth to an accurate diameter. Each tooth is then ground at the hub fit and faced both sides. A gray iron or soft steel hub is then inserted under a pressure of from 35 to 45 pounds per square inch. This is then bored out to the proper size for forcing upon the axle. It is unnecessary to use key-ways, as the gears are supposed to be forced on with a pressure of from 30,000 to 35,000 pounds per square inch, and it is stated that none has ever come loose on the axle.

"Titan" gears are standard upon the lines of the Public Service Corporation of New Jersey, where from 400 to 500 of them are in use, and an order for 425 is now being filled for the Boston Elevated. In addition to this the company is doing business with some 40 or 50 roads throughout the country and the records of service obtained indicate that these gears wear five times as long as ordinary gears.

Engineers Report on Safety of Battery Tunnel.

William Barclay Parsons, consulting engineer, and George H. Pegram, chief engineer, of the Rapid Transit Subway Construction Company of New York, have written to President Shonts of the Interborough-Metropolitan Company that the tunnel from the Battery to Joralemon street, Brooklyn, when completed, would be safe and stable. On account of the use of piles under a part of the tunnel near the Brooklyn shore, it has been reported that the tunnel was constructively weak. Mr. Parsons' letter said:

"In reply to your letter of May 29 I beg leave to advise you that, in my judgment, when the tunnels from South Ferry to Brooklyn are completed, they will be entirely safe for the passage of trains." Mr. Pegram wrote: "The anonymous statements that have appeared lately in the daily press questioning the strength and safety of the East river tunnel between the Battery and Brooklyn are calculated to induce an unwarranted distrust. This work has been under the direction and inspection of the engineers of the rapid transit commission from the start, and the answers that have been given to the criticisms would seem adequate. I desire, however, to state that, in my opinion, the work, when completed according to the plans which have been adopted from time to time to meet unexpected contingencies, will be safe and stable beyond question."

A prominent engineer has suggested the feasibility of improving the load factor of electric railway power plants by the sale of current for use in pumping stations. Inasmuch as some interurban companies during the past two years have derived substantial revenues and bettered their load curves by the sale of 500-volt current to farmers for lighting and power purposes, there would seem to be a possibility in this suggestion worthy of some consideration. If, for example, an interurban line has on its route a number of small towns or villages, each with its own pumping plant and standpipe, the conditions are, indeed, favorable for considering the sale of power. It is suggested that instead of the usual steam pump with its irregularly operated and therefore inefficient boiler plant and steam pump, there could be substituted a pressure pump driven by an electric motor connected through a centrifugal clutch, the clutch to be thrown in during the period of light load at the power station. With a number of such installations taking their current from the railway power feeders and each pumping into an elevated tank or a standpipe as ordinarily used in small city water systems, the load factor could be well regulated. The sale of current generated under such conditions could be made at a comparatively low cost to the consumer, and therefore the advantages would be mutual.

Some two years ago, recognizing the clamor of the popular press, the Union Elevated Railroad, Chicago, removed all advertisements from its loop platforms. These since have been replaced, but it is to be noted that in their replacement care has been taken to provide the mounting of all advertisements with a view to uniformity and also, if it can so be considered, with an artistic effect. This experience and its results were no doubt realized by those who had in hand the designing of station details for the new Ravenswood extension of the Northwestern Elevated Railroad, which now affords a much welcomed express service for residents of the northwestern part of the city of Chicago.

It is remarked that particular attention has been given toward facilitating the placing of advertising posters on station platforms of the new structure without the usual encumbrances, such as loose boards or insecurely fastened pieces of sheet iron. To accomplish this commendable detail and refinement in the construction, the platform railings were built with uniform sheet-iron panels about two and a half by three and a half feet in size. This is a size suitable for receiving standard advertising posters. To stiffen these poster panels an ornamental border of pressed steel surrounds the panel. Such details may seem trifling, but are they not to be considered of value if, as others have shown, they relieve a railroad organization from being held up for public criticism? As one manager has sagely remarked, "It would be nice to refuse advertising in our cars and on our stations, and yet get the money, but we can't get the money without the advertising, and we need it."

Probably no electric railway in this country operating under similar conditions has had more thought given to its detail design as regards operation than has the Philadelphia & Western. The constructional details of this new road were described and illustrated in the issue of the Electric Railway Review for June 15, 1907, page 770. At this time it is desired to call special attention to the arrangement of tracks at waystations. It will be remembered that the Philadelphia & Western is a double-track line from terminal to terminal. To provide for additional track space at waystations the track centers are spread and a third track is interposed between the east and west bound platforms and for a distance of about three hundred feet either way from their mid-point. One end of this third track connects with one of the two main tracks and the other end with the second main track. This arrangement might briefly be described as a long cross-over that passes close by one loading platform. The layout has obvious advantages. A train may come from one terminal, unload its passengers in the usual way, run on to the switch, where the crew could

change ends, then run back on the center track to load for a return trip and pass out to the main track for a return trip to the starting terminal, and by the nature of the track layout perform all these movements with the least possible shunting. In suburban service for a metropolis the third track becomes of especial value, since it is there desired to operate both locals and expresses, turning the locals at various waystations and thus permitting the expresses to handle in a more economical and satisfactory way the traffic of outlying districts. These long cross-overs are also available as passing tracks on which to hold locals for meets with the superior expresses operating in the same direction. When not required for any of these uses the third track is available, and at a comparatively low first cost, for storage purposes. In fact, there are any number of commendable features to substantiate the views of the designers of this roadway, and it is safe to say that no one will realize the desirable features of these long cross-overs more than the superintendent of transportation and his dispatchers.

While the public utility bill which has been passed by the lower house of the Wisconsin legislature has no application to

**Public
Utility Law
in Wisconsin.**

electric railways, it is nevertheless of interest because of the provision that a franchise which is granted hereafter shall have the effect of an indeterminate permit, subject to the provisions of the act. The acceptance of such a permit constitutes an agreement that the municipality in which the major part of the public service property is situated may purchase such property, paying therefor its then value as determined by the state railroad commission and according to the terms and conditions fixed by the commission. The bill applies to corporations as well as to municipalities which own or operate telephone, heat, light, water or power plants for public use. There was no need to mention electric railways on account of the provision in the original railroad commission law giving the commission control over interurban lines, and because there is now a separate bill before the legislature, which, if it becomes a law, will vest power in the commission respecting electric lines which are situated wholly within the limits of municipalities.

The operation of machinery at inefficient loads is a very frequent defect in power plant service. The problem in a railway plant is a matter of striving to attain the ideal—but there is not the least doubt of the importance of knowing that the employes have done their best. Old as the load curve is, it is used far too seldom as a daily method

of analysis in connection with a log of the engine and generator duty, and in relation to the banking of boilers, operation of small feed pumps at times of light output, and the running of large compound duplex outfits when the boilers are forced. The carbon dioxide recorder is not yet appreciated at its full worth, nor is the value of the thermometer in the various piping sections sufficiently recognized. The draft gauge, the revolution counter on the fan engine, and even the pyrometer in the boiler furnace are slow in coming into general use. The saving in operating motor-driven exciters on generator voltage without transformers does not seem to have entered the minds of some designers, nor does the immediate connection between a poorly insulated superheated steam pipe and the coal pile always seem to be realized by operating men. The handling of coal between the barge or the car and the boiler grate is many times carried out in inefficient ways, and the possibilities and advantages of mechanical conveying and stoking systems are none too well recognized. The reduction of maintenance by making repairs at the proper time and by correct operating judgment in routine service is a point of attack in too few installations.

The whole question of power plant economy may well be considered as a specialty to be studied constantly by an expert on a large system, for large expenses offer greater opportunities to make conspicuous savings than do the smaller items of secondary importance.

THE ATLANTIC CITY CONVENTION.

The annual conventions of the Master Car Builders' and American Railway Master Mechanics' associations have been held at Atlantic City during the past two weeks. These conventions have a certain timely interest for readers of the *Electric Railway Review* because of the fact that the convention of the American Street and Interurban Railway Association and the affiliated associations is to be held at the same place and under practically identical conditions in October of this year.

Atlantic City has been chosen as the place for the 1907 convention by a joint committee representing the American association and the Manufacturers' association after a careful investigation. On account of the natural attractiveness of America's premier seaside resort and because of its excellent facilities for convention purposes, Atlantic City has always proved a popular place for conventions. This characteristic and the special arrangements made this year for handling the manufacturers' exhibits—always a most important feature of a convention—should add to the success of the occasion.

In choosing the convention city three points must be considered as of the highest importance: there must be adequate hotel accommodations of the first class, a sufficient space for the manufacturers' exhibits and suitable assembly rooms in which to hold the meetings of the several associations.

Atlantic City is especially suited to fulfill these requirements. In regard to hotel rooms the choice is almost unlimited, and there is no fear of a repetition of the somewhat crowded conditions at Columbus last fall, practically the only cause for criticism at that convention. Atlantic City can easily provide at least 3,000 rooms in the large hotels fronting on the ocean beach, with from 1,200 to 1,500 private baths, besides an almost unlimited number of rooms in first-class hotels not fronting on the beach, many of which are provided with private baths.

Atlantic City is also fortunately situated in regard to exhibit space for members of the Manufacturers' association. The exhibits will be located on the Steel Pier, within a few minutes' walk from the various beach hotels. Reference to the illustrations from photographs of exhibits at the steam railway conventions just concluded, which are presented in another part of this issue, will serve to show the arrangement and general appearance of the exhibits, as it is understood that the same general plan of handling the exhibits will be used for the October conventions. The plan of uniform booths has been employed here for the first time.

A large convention hall with a seating capacity of 800 will be provided on the Steel Pier for the opening meeting of the American association, and smaller meeting rooms will be provided for the various sectional meetings of the allied associations.

The Columbus convention last fall, following the reorganization meeting at Philadelphia in September, 1905, was unanimously considered the most successful in all respects ever held by the street railway association, both from the delegates' and the manufacturers' points of view, and the 1907 convention promises to surpass even that successful meeting. An examination of the attendance figures of the conventions of the American Street Railway Association for the past few years reveals a general increase which augurs well for the coming meetings. The total registration at Columbus was about 2,400, as compared with 1,958 at Philadelphia in 1905, 1,538 at St. Louis in 1904 and 1,584 at Detroit in 1902. The number of delegates from member companies at Columbus

was 666, as compared with 482 at Philadelphia, 456 at Detroit and 498 at New York in 1901. The greater part of the increase, however, was in the number of representatives of manufacturers—1,253 at Columbus, as against 939 at Philadelphia and 796 at Detroit—although the number of exhibitors fell from 243 in 1905 to 195 in 1906. The electric railway business is growing rapidly and the association, guided by some of the strongest men in that business, is growing with it. This general increase in attendance, coupled with the fact that Atlantic City is in itself by far the most attractive of the cities thus far chosen, indicates a most successful convention.

PROFIT IN FREIGHT HANDLING.

In the upbuilding of freight traffic some electric railways which have terminals on the great lakes or other bodies of water which are navigated have found it advantageous to arrange through traffic schedules with steamship lines. Such arrangements have been in force for several years between the Goodrich Transit Company, operating several steamship lines on Lake Michigan, and the Grand Rapids Grand Haven & Muskegon Railway, and between the Graham & Morton Transportation Company and the Grand Rapids Holland & Chicago Railway. These arrangements permit the transportation of freight and passengers between Chicago and Grand Rapids and surrounding points in Michigan on through rates. Attention is called to this subject again by the announcement of traffic agreements between the Graham & Morton company and the Southern Michigan Railway, the Chicago South Bend & Northern Indiana Railway and the Winona Interurban Railway. By this latter arrangement traffic will be carried from Chicago to St. Joseph, Mich., by boat, and will be transferred at that point to the electric line. With the connections named the traffic can be hauled as far as Warsaw, Ind., and also to South Bend and other good traffic centers. The advantage of this route to passengers will lie in an attractive interurban and boat ride, while freight should be delivered with promptness. This, of course, is interstate business and, under the law, the freight and passenger tariffs must be filed with the interstate commerce commission.

The new arrangement which is mentioned in the foregoing derives additional importance from the increasing mileage and future connections of some of the electric railways concerned. The Winona Interurban company will soon have in operation a new division which will connect at Peru with the Indiana Union Traction Company and the Ft. Wayne & Wabash Valley Traction Company. With the Indiana Union a direct route will be afforded from South Bend to Indianapolis, shorter than any steam railway line between those places. The Winona company is also building a direct line from Warsaw to Ft. Wayne. From the latter point the Lima & Toledo Traction Company affords a through route to Lima, and the facilities of the two companies will constitute as direct a line from Warsaw to Lima as obtained by any existing steam railway. The Toledo & Chicago Interurban Railway has under active construction the Ft. Wayne-Kendallville extension, which will connect at Goshen with the Chicago South Bend & Northern Indiana Railway. The completion of these roads will add to the business of the connecting lines.

Contracts for handling freight on traffic agreements with other lines are very inviting to electric railways at this time. Owing to the attacks on their policies and rates, steam railways have been hampered in borrowing money on reasonable interest terms and are therefore not vigorously prosecuting improvements or enlarging facilities. Yet traffic is not diminishing, and there is an abundance of business for all the transportation facilities offered. In view of these traffic conditions and the industrial activity which prevails, the introduction of freight service on electric railways is wise wherever business can be obtained in sufficient volume and

handled on a margin of profit wide enough to leave no room to doubt the essential fact that it affords adequate income.

On this question of determining the profitability of the service rendered each line must make its own decision, but the problem is serious enough to justify reiteration of the truth that only complete analysis of the entire cost of handling freight will determine whether the business is paying its proper return or is conducted at a loss. In order to save possible disappointment in the ultimate results, such an inquiry should be made before a traffic agreement is entered into. If a traffic agreement has been closed, the terms on which it is based should receive the keenest analysis.

To the true cost of freight service all of the expenses which pertain to the operation and maintenance of the property belong in some degree. The actual cost in expenditure of money for the service rendered, the expense of conducting transportation, should first be ascertained. It is not fair to the property to assume a profit because the gross revenue from freight service greatly exceeds the cost of operating the cars from day to day. Other expenses which are ascertainable only by analysis may be either excessive or so large as to destroy the margin of seeming profit. It is necessary to allow for maintenance of equipment and of way and structures. Allowance is essential for all needed repairs, as well as renewals and adequate provisions for depreciation, and, if a limited franchise is held at any point, for amortization of the investment. A fair proportion of general expenses should be charged to the freight business. It may appear to many that stress upon these points is unnecessary, but there is an understanding in some quarters that looseness in accounting for freight operations is more common than is supposed; and therefore attention is directed to the advisability of careful consideration of every detail of expense which in any way, however slight, can add to the cost of freight service. While added labor and responsibility may make some employes more efficient, others may do the extra work only by sacrificing the excellence of that on which they were previously engaged. The item of terminal expense, for instance, is one which may easily grow in undue proportion to the value of the traffic handled.

Evolution in the ways of doing business, combined with the new prosperity of farmers, gives electric railways openings for freight handling which did not exist a few years ago. There is every indication that this freight traffic will grow as it should, provided it is so conducted as to yield a profit, and not to interfere with desirable passenger business.

Blast Furnace Slag in Reinforced Concrete.

Does blast furnace slag used in concrete have an injurious effect on the steel rods used as reinforcement? In answering this question, Sanford E. Thompson says: "The only ingredients in slag which might affect the reinforcing steel in concrete are the compounds of sulphur which may occur in it. The amount of sulphur in slag is variable, but analyses show that ordinarily it contains but a very small percentage, less, in fact, than cinders. Experiments by Professor Norton prove conclusively that sulphur in cinders cannot affect the steel if the concrete is of ordinary richness and laid wet, so that the mortar will coat the steel and produce a dense concrete. We may therefore draw the conclusion that sulphur in ordinary slag will not affect the steel."—Concrete Review.

The Detroit United Railway Company has had a substantial increase in its suburban freight and express business during the past year, as shown in a statement filed with the city treasurer at Detroit. This shows that between May 1, 1906, and April 30, 1907, the company operated 13,872 cars over the different lines as follows: Detroit United Railway, 7,260; Rapid Railway, 2,150; Detroit Ypsilanti Ann Arbor & Jackson Railway, 2,010; and Detroit Monroe & Toledo Short Line Railway, 2,292. The total for the year previous was 11,902 and for the year prior to that 10,282.

CONCRETE SHOPS FOR SEATTLE ELECTRIC RAILWAY.

The Stone & Webster Engineering Corporation, Boston, Mass., has just completed the erection of an interesting group of concrete shop buildings for the Seattle Electric Company. The new shops are at Georgetown, Wash., a

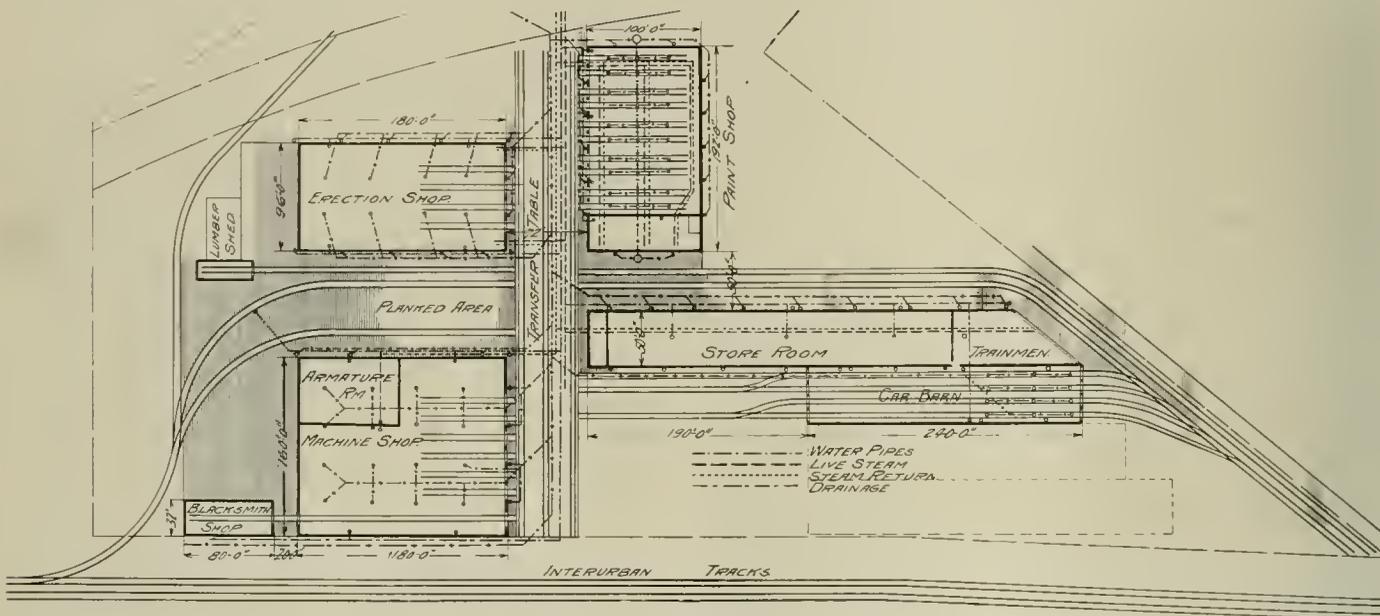

will be noted that the interurban tracks of the Puget Sound Electric Railway, also a Stone & Webster property, as well as the tracks of the Seattle Electric Company, pass the new buildings.

Machine Shop.

The machine shop is 160 by 180 feet in floor area and

New Shops at Seattle—General View of Buildings During Construction—Store Room at the Left, Paint Shop at the Center, Erection Shop at the Right.

New Shops at Seattle—Ground Plan of Shop Yards, Showing Arrangement of Buildings Along Transfer Table.

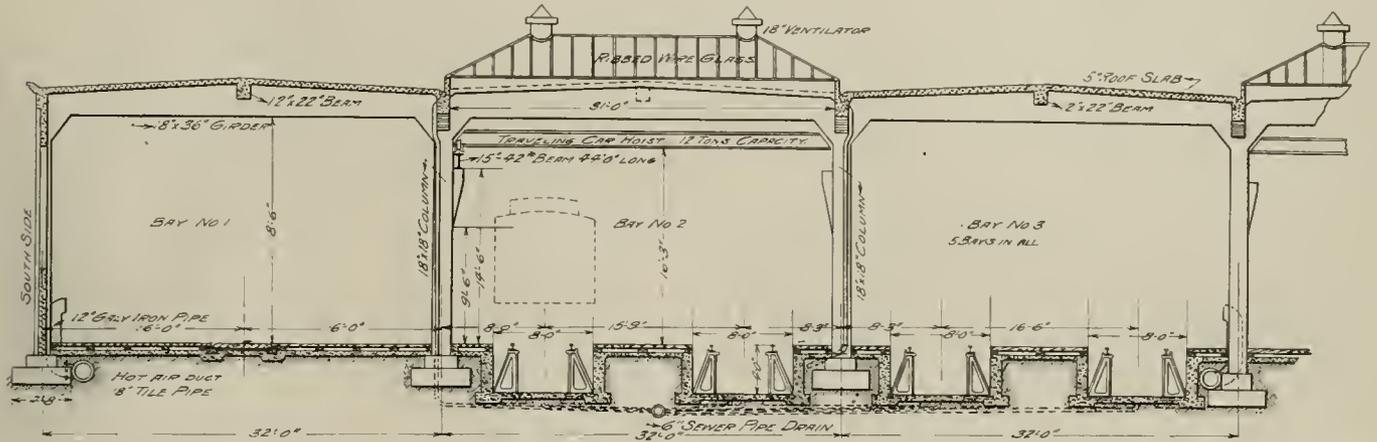

New Shops at Seattle—Exterior of Machine Shop Showing General Type of Buildings.

suburb of Seattle. All of the buildings are of concrete construction throughout. Those now built include a machine shop, erection shop, paint shop, storeroom, trainmen's quarters and a car barn. The arrangement of these buildings with reference to each other and to the transfer table which serves them is shown in an accompanying illustration. It

includes in this space an armature room 80 by 64 feet. The entire building comprises five bays separated by the 18-inch square columns that support the roof. The three center bays are provided for half their distance from the front of the building with repair pits under six tracks. Each pit has a motor-driven screw-operated car hoist. The pits are also pro-

vided with hydraulic motor-jacks mounted on trucks running on a track built in the floor of the pit. The cross-sectional view through the machine shop will serve to outline the general dimensions of the structure. The track in the center of bay No. 1 leads from the transfer table in front, through the

different parts of this building and the near-by erection and blacksmith shops are provided by an overhead Coburn trolley carrier. This economical method of handling materials between shops and between different parts of one building is also to be used elsewhere in this shop layout. The supports

New Shops at Seattle—Interior of Inspection Shop, Showing Open Pit with Rails Supported on Cast-Iron Yokes.

New Shops at Seattle—Interior of First Floor of Store Room, Showing Massive Concrete Construction.

New Shops at Seattle—Section Through Stores Building and Inspection Shop.

machine shop, to the blacksmith shop in a separate building at the rear.

The armature room is set off from the machine shop proper by concrete partition walls. Separate rooms are also provided in the machine shop building for the heating plant, toolrooms and an office. Facilities for handling work between

for the carriers are shown in the sectional views of the shops.

Erection Shop.

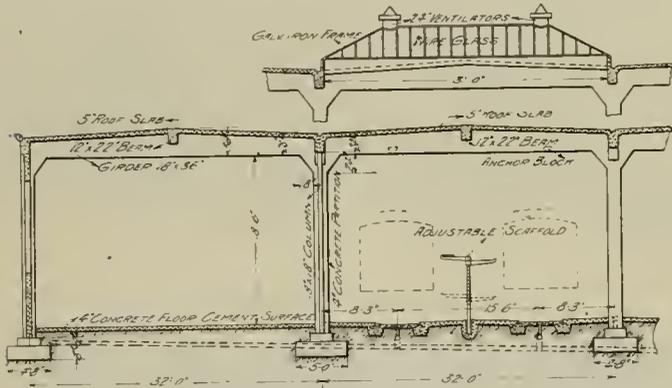

The erection shop is a building 96 feet by 180 feet, having a pattern gallery 20 feet wide across the rear end. Four tracks from the transfer table pit extend 90 feet into the

front of this building. One of these tracks is provided with a repair pit. An office also is provided for the foreman and accommodations are given the workmen in the form of locker and toilet rooms.

The floors in both the machine and erection shops will be of wood supported on stringers resting on a 4-inch concrete subfoundation.

Paint Shop.

The paint shop is a building 100 by 196 feet, into which extend 10 tracks reaching to the rear wall of the building.

New Shops at Seattle—Cross Section Through Finishing Department and One Bay of Paint Shop.

At one end of the building is set off a room 32 feet wide, mainly occupied for finishing work. In one end of this finishing room are found a laboratory, mixing room, paint store-room, locker room and lavatory. A section through two bays of the paint shop shows the arrangement of tracks and adjustable scaffold for painters' use. There also is shown in

New Shops at Seattle—View of Incompleted Interior of Machine Shop, Showing Sunken Floor over Which Will Be Placed Repair Tracks.

this section one of the skylights with which each of the entire group of shop buildings is plentifully supplied.

Store Building, Car Barn and Trainmen's Quarters.

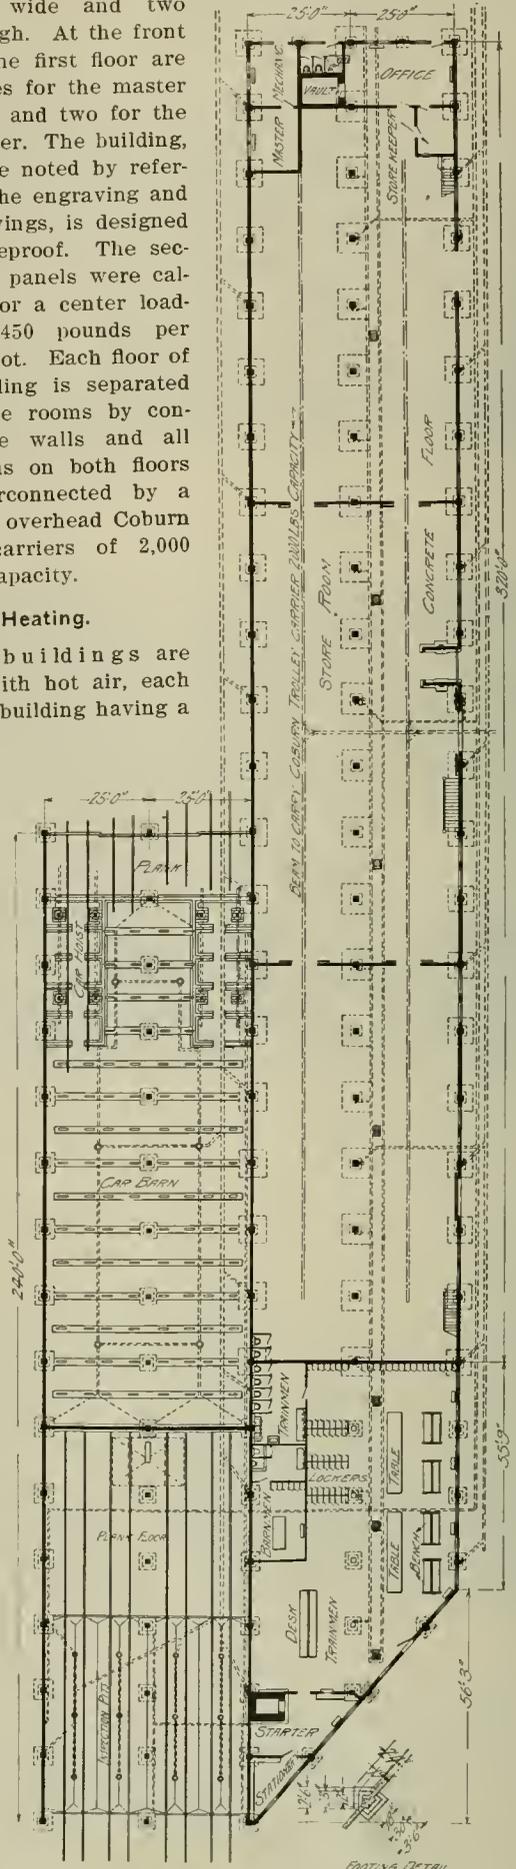

The storehouse, trainmen's quarters and inspection barn are built with division walls in common and arranged as shown in an accompanying illustration. The inspection and car barn is 240 feet long by 50 feet wide and has four tracks extending through it, connecting at one end with the transfer table and at the other with direct leads to the tracks in the streets. The ground adjacent to the present car barn building is sufficient to permit of an addition that will bring the total storage capacity up to 120 cars.

The trainmen's quarters comprise a general room fitted with desk, tables and benches, a locker room, toilet rooms

for barnmen and trainmen, an office for the car starter and a stationery room. The storeroom building is 320 feet long by 50 feet wide and two stories high. At the front end on the first floor are two offices for the master mechanic and two for the storekeeper. The building, as will be noted by reference to the engraving and line drawings, is designed to be fireproof. The second floor panels were calculated for a center loading of 450 pounds per square foot. Each floor of the building is separated into three rooms by concrete fire walls and all the rooms on both floors are interconnected by a system of overhead Coburn trolley carriers of 2,000 pounds capacity.

Heating.

The buildings are heated with hot air, each separate building having a

New Shops at Seattle—Floor Plan of Inspection Barns, Stores Building and Trainmen's Quarters.

motor-driven fan, steam coils and a system of under-the-floor air pipes. The steam for use in heating is obtained from a new 11,000-kilowatt capacity turbine station that has just been erected near the shop buildings.

NEW SUBSTATION FOR THE SCHENECTADY RAILWAY COMPANY.

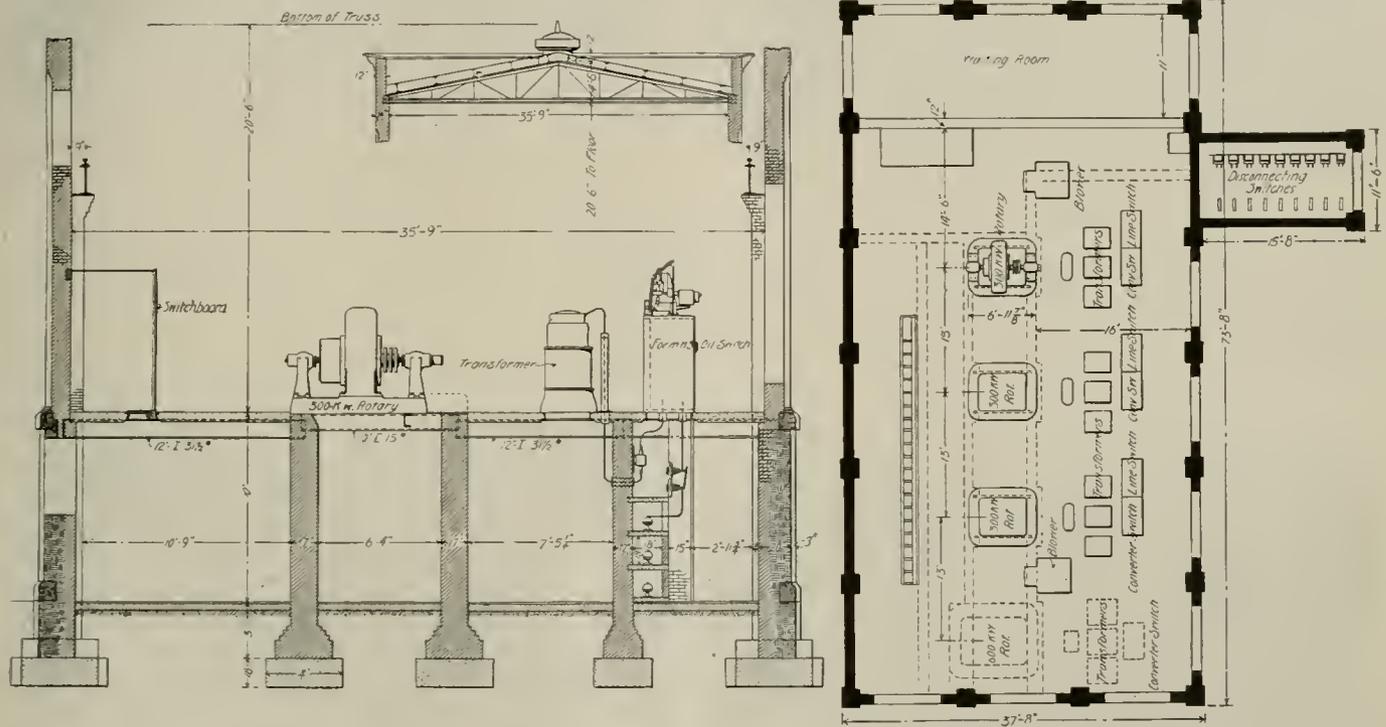

The Schenectady Railway Company is about to replace its frame substation at Karners, between Schenectady and Albany, N. Y., with a new fireproof station of stone, brick and steel construction. The front portion of the new building will be a waiting room.

To provide attractive grounds the company has purchased additional property and now has a lot with a frontage of 225 feet and a depth of 150 feet. The new substation will be placed in the center of this plot and a branch from the

at Karners. To provide power in case of a breakdown on this line a second 10,000-volt line supplies the Karners substation from the substation at Mechanicsville. The 10,000-volt current will be connected with the busbars in the Karners station through form-H oil-break line switches.

The three-phase alternating current delivered to this system has a frequency of 40 cycles. The busbar compartment will be on one side of the building in a brick-enclosed room 53 feet 2 inches long. The lightning arresters and connecting switches will be located in a special tower 11 feet 6 inches wide by 15 feet 8 inches long, separated from the remainder of the building by 20-inch walls. The lightning arresters will be of the General Electric type.

The step-down transformers will supply alternating current at 325 volts to the 300-kilowatt machines, and the rotaries will convert to 650 volts direct current for railway purposes. The switchboard will have 14 panels and will be equipped with

New Schenectady Railway Substation at Karners—Floor Plan and Section.

main line will be built to pass through the waiting room section. The present frame substation building, which is of the Queen Anne style of architecture, will be moved to the back of the new property and will be leased to the employees of the company for a home. It is planned to lay the grounds out in an attractive design and to make the Karners station a feature of interest to passengers.

The new building will be 73 feet 8 inches long and 57 feet 8 inches wide with basement and waiting room floor at ground level. The rotary converters and transformers will therefore be above on the first floor level. The foundation walls of the building will be of stone 20 inches thick to the height of 9 feet above the ground. The pilasters will be of brick spaced 12 feet apart, center to center, and will rest on stone and concrete foundations.

The equipment of the substation will be increased by the addition of three new rotaries and will consist of four 300-kilowatt machines fed from a bank of 10,000-volt air-cooled transformers. The Schenectady Railway Company secures its power from the General Electric Company through one of two duplicate 10,000-volt high-tension lines which enter the Dock street substation at Schenectady through underground ducts. From the Dock street station the 10,000-volt line is continued underground within the city limits and on a high-tension pole line beyond the city limits to the substation

automatic relays for throwing the switches in the 10,000-volt lines and with General Electric circuit-breakers for the direct current.

An accompanying plan shows the arrangement of the rotaries. The station will be provided with air compressors to supply air for cleaning and blowing out the machinery. The station will be equipped with a storage battery to provide lighting in case of a shut-down of the plant and to operate the remote-control switches. The machinery will be served by a hand-operated traveling crane.

In a paper by an English author, on "Notes on the Application of Induced Draft," reference was made to one case in particular of five boilers fitted with steam jets, which resulted in a coal consumption of 27.3 pounds of coal per square foot of grate, the evaporation from and at 212 degrees being 9.8 pounds of water per pound of coal, with a temperature of the economizer water of 166 degrees. With induced draft the results obtained were as follows: Coal consumption per square foot of grate, 25.4 pounds; evaporation of water, 10.2 pounds per pound of coal; and temperature of economizer water, 259 degrees. Taking measurements of the electrical output of the plant, it was found that, using the steam jets, for each unit generated, 3.6 pounds of coal and 30 pounds of water were consumed. With induced draft the results were 3.1 pounds of coal and 28 pounds of water per unit of current. In this case 1,800 gallons of water were simply evaporated for use by the steam jets. The net saving in this case worked out at 14½ per cent.

RAVENSWOOD EXTENSION OF THE NORTHWESTERN ELEVATED RAILROAD.

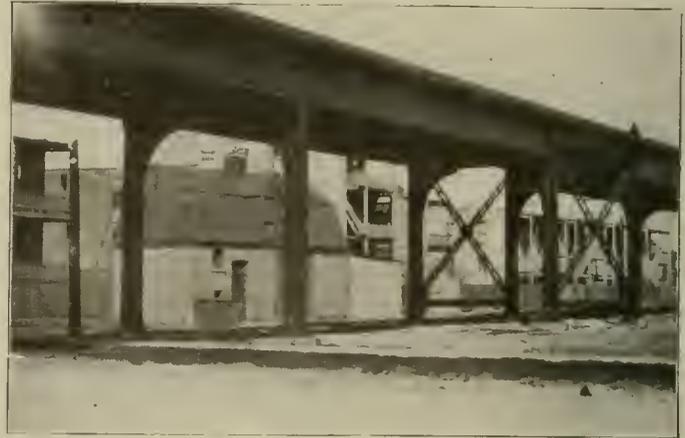

On May 18, 1907, the Northwestern Elevated Railroad Company began operating trains to Ravenswood, one of the northern suburbs of Chicago. This service was made possible by the completion of a new elevated structure connecting

pansion bent is provided between towers. The tracks of the Chicago & Northwestern Railway and also those of the Chicago Milwaukee & St. Paul Railway are crossed on 80-foot through girder spans, supporting the elevated tracks 33 feet above those of the steam roads.

The maximum grade of the tracks is $1\frac{1}{2}$ per cent, which

Ravenswood Extension of the Northwestern Elevated—Plate Girder Through Span over Chicago Milwaukee & St. Paul Railway.

Ravenswood Extension of the Northwestern Elevated—Standard Construction Showing Longitudinal Bracing.

with the original line at Clark and Roscoe streets in Chicago and extending west $3\frac{1}{2}$ miles, to join there a new surface line $1\frac{1}{2}$ miles long terminating in Ravenswood. Both local and express service are given.

Details of Steelwork.

The new structure supports two tracks throughout its

occurs at the crossing over the Chicago & Northwestern tracks.

About 8,800 tons of open-hearth bridge steel were used. It was specified that this material should have an ultimate tensile strength of 28 to 32 tons, and an elastic limit of not less than 16.5 tons per square inch. The steel was first given a shop coat of Lowe Brothers red lead lute paint and then

Ravenswood Extension of the Northwestern Elevated—View of Clark Street Junction.

Ravenswood Extension of the Northwestern Elevated—View Under Structure, Showing Slight Obstruction to Light and Air.

length and is designed to carry a third track, about 1,500 feet long, for storing cars near Western avenue. The spans comprise deck plate girders, 40 feet long, supported on built-up columns, anchored to concrete footings. The structure, averaging 20 feet high to the base of rail, is braced every fourth span by towers having longitudinal cross-ties. An ex-

a field coat of the Northwestern Elevated standard first coat, which is a mixture of Prince's mineral graphite and red lead ground in raw linseed oil, the latter coat having been applied when the work was in position.

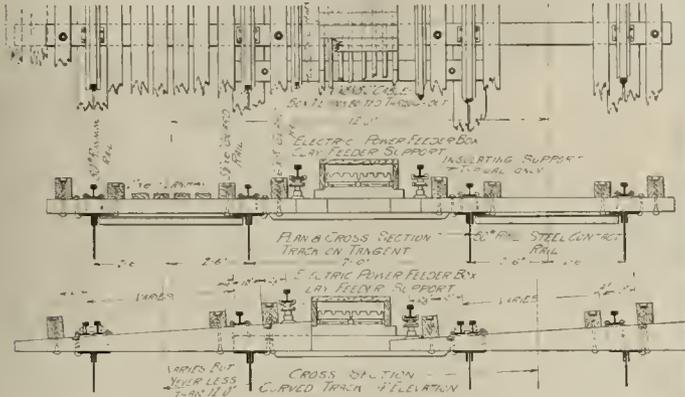

Track Construction.

The rails are laid on ties of long-leaf yellow pine. Both

inner and outer guard rails are provided for each track, being 5½ by 5 inches and 6 by 8 inches in section, respectively. The rails used are of standard 80-pound section, 60 feet long on tangents and 30 feet long on curves. Two 500,000-circular mil bonds are used at each joint. "Continuous" joints are used except on the inner rail of curves, where sheared angle bars and filler blocks support the joints. The rails are

to the ties by bolts passing through the fishplates and tie-plates.

A special detail is exhibited in the construction of the special track work at the Clark street junction. Since the angle of intersection was too small for the usual type of frog,

Ravenswood Extension of the Northwestern Elevated—Plan and Section of Track on Tangent and Curves.

Ravenswood Extension of the Northwestern Elevated—View of Station Platform.

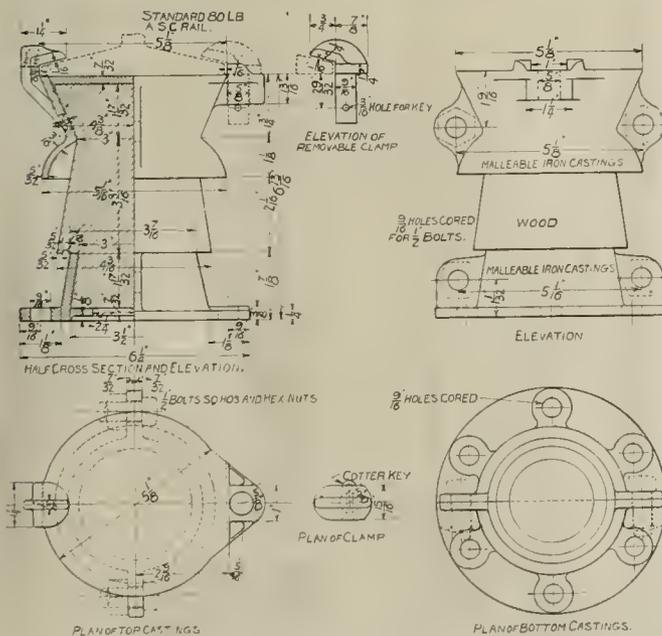

fastened to the ties by specially designed screw spikes with cold-rolled threads. Details of the standard track construction on the tangents and on curves are illustrated herewith. As will be noted, the guard rails are fastened to the ties by screw spikes and the ties are secured to the structure by through hook bolts.

the switches are all provided with movable frogs. All the special track work was furnished by the Morden Frog & Crossing Works, Chicago, Ill., in accordance with designs furnished by the company. The sharpest curves are 400 feet radius and the maximum superelevation of the outer rail is 4 inches.

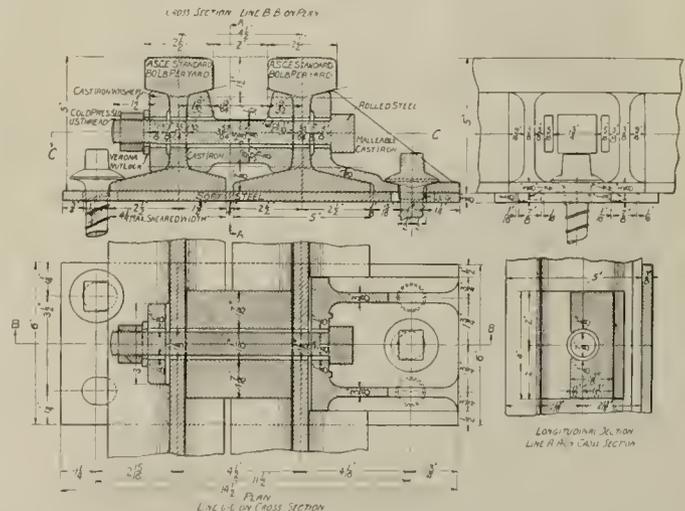

Since much difficulty has been experienced with the stand-

Details of Electrical Work.

An interesting detail which is illustrated in one of the accompanying drawings is the form of insulator employed for the third rail. This insulator, which was designed and patented by F. J. Guernesey of the Northwestern Elevated,

Ravenswood Extension of the Northwestern Elevated—Details of Third-Rail Insulators.

Ravenswood Extension of the Northwestern Elevated—Details of Guard Rail Construction.

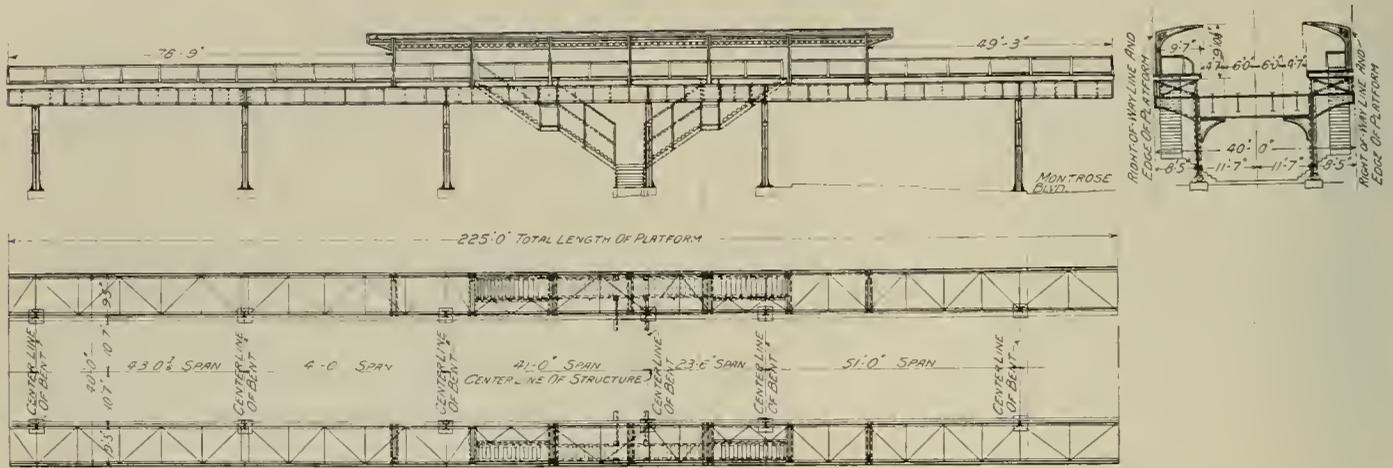

ard form of screw spike with a square head, the engineers of the Northwestern Elevated have adopted a screw spike of their own design. Heretofore the head of a spike would become worn, rendering it difficult to tighten, as the wrench would slip around on the head. To obviate this trouble the head is made oblong in shape, so that the wrench must always be put on in one position. This prevents the head becoming worn.

combines simplicity with a low first cost. The insulator is composed of four malleable iron castings and a hard maple pin thoroughly hoiled in paraffin. The iron castings are bolted together around the insulating pin and the third rail is bolted to the top castings by two hook bolts fitted with split pins. These insulators have been found thoroughly satisfactory and are considerably cheaper and less liable to damage than the earlier types used for this service. In tests made by the engineers of the elevated company, an insulator, after soaking in water for 24 hours, withstood a potential of 5,000 volts.

A feature in the construction of the guard rails on curves, which is worthy of particular note, is the securing of the rail

The third rail supported on these insulators is of standard 80-pound section. There are five supplementary feeders, each of 1,300,000 circular mils, at the beginning of the extension. Their cross section is gradually reduced toward the end of the line to two 1,500,000-circular mil lead-covered cables, which serve the surface portion of the road. The

platforms, which are supported by cantilevers, riveted to the columns supporting the structure, are shown in one of the accompanying illustrations. The cut also shows the construction of the awning roof, which is made entirely of steel. As will be seen, it is of the cantilever type, thus avoiding columns at the front of the platform, which might interfere with

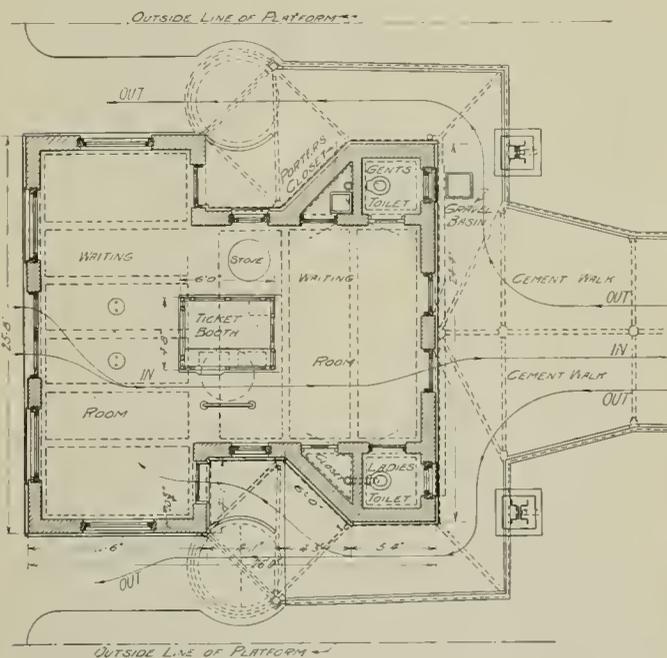

Ravenswood Extension of the Northwestern Elevated—Plan, Elevation and Section of Typical Station.

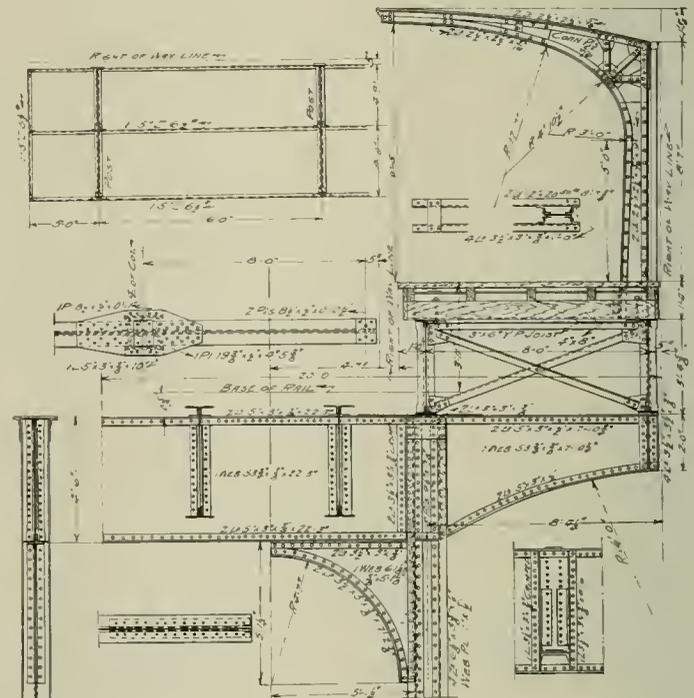

feeders on the elevated portion of the line are bare copper, carried on clay insulators furnished by the Brennan Electric Construction Company of Chicago, which firm furnished all the electrical supplies for the new work. The cables for the surface extension are inclosed in a wooden box, as shown in the drawing of the standard track cross section. All switches are operated by the Union Switch & Signal Company's electropneumatic interlocking system. It is ar-

the loading and unloading of trains. An interesting feature in the design of the awning is the backward slope of the roof and the placing of the gutter at the rear, thus preventing the overflow and drip from the gutters from falling on passengers boarding trains.

Particular attention has been given to facilitating the placing of advertising posters on the stations without encumbering

Ravenswood Extension of the Northwestern Elevated—Plan of Typical Station, Showing Method of Handling Passengers.

Ravenswood Extension of the Northwestern Elevated—Details of Construction of Station Platforms.

ranged so that the brakes will be applied on trains passing a signal set against it.

Elevated Stations.

Special attention has been given to the design of the stations for the new extension and a few of the many interesting details are illustrated herewith. The length of the standard platform is 225 feet, 97 feet of which is covered by an awning roof, as shown. The construction details of the

the station platforms with loose boards of various styles and sizes. The railings of the platforms and stairways have been specially designed with uniform sheet iron panels 2 feet 5/8 inches by 3 feet 7 inches, having an ornamental pressed steel border serving as a frame for a standard size of advertising poster. Between the advertising panels and posts are inserted three cast-iron posts and a small ornamented rosette, as shown in the illustration.

The general arrangement of the stairways is shown in

ELECTRIFICATION OF WEST SHORE RAILROAD BETWEEN UTICA AND SYRACUSE.

The official opening of the electrified section of the West Shore Railroad between Utica and Syracuse, N. Y., took place on June 15. A description of this construction appeared in the Electric Railway Review of November, 1906, page 911.

The work of this installation has been carried out by the Oneida Railway Company, a corporation identified with the so-called Andrews-Stanley syndicate, which syndicate in conjunction with the Vanderbilt-New York Central interests owns several electric traction properties in New York state, including the Utica & Mohawk Valley Railway, the Syracuse Rapid Transit Company, the Rochester Railway & Light Company and the Rochester & Eastern Rapid Railway, and also in conjunction with the Delaware & Hudson Company, the traction systems in the cities of Schenectady and Albany. The Oneida Railway Company entered into a contract with the New York Central under which the former agreed to lease the tracks of the West Shore Railroad between Utica and Syracuse, equip them for electric operation and conduct the passenger business between these two points.

The distance between the two cities is a little over 44 miles. It is proposed to give three classes of service over

The transmission towers used on the Oneida company's transmission line consist essentially of a square latticed structure composed of four angles. The distance between towers is 480 feet.

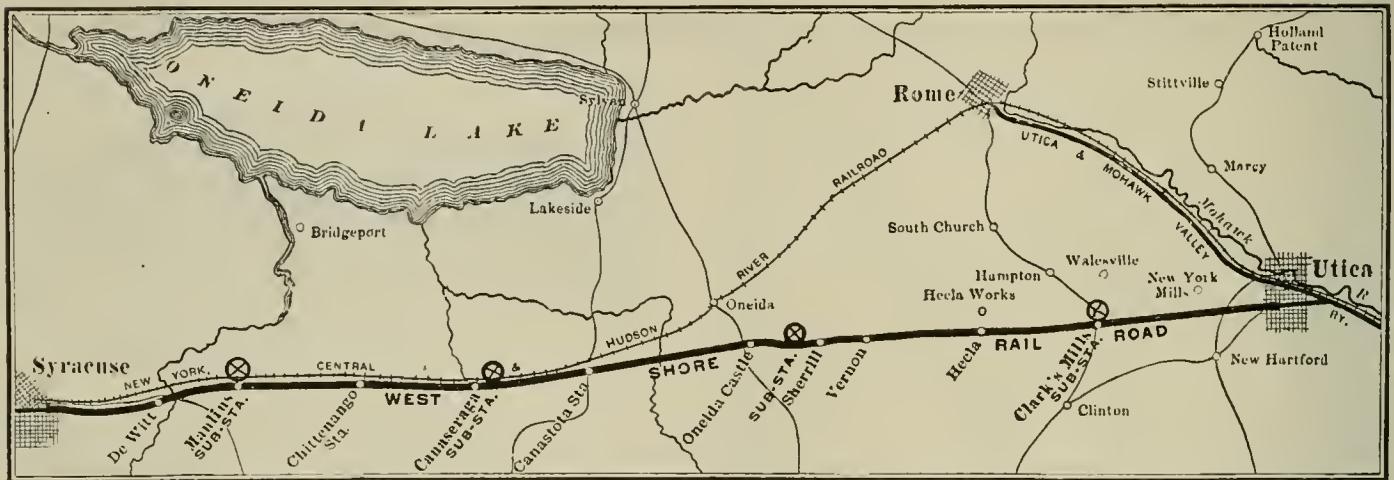

The insulators are of porcelain, were supplied by R. Thomas Sons & Co. of Lisbon, O., and are placed at the corners of a 7-foot triangle. A No. 0 seven-strand, hard-drawn copper cable is used for each conductor. This cable is strung on the towers with a sag of 12 feet for a 480-foot span, at 32 degrees F. This sag corresponds to a normal tension of 300 pounds in the cable. The use of lightning arresters is confined to the substations themselves.

Substations.

The four substations previously mentioned are of similar design. They are of brick with litholite trimmings, concrete roof and concrete floors. They are divided into two main compartments—at the rear the high-tension room and in front the converter room.

This being one of the first 60,000-volt installations in this section of the country, extreme care has been taken to give the necessary clearances on the high-tension side. The arrangement in general is a typical General Electric layout.

In the converter room are two units, consisting of one

West Shore Electrification—Map Showing Routes of New York Central and West Shore Tracks Between Syracuse and Utica.

the West Shore tracks between Syracuse and Utica. First—There will be the fast limited electric cars or trains which will run hourly between the two cities and will make two stops only, completing the run in 1 hour and 28 minutes. Twenty-eight minutes of this time will be taken on the local system at each end and one hour for the run between the two cities. Second—There will be the local trains or cars which are scheduled to make 24 miles per hour, and which will complete the run in 1 hour and 58 minutes. This service will be run hourly and the cars will make frequent stops at every highway if necessary. Third—There will be the steam service.

Power Transmission Lines.

Power for the operation of the line is purchased from the Hudson River Electric Power Company, which owns the hydraulic power plants at Spiers Falls and Mechanisville. This company is now extending its transmission line from its water-power plants to Utica and expects soon to be able to deliver electric power to those points at 60,000 volts.

At Clark's Mills substation current is taken by the Oneida Railway Company and is conducted to the three other substations over its own transmission line. There are four substations. The distance between the substations averages approximately 10.75 miles. The transmission line is carried into each substation and is there tapped to the busbars through disconnecting switches, then passes to the next substation.

330-kilowatt, 60,000-370-volt, oil-cooled transformer, Y-connected on the primary side and delta-connected on the secondary side, and one 300-kilowatt, 370-volt alternating-current and 600-volt direct-current rotary converter. Between the transformer and the rotary stands the reactance which is used for starting the rotary converters. This is the General Electric Company's latest method of starting rotary converters without synchronizing.

The converter room is provided with a heater system which is located in the west end of the building in an entirely separate room along with the toilet, lavatory conveniences and storage room for supplies. The building is of fireproof construction throughout.

Third Rail.

The third rail is of the bull-headed or double-headed type, of the same section as that adopted in the New York City zone of the New York Central Railroad, and is adapted for under-running contact. It was described in detail in the Electric Railway Review of November, 1906, page 911.

The insulators used for holding the third rail in the brackets were supplied by the Ohio Brass Company and are of semi-porcelain. Two sizes are used, one for holding the rail at the inclines where a shallower insulating block is required, the other for supporting the rail at other points. The insulators were required to pass severe tests.

In laying the third rail a space of about one-fourth inch is left at each joint for expansion and contraction. The in-

clines are of gray cast iron of the same quality as that specified for the third-rail brackets and are attached to the third rail by standard two-bolt splice plates. The standard incline used whenever the shoes have to take the incline at high speed is 7 feet in length. The inclines have a pitch of 1 in 44. Two types of protective covering are used, as on the New York Central, viz., a three-part wooden covering which originally was adopted, and a single-piece fiber covering which was manufactured by the Indurated Fiber Company and is

fishplate. There is one of these at each joint, and each bond is of No. 0000 capacity. The track is cross-bonded only at special work. Both rails are available for use for the return circuit.

Connections to Third Rail and Third-Rail Jumpers.

The connection between the direct-current busbars in the various substations and the third-rail system is made through several cables of 1,000,000-circular mil capacity, car-

West Shore Electrification—Passenger Rolling Stock.

considered preferable. Fiber covering is used between New York Mills and Clark's Mills, and would have been employed throughout if a sufficient quantity could have been secured in time for use on the entire installation.

Third-Rail Bonds.

The majority of the bonds on the third rail are the John A. Roebling's Sons Company's ribbon bond. These bonds are 15 inches in length over all and are soldered to the rail, one on each side of the upper head, and have a very large contact

ried in iron ducts 3 inches in diameter. The cable is insulated with 3/32-inch rubber and is lead-encased. The end of this duct at the track is brought up to 2 inches below the top of the track rail or 2.5 inches above the surface of the tie. Great care is taken to insulate and protect the cable at the point at which it emerges from the duct by taping and painting with insulating and waterproof paint.

At the substation end the connections to the east and west bound tracks are carried to separate panels on the switchboard so that electrically the east and west bound

West Shore Electrification—Under-Contact Third Rail as Installed.

surface per terminal. There also have been installed on a portion of this line about 3,000 Ohio Brass Company's ribbon soldered bonds and about 7,000 American Steel & Wire Company's twin terminal bonds. These bonds are of 500,000-circular-mil capacity each and are installed two per joint on the upper head of the third rail. The wood cover is cut away at all joints so as to allow the cover to go over the bond. The fiber cover has an enlarged section at these joints which allows for completely covering the bond.

Running-Rail Bonds.

The running rail is bonded with the Ohio Brass Company's 11-inch compressed terminal bond placed under the

tracks are kept entirely distinct except through the busbars.

Cars.

As the cars are to operate over the city systems in both Utica and Syracuse, a different type was adopted than if they were to use the West Shore tracks exclusively. The main dimensions follow: Length over end panels, 40 feet; over crown pieces and vestibules, 48 feet; width over sills, including sheathing, 8 feet 4 inches by 8¾ inches; end sills, 6 inches by 8 inches; sill plates, ¾ inch by 15 inches; thickness of corner posts, 4½ inches; thickness of side posts, 2¾ inches and 4¾ inches; centers of posts, 2 feet 9 inches.

The bottom framing consists of two intermediate and two

center sills, composed of 6-inch I-beams, extending under the vestibules, with malleable iron caps and supports for main truss rods; the latter are 1½ inches in diameter. The interiors are of inlaid mahogany, which includes the doors; the ceilings are full Empire decorated. The floor is covered with interlocking elastic tile, while a rubber mat is furnished for each vestibule. Storm sashes are furnished for the side windows, which replace window guards in winter. The cars are equipped with 24 reversible and two stationary plush seats

West Shore Electrification—Interior of Standard Passenger Coach.

with high backs and head rolls. Each car is also fitted with a toilet lined with "Mettilite."

The truck used is the Brill No. 27 E-2, with a wheel base of 6 feet 6 inches. The wheel diameter is 37 inches; the axle diameter 5½ inches and 6 inches. The wheel tread is 4 inches wide and the depth of the flange is 1 inch to allow the cars to operate over the city systems in Utica and Syracuse.

Each car is equipped with four G.E. 73 motors with Sprague-General Electric multiple-unit control. Westinghouse

West Shore Electrification—Interior of Rotary Converter Substation.

automatic air brakes with graduated release and Peter Smith hot water heaters are used.

Engineering.

The installation of the electrical equipment of the line has been conducted by the engineering force of the Oneida Railway Company, of which C. Loomis Allen is vice-president and general manager; W. J. Harvie is electrical engineer; and M. J. French, Jr., is engineer of maintenance of way.

Preliminary plans are now being considered by the Northern Texas Traction Company of Ft. Worth, Tex., preparatory to making arrangements for reducing the schedule time of the limited cars from Ft. Worth to Dallas to 1 hour and 15 minutes, 15 minutes less than the present schedule. The line across the Trinity river bottom in Dallas is now being double-tracked and a number of additional switches are to be installed.

LATE INFORMATION ABOUT THE ATLANTIC CITY CONVENTION.

Convention Bulletin No. 2, issued by Secretary Swenson, announces that the plans for the 1907 convention to be held at Atlantic City on October 14 to 18, inclusive, are progressing most satisfactorily. The choice of meeting place has been most favorably commented upon. Elsewhere in this issue is an extended discussion of the convention facilities offered by Atlantic City, N. J. The bulletin contains a detailed schedule of hotel rates for more than 75 of the leading hotels.

Headquarters Hotels.

It has been decided by the official representatives of the various associations that each association shall have its own headquarters hotel. It is the desire that these hotels be used as general meeting places for those interested in specific lines of work.

The Marlborough-Blenheim will in general be considered the headquarters hotel of the American and Manufacturers' associations. The Chalfonte hotel will, in general, be considered the headquarters hotel for the Accountants' association, and the Engineers and Claim Agents will have their headquarters at the Dennis and the St. Charles respectively.

Hotel Reservations.

Arrangements for hotel reservations should be made directly with the hotels. It will aid greatly in avoiding mistakes if the members when writing will indicate that their reservations are made in connection with the convention. In making reservations, explicit statements should be made concerning the kind of room desired and the dates of arrival and departure from the hotel. The special rates are made with the understanding that the charges of the hotel will be for the full time of reservation.

Programme.

The complete programmes of the various associations will be announced in a bulletin which will be issued in July. The morning of Monday, October 14, will be reserved for registration purposes, and the first meetings of the convention will be held on the afternoon of that day. The meetings of the various associations will continue throughout the week, closing on Friday, October 18. Considerable attention has been given to the arrangement of the days upon which the various associations will meet. The following general schedule of meeting days has been decided upon:

Monday, October 14.

9:30 a. m.—Registration and badges.

2:00 p. m.—Meeting of Engineering and Claim Agents' associations.

Tuesday, October 15.

9:30 a. m.—Meeting of Accountants', Engineering and Claim Agents' associations.

2:00 p. m.—Meeting of Accountants', Engineering and Claim Agents' associations.

Wednesday, October 16.

9:30 a. m.—Opening session of American association and joint meeting of affiliated associations.

3:00 p. m.—Meeting of Accountants', Engineering and Claim Agents' associations.

Thursday, October 17.

9:30 a. m.—Meeting of American and Accountants' associations.

Friday, October 18.

9:30 a. m.—Meeting of American association.

The opening session of the American association, which will be a joint meeting with the affiliated associations, will be held in Casino hall.

The usual arrangements are being made with the various passenger traffic associations whereby those attending the convention will be enabled to obtain round trip tickets for one and one-third fare upon the certificate plan.

THE SUPPLY MEN AT ATLANTIC CITY.

The annual conventions of the American Railway Master Mechanics' and the Master Car Builders' associations, two steam railway organizations, have just been concluded at Atlantic City. By reason of the fact that the annual conventions of the American Street and Interurban Railway Association and its allied bodies will be held at that place in October next, the readers of the Electric Railway Review will be especially interested in the arrangements for exhibits at Atlantic City, which will be made on the same Steel Pier and under practically the same conditions as those which prevailed this week during the steam railway meetings.

The interest which the officers of the street railway associations take in the meetings which have just adjourned is indicated by the fact that President John I. Beggs and Secretary B. V. Swenson of the American Street and Interurban

and the American Railway Master Mechanics' associations; to arrange for and have general charge of the exhibits made by its members before said conventions, and to promote friendly relations between its members and the members of said associations.

Art. III.—Membership—Any corporation, co-partnership, or individual engaged in the manufacture or sale of railway material or in the publication of periodicals in the interests of railways and manufacturers of railway materials, may become a member of the association by conforming to the provisions of its by-laws.

Art. IV.—Amendments—Amendments may be made to this constitution at any meeting of the association by a two-thirds vote of the members present and voting.

By-Laws.

Article I.—Qualification of Members.

Section 1.—Payment of the sum of \$25 to the treasurer of the association (or such sum as may be fixed by the executive committee), by those eligible to membership under Article III of the constitution, shall qualify them and their duly

Atlantic City Convention Facilities—Entrance to Steel Pier.

Railway Association visited Atlantic City during the meetings. Mr. George Keegan, the secretary of the Manufacturers' Association, was also an interested observer of the methods employed in handling the exhibits and other things pertaining to the supply interests.

The supply men who attended the Master Mechanics' and Master Car Builders' conventions have had a very excellent organization for a number of years, but the growth of the exhibits and the increase in the importance of the conventions generally, called for a more formal organization. Our readers will, therefore, be interested in the new constitution and by-laws which were adopted at Atlantic City for the Railway Supply Manufacturers' Association. The constitution and by-laws are as follows:

Constitution.

Article 1.—Name—This association shall be called "The Railway Supply Manufacturers' Association."

Art. II.—Objects—Its objects shall be: The advancement of the interests of its members as they are connected with the annual conventions of the Master Car Builders'

designated representatives as members, and entitle them to all the privileges granted by the executive committee as regards exhibit space and entertainment, subject to the limitations hereinafter named.

Sec. 2.—A corporation, firm or individual, upon payment of the fee for membership as prescribed by the executive committee, shall be entitled upon application to receive one badge or other insignia of membership adopted by the executive committee.

Sec. 3.—Any corporation, firm or individual, having paid the membership fee and having need of more than one representatives' badge, may secure additional badges upon payment of \$5.00 for each additional badge, and the application for such badges shall designate the names of their representatives, by whom the badges are to be used; and it is to be expressly understood that no representatives' badges are to be issued to or for any person who is not actually connected with the concern holding the membership, and who is not actually in attendance upon the conventions. The executive committee shall provide for the issuance of guests' badges for ladies, or for other persons, who, in its discretion, may be entitled thereto, by such regulations as it may deem proper.

Sec. 4.—All corporations, co-partnerships or individuals

that shall have paid the assessment of the executive committee of the supply men in connection with the conventions of the Master Car Builders' and the American Railway Master Mechanics' associations for 1907, and all their duly designated representatives who shall have been enrolled and received badges as such, shall, by virtue thereof, be members of this association until May 1, 1908.

Sec. 5.—No application for exhibit space at any convention of the Master Car Builders' or American Railway Master Mechanics' associations shall be accepted by the executive committee unless said application be accompanied by the sum prescribed by the executive committee, thereby renewing the membership of said applicant if he shall be a member or qualifying the applicant as a member under the constitution and by-laws of the association.

Sec. 6.—All membership rights, unless renewed, shall expire on the first day of May subsequent to the conventions preceding or during which the membership fee is paid.

Article II.—Executive Committee.

Section 1.—The government and management of the affairs of the association shall be vested in an executive committee of 12 members, who shall be chosen from among the

Sec. 4.—At the first election to be held after the adoption of these by-laws, eight executive committee members shall be chosen, viz., one from the first district, three from the second, one from the fourth, two from the fifth and one from the seventh, who shall by lot divide themselves into two classes, so that four of them shall serve two years and four three years. The members of the executive committee of the supply men, as constituted at the time of the adoption of these by-laws, who have another year to serve, shall complete the term for which they were chosen. Thereafter, annually, four members shall be elected for terms of three years to fill the places of those whose terms have expired. A member of the executive committee who shall have served three years continuously shall be ineligible for further service until an interim of three years shall have elapsed.

Sec. 5.—Vacancies occurring in any class of the executive committee shall be filled by a majority vote of the remaining members of the executive committee until the next annual meeting of the association, at which time the members of the association from the district where the vacancy shall have occurred shall fill such vacancy for the unexpired term.

Sec. 6.—The executive committee shall hold such meet-

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

members of the association in the manner following, and no corporation, co-partnership or individual proprietor shall be represented on the committee by more than one member:

Sec. 2.—The United States shall be divided into seven representative districts, comprising territory as follows, with the number of members for each district as designated:

- First District—New England States.....1 member
- Second District—New York and New Jersey.....3 members
- Third District—Pennsylvania, Maryland, Delaware, District of Columbia, West Virginia.....2 members
- Fourth District—Ohio, Indiana, Michigan, Kentucky, Tennessee2 members
- Fifth District—Illinois, Wisconsin, Iowa, Minnesota2 members
- Sixth District—Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi1 member
- Seventh District—States west of Mississippi river, including Louisiana, but excepting Iowa and Minnesota1 member

Sec. 3.—The executive committee members for the several districts shall be chosen by the members of the association residing in such districts, in the manner prescribed in Section 2, Article IV, of the by-laws.

ings as may be necessary to be called by the president or by six members of the committee, at which meeting reasonable notice shall be given to the members. The attendance of four members shall constitute a quorum of the committee at any meeting. Any member of the executive committee unable to attend a meeting of the same may appoint some other member of the association as his proxy, and such proxy shall for such meeting have all the powers of the member whom he represents.

Article III.—Officers.

Section 1.—The officers of the association shall be a president, a vice-president, a secretary and a treasurer, who, with the exception of the secretary, shall be chosen from the members of the executive committee who have served at least one year as members of said committee, at the annual meeting of the association, by a plurality vote of its members. Each officer shall hold office for one year from August 1 after his election, or until his successor shall be elected and qualified, except the secretary, who shall be elected by the executive committee and serve during the pleasure of said committee.

Sec. 2.—No salaries may be paid to any of the officers except the secretary, who may, within the discretion of the executive committee, be paid a salary for his services.

Sec. 3.—It shall be the duty of the president to preside at all meetings of the association and of the executive committee. He shall manage the business of the association and do and perform all such acts in the name of the association as he may thereunto be authorized by the executive committee, subject at all times to the action and control of the executive committee.

Sec. 4.—The vice-president shall, in absence of the president, act in his stead, with the same powers and subject to the same restriction imposed upon the president.

Sec. 5.—The treasurer shall have the care and custody of the funds of the association which may come into his hands, to hold and dispose of same as the executive committee may direct, and give such bond or security as the executive committee may deem proper.

Sec. 6.—The secretary shall keep the minutes of the proceedings of the association and of the executive committee; attend to such correspondence as shall be assigned to him; have charge, under the direction of the president and of the executive committee, of the allotment of exhibit spaces for the conventions, and shall in general, under the direction of the president and of the executive committee,

Sec. 2.—The executive committee shall by proclamation, to be duly published in such daily paper or papers as may be mentioned, and also to be posted conspicuously at least two days prior thereto, name the time and places for holding the meetings of the members of the association residing in the several districts, for the election of members of the executive committee. At each of such meetings a chairman and a secretary shall be chosen, who shall certify to the association the person or persons elected thereat as members of the executive committee, and such certificate shall contain the names of the members attending the meeting. The executive committee shall be the final arbiter of any contests affecting the election of members of the executive committee.

Sec. 3.—In case the members of the association residing in any district shall fail to elect a member or members of the executive committee, then and in that event the executive committee shall fill the vacancy as provided for in Section 3, Article II, of the by-laws.

Article V.—Order of Business.

Section 1.—The order of business at the annual meeting shall be:

Atlantic City Convention Facilities—Arcade on the Steel Pier.

tee, perform all duties incident to the office of secretary.

Article IV.—Meetings.

Section 1.—The annual meeting of the association shall be held on the Saturday intervening between the annual meetings of the Master Car Builders' and the American Railway Master Mechanics' associations, in the same city or village where said associations meet, at such time and place as the executive committee may appoint, and of which the members shall have due notice. If the dates of the conventions of the Master Car Builders' and the American Railway Master Mechanics' associations should be changed so as to make it impracticable to hold the annual meeting of this association on Saturday as above prescribed, then a time three days after the beginning of said conventions shall be appointed by the executive committee for such meeting. Special meetings may be called by the executive committee upon the petition of 25 or more members, representing at least 25 separate and distinct corporations, co-partnerships or individual proprietors. If such special meetings are called for any other time than during the conventions above named, at least 30 days' notice shall be given to all members. Twenty-five members, representing 25 different concerns, shall constitute a quorum for the transaction of business at any meeting of the association.

1. Reading of minutes of preceding meeting.
2. Report of executive committee.
3. General business.
4. Reports from district meetings of election of members of executive committee.
5. Election of officers.

Article VI.—Amendments.

These by-laws may be amended at any meeting of the association by the affirmative vote of two-thirds of the members present and voting.

The New Executive Committee and Officers.

In conformity with the provisions of its new organic law the Railway Manufacturers' Association elected officers as follows:

- President—R. T. Walbank, Glidden Varnish Company.
- Vice-President—F. L. DeArmond, Protectus Company.
- Treasurer—George N. Riley, National Tube Company.

These gentlemen are all members of the executive committee, which is made up as follows:

- First District (New England States)—Frank A. Morrison of the Mason Regulator Company.
- Second District (New York and New Jersey)—Alexander

Turner of the Galena-Signal Oil Company; A. L. Whipple of the Curtain Supply Company; and Thomas Aldcorn of the Chicago Pneumatic Tool Company.

Third District (Pennsylvania, Maryland, District of Columbia, West Virginia)—George N. Riley of the National Tube Company and F. L. DeArmond of the Protectus Company.

Fourth District (Ohio, Indiana, Michigan, Kentucky, Tennessee)—George A. Cooper of the Frost Railway Supply Company and A. G. Hollingshead of the Ralston Steel Car Company.

Fifth District (Illinois, Wisconsin, Iowa, Minnesota)—R. T. Walbank of the Glidden Varnish Company and W. H. Miner of the W. H. Miner Company.

Sixth District (Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi)—L. O. Cameron of the Pressed Steel Car Company.

Seventh District (states west of Mississippi river, including Louisiana, but excepting Iowa and Minnesota)—R. H. Weatherly of the Scullin-Gallagher Iron & Steel Company.

The secretary is chosen by vote of the executive committee, and Mr. Bruce V. Crandall, president of the Bruce V. Crandall Company, Chicago, which publishes the American Railway Master Mechanic, has been elected to that office.

The exhibits were made on a more comprehensive scale than ever before and well-nigh taxed the facilities of the Steel Pier. There was some space, however, which was not filled, and the results of the experience of the last two weeks at Atlantic City indicate that the exhibits of October next will be well provided for. A scheme of uniform booths, which contributed much to the attractiveness of the exhibits, was employed for the first time, and these same booths and the same general plan of handling the exhibits are, we understand, to be used for the October conventions. The views which we reproduce herewith from photographs taken for the Electric Railway Review will give a very good general idea of the appearance of the exhibits. Owing to the fact that the awnings which are attached to each booth were up when these pictures were taken, they do not show clearly the details of the exhibits. They will, however, serve the purpose of giving a good idea of the booth scheme which was described in our issue of April 13, 1907.

Following is a complete list of the concerns which made displays at Atlantic City, together with an enumeration of what their exhibits contained and the names of their representatives:

List of Exhibitors.

Acme Ball-Bearing Company, New York City.—Acme ball-bearing jacks. Represented by George F. Wasson, Charles C. Sturtz and E. T. Sawyer.

Acme Supply Company, Chicago, Ill.—Acme vestibule curtain, Acme vestibule roller, Acme vestibule curtain shield, Acme car shade roller, Acme metallic weather strip, Acme vestibule diaphragm. Represented by W. H. Schrover, R. E. Slagle.

Adams & Westlake Company, Chicago, Ill.—Adlake-Newbold car lighting system, lighting fixtures, car trimmings, signal lamps. Represented by F. B. Jones, E. L. Langworthy, A. S. Anderson, R. M. Newbold, F. N. Grigg.

Addressograph Company, Chicago, Ill.—Card index addressograph, a combined addressing machine and card index system. Represented by E. D. Dorsey.

Aikman & Co., C. M., New York.—Samples of car plush at the Hotel Dennis. Represented by Richard Harris.

American Balance Valve Company, Jersey Shore, Pa.—American semi-plug piston valves after two years' (night and day) service over ports without bridges, semi-plug valves for simple and compound engines, Jack Wilson high-pressure slide valves for standard and for low-clearance cylinders, model of Walschaert valve gear with piston valves, model of modified Stevens valve gear with Jack Wilson internal-admission, low-clearance, separately-actuated valves, giving extremely close distribution of steam. Represented by J. T. Wilson and Frank Trump.

American Blower Company, Detroit, Mich.—Blower, exhaust fan, generator set, pressure blower, heating coils, model of a moist air dry kiln, volume blower and motor, also a 5 by 5 inch engine. Represented by C. W. Old and R. B. Bedford.

American Brake Company, Pittsburg, Pa.—Locomotive driver and truck brakes and slack adjusters. Represented by E. L. Adreon, C. C. Higham and F. E. Schwentler.

American Brake Shoe & Foundry Company, Mahwah, N. J.—

Steel back locomotive driver brakeshoes, steel back flanged coach shoes, steel back unflanged car shoes, steel back electric railway brakeshoes. Represented by W. S. McGowan, F. L. Gordon, F. W. Sargent, J. S. Thompson, H. S. Bradfield, E. L. Janes, E. J. Searles, C. C. Higgins, L. R. Dewey, E. B. Smith, L. J. Hibbard, Charles Herron, F. H. Coolidge, B. H. Grundy, J. D. Gallagher and J. B. Terbell.

American Car & Foundry Company, St. Louis, Mo.—One New York Central steel passenger coach designed for suburban service. On exhibit track. Represented by Scott H. Blewett and Messrs. Sturtevant and Duvall.

American File Sharpener Company, New York, N. Y.—File sharpening machine, carbolynt for sharpening files. Represented by A. H. Radell and M. G. Grubb.

American Locomotive Company, New York.—Booth on the pier. Represented by W. H. Marshall, H. F. Ball, G. M. Basford, J. D. Sawyer and F. J. Cole.

American Mason Safety Tread Company, Boston, Mass.—Mason safety tread, steel base and brass or delta metal base, lead filled, carborundum filled, karbolith filled, both flat and with nosings, repair tread and method, running board of cars and method of preventing slipping, combination of Mason safety tread and cork composition for passageways, vestibules, etc., worn safety treads, safety tread as installed on wood and in concrete, anchors used for holding tread in granolithic work, karbolith flooring for car and other floors set on wood, concrete or steel. Represented by Henry C. King and L. H. Myrick.

American Steel Foundries, Chicago, Ill.—Steel truck on turntable equipped with Simplex bolster, Susemihl side bearings, four Davis wheels and Andrews cast-steel side frames. Simplex brakebeams and springs, T-shaped cast-steel truck bolster, I-shaped bolster, U-shaped bolster and box-shaped bolster, swayback body bolster for furniture cars, body bolster for low-hung sills, steel cross-heads, driving wheel centers, Andrews side frame, Janney freight and tender couplers, Kelmont passenger coupler. Represented by W. V. Kelley, R. P. Lamont, W. W. Butler, G. E. Slaughter, D. T. Harris, J. V. Bell, T. D. Kelley, G. E. Murray, T. E. Cook, W. F. Shults, J. Stewart Andrews, D. W. Coll, P. J. Kalman, J. Soule Smith, H. P. Shaw, J. R. Stuart, E. H. Bauer, W. E. Fowler, Jr., R. H. Ripley, W. Ross Gravenor, F. B. Ernst and G. G. Floyd.

American Steam Gauge & Valve Manufacturing Company, Boston, Mass.—American Thompson improved indicator, American muffled pop safety valve, American locomotive steam gauge, American locomotive duplex gauge, American dead-weight gauge tester, American locomotive chime whistle and several other locomotive appliances. Represented by R. B. Phillips, Gardner Cornett, C. A. Allen and Horace Parker.

American Water Softener Company, Philadelphia, Pa.—Model of railway water softening plant in operation. Represented by A. S. Garrett, G. S. Garrett, W. H. P. Fisher, A. C. Tomlinson, George Bacon and A. C. Emlen.

American Track Barrow, Lowell, Mass.—One-rail track tools, devices for carrying railway material on one rail. Represented by E. D. Peirce.

Anglo-American Varnish Company, The, Newark, N. J.—Samples and advertising matter. Represented by William Marshall and Franklin W. Fort.

Armstrong Bros. Tool Company, Chicago, Ill.—A full line of Armstrong lathe and planer tool holders, Universal ratchet drills, improved tool posts for lathes, boring bars, bolt drivers for lathe and planer jacks. Represented by Paul Armstrong and John McBride.

Atha Steel Casting Company, The, Newark, N. J.—One B. R. & P. cast-steel truck bolster, one D. & H. cast-steel truck bolster, one Maine Central cast-steel truck bolster and cast-steel body bolster, two "Titan" steel motor gears. Represented by R. N. Barrows, G. T. Paraschos, C. W. Gennet, C. W. Owston and L. A. Shepard.

Baeder, Adamson & Co., Philadelphia, Pa.—Model of a refrigerator car, showing the application of insulating material. Represented by H. J. Bellman and M. J. Murphy.

Bald Manufacturing Company, Pittsburg, Pa.—The Miller quick-acting monkey wrench. Represented by William Bald.

Baldwin Steel Company, New York.—Full line of Hudson high-speed tools, twist drills, reamers, milling cutters, etc., Hudson high-speed steels, crucible tool steel, lathe tools. Represented by C. F. Simmons, J. A. Collom, Edward Milnor, W. L. Stone.

Barnett Equipment Company, New York and Newark, N. J.—The Barnett connector, automatically coupling signal, air and steam lines and safety chains between cars, exhibited under service conditions, the Barnett universal steam hose coupler, couples with all sizes and makes. Represented

- by Stephen D. Barnett, E. W. Hine, E. E. Silk, Robert A. Wolff.
- Besly & Co., Chicago, Ill.—Besly spiral disc grinders, spiral grooves, shear-cut, Helmet spiral paper and cloth circles, Helmet temper taps, Helmet oil, Helmet babbitt, Helmet iron oil cups, bonanza oil cups, Helmet bronze, spring, sheet and wire. Represented by Edward P. Welles and Charles A. Knill.
- Best American Calorific Company, W. N., New York.—Oil burners and oil-burning furnaces. Represented by R. G. Wells, W. N. Best and L. D. Douglas.
- Bethlehem Steel Company, South Bethlehem, Pa.—Staybolt irons, high-speed steel, special alloy steels, drop forgings and heavy machinery. Represented by W. C. Cutler, J. C. Halliday, G. J. Costello, R. D. Chapman, J. S. Hageman and O. H. Reynolds.
- Bettendorf Axle Company, Davenport, Ia.—Bettendorf I-beam bolster, Bettendorf all cast-steel truck, Bettendorf structural steel underframe with cast-steel and center sill ends. Represented by W. P. Bettendorf, J. W. Bettendorf, G. N. Caleb, J. H. Bendixen and S. S. Shields.
- Bickford Drill & Tool Company, Cincinnati, O.—No. 1 stand-
- also storage tanks and oil cabinets. Represented by C. A. Dunkelberg, W. T. Simpson and W. A. Pitcher.
- Bradford Car & Manufacturing Company, Chicago, Ill.—Bradford draft gear, steel underframes, rocker bottom cars and steam and air connectors. Represented by H. C. Priebe.
- Brady Brass Company, Jersey City, N. J.—Cypress bronze in casting and ingot form, phosphor bronze in casting and ingot form, engine castings, brass castings, motor bearings, babbitt metals, trolley wheels, journal bearings and solder. Represented by Daniel M. Brady, Amos J. Passino, Henry J. Lahay, Clarence M. Mendenhall and George C. Morse.
- Bridgeport Safety Emery Wheel Company, The, Bridgeport, Conn.—Eighty-inch guide bar grinder, motor-driven; tool grinder, motor-driven; emery, corundum and carborundum alumina wheels. Represented by D. T. Homan.
- Buchs & Son, A., Elizabethtown, Pa.—A gravity molding machine. Represented by A. Buchs, C. A. West.
- Buckeye Steel Castings Company, Columbus, O.—Major steel freight car coupler, Buckeye cast-steel coupler, yoke and Buckeye cast-steel truck bolster. Represented by S. P.

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

- ard plain radial drill fitted with variable speed motor in operation. Represented by H. M. Norris and Fred H. Holz, Jr.
- Birdsboro Steel Foundry & Machine Company, Birdsboro, Pa.—Jackson belt lacing, Wagner universal cold saw. Represented by W. C. Johnson.
- Bliss Electric Car Lighting Company, Milwaukee, Wis.—Three types of axle lighting equipments, one with Bliss constant potential bucker regulation, one with Bliss New York Central constant potential booster regulation, one with Bliss Santa Fe constant current regulation. Various parts which go to make up the apparatus, disassembled. Types of standard car lighting batteries. Represented by W. L. Bliss, John T. Dickinson, F. Urban, W. M. Labor, Robert C. Shaal, L. Mau, John Bliss and Edwin H. Tower.
- Boker & Co., Hermann, New York.—Intra-steel—a new semi-high-speed steel, to be used as a substitute for regular carbon steel, also "Novo" steel. patent sections. Represented by Ellsworth Haring.
- Bordo Company, L. J., Philadelphia, Pa.—Locomotive blow-off valves, locomotive gauge cocks and locomotive swing joints. Represented by L. J. Bordo, Edwin A. Knowlton, Edward W. Hodgkins, C. R. Weaver and C. W. Allen.
- Bowser & Co., Inc., S. F., Ft. Wayne, Ind.—Self-measuring hand and power pumps for handling all kinds of oils.
- Bush, J. C. Whitridge, A. H. Thomas, George Broobey, G. T. Johnson and H. L. Winslow.
- Buda Foundry & Manufacturing Company, Chicago, Ill.—Hand-car wheels, Paulus track drills with high-speed Rich bits, Buda grinders and attachments for grinding Rich and twist bits, ball-bearing jacks up to 60 tons, one 25-ton locomotive jack on traversing base, ratchet track jacks, car jacks, track lining-up jacks, Buda replacers, Buda pressed steel hand-car wheels. Represented by W. R. Burrows, R. D. Bates, R. H. Hyland, R. M. Smith, T. J. Stocks.
- Buffalo Brake Beam Company, New York, N. Y.—Solid brake-beams for all classes of equipment, forged steel brake-heads, forged steel fulcrums, forged steel wheel guards, forged steel chain clips and steel backs for brakeshoes. Represented by S. A. Crone, R. C. Fraser, E. Strassburger, C. E. Barrett and E. C. Farlow.
- Bullard Machine Tool Company, The, Bridgeport, Conn.—The 36-inch vertical turret lathe in operation. Represented by S. H. Bullard, J. W. Bray, Allen W. Ransom, H. C. Elliott, G. J. Stansbury, G. E. Merryweather, Charles G. Smith and W. J. Alles.
- Cambria Steel Company, Johnstown, Pa.—One low side gondola car and one 100,000-pound capacity, Pennsylvania

- standard, hopper car on exhibit track. Represented by Mr. Sage.
- Camel Company, Chicago, Ill.—Refrigerator car on tracks. Represented by J. M. Hopkins and P. M. Elliott.
- Carborundum Company, The, Niagara Falls, N. Y.—Carborundum products. Represented by E. J. Eames, W. W. Sanderson, R. B. Fuller, C. C. Schumaker, Charles Nicholson and C. O. Taylor.
- Cardwell Manufacturing Company, Chicago, Ill.—Cardwell friction draft gear, Cardwell rocker side bearings. Represented by W. G. Krauser, C. H. Tobias and J. R. Cardwell.
- Carey Manufacturing Company, The Philip, Cincinnati, O.—Carey's 85 per cent magnesia locomotive lagging, Carey's standard flexible cement roofing, Carey's 85 per cent magnesia sectional steam pipe covering, Carey's all-asbestos train pipe covering, asbestos paper, millboard and packings, asbestos-metallic packing and gaskets, standard asbestos-molded covering, nonpareil cork covering and lagging, 85 per cent magnesia cement, asbestos cement, asbestos fibers, asbestos cold water paints, magnesia roofing paint, etc. Represented by George D. Crabbs, Steve J. Bowling, N. S. Kenney, John G. Howley and W. I. Kelly.
- Castle & Co., A. M., Chicago, Ill.—Corrugated side sheets for locomotive fireboxes. Represented by W. A. Roomse, C. M. Chamberlin.
- Celfor Tool Company, Successor to George R. Rich, Chicago, Ill.—High-speed twist and flat drills in operation. Represented by Russell Dale, W. F. Heacock, William Brewster.
- Chase & Co., L. C., Boston, Mass.—Chase's "Goat Brand" mohair car plushes for car seats and upholstering purposes, in plain and frieze effects. Represented by R. R. Bishop, Jr.
- Chicago Car Heating Company, Chicago, Ill.—Vapor system of car heating, pressure system of car heating, steam hose couplers, vertical steam traps, horizontal steam traps, automatic train pipe valves and special devices for Baker heater. Represented by Egbert H. Gold, E. A. Schreiber, B. A. Keeler and F. F. Coggin.
- Chicago Railway Equipment Company, Chicago, Ill.—Creco, National Hollow, Diamond, Kewanee, Reliance, Monarch, Sterlingworth and 96 types of brakebeams, Monitor bolsters, Creco roller side bearings for steam and street railways and Creco slack adjusters. Represented by E. B. Leigh, F. T. De Long, A. J. Farley, E. G. Buchanan, Fred G. Ely, Harry W. Frost, C. H. Williams, Jr., E. F. Leigh, B. F. Pilson, Raymond H. Pilson, H. W. Fennell, C. P. Williams and George A. Cooper.
- Clark & Co., A. C., Grand Crossing, Ill.—Mechanical boiler cleaner. Represented by J. C. Mohr and W. C. Smith.
- Cleveland Car Specialty Company, Cleveland, O.—Pressed steel carlines for passenger and freight equipment. Represented by George L. Weiss, W. S. Bidle, B. Haskell, J. A. Costello and George B. Maltby.
- Chicago Pneumatic Tool Company, Chicago, Ill.—Franklin air compressor, Boyer and Keller riveting and chipping hammers, Little Giant piston air drills in several sizes with plain and Corliss valves, turbine air drills, Duntley electric drills, grinders, blowers, hoists, compression riveter, magnetic oldman, drilling stands, etc. Represented by W. O. Duntley, Thomas Aldcorn, W. P. Pressinger, C. B. Coates, F. C. Severin, G. A. Barden, C. E. Walker, B. H. Tripp, Charles Booth and Howard Small.
- Cleveland Pneumatic Tool Company, The, Cleveland, O.—Pneumatic riveting hammers, chipping and calking hammers, stone and scaling hammers, valve grinder, drills, reversible and non-reversible, breast drills, Bowes' automatic air hose couplings, hose and holders-on. Represented by H. S. Covey, W. J. Greer, C. R. Ely, C. A. McInturff, Charles F. Palmer and Arthur Scott.
- Cling-Surface Company, Buffalo, N. Y.—Cling-Surface for belts. Represented by William D. Young and Charles F. Chase.
- Coale Muffled Safety Valve Company, Baltimore, Md.—Standard muffled safety valves in the exhibit of the Nathan Manufacturing Company. Represented by H. C. McCarty.
- Coe Brass Manufacturing Company, The, Ansonia, Conn.—Extruded metals in great variety of intricate designs, especially adapted to car and railway construction and ornamentation; also for use in electrical and other apparatus. Represented by James A. Doughty, E. J. Steele, William W. Cotter and William H. Rippere.
- Coe Manufacturing Company, W. H., Providence, R. I.—Coe's gilding wheels and ribbon leaf, Coe's Hibernish bronze powders, Coe's Hibernish bronzing liquid. Represented by Charles H. Bowers.
- Columbia Nut & Bolt Company, Bridgeport, Conn.—Samples of the Columbia lock nuts. Represented by Fred Atwater.
- Commercial Acetylene Company, The, New York, N. Y.—Acetylene safety storage system as applied to car and signal lighting, locomotive headlight, etc., car lamps and brackets, signal lamps, locomotive headlights, tank cut open showing asbestos packing, tanks which went through fire on the Delaware Lackawanna & Western, railway appliances. Represented by W. P. Hix, Roger J. Faure, Oscar F. Ostby and C. N. Neilson.
- Commonwealth Steel Company, St. Louis, Mo.—Models of transom draft gear for steel cars, transom draft gear for wooden cars, Davis counterbalanced locomotive driving wheel, tiregraph machine, separable body bolster for wooden cars, separable body bolster for steel cars and engine and tender trucks. Represented by Clarence H. Howard, H. M. Pflager, George H. Howard and A. R. Thomas.
- Consolidated Car Heating Company, New York, N. Y.—Direct-steam hot-water and low-pressure car heating systems, steam couplers, steam traps, steam valves, McElroy automatic electric car lighting system and electric heaters and switches. Represented by Francis C. Green, Cornell S. Hawley, James F. McElroy, William H. Fulton, W. S. Hammond, Jr., S. B. Keys, C. C. Nuckols and T. M. May.
- Consolidated Railway Electric Lighting & Equipment Company, New York, N. Y.—Showing standard D-type generator and Kennedy regulator and type F generator and A regulator, in operation, and several types of storage battery, Kennedy system of axle lights. Represented by Patrick Kennedy, J. L. Watson, Thomas L. Maunt, Chester Terry and Barton H. Grundy.
- Crocker-Wheeler Company, Ampere, N. J.—Form I-F field-weakening motor in operation; a large number of photographs of various lines of motors and generators, both alternating and direct current. Represented by H. de C. Hamilton, Rodman Gilder, F. B. De Gress, H. J. Sage, L. S. Horner, A. L. Doremus, H. L. Patteson, R. J. Randolph, Jr.
- Crucible Steel Company of America, Pittsburg, Pa.—All kinds of tool steel forgings, Rex "A" twist drills and bar steel, cold drawn drill rods, wire and strips. Represented by I. Baskerfield, M. R. Ferguson, W. A. Gowing and B. V. Maxwell.
- Curtain Supply Company, Chicago, Ill.—Forsyth roller tip No. 86 fixtures, No. 88 ring fixtures, No. 89 ring fixtures with projecting pins, Keeler eccentric fixtures, Burrowes No. 83 fixtures, Pantasote curtain material, Crown curtain material and Oakette curtain material. Represented by W. H. Forsyth, A. L. Whipple and R. F. Hayes.
- Dahlstrom Metallic Door Company, Jamestown, N. Y.—All-steel door, interior steel car trim. Represented by O. C. Reinecke, Charles Dahlstrom, W. H. E. Reinecke.
- Damascus Brake Beam Company, The, Cleveland, O.—Damascus beams in both 5 and 6 inch sections of various weights, forged fulcrums for Damascus beams, Waycott trussed beams of various weights for freight and passenger equipment and adjustable heads for Waycott passenger beams. Represented by Albert Waycott and Philip T. Handiges.
- Davis Company, The John, Chicago, Ill.—Reducing valves, back-pressure valves, pump regulators, air regulators and armored hose. Represented by George F. Hughson.
- Davis Expansion Boring Tool Company, St. Louis, Mo.—Expansion boring tools. Represented by Mr. Moberly.
- Davis Solid Truss Brake Beam Company, Wilmington, Del.—Brakebeams and brakebeam testing machine. Represented by Nathan H. Davis, Thomas C. Davis, W. C. DuComb, Jr., and H. Dohl.
- Dearborn Drug & Chemical Works, Chicago, Ill.—Water purifying reagents and exhibit of the action of different kinds of boiler waters on locomotive boiler tubes. Represented by Robert F. Carr, George R. Carr, D. E. Cain, J. D. Purcell and H. G. McConnaughy.
- Detroit Hoist & Machine Company, Detroit, Mich.—See Pilling Air Engine Company.
- Detroit Lubricator Company, Detroit, Mich.—Three-feed sectional lubricator, three-feed No. 21 lubricator, with new type gauge glasses, a seven-feed No. 61 lubricator for superheated steam locomotives. Represented by A. B. Wetmore, H. J. Lord, John Arnold, A. D. Homard.
- Detroit Seamless Steel Tubes Company, Detroit, Mich.—Detroit locomotive flues and Detroit safe ends. Represented by T. H. Simpson, T. N. Motley, Frank H. Clark and R. B. Owen.
- Dickinson, Paul, Incorporated, Chicago, Ill.—Photographs and full-sized models of Dickinson cast-iron smokejacks, ventilators and chimneys. Represented by A. J. Filkins, E. W. Hodgkins, W. A. Bither and J. A. Meaden.
- Dill Machine Company, T. C., Philadelphia, Pa.—One 15-inch Dill rapid-production slotter in operation. Represented by T. C. Dill, Harry Taylor and Robert Russell.
- Dixon Crucible Company, Joseph, Jersey City, N. J.—Dixon's silica-graphite paint, American graphite pencils, Ticonderoga flake graphite lubricants, plumbago crucibles, pipe-

- joint compound, graphite air-brake and triple valve grease, and graphite greases and other graphite products for railroad use. Represented by C. H. Spotts, L. H. Snyder, J. J. Tucker, H. A. Nealley, W. A. Houston, A. C. Bowles and R. A. Brown.
- Dressel Railway Lamp Works, The, New York, N. Y.—Locomotive headlights, engine signal lamps and train marker lamps. Represented by F. W. Dressel, Robert Black, F. W. Edmunds, H. S. Hoskinson, J. M. Brown, E. W. Hodgkins.
- Drouvé Company, The-G., Bridgeton, Conn.—Anti-Pluvius skylight and Lovell window-operating device. Represented by A. C. Bradley.
- Dudgeon, Richard, New York, N. Y.—Thirty-ton Universal jacks of the railroad type, plain type and claw type; 30-ton Universal railroad jack of the independent claw type, 40-ton Universal railroad jack, 60-ton independent pump Universal jack and test pump. Represented by James W. Nelson, W. H. Mathers and Frederick Tenney.
- Duff Manufacturing Company, The, Pittsburg, Pa.—Barrett track and car jacks, Duff ball-bearing screw jacks in all sizes and capacities up to 75 tons, Duff roller-bearing and cone-bearing screw jacks, Barrett and Duff journal jacks and traversing jacks. Represented by T. A. McGinley, George A. Edgin and P. F. Kobbe, Jr.
- Edwards Company, O. M., The, Syracuse, N. Y.—Models illustrating 30 designs of Edwards' window fixtures and 4 de-
- water, and many other interesting tests. Represented by Thomas H. Downward and S. F. Osbourn.
- Farlow Draft Gear Company, Baltimore, Md.—Models of the Farlow twin-spring draft gear as applied to cars of the Great Northern Railway and Seaboard Air Line, showing the malleable iron draft sill; twin spring applied to channel draft sills for wooden underframe construction, Farlow attachments in combination with the Westinghouse friction barrel, twin-spring gear applied to cast-steel end sills, Farlow attachments in combination with the Sessions friction barrel, twin-spring gear applied to channel sills cut off from a wrecked car. Represented by I. O. Wright, Dwight F. Mallory, Bradley S. Johnson, John H. Farlow, M. A. Garrett and C. M. Garrett.
- Fibrous Paint Company, Inc., Philadelphia, Pa.—Adhesive, waterproof and flexible paint. Represented by Frank Davis, H. S. McCartney, W. L. Corson, Alfred Voelker, B. F. Davis.
- Flannery Bolt Company, Pittsburg, Pa.—Several sizes of Tate flexible staybolts and tools for applying them to locomotive boilers. Represented by B. E. D. Stafford, J. Rogers Flannery, Harry A. Pike, W. M. Wilson and Tom R. Davis.
- Forsyth Brothers Company, Chicago, Ill.—Forsyth buffing mechanism for passenger equipment, metallic sash, draft rigging and truck-actuated drawbar controlling devices, Chaffee drawbar centering devices, Stucki radial drawbar centering devices, safety deck sash ratchets, all metallic

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

- signs of Edwards' extension platform trap-door fixtures, samples showing metal windows and window sash, Edwards' tin barrel-spring rollers, both pawl designs and the Edwards special ratchet design, with roller brackets, both plain and worm gear, and samples of hardware showing special finishes in brass and bronze. Represented by Oliver M. Edward, Edward F. Chaffee, Franklin M. Nicholl, C. H. Rockwell, C. L. Eddy and George G. Norris.
- Ehret Magnesia Manufacturing Company, Philadelphia, Pa.—Samples of 85 per cent magnesia locomotive laggings. Represented by W. A. Macan.
- Electric Storage Battery Company, Philadelphia, Pa.—Car lighting cells, all kinds of single cells, types D, E and F, in glass jars, New York Central type, for electrified steam roads. Represented by E. L. Reynolds, Charles Blizzard, E. H. Hunt, A. Taylor and Robert Hull.
- Falls Hollow Staybolt Company, Cuyahoga Falls, O.—Samples of hollow and solid staybolt iron, manufactured of a blend of imported Swedish and native high-grade charcoal iron stock, samples of staybolt iron nicked in various ways, and broken to indicate the superior quality and fibrous texture of Falls hollow and solid staybolt iron, and samples threaded and bent double flat without fracture. Represented by C. M. Walsh, John Livingstone, F. C. Lippert and W. H. Dangel.
- Flexible Compound Company, Inc., The, Philadelphia, Pa.—Flexible compound, flexible black enamel No. 75 iron destroyed in any kind of acid asked for, without destroying paint or film, all kinds of acids put in tissue paper napkins, water boiled in tissue paper napkins and china silk bags, water in muslin bags, hundred pounds to square foot, hardwood finishing, flexible paints and varnishes on silks and muslin, silk transparent signs, painting under weather stripping and Forsyth patent car seat beaters. Represented by George H. Forsyth and Louis A. Gray.
- Foster Company, The, Walter H., New York, N. Y.—Landis universal and piston rod grinders and bolt cutters, Lassiter staybolt threading machine and chaser grinder, and taper bolt cutter heads. Represented by Walter H. Foster, Frank H. Robinson, B. D. Jackson and George R. Willis.
- Fox Machine Company, Grand Rapids, Mich.—Fox heavy pipe or flue cutter, Thomes core box machine, Fox mitering machine, Fox milling machine, Fox universal wood trimmers, Fox bench type trimmers, patternmakers' bench with patent vise, and Fox adjustable saw dado or gaining heads. Represented by George Schow and S. O. Livingston.
- France Packing Company, Inc., Philadelphia, Pa.—Metallic packing, grease cup, fibrous packing, sheet packing. Represented by A. W. France, L. T. Safford, J. K. Rutherford.
- Franklin Manufacturing Company, Franklin, Pa.—Reinforced corrugated asbestos roofing or sheathing asbestos shingles in assorted colors, asbestos building lumber, K. & M. 85 per cent magnesia locomotive lagging, magnesia pipe coverings, asbestos pipe coverings, asbestos boards, papers, packings and textile goods, Ambler asbestos ring air pump and throttle packings, asbestos lumber smoke jacks, and asbestos roofings, 2 and 3 ply. Represented by R. J. Evans, Wallace W. Johnson, George S. Stuart, Frederick Alford, L. B. Melville, C. E. Wade, Charles H. Stringer and W. C. Walsh.
- Franklin Railway Supply Company, Franklin, Pa.—Franklin automatic locomotive fire door and fire door opener, Franklin driving box lubricator, Franklin flexible ball joint for steam, air and oil connections, McLaughlin flex-

- ible joint, McLaughlin lock nut and Franklin journal-bearing replacement jack. Represented by J. S. Coffin, A. G. Allen, B. H. Haskell, A. G. Elvin, H. S. Hayward, Jr., B. A. Krenz, J. Sinkler and Paul Weiler.
- Frost Railway Supply Company, Detroit.—Harvey friction draft spring gear, Harvey permanent stake pocket. Represented by Harry W. Frost, George L. Harvey, George A. Cooper.
- Galena-Signal Oil Company, Franklin, Pa.—Booth on the pier. Represented by J. S. Coffin, E. V. Sedgwick, Harry Hillyer, J. A. Roosevelt, William Walsh, William Holmes, E. W. Grieves, W. O. Taylor, E. G. Johnson, J. S. Patterson, J. S. Seeley and Alexander Turner.
- Garlock Packing Company, The, Palmyra, N. Y.—Fibrous, metal and asbestos packing, hose, pump valves and all other mechanical rubber goods for railroad service. Represented by O. J. Garlock, F. W. Griffith, L. E. Adam, W. R. Haggart, George L. McCabe, F. A. Ebert, E. H. Morrison, A. J. Bolting, G. A. Wismer, J. N. Todd, E. C. Adams, J. F. Edmonds, D. Newhall and J. E. Johnson.
- Garvin Machine Company, The, New York, N. Y.—No. 2 Garvin universal milling machine with new design dividing head, No. 22 vertical milling machine with rotary table, No. 14 vertical spindle milling machine, Garvin's latest pattern with adjustable rail, Garvin die slotter, four sizes of Garvin straight-line milling machine vises, No. 2 Garvin automatic tapping machine, No. 14 Garvin plain milling machine in operation, motor driven, column type millers to be provided with the Garvin solid top and extended knee. Represented by George J. Thompson and Roy Garvin.
- General Electric Company, Schenectady, N. Y.—Booth on pier. Represented by F. H. Gale, W. J. Clark, J. G. Barry, L. R. Pomeroy, R. E. Moore, C. C. Peirce, J. J. Mahoney, E. D. Priest, A. W. Jones.
- Gisholt Machine Company, Madison, Wis.—Photographs of standard Gisholt "Big Bore" lathe, Gisholt combination lathe, a chucking and bar machine with spindle capacity up to 7½ inches, Gisholt boring mills and universal tool grinder. Represented by Stanley G. Hanks, C. W. Johnson, Ellis F. Muther, J. E. Brandt.
- Gold Car Heating & Lighting Company, New York, N. Y.—Improved Gold systems of car heating by means of direct steam apparatus, as well as hot-water circulating systems, and a very simple and commendable car-lighting system using acetylene gas, improved steam couplers, automatic steam traps, temperature regulators, end train pipe valves, locomotive reducing valve, electric heaters, and refrigerator car-heating apparatus. Represented by Edward E. Gold, John E. Ward, William E. Banks, W. H. Stocks, Thomas Fildes, J. M. Stayman, J. O. Brombaugh, A. E. Robbins, Richard Voges, E. B. Wilson, George F. Ivers, F. E. Weir and F. A. Purdy.
- Goldschmidt Thermit Company, New York, N. Y.—Thermit for welding, repairing and reheating molten iron; welded sections of locomotive frames, trolley rails, wrought-iron pipes, steel castings, etc.; firebrick molds for welding locomotive frames, and samples of nickel thermit, manganese, chromium, molybdenum, manganese-copper, manganese-tin, manganese-zinc, ferro-vanadium and ferro-titanium. Represented by A. M. Guenther and W. R. Hulbert.
- Gould Coupler Company, New York, N. Y.—Freight couplers, tender couplers, tender buffers, steel platforms, Crown truck bolsters, Crown body bolsters, Gould bolsters, friction draft gear, buffers for stub-end cars, vestibules, tandem draft gear and journal boxes. Represented by F. P. Huntley, S. R. Fuller, Jr., C. W. Gould, H. N. Loomis, T. L. McKeen and W. F. Richards.
- Greene, Tweed & Co., New York, N. Y.—Palmetto air pump and throttle valve packings, Favorite reversible ratchet wrench and Exacto packing gauge and cutter. Represented by H. S. Demarest, F. E. Ransley and B. M. Bulkley.
- Grip Nut Company, Chicago, Ill.—A full line of square and hexagon shaped grip nuts, U. S. standard threads, from ¾ inch to 1¼ inches, and a line of semi-finished hexagon nuts for locomotive use. Represented by E. R. Hibbard, J. W. Hibbard, R. S. Wickersham and T. F. DeGarmo.
- Hale & Kilburn Manufacturing Company, The, Philadelphia, Pa.—Car seats of all kinds, for steam railways and heavy electric railway cars, "Neverbreak" pressed steel "Walk-over" seats, all-steel and fireproof upholstered seats as adopted for about 400 steel coaches under construction at the present time, and reclining and revolving parlor car chairs. Represented by H. T. Bigelow, A. F. Old, B. F. Pilson and S. A. Walker.
- Hammond Typewriter Company, The, New York.—Large machines for payrolls and close space machines for special tabulated work. Represented by A. G. Kupetz, Miss L. Wright, Miss Stephenson.
- Hammett, H. G., Troy, N. Y.—Trojan metallic packing for piston rods and valve stems, triple valve business roller and Sansom bell-ringers. Represented by H. G. Hammett and J. J. Leighton.
- Hanlon Locomotive Sander Company, The, Winchester, Mass.—Locomotive sandbox with Hanlon sander attached. Represented by J. H. Hanlon, W. J. Hanlon and J. W. Russell, Jr.
- Hanna Engineering Works, Chicago, Ill.—Represented on pier by Thomas W. Pangborn Company of New York, showing a pneumatic compression riveter in operation, electric and air driven screening machines, a No. 2 sand blast machine. Represented by John C. Pangborn.
- Harrington Son & Co., Edwin, Philadelphia, Pa.—Peerless spur gear hoists, screw hoists, plain and geared travelers, stay-bolt threading machine. Represented by W. J. Somerset, E. Van Note and J. A. Slaughter.
- Harrison Dust Guard Company, Toledo, O.—Harrison dust guard in various sizes, Harrison driving box lubricators, cellar lubricators, Harrison car journal lubricators, Harrison driving box cellars and Williams-Harrison journal boxes in various sizes. Represented by Lacey Y. Williams and Frank B. Harrison.
- Heath & Milligan Manufacturing Company, Chicago, Ill.—Reception booth on the pier. Represented by E. T. Trigg, H. O. Quest, W. R. Parker.
- Helwig Manufacturing Company, St. Paul, Minn.—Helwig pneumatic staybolt clippers, Helwig reversible pneumatic motors (end spindle drills), Helwig portable pneumatic grinders, Helwig improved self-feeding flue expanders and Helwig pneumatic hammers, for chipping, calking and riveting. Represented by J. Helwig and A. Helwig.
- Hess-Bright Manufacturing Company, The, Philadelphia, Pa.—Complete axle and wheels mounted on ball-bearings as used on European railways. Represented by Henry Hess.
- Hewitt Electric Company, Cooper, New York.—Lamps for shop lighting. Represented by M. B. Buckman.
- Hicks Locomotive & Car Works, Chicago, Ill.—Photographs and woods, one passenger coach. Represented by George A. Berry, Elliott C. Smith and George E. Pratt.
- Hicks Improved Engine Brake Company, Atlanta, Ga.—Two engine equipments of air brakes. Represented by James A. Hicks and J. H. Bouchard.
- Hitner's Sons Company, Henry, Philadelphia, Pa.—Showing the product of the Kensington Plate-Washer Company. Represented by L. Lewis.
- Home Rubber Company, The, Trenton, N. J.—N. B. O. sheet packings, steam hose, air pump packings, pump valves. Represented by A. R. Foley, H. M. Royal, C. E. Stokes.
- Homestead Valve Manufacturing Company, Pittsburg, Pa.—Homestead valve, locomotive blow-off valve, straightway valve, 3-way valve and 4-way valve. Represented by P. L. Rhodes and W. R. Schuchman.
- Houghton & Co., E. F., Philadelphia, Pa.—Hydro-carbonated bone-black for case-hardening, cutting oils, cutting compound, Vim cylinder oils, cosmolubric engine oils, cosmic counter-corroder, tempering oils, lubricating greases, Marck railway steam trap, Marck steam trap, Vim air brake leathers, Vim hydraulic leathers and Houghton oil filter. Represented by Fred C. Wilson, A. Everly Carpenter, 2d, and A. C. Bass.
- Hunt-Spiller Manufacturing Corporation, South Boston, Mass.—Cylinder bushings, cylinder packing, pistons, piston valve cages, piston valve packing, eccentrics, eccentric straps, driving boxes, shoes and wedges, crosshead shoes and superheater headers. Represented by Walter B. Leach and John G. Platt.
- Independent Pneumatic Tool Company, Chicago, Ill.—Thor pneumatic reversible and non-reversible piston air drills, reaming, tapping, flue-rolling, and wood-boring machines, pneumatic one-piece long-stroke riveting hammers, pneumatic chipping, calking and beading hammers, cose-quarter piston air drills, pneumatic turbine wood saw and pneumatic hose couplings in operation. Represented by James B. Brady, W. O. Jacquette, R. S. Cooper, J. A. Porter, J. P. Bourke, Charles Parsons, R. D. Hurley, R. T. Scott, J. H. Davis, J. D. Hurley, A. B. Holmes, George A. Gallinger and Campbell Mathie.
- Indestructible Fibre Company, The, New York, N. Y.—Decorated panels, car headlinings and ferryboat partitions, samples showing methods of applying decoration and section of wainscoting in imitation tile. Represented by John Jolly, R. L. McDuffie, Jacob Wendell, Jr., H. E. Osterreich, F. C. Field, O. Ferans.
- Invisible Roll Screen Company, Brooklyn, N. Y.—Invisible roll screens for railway coaches, dining cars, private cars, etc., to screen against dust and smoke, invisible roll screens for railway offices, station buildings, dining-rooms, etc., to screen against flies and mosquitos; exhibit in Hotel Islesworth. Represented by R. A. Bagnell.
- Jenkins Bros., New York, N. Y.—A full line of Jenkins Bros."

- radiator valves, automatic non-return valve, regular and extra heavy brass and iron body globe and angle valves, sheet packing, pump valves and gasket tubing, car heating and air brake discs and Jenkins Bros.' extra heavy gate valves. Represented by Arthur C. Langston, Joseph J. Williams, Charles J. Jackson and Charles W. Martin, Jr.
- Johns-Manville Company, H. W., New York, N. Y.—Asbestos-sponge felted sectional pipe covering, fire felt, fire felt train pipe covering, 80 per cent magnesia pipe covering, vitribestos pipe covering, vitribestos smokejacks, asbestos fire felt and 85 per cent magnesia locomotive lagging, asbestos cement felting, 85 per cent magnesia cement, high and low pressure, hot and cold water pipe covering, J-M asbestos roofings, air pump packings, asbestos steam packings, asbestos sheet packings, vulcabeston packings, asbesto-metallic flange gaskets, all kinds of fire-resisting cements, electrical insulating materials, Noark fuses, fire extinguishers, refrigerator and produce car insulating material. Represented by H. O. Fettinger, E. C. Sawyer, John H. Trent, W. F. Taylor, E. M. Gilmore, J. C. Younglove, C. E. Murphy, J. W. Allan, F. G. Corbin and J. E. Meek.
- Justice & Co., Philip S., Philadelphia, Pa.—Forty-ton Reliance hydraulic jacks, 20-ton Reliance hydraulic jacks, 15-ton Reliance hydraulic car box jack, all lowered by thumb-key, and Justice spike puller. Represented by Philip Justice Mitchell and O. L. Wright.
- Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Root Koppel Company, Arthur, New York.—Industrial railway track material. Represented by Henry Robiczek.
- Kinnear Manufacturing Company, The, Columbus, O.—Wood slat rolling door for roundhouses, steel slat rolling door for shops, power houses and freight houses. Represented by F. B. Billheimer and F. C. Schmidt.
- Landis Machine Company, Waynesboro, Pa.—One 2-inch double-head bolt-cutting machine and staybolt cutter, showing staybolt machine without using the lead screw, different styles of dies for cutting special threads. Specimen of staybolt cut without using a lead screw, showing accurate pitch. Numerous samples of work showing special threads and many operations of interest, capable only of being done on the Landis die. Represented by J. G. Benedict and H. L. Fisher.
- Landis Tool Company, Waynesboro, Pa.—No. 16 gap grinder and No. 1½ universal grinder. Represented by T. H. King.
- Lang Company, G. R., Meadville, Pa.—T-bolt heads for planers and boring mills. Represented by George R. Lang.
- Latrobe Steel & Coupler Company, Philadelphia, Pa.—Latrobe freight coupler, Melrose freight coupler, Chicago freight coupler, Latrobe Lewis-Seley engine coupler, Goodman wrecking hook and cast-steel drawbar yoke. Represented by W. L. Jacoby, Jay G. Robinson, W. N. McMunn and E. O. Warner.
- Lawrence Manufacturing Company, Philadelphia, Pa.—Anti-

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

- locomotive spring snow scraper, Moore track drills, bonding drills, with new chuck, flat drills, Kalamazoo velocipede and hand-car wheels in three sizes. Represented by F. N. Root.
- Kansas City Railway Foundry Company, Kansas City, Kan.—Rogers journal box, open end box, wastebox and engine cellars, Fisher grain door. Represented by A. F. Reitz, J. A. Kennedy.
- Kelly-Arnold Manufacturing Company, Wilkesbarre, Pa.—Automatic air and steam connector for use on passenger cars, automatic air connector for freight service, automatic device for detaching connector from draft coupler, flexible metal conduits, auxiliary connections for gum hose. Represented by George F. Royer, George E. Kelly and John J. O'Donnell.
- Kent & Co., Edwin R., Chicago, Ill.—Tool steel, high-speed twist drills, high-speed improved milling cutters, high-speed improved flat drill chucks. Represented by Edwin R. Kent, J. T. Stafford, W. E. Nagle.
- Keystone Lubricating Company, Philadelphia, Pa.—Keystone lubricating grease in its various densities and forms of application for various purposes, such as engine lubrication, for shafting purposes and general machine lubrication. Represented by H. A. Buzby, Charles A. Hopper and H. L. Carpenter.
- Keystone Drop Forge Works, Chester, Pa.—Keystone connecting link, Keystone safety shackle hook, boiler jaws, tank lugs, driving spring links and keys and other special locomotive and car forgings. Represented by George H. Berlin.
- Keystone Nut Lock Manufacturing Company, Pittsburg, Pa.—Smith nut locks. Represented by William M. Smith, W. M. Simmons.
- waste grabber Filion folding vestibule trap. Represented by V. O. Lawrence and Nat P. Lane.
- Lawrenceville Bronze Company, Pittsburg, Pa.—Malleable bronze castings, phosphor bronze ingots, journal bearings, driving boxes, and side rod brasses. Represented by Edward Kerr, C. B. Ault.
- Livezey, John R., Philadelphia, Pa.—Sheet and granulated cork for cold storage work and refrigerators, cork pipe covering for cold pipes, asbestos, air-cell coverings, etc., for steam and exhaust pipes, hard pressed cork for electrical insulation and flooring, models of cold-storage construction. Represented by John R. Livezey and Harry E. Souder.
- Locomotive Stoker Company, Chicago, Ill.—Strouse locomotive stokers. Represented by C. A. Street, James Elder.
- Lodge & Shipley Machine Tool Company, The, Cincinnati, O.—24-inch by 12-foot patent head standard screw-cutting engine lathe, driven by 10-horsepower General Electric 2 to 1 variable speed motor, 450 to 900 R. P. M. Represented by R. G. English and R. D. Betts.
- Lord Company, George W., Philadelphia, Pa.—Boiler compounds. Represented by V. O. Lawrence, J. E. Doughty and Nat P. Lane.
- Love Brake Shoe Company, Chicago, Ill.—Armbrust car and driver brakeshoes and driver brakeheads. Represented by C. W. Armbrust, H. G. Fuchs, W. H. Colebrook.
- Lucas & Co., John, Philadelphia, Pa.—Comical mirrors, coach colors. Represented by William C. McMullin, E. W. Storey and H. A. Clark.
- Mason Regulator Company, The, Boston, Mass.—Mason locomotive reducing valves, Mason air pump governors, Mason pump pressure regulators, Mason elevator pump pressure regulators, Mason damper regulators, Mason belt

- shitters, Mason steam pump speed governors, Mason steam pump gravity tank regulators, Mason by-pass or water relief valves for power and electric pumps and Mason steam pump. Represented by William B. Mason and F. A. Morrison.
- Massachusetts Mohair Plush Company, Boston, Mass.—Car seats covered with mohair plush in various colors and figures, articles showing various stages of manufacture of plush, samples of different kinds and qualities of plush, photographs of plush mill in operation. Represented by J. S. Seabury and W. D. Sawyer.
- McConway & Torley Company, The, Pittsburg, Pa.—Janney "X," Kelso and Pitt freight couplers, various designs of passenger car and tender couplers, Buhoup 3-stem passenger equipment applied to standard steel platform, and samples of miscellaneous steel castings for railroad work. Represented by E. M. Grove, William McConway, Jr., H. C. Buhoup, I. H. Milliken, Stephen C. Mason and G. W. McCandless.
- Metal Plated Car & Lumber Company, New York City.—Brown metallic window strip. Represented by Garrett Burgert.
- McCord & Co., Chicago, Ill.—McCord journal box, McCord draft gear, McCord spring dampener, McKim gasket, force feed locomotive lubricator. Represented by J. A. Lamon, W. J. Schlacks, Clive Rummells, J. W. Cain, H. H. Newsom, D. J. McOsker, W. G. Dunham, Morrill Dunn, I. A. Randel.
- McIlvain & Co., J. Gibson, Philadelphia, Pa.—Samples of white metal, phosphor bronze and German silver. Represented by T. A. Dalton, J. Gibson McIlvain, Jr.
- Merchant & Evans Company, Philadelphia, Pa.—Star ventilators, habbit metal. Represented by W. C. Thomas.
- Michigan Lubricator Company, Detroit, Mich.—One 5-feed bullseye locomotive nickel lubricator and trimmings for same, one 4-feed quadruple nickel by-pass, one triple-feed nickel lubricator, sectionized parts of the bullseye and by-pass bullseye lubricators, one by-pass triple lubricator, new type with stand, one 1½-pint double bullseye nickel with round observation glass, one quart double bullseye nickel lubricator with oblong observation glass, one 1-pint duke nickel with gauge glass two stationary lubricators, one applied with the automatic valve, automatic valves, locomotive automatic valves, new automatic drain stems, nickel, one angle nut steam chest plug, one nickel-plated wrench for same. Represented by John B. Corliss and W. E. Bryant.
- Modoc Soap Company, Philadelphia, Pa.—Soaps for cleaning cars, demonstration daily on the exhibit tracks. Represented by Henry Roever, J. D. Holtzinger.
- Morgan & Wright, Detroit Rubber Works, Detroit, Mich.—White steel sheet packing, Morganite throttle stem packing, triangle piston rod packing, air-brake steam hose and car-heating hose, engine and tender hose, matting. Represented by Hudson Dickerman.
- Moran Flexible Steam Joint Company, Louisville, Ky.—Moran flexible joints for steam, air, gas and liquid, trolley controller. Represented by C. H. Jenkins.
- Nathan Manufacturing Company, New York.—Injectors, lubricators, boiled checks, oil cups, steam fire extinguishers, boiler tester and washer, feedwater strainers, locomotive whistles and boiler fittings, Coale muffler and safety valves. Represented by E. S. Toothe, J. C. Currie, J. E. Miner, Charles Kearns, Sanford Keeler and L. Minetree.
- National Brake & Electric Company, Milwaukee, Wis.—Motor-driven portable air compressor outfit mounted on steel frame truck—in operation; also latest oil pneumatic governor, sectional motor-driven compressors, engineer's valve and emergency valve for air-brake equipment. Represented by J. T. Cunningham, W. H. Goble, F. E. Huntress, W. M. Bisel, C. N. Leet, R. P. Tell, S. I. Wailes and Bert Aikman.
- National Lock Washer Company, The, Newark, N. J.—Car curtains, curtain fixtures, sash locks, sash balances and window fixtures operating on full size models; also samples of nut locks for all sizes of bolts. Represented by F. B. Archibald, W. C. Dodd, Daniel Hoyt and John B. Seymour.
- National Malleable Castings Company, The, Cleveland, O.—Tower and Climax couplers for freight, passenger and locomotive equipment, special exhibit of coupler repair parts, special exhibit of coupler pivot pins, National safety car door fasteners. Represented by S. L. Smith, J. V. Davison, F. R. Angell, J. H. Jaschka, J. A. Slater, K. R. Johnston, L. S. Wright, George V. Martin, H. D. Hammond, C. L. Johnston, M. C. Pilson and R. T. Hatch.
- National Patent Holding Company, Chicago, Ill.—White boltless sectional piston head, Atlas side bearing, Atlas center bearing, National boiler washing system, National case-hardening compound. Represented by W. White and Frederick A. Lester.
- National Roofing Company, Tonawanda, N. Y.—National asphalt roofing. Represented by F. A. Fuller, Morris Ayrault.
- National Tube Company, Pittsburg, Pa.—Carload of 6-inch pipe loaded on a gondola car to show the method of service of the tubular telescopic side stakes. Represented by George N. Riley, L. R. Phillips, E. D. Giberson, J. F. Townsend, J. G. Bateman.
- Nernst Lamp Company, Pittsburg, Pa.—Display of Nernst lamps. Represented by John Sorber.
- Newman Clock Company, Chicago, Ill.—Watchman's portable clocks. Represented by A. A. Newman and August Nanz, Jr.
- New York Air Brake Company, New York.—Automatic air and steam connector (Forsyth patent). Represented by W. T. Henry, J. E. Forsyth, C. P. Lovell, H. F. Bickel, W. N. Campbell, E. F. Wentworth and William Owens.
- Norton, A. O., Inc., Boston, Mass.—Genuine Norton bridge, journal and car jacks. Represented by Harry A. Norton, Joseph O. St. Pierre, B. B. Terrill, F. L. Gormley, F. M. Twombly, A. O. Norton and Charles G. Erickson.
- Norton Company, Worcester, Mass.—Alundum grinding wheels and specialties, India oilstones, alundum grain for polishing. Represented by George C. Montague, Arthur C. Scott and George A. Stone.
- Norton Grinding Company, Worcester, Mass.—One electrically driven "gap table" grinding machine, for railway work, in operation, pair of steel car wheels revolving on their journals, to show the accuracy with which these are ground by Norton wheel-grinding machine. Represented by Hiram Cushworth and Hans Wickstrom.
- Norvell-Shapleigh Hardware Company, St. Louis, Mo.—Display of the company's special brand Diamond Edge tools of all kinds, including axes, hatchets, saws, ship augers, files, also a line of shovels and scoops, showing evolution of 1-piece Conqueror shovel. Represented by Joe C. Reed.
- Ohio Brass Company, The, Mansfield, O.—Tomlinson automatic radial car coupler, Nichols-Lintern pneumatic track sander, Lintern electric car signal system. Represented by J. S. Hamlin, F. A. Strail, N. Shute, R. M. Campbell.
- Oil Well Supply Company, Pittsburg, Pa.—Railroad special globe and angle valves. Represented by Joseph C. Bruff.
- Ostermann Manufacturing Company, Chicago Ill.—The Ostermann grain door. Represented by R. B. Kadish.
- Otis Company, Spencer, Chicago, Ill.—Tubes made by the Tyler Tube & Pipe Company, Hutchins Car Roofing Company's roofs, Solid Steel Tool Company's forgings. Represented by Spencer Otis, William Baker, H. H. Hart, William Latta, Jr.
- Pantasote Company, The, New York.—Samples of Pantasote in car seats and curtains. Represented by John M. High, D. E. Bonner.
- Parker Car Heating Company, Ltd., The, London, Ont., Canada.—Parker anti-freezing and hot water system for railway cars. Represented by Thomas Parker, J. M. McEvoy, J. C. Duffield and C. S. Parker, Jr.
- Pels & Co., Henry, 68 Broad Street, New York City.—Johns' patent beam shears, Johns' patent plate shears, Werner's hand power punch, Werner's hand power bar cutter, roller trestles. Represented by Ingo Maddaus and W. L. Kerlin.
- Penn Steel Casting & Machine Company, Chester, Pa.—Locomotive cast-steel cylinder, high-pressure steam valves. Represented by W. S. Bickley and T. Burd Zell.
- Perry Side Bearing Company, Chicago, Ill.—Side bearings after three years' use under 237,000 pounds, industrial cranes on Pennsylvania Railroad, passenger hearings after 130,000 miles on 104,000-pound body observation car, C. & N. W., also full set of all styles and types Perry bearings. Represented by H. M. Perry, E. A. Laughlin and J. H. Sewall.
- Phillips Laffitte Company, The, Philadelphia, Pa.—The Laffitte welding plates, welding, tempering and brazing powders. Represented by J. J. H. Phillips.
- Phillips Sons & Co., F. R., Philadelphia, Pa.—Velos high-speed steel and twist drill made by the Walter Spencer Company, Sheffield, England. Represented by F. Rees Phillips and E. D. Manley.
- Pilling Air Engine Company, Detroit, Mich.—Locomotive turntable mule, pneumatic geared hoists. Represented by J. C. Pilling.
- Pittsburg Automatic Vise & Tool Company, The, Pittsburg, Pa.—The Pittsburg double swivel machinists' vises, the Pittsburg single swivel machinists' vises, the Pittsburg double swivel pipe vises, the Pittsburg portable pipe vises, the Pittsburg double swivel woodworkers' vises, the Pittsburg Ysiad woodworkers' vises, the Pittsburg automobile and motor boat vises, the Pittsburg jewelers' vises, the Pittsburg single swivel pipe attachments, one very large vise weighing 695 pounds and having a jaw opening of 15 inches. Represented by G. P. Blackiston.
- Pittsburg Equipment Company, Pittsburg, Pa.—One cast-steel

side frame, one cast-steel column casting, one built-up bolster with cast-steel hook ends, models of cast-steel draft carrier, three-piece side frame truck bolster, roller center plates and side bearings. Represented by O. S. Pulliam and H. V. Seth.

Pyle-National Electric Headlight Company, Chicago, Ill.—Ladies' rest room in handsome booth on the Steel pier. Represented by Mark A. Ross, J. W. Johnson and H. W. Withington.

Ralston Steel Car Company, The, Columbus, O.—Ralston gondola dump car, Ralston steel underframe. Represented by J. S. Ralston, J. D. Ellison, A. G. Hollingshead, L. C. Brown, J. L. Connors, J. E. Tesseyman and C. W. Martin.

Refined Iron & Steel Company, Pittsburg, Pa.—Staybolt, engine bolt, muck bar and other irons. Represented by J. C. Denoon, H. F. Gilg, W. A. Stubblebine.

Republic Railway Appliance Company, St. Louis.—Republic friction draft gear. Represented by C. S. Shallenberger, H. T. Curd.

Restein Company, Clement, Philadelphia, Pa.—All kinds of steam and hydraulic packings for locomotive and general shop use. Represented by Norman Miller.

Riverside Metal Company, Riverside, N. J.—Cold rolled sheets of white metal, phosphor-bronze and German silver, German silver and phosphor-bronze wire and coil stock, phosphor-bronze rope, phosphor-bronze and nickel castings, phosphor-bronze tubes. Represented by W. P. McGlynn, H. W. Berroth, L. J. Kane, W. K. McGlynn.

Rockwell Engineering Company, New York.—Oil furnaces for

frame punch, motor driven with 36-inch throat and capacity to punch 3/4-inch hole in 3/4-inch material, working model of Ryerson flue cleaning machine, capacity to clean 500 boiler tubes up to 24 feet long at one time, working model of Continental boiler with Morison corrugated furnaces. Represented by Gilbert H. Pearsall, Edward T. Hendee and Austin M. Mueller.

Safety Car Heating & Lighting Company, New York, N. Y.—Improved mantle lamps, flat flame lamps and single mantle lamp of 100 candlepower, models showing straight steam and hot water heating systems, steam couplers, traps and valves, buoy lantern. Represented by R. M. Dixon, D. W. Pye, E. F. Slocum, J. S. Henry, W. H. Hosper, William St. John, George E. Hulse, W. L. Garland, C. B. Adams, M. T. Elliot, H. J. McMinn, Lewis Judge, W. I. Thompson, A. Sebald, George H. Chadwell.

Schoen Steel Wheel Company, Pittsburg, Pa.—Method of making the Schoen wheel, showing steel slab, first and second forging and finished rolled wheel, steam and electric wheel unmounted, also mounted wheels on axle that have been in service. Represented by Charles T. Schoen, M. R. Jackson and N. B. Trist.

Schutte & Koerting Company, Philadelphia, Pa.—Injectors and injector regulating attachment (also sectional injector), check valve, steam stop valve, gate valve, globe valves and check valves, sectional stop check valve, balanced lever valve, hand test pump, syphons, automatic eductor, trip valve. Represented by S. C. Smith.

Scullin-Gallagher Iron & Steel Company, St. Louis, Mo.—Booth

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

brass melting, flue welding, rivet heating, bolt heating, case-hardening, forging, etc. Represented by F. S. Garrett and W. S. Quigley.

Roadhouse Steam Coupler Company, Detroit, Mich.—Coupler for steam hose. Represented by W. L. Kelley, A. L. Sellers, N. F. Roadhouse.

Robinson Company, The, Boston, Mass.—Robinson exhaust nozzle, device for protecting air strainers, wrecking anchor. Represented by Charles L. Snow, Frank Robinson and Frederic Parker.

Rostand Manufacturing Company, Milford, Conn.—Baggage racks. Represented by Frank Barbey, P. N. Landine, George H. Bryant, W. B. McCarthy.

Rutherford Automatic Connector Company, Chicago, Ill.—Automatic connector for air, steam and signal hose on cars and engines. Represented by F. H. Rutherford and C. H. Carman.

Rubberset Brush Company, The, Newark, N. J.—"Ruhberset" paint and varnish brushes. Represented by A. L. Holtzman and T. B. Denton.

Russell, Burdsall & Ward Bolt & Nut Company, Port Chester, N. Y.—Steel nuts and bolts, special nuts for locomotives, all finished screw products. Represented by John Abel, W. S. Comly, Robert Cook, R. J. Snyder, C. B. James.

Ruud Manufacturing Company, Pittsburg, Pa.—Automatic gas water heaters. Represented by Charles F. Bartlett.

Ryerson & Son, Joseph T., Chicago, Ill.—Lennox rotary bevel shear in operation, beveling steel plates, angles, etc., up to 3/4 inch in thickness, motor-driven, Ryerson portable automatic key seating machine in operation, cutting key-ways in nickel steel locomotive axles, Cleveland vertical solid

nicely fitted up as rest room, with chairs, etc., for the convenience of visitors. Represented by S. M. Dolan, Thomas M. Gallagher, P. J. Howard, B. V. H. Johnson, G. B. Longstreth, J. V. McAdam, F. L. Norton and R. H. Weatherly.

Sectional Grain Door Company, Indianapolis, Ind.—Grain door. Represented by A. E. Dennison.

Sellers & Co., William, Inc., Philadelphia, Pa.—Non-lifting injector and attachments operating under steam, lifting injectors, boiler checks, locomotive feedwater strainer. Represented by Strickland L. Kneass, John D. McClintock and Franklin Martin.

Shelby Steel Tube Company, Pittsburg, Pa.—Seamless link bushing material, seamless locomotive flues, welding demonstrations, Shelby seamless steel locomotive bells, 17 in number, representing each note in musical scale, suspended from Shelby seamless tube tree, each bell being electrically connected with keyboard so that musical selections can be produced. Represented by H. S. White, H. A. Flagg, J. E. Minetree and C. H. Wood.

Sherwin-Williams Company, The, Cleveland, O.—Locomotive finishes, car body system, steel coach finishes and enamels, varnishes and dry colors, railway specialties, rattan seat enamel, handcraft stains, metal paints. Represented by W. B. Albright, E. M. Richardson, Thomas Madill, J. H. Eames, F. A. Elmquist and E. M. Williams.

Simplex Railway Appliance Company, Chicago, Ill.—(See American Steel Foundries.)

Societe Generale des Freins Lipkowski, Paris, France.—Chapsal-Saillet's long freight train brake. The same brake is used on the Western Railway of France, and to be tried

- on the Northeastern of England. Represented by A. Sallot.
- Sprague Electric Company, New York City.—Air brake hose, signal line hose, car heating hose, pneumatic tool hose; all these covered with Sprague Electric Company's flexible steel armor. Represented by Allan C. Bakewell, E. E. Ruete and W. A. Treat.
- Standard Coupler Company, New York City.—Standard steel platform. Sessions standard friction draft gear. Represented by George A. Post, A. P. Dennis, R. D. Gallagher, Jr., E. H. Walker, George A. Post, Jr.
- Standard Metal Manufacturing Company, Chicago, Ill.—Anti-friction S. T. B. car journal bearings, anti-friction metal. Represented by Donald C. Barbee and Carl E. Tandy.
- Standard Paint Company, The, New York, N. Y.—Ruberoid roofing for buildings, Ruberoid cab roofing, Ruberoid car roofing, Ruberoid colored roofings, red, green and brown, Giant, Hercules and P. & B. insulating papers, P. & B. preservative paints, Flexite metal preservative paints, Ruberine, varnishes, clear baking, black baking, black air drying, black finishing, core plate air drying, core plate baking, P. & B. insulating tapes. Represented by J. N. Richards, J. H. Thomas, Charles Earnshaw, B. C. Beckman, J. G. Satterthwait, George Wilms and E. F. Van de Water.
- St. Louis Car Company, St. Louis, Mo.—Sleeping car "Beulah," built for the American Palace Car Company. On exhibit track.
- Standard Steel Works, The, Philadelphia, Pa.—Forged and steam and electric service. Represented by T. H. Symington, E. H. Symington, J. F. Symington, C. J. Symington, D. Symington, W. W. Rosser, Carl Tucker, T. C. de Rosset, A. H. Weston and H. W. Baldwin.
- Tate, Jones & Co., Inc., Pittsburg, Pa.—Oil burners and oil-burning appliances for railroad shops, portable oil rivet furnaces, oil pumping systems, furnaces for all purposes. Represented by J. M. Tate, Jr., and R. G. Kirkwood.
- Timms, James & J. O., Columbus, O.—The "Excel" automatic car coupler. Represented by James Timms and J. O. Timms.
- Toomey, John A., Chicago, Ill.—Folding car stake for flat cars. Represented by John A. Toomey.
- Trojan Car Coupler Company, The, New York, N. Y.—Junior M. C. B. car coupler. Represented by Charles Chew Mickle, Harry D. Dumont and Henry W. Wasserbach.
- U. S. Metal & Manufacturing Company, New York City.—Perfect pressed steel car replacers, Nos. 1 and 2, Victor cast-steel car replacers, Nos. 1, 2, 3 and 4, Columbia lock nuts, "Ideal" drawbar centering device, Western malleable iron brake jaws, "Almetl" lumber stake, Cliff and Guibert automatic fire hose reel, "Hoyt" push car door. Exhibition car on exhibition track equipped with Dunham hopper door device, Columbia lock nuts, "Ideal" drawbar centering device, Feasible drop brake staff, "Almetl" lumber stake. Represented by B. A. Hegeman, Jr., F. C. Dunham, M. Jackson Crispin, E. D. Hillman, Thomas Beaghen, Jr., Fred Atwater and John Varian.
- Universal Railway Equipment Company, Jackson, Mich.—

Atlantic City Convention Facilities—Exhibit Booths Along the Steel Pier.

- rolled steel wheels and steel-tired wheels. Represented by E. S. Lewis, H. DeH. Bright, Frank Carpenter, Charles Riddell, Oliver J. Bamford, Edward B. Halsey, George F. Jones, Harry W. Sheldon, William Penn Evans.
- Star Brass Manufacturing Company, Boston, Mass.—Samples of safety valves, whistles, gauge testers, steam gauges and indicators, in the St. Charles hotel. Represented by G. H. Musgrave, J. A. Edgar.
- Stoeber Foundry & Manufacturing Company, The, Myerstown, Pa.—One-half-inch automatic pipe threading and cutting off machine, capacity $\frac{1}{4}$ inch to 2 inches, automatic power pipe bending machine, capacity 1 inch to 2 $\frac{1}{2}$ inches. Represented by Ralph McCarty, Ed. R. Euston, A. A. Schaefer.
- Storrs Mica Company, Owego, N. Y.—Copies of Storrs' calendar of railroad club and association meetings and conventions, advertising their mica headlight and caboose lamp chimneys; register for mailing list for quarterly numbers of this calendar. Represented by A. P. Storrs and Charles P. Storrs.
- Stowell Manufacturing & Foundry Company, South Milwaukee, Wis.—Model of baggage car door fitted with adjustable hangers, Wilbern adjustable warehouse door hangers. Represented by D. J. Dalton, R. A. Nourse.
- Summers, H. J., Chicago, Ill.—Automatic releasing vestibule curtain hook. Represented by Harry J. Summers.
- Symington Company, T. H., Baltimore, Md.—Symington journal boxes of various designs for standard archbar trucks, special steel trucks, M. C. B. passenger trucks, M. C. B. electric trucks and special electric trucks, Baltimore ball-bearing center and side bearings of various designs for "Easy Lift" grain door. Represented by H. E. Edwards, S. F. Randolph.
- Union Spring & Manufacturing Company, Pittsburg, Pa.—Locomotive and car springs, pressed steel spring plates and journal box lids. Represented by A. M. McCrea, L. G. Woods, C. S. Foller and T. B. Arnold.
- Underwood & Co., H. B., Philadelphia, Pa.—Portable boring bar outfit for cylinders 12-inch to 26-inch diameter, 2-cylinder steam or air motor for driving the above, portable rotary planing machine for flat valve seats on locomotives. Represented by A. D. Pedrick, C. O. Ralph, F. E. Emery.
- Wagenhorst & Co., J. H., Youngstown, O.—Electric blue-printing machine. Represented by Donald Parson.
- Walworth Manufacturing Company, Boston, Mass.—Stillson wrench, Smith track drill, "Neverstick" blow-off cock, Walworth pipe stock and die, Smith friction tool, also general line of small tools. Represented by W. P. F. Ayer.
- Washburn Steel Castings & Coupler Company, The, Minneapolis, Minn.—Car couplers, boilers, car replacers, steel buffer beams, friction draft rigging. Represented by E. C. Washburn, A. Munch.
- Watson-Stillman Company, The, New York.—Hydraulic jacks, hydraulic rail benders, hydraulic crankpin presses, hydraulic bar straighteners, hydraulic wheel presses. Represented by George L. Gillon and Edward A. Johnson.
- Watters, J. H., Augusta, Ga.—Pneumatic track sander, working model in a glass case. Represented by J. H. Watters.
- Wells Light Manufacturing Company, The, New York.—The Wells light in three sizes, the Wells standard oil gas lamp,

- Wallwork's patent universal electric lamp brackets. Represented by George H. E. Robinson and Howard Manahan.
- Wendell & McDuffie, New York.—The Gutelius ventilating smoke jacket; made of asbestos board. Represented by D. H. Ferguson.
- West Disinfecting Company, New York.—Disinfecting appliances, chloro-naphtholeum, disinfectant, liquid soap dispensers and liquid soap, Taussig fumigating lamps, carbiform fumigators, CN soap for the skin. Represented by E. Taussig and C. A. Ekstromer.
- Western Railway Equipment Company, St. Louis, Mo.—Acme brake slack adjusters, Western sill and carline pockets, Western brake jaws, Acme pipe clamps, Hoerr tandem draft gear, Linstrom eccentrics, Linstrom syphon pipes, interchangeable car doors, Hoerr car doors, Western truck end castings, St. Louis flush car door, Missouri car door, Downing card holders, Economy slack adjuster, Western bell ringer, car door fastenings, fishhook tie-plates, brake jaws, tie dating nails. Represented by Louis A. Hoerr and S. H. Campbell.
- Western Tool & Manufacturing Company, Springfield, O.—Expanding mandrels, adjustable reamers, portable vice stands and tool stands, vises, tool holders, abrasive polishing wheels, scrapers. Represented by E. V. Galen and Henry Morris.
- Western Tube Company, Kewanee, Ill.—Kewanee unions, Kewanee union specialties, high duty metal valves, malleable, cast iron and brass fittings, iron body valves and cocks. Represented by N. J. Higinbotham.
- Westinghouse Air Brake Company, Pittsburg, Pa.—Cross-compound steam-driven air compressor, self-locking angle cock, friction draft gear. Represented by John F. Miller, W. S. Batholomew, E. A. Craig, W. V. Turner, R. H. Blackall, A. L. Humphrey, Joseph R. Ellicott, A. Johnson, F. T. Reese, I. H. Brown, T. L. Burton, H. S. Clark, C. C. Farmer, F. V. Green, J. P. Kelly, C. J. Olmstead, H. S. Kolseth, C. P. Cass, W. G. Clark, S. D. Hutchins, F. M. Nellis, George Westinghouse, Jr.
- Westinghouse Automatic Air & Steam Coupler Company, St. Louis, Mo.—Automatic air and steam coupler. Represented by N. F. Niederlander and R. E. Adreon.
- Westinghouse Electric & Manufacturing Company, Pittsburg, Pa.—Motors, controllers, switchboards, current measuring instruments. Represented by A. T. Chamberlain, J. R. Gordon, J. H. Klinek, R. F. Moon, D. D. Pendleton, Charles Robbins, F. H. Shepard, C. F. Street, Charles Stuart, Charles Talbot.
- Westinghouse Machine Company, The, Pittsburg, Pa.—Automatic truck, storage batteries. Represented by E. H. Sniffen, L. L. Brinsmade, L. H. Flanders, Samuel Hazlett, Edgar Lewis, D. C. Arlington, D. G. Davis, H. M. Hampton.
- Westmoreland Coal Company, Philadelphia, Pa.—Full-sized reproduction of a room in a mine, with electric coal cutter actually in operation. Represented by H. C. Adams and G. B. Wood.
- Wheel Truing Brake Shoe Company, Detroit, Mich.—Abrasive brakeshoes. Represented by J. M. Griffin.
- White Enamel Refrigerator Company, St. Paul, Minn.—Bohn syphon refrigerators. Represented by H. S. Parks.
- Wilmarth, Morman & Co., Grand Rapids, Mich.—New Yankee drill grinders, one electrical machine ready to operate. Represented by Charles E. Meech.
- Yale & Towne Manufacturing Company, The, New York.—Portable electric hoists, equipped with graduated speed controllers for careful handling of material and close adjustment of parts when assembling or placing in machines, 20-ton triplex chain block, enabling one man to lift a 20-ton load, 1-ton triplex, duplex and differential chain blocks in operation under service conditions. Quick speed chain blocks for rapid handling of light loads, overhead I-beam trolleys for use with hand and electric hoists, crane models and photographs of installations. Blount door checks, builders' hardware, Yale cabinet locks, Yale padlocks. Represented by F. A. Hall, E. J. Ford, H. E. Dickerman, William Hazeltin, R. T. Hodgkins, C. W. Beaver, W. C. Bigelow.

The Kern River Power Station No. 1, of the Los Angeles Edison Electric Company, has recently been put in operation. It is located near the headwaters of the Kern river, in the Sierra Nevada range. The plant is claimed by the builders to be the largest hydro-electric system west of Niagara Falls. The water is brought some 12 miles by flume to a penstock having a static head of 874 feet. Four Allis-Chalmers impulse wheels of 10,750 horsepower operate under an effective head of 865 feet at 250 revolutions per minute. Current is transmitted to Los Angeles, Cal., 117 miles, at 75,000 volts. The transmission cables are supported by galvanized iron towers.

NEW YORK CITY RAILWAY'S EIGHTY-SIXTH STREET CAR BARN BURNED.

The New York City Railway, which lost by fire on April 8 its car barn at One Hundred and Forty-sixth street, suffered a similar misfortune on June 16, when the car barn at Madison avenue and Eighty-sixth street was burned. The building was a three-story brick structure of semi-mill construction with substantial brick walls, and was built about thirty years ago.

The first floor was used as a car barn by the company and the second and third floors were leased by the New York Transportation Company, which lost fifty or more automobiles. Ordinarily the New York City Railway Company has about sixty-five cars in this barn, but the demand for rolling stock was so great on Sunday, the day of the fire, that only four cars were destroyed.

The origin of the fire is not known. An examination of the burned structure shows that the wooden timbers were

Ruins of New York City Railway Car Barns.

heavy, but the floors were not self-releasing and when they collapsed the side walls fell with them. The offices of the company were located in a partitioned space at the left of the car entrance. From this section a passenger elevator led to the floors above, while the automobiles of the Transportation company were hoisted by means of an elevator shaft about half way between the office and the rear of the building. It is stated that the building will be rebuilt in the near future.

An Improvement in Commutating Poles.

A. E. L. Chorlton and H. Smith, Manchester, Eng., have recently been granted a patent on an improved method of constructing commutating poles for motors and generators. The invention consists of separating the commutating poles from the main yoke, thus establishing an independent magnetic circuit. This construction has a number of advantages; the commutating poles can be more easily designed to give the desired effect, can be more easily controlled, and magnetically have the advantage of not being affected by changes of the magnetic flux in the main pole pieces.

Another important advantage secured by this invention is that the commutating poles can be added to motors and generators already in service, the commutating poles and yoke being entirely independent of the generator or motor proper. The yoke for the commutating poles is made in sections so that it can be easily installed in motors or generators which are in service without dismantling them. The commutating pole yokes are bolted to the pole pieces of the main field magnets.

News of the Week

Traction Affairs in Chicago.

Judge P. S. Grosscup declares that he has a satisfactory plan for settlement of the differences between the New York interests in the Chicago Union Traction Company and the protective committee representing the stockholders of the Chicago West Division Railway and the North Chicago City Railway, underlying companies. The continued failure of these interests to agree to a plan for leaving the distribution of the stock of the new Chicago Railways Company to the arbitrators named in the ordinance postpones the acceptance of the ordinance.

The Chicago City Railway Company has taken out a permit for the beginning of reconstruction work under the ordinance. Work has been begun on the track in Root street, between State and Wallace streets.

To avoid congestion, the Union Traction Company has abolished the terminus of the Twelfth street line at State and Van Buren streets, and hereafter the cars will run over a loop terminal on Dearborn street, Adams street, Fifth avenue and Twelfth street.

Michigan United Railways to Handle United States Express Company Business.

The United States Express Company is rapidly extending its service over the electric railway lines and is still seeking to make new contracts. In the Electric Railway Review of June 8 was published the announcement of a contract between the express company and the Detroit United Railway. We are now advised by J. M. Bramlette, general manager of the Michigan United Railways Company, which operates the city systems of Lansing, Kalamazoo and Battle Creek, and interurban lines between Lansing and St. John's and Jackson and Kalamazoo, that this company has also entered into a contract with the United States Express Company whereby the latter will operate over the Michigan United lines. Operation will be started between Jackson and Kalamazoo on July 1. The company will run three express trains a day over this 75-mile line, instead of two, as at present. Mr. Bramlette says: "I feel that this arrangement is one of great importance to our company. It is certainly a step in the right direction and indicates that interurban properties are daily becoming more serviceable to the communities through which they operate."

A general agent of the express company has been seeking during the past week to make a similar contract with the Winona Interurban Railway for the express business between Warsaw and Goshen, Ind. The matter will be submitted to the directors on June 20. It is reported that the company is seeking to make contracts with other northern Indiana roads.

Advertising Literature of the Boston & Northern and Old Colony Street Railways.

The passenger department of the Boston & Northern and Old Colony Street Railway companies has issued some new literature this year which is very attractive and convenient. The feature of the publications this year is a large four-colored map of eastern Massachusetts, east of Worcester, southern New Hampshire and northern Rhode Island, showing not only all the trolley lines of these companies, but all trolley lines in the district, as well as all the parks, groves and other inland and shore pleasure resorts. The map is a very artistic bit of work and is one of the most complete ever issued covering this district. This map forms the inside of both the Boston & Northern and the Old Colony Street Railway's folders, while the rest of the space is devoted to schedules showing the routes, distances, fares and mileage on these systems. Everything is arranged in as condensed a form as possible, tending to put as much helpful information for the passengers in as little space as is required. The covers of the two folders are in colors and are excellent examples of the printer's art. The Boston & Northern folder, entitled "Trolley Trips," shows a cool, attractive view of a rocky shore and a bay with an island in the background, all on a background of striking red. The Old Colony folder cover is a delightfully typical little country scene framed in an attractive arrangement of greenery. A glance at the covers creates a desire to seek the shore and country. Copies will be sent free upon application to the passenger department, 309 Washington street, Boston.

Legislation in Michigan.

An amendment to the law permitting the consolidation of electric light and street railway companies was passed in the house on June 17. At present the law provides that unanimous consent of all the stockholders must be obtained, and the amendment, which applies only to the upper peninsula, provides that the consents of only three-fourths of the stockholders be required.

The Seidmore railroad commission bill, which the house on June 12 substituted for the bill passed by the senate, provides for an interchange of freight between steam and electric railways, and in certain cases for the running of freight cars through city streets. The bill provides: "That in cases where shippers or consignees of freight in carload lots whose places of business are not provided with adequate steam railway facilities, but may be reached by means of interurban, suburban or urban railroad of suitable gauge, they shall have the right to be supplied by any steam railroad which has a physical connection with said interurban, suburban or urban railway with steam railway freight cars for the shipment of their freight and similarly shall have the right to receive their freight in steam railway cars. Such cars shall be turned over by said steam railroad to said interurban or street railway at the point of junction for the use of said shipper exclusively and shall be hauled between said point of junction and said place

of business of the shipper by said interurban or street railway under the same general conditions as cars of the foreign roads are now, or may be after handled upon so-called belt lines, or terminal railroads." This provision does not apply to purely city lines and the commission has no power to interfere with any franchise or contract with the city.

Progress of New York Subway Plans.

The New York rapid transit commission on June 13 decided to authorize the construction of a fourth track on the Broadway subway, between Ninety-sixth and One Hundred and Third streets. The cost of the improvement, which will permit uninterrupted traffic above Ninety-sixth street on the easterly and westerly branches of the subway, will be about \$850,000, and it is estimated that 16 months will be required for the work. The Interborough-Metropolitan Company has already stated its willingness to do the work, provided the expense shall be borne by the city under the heading of "extra work." The amount is to be added to the general construction account which the company must pay back to the city in the next 50 years. On the recommendation of Chief Engineer Rice it was also resolved to install the ventilating system on the stations of the Broadway route north of Fifty-seventh street. Only on the stations south of this point have the plants been established, and Mr. Rice explained that the result in cooling the tunnel had been so successful that it would be advisable similarly to equip the northern part of the Broadway subway. He estimated the cost at \$250,000. The cost of the downtown plants was \$390,000, so that the city will have to spend a total of \$670,000 on another extra.

Bids were also opened by the commission for the construction of the three sections of the subway connecting the terminals of the Brooklyn and Williamsburg bridges in Manhattan for which contracts had not yet been let. The Bradley Contracting Company was the lowest bidder for all the three sections. For that on Center street, between Pearl and Park Row, the bid for tunnel construction and pipe galleries was \$1,003,828; for the section on Delancey street, between Center and the Bowery, the bid was \$1,547,342, and for the third stretch, also on Delancey street, running from the Bowery to Norfolk street, the Bradley offer was \$1,298,436. The contracts were awarded to that company.

Comptroller Metz and Commissioner Hurlley were able to advance their demands for the Fourth avenue (Brooklyn) subway another step. George L. Rives, counsel to the board, was directed to draw up the form of contract and to present it for adoption to the next meeting of the commission. In order to lessen the cost of construction of the new route it was decided by the board that the open excavation method could be adopted except in the parts of the route where the traffic was heavy, and that on a portion of the route south of Flatbush avenue the contractor should be relieved of property damage responsibilities. The commission also practically determined that there would be no need for pipe galleries in the subway, but ordered Mr. Rives so to frame the contract as to provide for bids for and without the galleries. The cost of the subway has been estimated at \$31,000,000, but by leaving out the pipe galleries there would be a saving of about \$2,000,000.

Philadelphia Ordinance Passed by Councils.—The Philadelphia Rapid Transit Company ordinance was passed by councils on June 20, after an 8-hour session. The ordinance will restore the ability of the company to make improvements in its property through the use of the improved credit which it will now have.

Decatur-Champaign Line of the Illinois Traction System Opened.—The new line of the Illinois Traction Company from Decatur to Champaign, Ill., has been recently opened for operation. For the present the running time for the 50 miles will be three hours, as the track is still rather rough in places. Cars have been running between Champaign and Monticello for several months. This completes the line from Danville, near the Illinois-Indiana state line, to St. Louis.

Pittsburg & Butler Street Railway.—The Pittsburg Trust Company, financial agent of the Pittsburg & Butler Street Railway Company, has issued a most attractive booklet describing and illustrating the company's new single-phase line from Pittsburg to Butler, Pa., 38 miles, which has been recently opened for traffic. The booklet, which is an especially fine example of the printer's art, completely describes the new road and contains a large number of excellent halftone illustrations of views along the line and of the company's rolling stock and power house equipment.

Street Railway Association of the State of New York.—J. H. Pardee, secretary, is sending out, together with the programme of the annual meeting of the association, which was published in last week's issue of the Electric Railway Review, a pamphlet issued by the management of Hotel Champlain, Bluff Point, N. Y., where the meeting will be held on June 25 and 26. The pamphlet describes and illustrates with several good halftones the natural attractions and points of interest of Bluff Point and vicinity, and indicates that an especially favorable place has been chosen for the convention. A timetable of the trains running to Bluff Point and a circular in regard to the special railroad rates for the convention are also inclosed.

Brooklyn Bridge Improvements.—Two important contracts for work designed to increase the transit facilities of the Brooklyn bridge will be awarded within the next few weeks. Bridge Commissioner Stevenson has already started advertising one of these contracts, which provides for the widening of the roadways on the Manhattan approach to the bridge structure. This improvement is part of the plans which the department has made to establish the immense loop terminal station on the site of the Staats Zeitung building, which is to be used for trolley cars and elevated trains alike. According to the plans it is proposed to run the trolley cars from the roadways of the bridge into a subway to reach the system of loops in the new terminal station. In order to do this

and avoid cutting the masonry arches, the roadways must be widened to the full extent of the city's property, and the tracks carried on the outside of the roadways instead of on the inside, as at present. The terms of the contract require that the entire improvement must be completed by October 1.

Columbus Speeches and Municipal Ownership Report.—The office of the secretary of the American Street and Interurban Railway Association has just issued two pamphlets, one containing the addresses of the presidents of the various associations as presented at Columbus and the other containing the report of the committee on "Municipal Ownership," also presented at the 1906 convention.

Brooklyn Strike Ended.—The strike of the firemen and other power house employes of the Brooklyn Rapid Transit Company was settled on June 14, when an agreement in regard to wages was reached. The old men are to be taken back and the union is to be recognized. The wages of the firemen are increased from \$2.25 to \$2.40 per day and the water tenders are to get \$2.65 instead of \$2.50. Both classes of employes demanded an increase of 25 cents per day. The boiler men and coal handlers are to get \$2.00 a day, an increase of 25 cents.

Spokane's Lake Region.—The Spokane & Inland Empire Railroad of Spokane, Wash., has issued an attractive pamphlet with the above title, describing the many inland lake resorts reached by the lines of the Coeur d'Alene and Spokane division from Spokane. These resorts, of which several excellent halftone views are presented, include Newman Lake and Liberty Lake, Washington and Spirit Lake, Fish Lake, Hayden Lake and Lake Coeur d'Alene, Idaho. These lakes, which are all within a short distance from the city, are excellent places for summer cottages, camping, fishing, hunting, boating, etc.

Through Billing, Chicago to Warsaw.—H. S. Dickey, general superintendent of the Winona Interurban Railway, Winona Lake, Ind., writes that this company now has a through billing arrangement between Chicago, Ill., and Warsaw, Ind., in connection with the Graham & Morton Transportation Company, the Southern Michigan Railway Company and the Chicago South Bend & Northern Indiana Railway, and is also perfecting arrangements to sell through tickets between these points and all intermediate points. Although this arrangement has only been in effect for a short time, the business so far has been very encouraging.

Express Service from Boston to Springfield, Mass.—Plans for the through trolley express service from Springfield to Boston by way of Worcester are being gradually developed, and announcement is made that it will be in operation about October 1. The express cars will run over the Springfield & Eastern Street Railway, over the Brimfield extension and the Worcester & Southbridge Street Railway into Worcester, whence they will run over the Boston & Worcester lines. The last-named road has had some difficulty in securing rights to run the cars into Boston, but it is said that what franchises have hitherto been refused will be granted soon. The necessary equipment has been ordered. It is planned, if the necessary Boston franchises cannot be obtained, to run a line of automobile trucks from the Boston & Worcester line's terminal in Chestnut hill, Brookline, into Boston's business section.

Electric Railway Express Company to be Reorganized.—Following the action of Circuit Judge Reynolds of St. Louis, Mo., on June 14, denying to the minority stockholders of the Electric Railway Express Company of East St. Louis, Ill., an injunction restraining the East St. Louis & Suburban Railway from letting to the Illinois Traction Company the express privileges over the Suburban system between East St. Louis and Belleville, Ill., and other points, the announcement was made that a new company would be formed to conduct the express business. The plaintiffs claimed that the Electric Railway Express Company had the exclusive right to do an express business over the Suburban system. The contract was declared forfeited by the Suburban company for failure of the express company to comply with the terms of the contract. The company was recently placed in the hands of receivers and has ceased operating.

Detroit Strike Avoided.—The trainmen employed by the Detroit United Railway, who about two weeks ago voted to strike unless the company granted their demands for 28 cents an hour and improvement of working conditions, especially in the tripper service, on Monday of this week practically voted to accept the company's offer. This offer, as reported in last week's issue of the Electric Railway Review, includes the concessions demanded by the men as to working conditions without increasing the wages. The vote on Monday was as to whether the entire contract between the company and its employes should be submitted to arbitration and the proposition was defeated by a large vote. The men are now working under an agreement by which the question of wages is not to be reopened except by the consent of both parties. The vote not to arbitrate therefore practically means an acceptance of the company's offer.

Chicago-New York Air Line.—The Chicago-New York Electric Air Line Railroad, the company which has attracted so much attention through advertisements of its proposed 10-hour 10-dollar air line from Chicago to New York, on Saturday, June 15, formally opened a 5-mile spur line from Laporte, Ind., to its grading camp on the main line at South Laporte. Speeches were made by officers of the company, Mayor Becker of Milwaukee, Mayor Darrow of Laporte, and others. Special trains at the expense of the company were run from New England and from Minneapolis, carrying parties of stockholders to inspect the work. Grading is now nearly completed over about 20 miles of the main line from South Laporte toward Chicago. It is reported that the company has made an agreement with the Chicago South Bend & Northern Indiana Railway for joint use of the latter's tracks in South Bend and of the Air Line company's tracks in Laporte.

Construction News

FRANCHISES.

Augusta, Ga.—The Augusta & Columbia Railway Company, which proposes to build a 59-mile interurban line from Aiken, Ga., to Columbia, S. C., has petitioned for permission to lay a single-track passenger and freight line in Augusta, from Thirteenth street to the city wharf. Terminal facilities already have been purchased and it is stated that work will be started at once if the petition is acted upon favorably. It is estimated that the improvements will cost \$250,000. James U. Jackson, vice-president, Augusta, Ga.

Carthage, Mo.—A franchise in this city has been granted to the Kansas City Springfield & Southern Railway for its line from Springfield to Nevada, Mo.

Morris, Ill.—The Chicago Ottawa & Peoria Railway, recently incorporated to connect the Peoria lines of the Illinois Traction System with those of the Illinois Valley, has been granted a franchise to operate its line on Benton street in Morris. The line must be completed by January 1, 1909. H. E. Chubbuck, general manager, Ottawa, Ill.

Peoria, Ill.—The Peoria Railway Company, through S. L. Nelson, vice-president, has submitted to the council a proposition to build a double-track interurban railway on Washington street, from Chestnut street to Western avenue, the city of Peoria, after its completion, to have absolute ownership, the railway company retaining the perpetual right to occupy and use same. By this arrangement the city is to maintain the tracks and may, at its discretion, lease them to other interurban electric railways on such terms as it may deem advantageous to the city, the revenue accruing therefrom to go to the city of Peoria. This improvement would require about four miles of additional track and an expenditure of \$100,000, as estimated by the company.

Point Loma, Cal.—The Point Loma Electric Railway Company has applied for an additional franchise to construct a loop line in Point Loma, which privilege was not embodied in the franchise previously obtained. The San Diego Electric Railway Company will build and operate this new line.

Terre Haute, Ind.—The city council has refused to ratify the action of the board of public works in accepting the contract or new franchise submitted by the Terre Haute Indianapolis & Eastern Traction Company. The reasons given by the council are three in number, viz., the failure to provide for universal transfers from interurban lines to the city lines, and vice versa; the refusal to stop interurban cars upon signal except once in every six squares, and the failure to provide for a reasonable remuneration to the city for such a valuable franchise. The traction company is experiencing a similar trouble in the securing of a franchise in Richmond, and the business men of both cities are urging that some settlement be made, because the delay occasions them considerable inconvenience and is detrimental to business.

West Newton, Pa.—The Pittsburg McKeesport & Westmoreland Street Railway, which proposes to build an interurban electric line from Herminie to West Newton, with a branch to Suterville, has secured a franchise to operate its line in West Newton.

RECENT INCORPORATIONS.

Bellebridge Street Railway, Elizabeth, Pa.—Incorporated in Pennsylvania to build a 4-mile electric line from Glassport to Elizabeth, Pa. Capital stock, \$24,000. D. B. Neagley, president, Pittsburg, Pa. Other incorporators: E. L. Kern, J. K. Neagley, George McKain and N. F. Bicking, all of Pittsburg.

Centralia & Sandoval Railway, Centralia, Ill.—Incorporated in Illinois to build an electric railway from Centralia to Sandoval, parallel to the Illinois Central Railroad. Incorporators: W. M. Warnock, George D. Burroughs of Edwardsville, and others.

Crucible Street Railway, West Elizabeth, Pa.—Incorporated in Pennsylvania to build an electric railway 2½ miles long, from State street in Clairton to First street in West Elizabeth and the Allegheny county boundary line. Capital stock, \$15,000. Incorporators: D. B. Neagley, president; E. L. Kern, J. K. Neagley, George McKain and N. F. Bicking, all of Pittsburg, Pa.

Electric & Hydraulic Company, Grand Junction, Colo.—Incorporated in Colorado to promote power developments and electric railways. Capital stock, \$100,000. Incorporators: John Hays Hammond, John S. Bartlett, Irving W. Bonbright, Henry Hine, Leonard E. Curtis and others of Colorado Springs.

Idaho & Northwestern Railway, Coeur d'Alene, Idaho.—Incorporated in Idaho to build an 80-mile standard-gauge interurban line with four branches, to be operated by either steam or electricity or both. The line will start from Coeur d'Alene and end at Clarkia, Wash., by way of Chatelet. Capital stock, \$3,000,000. Incorporators: A. E. Gallagher, W. J. Taylor, Moscow, Idaho; Earl M. Rogers, Coeur d'Alene; E. R. Lewis, Fred B. Morrill, Spokane, Wash.

Ithaca-Owego Traction Company, Owego, N. Y.—Incorporated in New York to build an electric railway from Ithaca to Owego, 50 miles. Officers: President, Sherman Collins; vice-president, Charles D. Nixon; secretary and treasurer, George R. Peck.

Joplin & Pittsburg Railway, Joplin, Mo.—Incorporated in Kansas and Missouri to build an 80-mile interurban electric railway

between Joplin, Mo., and Pittsburg, Kan. Capital stock, \$5,000,000. Incorporators: H. W. Noble, Detroit, Mich.; F. H. Fitch, Pittsburg, Kan.; D. L. Robinson, Buffalo, N. Y.; C. G. Hutchinson, T. K. Irwin, Joseph I. Heim and others. The charter of the company, notice for application of which was noted in our issue of June 1, empowers the company to take over the street railway now under construction in Joplin, and the Pittsburg Railway & Light Company, operating from Columbus to Pittsburg, Kan.

Ohio & Southern Michigan Interurban Railway, Kalamazoo, Mich.—Incorporated in Michigan to build an interurban line from a point in Ohio through Coldwater, Hillsdale, Union City and Athens, Mich., to Kalamazoo. Capital stock, \$150,000. The line will be financed by Toledo and Pittsburg capitalists.

Penn Eastern Railroad.—Incorporated in Pennsylvania to build a 14-mile electric line in Pike county. Capital stock, \$150,000. William V. Hilliard, Milford, Pa., is president.

Rockwood & Bakersville Railway.—Incorporated in Pennsylvania to construct and operate an interurban line between Rockwood and Bakersville, Somerset county. Charles F. Hood, Connelville, Pa., is interested.

TRACK AND ROADWAY.

Ashland, Ky.—Thomas Boggess, Jr., is vice-president of a company that proposes to build an electric railway connecting Ashland, South Ashland, Oakview, Pollards, Russell and Greenup, Ky., about 20 miles.

Aurora Elgin & Chicago Railway, Wheaton, Ill.—Chief Engineer Charles Jones has announced that the first section of the line to Pigeon Hill, Aurora, Ill., will be opened for traffic on July 4, and that the entire line will be operating by August 1.

Bartlesville (I. T.) Interurban Railway.—This company, it is reported, will soon begin construction work on its proposed line from Bartlesville to Dewey, I. T. At a recent meeting it was decided to purchase track material immediately. The following officers have been elected: President, Joseph J. Carl; vice-president, George B. Keeler; treasurer, W. A. Smith.

Burlington-Bonaparte Interurban Railway, Burlington, Ia.—The promoters of this proposed line to connect Burlington and Bonaparte, Ia., via West Point, have organized by electing the following officers: President, J. A. Johnson, Bonaparte; first vice-president, John Blual, Burlington; second vice-president, T. L. Lampe, West Point; treasurer, H. H. Meeke, Bonaparte; secretary, Edward E. Egan, Burlington. It is stated that capital has been secured and that construction will begin without delay.

Canandaigua Southern Electric Railroad, Canandaigua, N. Y.—This company, which proposes to build an electric railway from Canandaigua to Atlanta, N. Y., has obtained permission from the state board of railroad commissioners to issue a \$2,000,000 mortgage. A 6½-mile extension from Atlanta to Wayland, one 2½ miles long from Atlanta to Lake Salubria, near Bath, N. Y., and a branch from Canandaigua to Palmyra, about 14 miles, also will be built after permission has been obtained from the commissioners.

Capital Circuit Traction Company, Indianapolis, Ind.—Charles E. Worth, secretary of this company, which proposes to build a belt line around Indianapolis, states that he has completed the work of securing the right of way. He states that the company is considering operating the road when completed with gasoline motors.

Cassville, Mo.—S. M. Mitchell of Cassville is reported to be seeking a charter for an electric railway from the Arkansas-Missouri state line to Eureka Springs, Ark.

Central Texas Traction Company, Corsicana, Tex.—Plans and specifications for this company's proposed interurban line, which will connect Corsicana and Palestine, Tex., are now completed and it is announced that work on the construction of the road and power plants will be started as soon as some of the minor details have been arranged.

Chatham Wallaceburg & Lake Erie Electric Railway, Chatham, Ont.—It is reported that \$40,000 of bonds for the construction of this road from Chatham to Lake Erie, via Wallaceburg, Blenheim and Dresden, Ont., have been subscribed locally, and that this sum is sufficient to insure the construction of the road by a party of American capitalists. George W. Kipp of Towanda, Pa., is president.

Chattanooga (Tenn.) Railways Company.—It is announced that this company will build a new railroad from Chattanooga, up Look-out mountain and to Lula lake and Minnehaha falls, on the mountain. It is also proposed to establish a 140-acre park on the mountain, near these lakes. A new line is also to be built to Chickamauga park, which will be much shorter than the present one.

Chicago & Western Indiana Traction Company, Indianapolis, Ind.—The preliminary survey for the line between Lafayette and Greencastle, Ind., 57 miles, has been completed. This line, known as the Educational Route, was originally intended to connect Chicago and Louisville, passing through the four college towns of Lafayette, Crawfordsville, Greencastle and Bloomington, but present plans contemplate only the construction of the section which has just been surveyed. W. L. Eckhouse of the American Engineering Company, Indianapolis, is chief engineer.

Chicago (Ill.) City Railway.—On June 17 about 200 men started the work of reconstructing this company's tracks in accordance with the provisions of the general settlement ordinance. The first work to be undertaken is on Root street, between Wallace and

State streets, where the tracks are being relaid with 129-pound grooved rails of a standard section approved by the board of supervising engineers, as described and illustrated in the Electric Railway Review of April 6, 1907, page 457. The directors have authorized a bond issue of \$10,000,000, the proceeds of which are to be used for the reconstruction work. Of this \$3,000,000 is to be available at once, \$3,000,000 on call, and \$4,000,000 when the work requires it.

Columbus Urbana & Western Traction Company, Columbus, O.—Right of way along the Scioto river is now being secured for this company's proposed extension through Dublin.

Columbia & Walla Walla Traction Company, Walla Walla, Wash.—It is reported that the officers of this company have under consideration the plan of extending the proposed line to Pasco. If this is done the line will run from Pasco to Wallula, thence to Walla Walla, to Dayton and up the Snake river to Lewiston or Charleston, with probably a branch line to the Palouse country to connect with the Spokane & Inland Empire system. J. W. Morrow of Waitsburg, Wash., is general manager.

Consolidated Railway, Bridgeport, Conn.—It is announced that this company will make extensive improvements to its lines on the Bridgeport division, including the construction of a large machine and repair shop, the enlargement of its rolling stock equipment by the purchase of a number of up-to-date cars, the extension of its freight and passenger system and other improvements, involving an expenditure of \$75,000.

Corry & Columbus Street Railway, Corry, Pa.—C. P. Northrup, president, is quoted as saying that as soon as the construction of the line from Corry to Columbus, Pa., five miles, is completed, it will be extended to Clymer, N. Y., and thence to Cutting, French Creek, Findley's Lake and northeast. Right of way is now being secured for a new line from Columbus to Ashville, via Bear Lake, Panama and Blockville. It is expected that the line to Columbus will be completed by July 4. The new line will connect at Ashville with the line of the Chautauqua Traction Company to Chautauqua lake.

Denver Interurban Railway, Ft. Collins, Colo.—T. S. McMurray, vice-president of this company, is quoted as saying that work on the local street railway lines in Ft. Collins would be started this week.

Des Moines Winterset & Creston Electric Railway, Des Moines, Ia.—B. Schreiner, chief engineer, writes that surveys, estimates, plans and specifications have been completed for this proposed line from Des Moines to Winterset and Creston, Ia., and that the proposition has been submitted to a bonding company. Construction is to begin at once, as soon as capital is secured.

Elkins (W. Va.) Electric Railway.—This company, recently incorporated to build an electric line in Elkins, and from Elkins to Belington, has elected the following officers: President, J. C. McShadden, Rockwood, Pa.; vice-president and general manager, J. E. Morgan of Elkins; secretary and treasurer, W. K. Taylor of Pittsburg. Construction is to begin as soon as material is shipped.

Evansville Suburban & Newburg Railway, Evansville, Ind.—It is reported that it has been decided to extend the line from Booneville to Chrisney, Ind., and that construction will begin immediately upon the completion of the surveys. It is also proposed to extend later to Cannelton, via Tell City and Troy.

Fresno (Cal.) Traction Company.—This company is preparing to build a new line on M street, from Inyo to Pollasky street. The Recreation Park line is also being double-tracked and work is progressing rapidly. C. A. Jenkins, superintendent.

Geary Street Park & Ocean Railroad, San Francisco, Cal.—It is reported that the board of supervisors has decided to proceed with the reconstruction of this road and has appropriated \$720,000 to be expended in converting the cable system to an underground conduit electric system.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—In accordance with an agreement reached between Hugh J. McGowan and the city, this company will begin at once the work of double-tracking its line in West Michigan street, from Blake street to the White river bridge.

Indianapolis & Cincinnati Traction Company, Indianapolis, Ind.—Charles L. Henry, president, has offered to build an extension from Greensburg to Madison, Ind., 52.4 miles, provided the residents along the line will subscribe \$300,000 of the estimated cost, \$1,321,967. The citizens are organizing to raise the money.

Indianapolis & Western Traction Company, Indianapolis, Ind.—be started by July 1. The road will be extended to Brazil to connect with a line from Terre Haute.

Iola Electric Railroad, Iola, Kan.—It is stated that this company is planning an extension of its line to Wheeler Heights, Kan.

Iowa-Missouri Traction & Power Company, Fairfield, Ia.—It is reported that this company, which proposes to build an extensive system of electric railways through eastern Iowa, has now completed surveys from Cedar Rapids to Oskaloosa, via Marengo, Genoa Bluff, Millersburg, Deep River and Montezuma, with a maximum grade of 2 per cent. Also a large per cent of the right of way has been acquired. J. W. Andrews, chief engineer.

Joplin & Pittsburg Street Railroad, Joplin, Mo.—Work on the electric railway in Joplin is progressing rapidly. Track is now being laid on Joplin street, between Fifth and Tenth streets, and material is arriving for the work on South Joplin street. Surveys have been completed for 48 miles of lines, running from Joplin

to Webb City, Carthage and Galena, and it is proposed to build about 15 miles this summer. W. O. Hands, manager and engineer.

Kansas City St. Joseph & Excelsior Springs Electric Railway, Kansas City, Mo.—It is reported that arrangements have been made for underwriting the bonds required for building the proposed line from Kansas City to St. Joseph and Excelsior Springs, Mo., 50 miles, and a bridge across the Missouri river at Kansas City, for which a franchise was recently secured.

Kansas City & Olathe Electric Railroad, Rosedale, Kan.—F. P. Dickson, president of this company, which proposes to build an interurban line from Kansas City, Mo., to Olathe, Kan., passing through Rosedale, Bryn Mawr, Rosedale View, South Park, Merriam, Shawnee, Lenexa and Lackmans, writes that the line has been surveyed from Rosedale to Olathe, Kan., its entire distance of 20 miles. Grading is completed from Rosedale to Lenexa, 11 miles, and 3 miles of track has been laid from Rosedale to South Park since the first of the year. Work on the overhead construction, which is of the bracket type, is now in progress from Rosedale to Merriam, a distance of 5 miles. The equipment for the power house will consist of two 150-horsepower gas engines and one 500-volt 90-kilowatt compound-wound multipolar direct-current generator, with switchboard apparatus, etc. F. P. Dickson, 408 Gumbel building, Kansas City, Mo., is president; D. B. Johnson, vice-president; R. W. Hoeker, secretary and treasurer. The Palmer Company, Dwight building, Kansas City, has charge of the engineering work.

Kansas City-Western Railway, Leavenworth, Kan.—The first car was operated last week over the Welborn cut-off, which will save about 15 minutes in the running time between Kansas City and Leavenworth.

Lafayette & Logansport Traction Company, Ft. Wayne, Ind.—It is announced that the line from Lafayette to Logansport, Ind., which was described in the Electric Railway Review of May 18, page 653, will be opened for traffic about July 15. A car will be operated over the line on June 23, when a party of officials will make an inspection trip, but the ballasting has not yet been completed.

Lake View Traction Company, Clarksdale, Miss.—It is announced that construction work on this company's line to Lake View will begin about September 1. Its capital stock has been increased to \$1,000,000 of preferred and \$1,500,000 of common stock and the company since its organization has been steadily at work acquiring right of way, real estate, franchises, etc., preparatory to beginning construction work in the fall. R. F. Tate, Memphis, is president.

Marlboro, Mass.—It is stated that a 17-mile interurban railway from Marlboro to Waltham is being promoted by C. E. Stevens of Sudbury, Mass.

Meridian (Miss.) Light & Railway Company.—It is announced that the Twenty-fourth avenue line in Meridian is to be extended at once to Poplar Springs, three miles, and that \$263,500 is to be expended in improvements.

Metropolitan Street Railway, Kansas City, Mo.—C. N. Black, general manager, has announced that the material for the extension of the Prospect avenue extension is expected to arrive the latter part of this month and that construction will begin about July 1. It is expected that 45 days will be required to build the extension.

Milford & Uxbridge Street Railway, Milford, Mass.—This company is reported to be contemplating the construction of an electric road connecting Whitinsville, East Douglas and Manchaug, Mass.

Milwaukee Northern Railway, Port Washington, Wis.—W. A. Comstock, president, writes in regard to the reports of a consolidation of this company with the Sheboygan (Wis.) Light Power & Railway Company that there has been no actual financial consolidation of the two companies, but consolidated management has been agreed upon between them, for mutual advantages in economy of operating charges, and for mutual protection. Ernest Gonzenbach, at present vice-president, treasurer and general manager of the Sheboygan Light Power & Railway Company, becomes general manager also of the Milwaukee Northern Railway. E. G. Broad, at present auditor of the Comstock-Haigh-Walker Company, which is building the Milwaukee Northern, becomes auditor of the two railway companies jointly. F. W. Walker of the Comstock-Haigh-Walker Company becomes operating engineer for the two railway companies. As far as the general officers are concerned the two companies will keep their identity as at present. The agreement goes into effect on July 1, 1907. The construction of the Milwaukee Northern is being pushed with all possible dispatch. There have been delays in construction, due to very bad weather, in the last two months, and there have been some delays in receiving material on account of strikes. It is expected, however, to be in operation to Port Washington, Wis., from Milwaukee about August 1. At the same time the work is being pushed along between Port Washington and Sheboygan, and with no untoward delays the line should be in operation into the last-named city from Milwaukee by November 15.

Mineola Roslyn & Port Washington Railroad.—It is announced that this company, which proposes to build an electric line from Oyster Bay to Flushing, L. I., via the points named in its title, has made application to increase its capital stock from \$150,000 to \$1,250,000, and to change its name to the New York & North Shore Traction Company.

Minneapolis Kansas City & Gulf Electric Railway, Minneapolis, Minn.—The Northwestern Securities Company has issued a prospectus for this company's proposed electric line from Minneapolis,

Minn., through Des Moines, Ia., Omaha, Neb., Kansas City, Mo., Wichita, Kan., Oklahoma City, Okla., Dallas, Waco, Houston and Galveston, Tex. The road is to be double-tracked and to handle both passengers and freight.

Montgomery Traction Company, West Point, Pa.—This company, which now operates an electric line from Lansdale to Norristown, Pa., announces that it will build an extension from Norristown to Ambler, with a possible continuation to Willow Grove.

New Orleans (La.) Railway & Light Company.—President E. C. Foster has announced that the company proposes to expend from \$700,000 to \$1,000,000 this year in track construction and roadbed improvements. At present the company is reconstructing its tracks on Broadway, from St. Charles avenue to Walnut street, and removing them from the side to the center of the street. As soon as this work is completed, or in about 30 days, the Villere street line is to be extended about five blocks. It is also proposed to make an experiment with wooden blocks for paving between the tracks and for one foot on each side.

Northern Cambria Street Railway, Patton, Pa.—Work is to be started in a few days on an extension from Barnesboro to Garman's Mills, Pa., three miles. Surveys have been completed. W. H. Denlinger, president.

Oregon Water Power & Railway Company, Portland, Ore.—Work will be started in a short time in replacing the present 40-pound rails between Oregon City and the Clakamas river with 70-pound rails. This division includes about two miles of track. Other portions of the track will be rebuilt this summer.

Paris (Ill.) Traction Company.—F. L. Kidder, president, writes that 3½ miles of track has been laid this year and put in operation, from the south city limits of Paris to Reservoir Park. The Paris & Northern Traction Company, which has the same officers, has been incorporated to build from Paris to Ridge Farm, Ill., 20 miles, from Horace to Brockton, 12 miles, and from Garland to Metcalf, 6 miles. Surveys have been completed from Paris to Chrisman, 14 miles, and surveying is in progress on the remainder of the distance to Ridge Farm. Grading is to begin in July. I. N. Doughty of Paris is chief engineer.

Public Service Corporation of New Jersey, Newark, N. J.—The new extension to Clementon, N. J., was opened for traffic on June 15.

Puget Sound International Railway & Power Company.—C. D. Wyman of Boston, Mass., vice-president of the Seattle Electric Company and the Puget Sound Electric Railway, who is also connected with other properties of the Stone & Webster Engineering Corporation in the northwest, has announced that this company has been organized and incorporated in Maine for the purpose of building and operating an extensive system of interurban electric lines in the state of Washington and to extend and improve the lines in the northwest already controlled by Stone & Webster. The cities which will be served by this system and their approximate distances from Seattle are as follows: Aberdeen, 133 miles; Blaine, 138 miles; Bellingham, 97 miles; Chehalis, 94 miles; Centralia, 94 miles; Puyallup, 32 miles; Everett, 46 miles. Negotiations for the controlling interest in the street railway properties of Everett, Wash., by Stone & Webster are now under way and as soon as these have been completed actual work will be begun on the construction of the first division, whose objective will be Bellingham. Between 30 and 40 miles have been surveyed south of the latter city. It is stated that power for the northern portion of the system will be obtained from the Noosack power plant, whose capacity will soon be increased to care for the additional load.

Pullman La Crosse & Columbia River Railroad.—J. O. Staats of La Crosse, Wash., has submitted a proposition to the people of Whitman county, Washington, south of Spokane, to organize a railroad company and build an electric line from Pullman to La Crosse and Hooper, 42 miles. It is to connect at Pullman with the Oregon Railroad & Navigation Company and at Hooper with the new Portland-Seattle branch of the Northern Pacific. The route will be from Pullman to Union Flat, via Wilbur gulch, thence crossing the flat to Little Pennewawa creek, thence down that creek and across the divide to Alkali Flat, thence to La Crosse, via Willow creek. Power will be generated at Falouse Falls, near Washuena, if sufficient force can be obtained. If not, steam will be used. The proposed line will occupy almost the route selected by the Northern Pacific several years ago when it was proposed to build a cut-off to connect with the main line near Pasco, thus saving a long haul to Marshall Junction and back to Pasco. The line will be 130 miles shorter than the road now running from Pullman to Pasco via Marshall Junction.

San Diego (Cal.) Electric Railway.—This company is under contract with the Columbian Realty Company to build and operate a car line from University boulevard, out University avenue, through City heights, to Fairmont avenue, and the construction of this line will be commenced and rushed to completion and operation as soon as the grading of the street has been completed. The line will be completed within six weeks after construction has begun, as most of the material is now in the city and the remainder will have arrived before the grading has been finished.

Sand Point, Idaho.—Announcement is made by A. McDonnell that plans for an electric railway to facilitate the transporting of ore from the Weber mine to Lakeview are under consideration. The line will be nine miles long.

Seattle-Everett Interurban Railway, Seattle, Wash.—Harry C. Todd, secretary, writes that this company has laid 2½ miles of track this year from Lake Ballinger to Hall's Lake, Wash., and is operating four 41-foot passenger coaches, one electric locomotive and 25 freight cars. An extension from Hall's Lake to Everett, 18

miles, is expected to be in operation by January 1. G. W. Chapman, chief engineer.

Southern Illinois Transit Company.—McCann Brothers of Herrin, Ill., who have the contract for grading this line from Murphysboro, through Carbondale, Herrin and Johnson City, Ill., were expected to begin work this week between Carbondale and Carterville. Another force of men is to be put at work soon between Carbondale and Murphysboro. The work of securing a private right of way is being pushed. The company is to be reorganized under the name of the St. Louis & Big Muddy Coal Belt Railway, with a capital stock of \$600,000.

Springfield (Ill.) Consolidated Railway.—Mullville Brothers of Alton, Ill., have been awarded the contract for the construction of this company's proposed extension to the Zoo park.

Springfield, Md.—The Springfield State Hospital for the Insane has let a contract to David E. Evans of Baltimore for building an electric railway line from Springfield to Sykesville.

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company will replace half a mile of track in Newcastle, Ind., with new 6-inch girder rails.

Texas Traction Company, Dallas, Tex.—The grading forces for the line from Sherman to Dallas, Tex., have begun work in the city of Sherman and will complete the work from the city to the next camp in the vicinity of Choctaw Bayou.

Toledo (O.) Railways & Light Company.—This company is relaying five miles of its tracks in Toledo with 90-pound rails, in place of the old 45-pound rails. The work on the Broadway line is completed and work is now in progress on South and Adams streets. The Monroe and Western avenue lines will be rebuilt next and also the Lower Summit line, when that street is repaved this summer. This line may also be double-tracked. L. E. Beilstein, general manager.

Union Traction Company of Kansas, Independence, Kan.—Tracklaying has been completed on the line from Coffeyville to Independence, Kan., and President D. H. Siggins is quoted as saying that cars will be operating over the line by June 30. Work on the park line in Coffeyville is expected to be completed by July 15. The company also proposes to build from Coffeyville to Parsons and from Coffeyville to Cherryvale.

United Railways, Portland, Ore.—E. E. Little, president of the Pacific Railway & Navigation Company, has acquired control and been elected president of this company, which is now building a street railway system in Portland and proposes to build to Hillsboro and Forest Grove. Work has been started on Flanders street, from Front to Twelfth street.

Washington & Martinsville Traction Company.—Thomas De Noon of Chicago and Chief Engineer E. J. Wilson announced recently that construction on the line from Washington to Martinsville, Ind., via Bloomfield, will begin in 30 days. Surveys are being completed and grading is to begin at the Washington end.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—The New York railroad commissioners have granted this company permission to issue \$300,000 of bonds for improvements.

Williamsport (Pa.) Passenger Railway.—E. H. Davis, general manager, writes that this company expects to complete this summer an extension of about 1½ miles.

Winnipeg (Man.) Electric Railway.—This company has written to the board of control of Winnipeg that it proposes to double-track its Portage avenue line from Nella street west; also the Belt line and the William avenue line.

Wyalusing Valley (Pa.) Railway.—W. D. B. Ainey, T. J. Davis, M. S. Allen and J. S. Courtright have applied for a charter to build an electric railway from Wyalusing to Montrose, Pa.

POWER HOUSES AND SUBSTATIONS.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y.—This company has closed a contract with the General Electric Company for a new converter substation, which will be built near Athol Springs, N. Y. It is expected that the station will be ready for operation by August 15. The cost of the new substation will be about \$60,000. This station is being erected as a result of a contract just entered into with the Ontario Power Company for electric power for the main line between Buffalo and Erie. It is stated that within a year power will be available for manufacturing purposes and it is predicted by President Joseph B. Mayer that this will do much to increase the development of towns along this line. The power house at Fredonia will be abandoned except for the manufacture of gas.

Chippewa Valley Electric Railway, Eau Claire, Wis.—It is announced that this company has decided not to renew its contract with the Chippewa Falls Power & Lighting Company for power to operate its cars. The company has decided to operate its plant at Menomonie, and expects to have sufficient power available to sell for power and lighting purposes.

Keokuk (Ia.) Electric Railway & Power Company.—It is announced that this company will spend about \$10,000 on improvements on its local property this fall and winter. A new 400-horsepower generator will be installed in its power house.

Memphis (Tenn.) Street Railway Company.—It is announced that this company will install two new units in an addition to its power house. The addition will be of brick of sufficient size to accommodate the new units. Work will be started in about a month.

Personal Mention

Mr. E. S. Fassett, general manager of the United Traction Company of Albany, N. Y., has been elected a director and a member of the executive committee, succeeding Mr. W. J. Mullen.

Mr. E. J. Bechtel, heretofore chief electrician of the Toledo Railways & Light Company, Toledo, O., has resigned, effective on July 1, to become consulting engineer for Hodenpyl, Walbridge & Co., New York City.

Mr. Leonard A. Jansen, superintendent of underground construction of the Milwaukee Electric Railway & Light Company, has been appointed south side commissioner of public works of the city of Milwaukee, Wis.

Mr. Charles R. McKay has been appointed chief electrician of the Toledo Railways & Light Company, Toledo, O., succeeding Mr. E. J. Bechtel, resigned. Mr. McKay formerly was with the General Electric Company at Cincinnati.

It is officially announced that Mr. Frank R. Henry, auditor of the United Railways Company of St. Louis, St. Louis, Mo., has been elected second vice-president of the American Street and Interurban Railway Accountants' Association, vice Mr. C. F. Bryant, resigned.

Mr. Hugh J. McGowan of Indianapolis, Ind., president of the Terre Haute Indianapolis & Eastern Traction Company and of the Indianapolis Traction Terminal Company, has sailed for Europe to spend at least three months, accompanied by his wife and daughter.

Mr. Ernest Gonzenbach, vice-president, treasurer and general manager of the Sheboygan (Wis.) Light Power & Railway Company, has been appointed general manager also of the Milwaukee Northern Railway of Port Washington, Wis., which is building a line from Milwaukee to Port Washington and Sheboygan, Wis.

Mr. S. N. Ford of Mansfield, O., has been elected president of the Mansfield Railway Light & Power Company, in place of Mr. Leopold Kleybolte of Cincinnati. Mr. C. F. Ackerman of Mansfield has been elected vice-president, succeeding Mr. A. S. Huey of Chicago, and Mr. S. A. Foltz of Mansfield, general manager, has also been elected secretary, to succeed Mr. George H. Koehler of Chicago.

Mr. M. Kuroki, a professor in the University of Japan, who has been sent to this country and also to Germany to study the electric traction systems, is spending a few weeks in inspecting the Indiana lines and especially the alternating-current system and power house of the Indianapolis & Cincinnati Traction Company at Rushville. Mr. Kuroki is accompanied by Mr. J. W. Meares, electrical adviser for the English government in India, who is likewise making an inspection of the interurban lines in Indiana.

It is officially announced that the new officers of the Connecticut Company, formerly the Thomaston Tramway Company, which will have charge of operation of the Connecticut electric lines of the New York New Haven & Hartford Railroad Company, are as follows: President, C. S. Mellen; vice-presidents, Calvert Townley, H. M. Kochersperger and E. H. McHenry; assistant to the president, H. A. Fabian; general traffic manager, A. B. Smith; general manager, John K. Punderford, all of New Haven, Conn.

The Michigan United Railways Company, Lansing, Mich., has issued the following notice: "The appointment of Mr. J. M. Bramlette as general manager of the Michigan United Railways Company has been announced, to take immediate effect. Mr. Bramlette has held the position of general superintendent for the company for more than a year past and the appointment is a well-merited recognition of his efficient services. His headquarters will continue to be in the city of Kalamazoo, the western terminus of the system. The office of general superintendent has been abolished." A portrait and biographical sketch of Mr. Bramlette were published in last week's issue of the Electric Railway Review.

The office of Mr. T. P. Shonts, president of the Interborough-Metropolitan Company of New York, has been moved from the Park Row building to the United States Realty building, 115 Broadway, seventeenth floor. Mr. H. M. Fisher, secretary, will also have his office there. A reorganization of the legal department of the companies embraced in the Interborough-Metropolitan Company system in New York has been announced as having taken effect on June 1. The department is now organized as follows: Mr. Paul D. Cravath, general counsel New York City Railway and subsidiary companies. Mr. George W. Wickersham, general counsel Interborough Rapid Transit Company and subsidiary companies. Mr. James L. Quackenbush, general attorney for all companies. Mr. A. A. Gardner, general solicitor for all companies. Mr. Charles A. Gardiner, solicitor for Manhattan Railway. Mr. Henry A. Robinson, solicitor for the New York City Railway and solicitor in charge of the bureau of real estate and taxes for the various companies in the system. Mr. Van Vechten Veeder, attorney and solicitor for the borough of Queens and Nassau county. Mr. Ambrose F. McCabe, attorney and solicitor for Westchester county. Mr. Quackenbush formerly had jurisdiction over the surface lines only. Under his new assignment he is general attorney for all the lines. The jurisdiction of Mr. Gardner extended formerly over the Interborough Rapid Transit Company only. His new duties entail much more work. Mr. Gardiner has been relieved of the legal work of the subway and will now confine his attention to the Manhattan company.

Financial News

Boston Elevated Railway.—The Massachusetts railroad commissioners have approved the issue of \$5,800,000 of 30-year 5 per cent bonds by this company, to supply funds needed in new construction and equipment, and the purchase of real estate.

Boston Suburban Electric Companies.—The shareholders voted on May 27 to amend the trust agreement with the object of enabling the company to consolidate three companies west of Newton, Mass. A. D. Clafin, the president, is quoted as saying that in acquiring these roads the Boston Suburban Electric Companies received about \$100,000 bonds, of which, together with some real estate, it will dispose. The three companies are the Westboro & Hopkinton Street Railway, Hopkinton, Mass.; the South Middlesex Street Railway, Framingham, Mass., and the Natick & Cochituate Street Railway, Natick, Mass., which will give a through line from the end of the Worcester Consolidated Street Railway tracks in Westboro to Newton, from whence the Boston Suburban Companies' cars may be run directly by the Boston Elevated Railway into the Park street station of the Boston subway.

Chicago City Railway Company.—An issue of \$10,000,000 of first mortgage 5 per cent 20-year bonds has been authorized, and \$6,000,000 of the bonds have been sold to the Harris Trust & Savings bank and the First Trust & Savings bank. Of this \$6,000,000 it is announced that \$4,000,000 will be issued on July 1, another \$1,000,000 on August 1, and the remaining \$1,000,000 on September 1. The proceeds of the issue will be used in rebuilding tracks, providing new equipment and for the purchase of additional real estate and the erection of buildings.

Consolidated Railway, New Haven, Conn.—Earnings of this company and controlled lines for the 10 months ended April 30, 1907, were as follows: Total gross earnings from operation, \$4,989,607; less operating expenses, \$3,181,448; net earnings, \$1,808,159; add income from other sources, \$851,647; total income, \$2,659,806; deductions from income, \$2,516,578; net income, \$143,228. Against net income there was charged: Six months' dividend paid on December 31, 1906, \$200,000; accrued dividend for January to April, 1907, \$100,000; total, \$300,000.

Electric Properties Company.—This company has issued a report for the 11 months ended April 30, 1907, as follows:

Earnings	\$388,248
Organization, legal and general expenses	104,744
Net	\$283,504
Preferred dividend	128,057
Common dividend	120,000
Surplus	\$ 35,447

At the annual meeting of stockholders the following directors, whose terms expired, were re-elected: H. Starr Giddings, George C. Smith, New York; E. G. Tillotson, Cleveland; John F. Wallace, New York; Theodore Vorhees, Philadelphia; F. Q. Brown, New York. The other members of the board are: Paul D. Cravath, New York; John A. Spoor, Chicago; Moses Taylor, New York; F. D. Underwood, New York; J. R. McGinley, Pittsburg; E. H. Jennings, Pittsburg; Charles H. Allen, N. W. Halsey, Robert B. Van Cortlandt, New York; George Westinghouse, Pittsburg; C. Sidney Shepard, New Haven, and W. H. Bixby, St. Louis, Mo. Immediately after the adjournment of the stockholders' meeting the board of directors organized and elected the following officers: John F. Wallace, president; George C. Smith, vice-president; P. F. Thompson, vice-president; John Seager, secretary; R. E. Keating, assistant secretary, and W. A. Esselstyn, treasurer.

Henderson (Ky.) Traction Company.—This company, which has acquired the property of the Henderson City Railway, recently foreclosed, has filed a trust deed to the Ohio Valley Banking & Trust Company of Henderson, Ky., as trustee, to secure an issue of \$150,000 of 5 per cent 20-year gold bonds. The authorized capital stock is \$150,000. Henry P. Barret is president, J. Henry Lyne vice-president, and Charles F. Dallam is secretary and treasurer. These three, together with B. G. Witt of Henderson, C. C. Tennis of Pittsburg, and Charles A. Hinsch and W. F. Boyd of Cincinnati, comprise the board of directors. For each \$1,000 bond of the old company \$500 in stock and \$500 in new bonds have been given.

Illinois Traction Company.—Gross earnings for the four months ended April 30 were \$1,195,324, an increase of \$212,939, or 23.72 per cent over the corresponding period of last year. The increase in net earnings was \$92,969, an increase of 24.29 per cent.

Indianapolis Traction & Terminal Company.—At the annual meeting of stockholders on June 12 the directors were re-elected as follows: Hugh J. McGowan, H. P. Wasson, John J. Appel of Indianapolis; Arthur W. Brady of Anderson, and W. Kelsey Schoepf of Cincinnati. The directors re-elected the following officers: President, Hugh J. McGowan; secretary-treasurer, W. F. Milholland; vice-presidents, H. P. Wasson, John J. Appel, Robert I. Todd, E. B. Peck of Indianapolis, and E. G. Edwards of Cincinnati. Mr. Todd also is general manager.

Mansfield (O.) Railway Light & Power Company.—At the annual meeting of stockholders in Mansfield on June 10 the following directors were elected: S. N. Ford, C. F. Ackerman and Reid Carpenter of Mansfield, F. L. Fuller, C. L. Southerden and Thomas W. Latham of Cleveland, and George Kohler of Cincinnati. The directors organized by electing the following officers: S. N. Ford,

president; C. F. Ackerman, vice-president; Reid Carpenter, treasurer, and S. A. Foltz, secretary.

Manila Electric Railroad & Lighting Corporation.—This company has issued its annual report for the year 1906. The income account, with a comparison, is as follows:

	1906.	1905.	Increase.
Gross earnings—			
Light and power	\$381,120	\$328,417	\$ 52,703
Railway	513,840	347,316	166,524
Trucking	15,514	47,793	* 32,279
Total	\$910,474	\$723,526	\$186,948
Operating expenses—			
Light and power	\$184,321	\$168,458	\$ 15,863
Railway	269,361	165,234	104,127
Trucking	14,167	36,286	* 22,119
Total	\$467,849	\$369,978	\$ 97,871
Net earnings	442,625	353,548	89,077
Other income		1,122	* 1,122
Total net	\$442,625	\$354,670	\$ 87,955
Interest on bonds	233,208	193,109	38,099
Surplus for year	\$209,417	\$159,561	\$ 49,856

*Decrease.

The operation of the railroad department was inaugurated on April 10, 1905, so that the figures for 1905 cover operations of the railroad department for less than nine months.

Maryland Electric Railways, Baltimore.—The declaration of a semi-annual dividend of 2 per cent increases the annual rate to 4 per cent. The first dividend, which was paid in January, was only 1½ per cent.

Meridian (Miss.) Light & Railway Company.—Shareholders have approved an amendment to the charter authorizing an increase in the capital stock from \$1,000,000 to \$2,000,000, in order to provide for additions and extensions.

Rio de Janeiro Tramway Light & Power Company.—The annual report for 1906 shows gross earnings of \$5,575,000 and operating expenses of \$4,010,000, leaving net earnings of \$1,565,000.

Rome (N. Y.) City Street Railway Company.—A meeting of stockholders will be held on June 22 to vote on a proposition to increase the capital stock from \$150,000 to \$500,000. The proceeds will be used for extensions.

Toledo Ann Arbor & Detroit Railway, Toledo.—Judge Lockwood of the circuit court at Toledo has taken under advisement the motion to sell the property. John O. Zabel of Toledo presented the motion for the sale and argued the case before the court. Other interests opposed the sale on the ground that their claims were not sufficiently protected.

Toledo (O.) Railways & Light Company.—The purchase of the property of the Toledo Gas Electric & Heating Company and the increase in the capital stock from \$12,000,000 to \$15,000,000 have been authorized by shareholders. The Toledo Railways & Light Company guarantees the \$2,200,000 outstanding bonds of the gas company.

United Railways Investment Company.—The directors have decided that it would be inadvisable to take any action on the semi-annual dividend on the preferred stock, which is ordinarily payable in July. This decision was taken on account of the existing labor situation in San Francisco, and in order that the investment company might be in a position to give the United Railroads of San Francisco the fullest measure of support.

United Traction Company, Albany, N. Y.—The directors have authorized the issue of \$859,000 additional first consolidated mortgage 4½ per cent bonds, making a total outstanding of \$2,588,000. The remainder of the authorized issue of \$6,500,000 is reserved to retire prior liens.

Uxbridge & Blackstone Street Railway, Uxbridge, Mass.—It is announced that the \$80,900 capital stock of this company will be acquired by the New England Investment & Security Company, which holds the New York New Haven & Hartford Railroad street railway properties in Massachusetts. The Uxbridge & Blackstone company has \$80,000 first mortgage 5 per cent bonds outstanding. It operates 10 miles of road, connecting Woonsocket, Whitins, Whitinsville, Millville and Uxbridge.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—Approval has been given by the New York railroad commission to the issue by this company of \$300,000 additional first and refunding mortgage bonds, making a total outstanding of \$2,474,000.

Dividends Declared.

American Cities Railway & Light Company, preferred, quarterly, 1½ per cent.
Bangor (Me.) Railway & Electric Company, quarterly, 1¼ per cent.
Cincinnati Street Railway, quarterly, 1¼ per cent.
Indianapolis Street Railway, 3 per cent.
Louisville (Ky.) Traction Company, common, quarterly, 1 per cent.
Manila Electric Railroad & Lighting Corporation, 1 per cent.
Reading (Pa.) Traction Company, 1½ per cent.
St. Joseph Railway Light Heat & Power Company, preferred, 1¼ per cent.
Union Passenger Railway, Philadelphia, 9½ per cent.
West Philadelphia Passenger Railway, 10 per cent.

Manufactures and Supplies

ROLLING STOCK.

San Jose & Santa Clara Railway, San Jose, Cal., has placed an order for 12 double-truck cars.

Camden & Suburban Railway, Camden, N. J., it is reported, is in the market for 41 motor cars.

Maryland Electric Railways, Annapolis, Md., has placed an order for eight new passenger cars.

Elkins Electric Railway, Elkins, W. Va., is in the market for a number of electric motor passenger cars.

Mt. Hood Railway & Power Company, Portland, Ore., under construction, will be in the market for cars about September 1.

Spokane & Inland Empire Railroad, Spokane, Wash., has ordered one locomotive from the Baldwin Locomotive Works.

Scioto Valley Traction Company, Columbus, O., has recently purchased and is now equipping for service four express trail cars.

Sandusky Norwalk & Mansfield Electric Railway, Norwalk, O., it is reported, has purchased a number of new 53-foot cars.

Pittsburg Harmony Butler & New Castle Railway, Grafton, Pa., placed an order with the St. Louis Car Company some time ago for 12 new cars.

Whatcom County Railway & Light Company, Bellingham, Wash., it is reported, expects to buy eight motor cars and a few trailers in the near future.

Williamsport Passenger Railway, Williamsport, Pa., as reported in the Electric Railway Review of April 6, has ordered four cars from The J. G. Brill Company.

Philadelphia & Western Railway, Philadelphia, Pa., it is reported, has drawn up specifications for 50 new cars and will be ready to award the contract in the near future.

Worcester Consolidated Street Railway, Worcester, Mass., has placed an order with The J. G. Brill Company for 15 closed cars for city service and 5 closed cars for suburban use.

Kansas City St. Joseph & Excelsior Springs Railway, we are officially advised, has not yet placed its order for equipment, but will be in the market for new cars later in the season. Ira G. Hedrick, consulting engineer, Keith & Perry building, Kansas City, Mo.

Washington Railway & Electric Company, Washington, D. C., has ordered 25 closed cars, 28 feet 3 inches long, from the St. Louis Car Company. These cars are to be mounted on maximum traction trucks, with steel-tired wheels and equipped with Westinghouse 93-A motors.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia., has placed a contract with the McGuire-Cummings Manufacturing Company for seven 10-bench open cars and seven closed cars. The closed cars will be 20 feet long over body, 31 feet 1 inch over all and will have 5-foot platforms.

United Traction Company, Albany, N. Y., has ordered 25 double-truck cars from J. M. Jones' Sons. These cars will have 28-foot bodies, longitudinal seats, pneumatically operated doors and six-foot vestibules. They will be equipped with 27-G Brill trucks, GE-80 motors and K-28F controllers.

Ferrocarril Electrico de Lerdo a Torreón, Gomez Palacio, Mex., it is reported, has placed an order with The J. G. Brill Company for six large double-truck cars. This is the second order for equipment that this road has placed in the United States. The first, given about a month ago, calls for 10 large cars.

Newton & Northwestern Railroad, Boone, Ia., has received from the Niles Car & Manufacturing Company 10 passenger interurban cars. These cars are 53 feet long and 8 feet 9 inches wide, inside measurement, and have three compartments—baggage and express, smoking and passenger. The company has also purchased an express car of the same length and width from the Niles Car & Manufacturing Company.

SHOPS AND BUILDINGS.

Chippewa Valley Electric Railway, Eau Claire, Wis.—Plans have been prepared for a new waiting station at Eau Claire, which will be 17 by 30 feet, with cement floor, iron columns and metal roof. H. G. Lawrence, superintendent.

Indiana Union Traction Company, Anderson, Ind.—It is announced that this company will expend \$15,000 additional on the large car shops now under construction at Anderson, bringing the total cost up to \$140,000.

Louisville & Southern Indiana Traction Company, New Albany, Ind.—It is reported that this company has taken an option on land near Midland, Ind., on which to erect a car house, gas house and a substation.

United Railways & Electric Company, Baltimore, Md.—The Maryland Electric Railways Company, acting for the United Company, has let a contract to J. Henry Miller for the erection of a large reinforced concrete car house on the block bounded by Pratt, Lombard, Seventh and Eighth streets, Highlandtown, Md. The

plans were prepared by Simonson & Pietsch, architects, and the estimated cost is \$140,000. Work is to be started immediately, with the intention of completing the building by fall.

New York (N. Y.) City Railway.—The car barns on Madison avenue, between Eighty-fifth and Eighty-sixth streets, New York City, were destroyed by fire on June 16. The loss is estimated at \$200,000.

Petaluma & Santa Rosa Railway, Petaluma, Cal.—It is reported that this company contemplates the erection of a new passenger station and other improvements, including the enlargement of the switching yards.

Spokane & Inland Empire Railroad, Spokane, Wash.—Three new passenger stations are now being erected at Liberty Lake, Liberty Lake Junction and Dalton Gardens, Idaho, on the Coeur d'Alene and Spokane division. The type of structure is similar to that used in the new station at Hayden Lake, of the Swiss chalet style, with long umbrella sheds.

TRADE NOTES.

General Electric Company, Schenectady, N. Y., has declared its regular quarterly dividend of 2 per cent, payable on July 15.

Beaumont Iron Works, Inc., Beaumont, Tex., will erect a building there, 50 by 150 feet, equipped for building and rebuilding cars.

J. G. White & Co., New York, have declared their regular quarterly dividend of 1½ per cent on the preferred stock, payable on July 1.

American Nut & Bolt Fastener Company, Allegheny, Pa., has declared its regular quarterly dividend of 5 per cent and 5 per cent extra, both payable on June 20.

Standard Coupler Company, Chicago, has declared a semi-annual dividend of 2½ per cent on the common stock and 4 per cent on the preferred stock, payable on June 29.

D. T. Williams Valve Company, Cincinnati, O., has opened an eastern branch office at 26 Cortlandt street, New York, in charge of Charles K. Thomas as eastern sales agent.

Union Switch & Signal Company, Swissvale, Pa., has declared the regular quarterly dividends of 3 per cent on its preferred and 3 per cent on its common stock, payable on July 10.

Northern Engineering Works, Detroit, Mich., has installed two 5-ton 3-motor electric traveling Northern cranes in the new plant of the Michigan Copper & Brass Rolling Mills, Detroit.

Virginia Passenger & Power Company, Richmond, Va., has recently placed an order for Allis-Chalmers turbines and Babcock & Wilcox boilers, equipped with Foster superheaters for 175 degrees.

Pittsburg Screw & Bolt Company, Pittsburg, Pa., has had plans prepared for a 4-story factory and office building, 72 by 100 feet. It will be located at Twenty-fifth street and Liberty avenue, Pittsburg.

H. M. Bylesby & Co., Chicago, have been retained as consulting and supervising engineers by the Mobile & Ohio for the rehabilitation and electrification of its general repair shops at Whistler, Ala.

Electric Storage Battery Company, Philadelphia, Pa., has declared the regular quarterly dividend of 1½ per cent on its preferred and common stocks, payable on July 1, to stockholders of record on June 25.

Evens & Howard Fire Brick Company, St. Louis, Mo., emphatically denies the rumors which associate this company with others in the so-called merger of St. Louis fire clay interests. The company advises it is not and will not be a party to the merger.

American Car & Foundry Company, St. Louis, Mo., has declared a regular quarterly dividend of 1 per cent on the common stock and 1½ per cent on the preferred stock, both payable on July 1. This increases the dividend on the common stock from 2 to 4 per cent yearly.

Federal Railway Signal Company, 42 Broadway, New York, will soon begin the construction of a factory building on upper Broadway, Albany, N. Y. The building will be 350 feet long and 100 feet wide, two stories high and of fireproof steel construction and will cost about \$50,000.

E. H. Symington, western sales manager of the T. H. Symington Company, who was seriously injured while riding in Lincoln park on May 18, is now rapidly regaining his health. He has recovered consciousness and his strength to such an extent that he is able to take some recreation.

R. L. Ginsburg & Sons, dealers in iron, steel and metals, announce that on July 1 this firm will be succeeded by a corporation known as the R. L. Ginsburg Sons' Company, with offices located both at Detroit, Mich., and Buffalo, N. Y., as heretofore. The new corporation will take over all the assets and assume all the liabilities of the present firm.

Goldschmidt-Thermit Company, 90 West street, New York, exhibited at the Master Mechanics' and Master Car Builders' conventions at Atlantic City three sizes of its new fire brick molds for welding locomotive frames. These molds represent a great advance in the process, as they entirely do away with the services of molders and pattern makers, allowing the repairs to be made in the roundhouse or repair shop. Daily demonstrations of the welding of locomotive frames were given in connection with the exhibit

and formed a most important feature. Other exhibits of the company were its new wax patterns, interesting samples of repair work and specimens of the rare metals free from carbon, such as chromium, manganese, manganese-copper, molybdenum, etc., produced by the Thermit process and supplied by the company.

Heywood Brothers & Wakefield Company, Wakefield, Mass., will construct a \$300,000 factory at Gardner, Mass. The plant will consist of a main building, 75 by 425 feet, and an office building, 60 by 60 feet, each building to be four stories high and basement. A contract has just been awarded the American Bridge Company for 1,500 tons of structural steel.

Acme Road Machinery Company, Frankfort, N. Y., manufacturer of contracting machinery and road building supplies, has prepared plans for a number of buildings to replace those recently destroyed by fire. These will include a main erecting and machine shop, 74 by 304 feet; woodworking shop, 50 by 100 feet; foundry, 60 by 80 feet; storage shed, 34 by 200 feet, and another storage shed, 20 by 200 feet.

General Fireproofing Company, Youngstown, O., announces that H. A. McMore, engineer, formerly with the Harlem Contracting Company of New York City, has been engaged by it. Mr. McMore is at present located at the home office and works in Youngstown. He will be connected with the reinforced concrete department and will be particularly concerned in designing and estimating work in which this company's system is to be installed.

Electric Controller & Supply Company, Cleveland, O., has moved into a plant of its own at 2698 East Seventy-ninth street. The company has been occupying leased quarters in the plant of the Wellman-Seaver-Morgan Company, but for some time both companies have been cramped for room and the change will greatly facilitate their work. The new plant of the Electric Controller Company is a 3-story building, 50 by 200 feet, with a T, 50 by 100 feet, and will enable it to double its output.

Southwestern Portland Cement Company, El Paso, Tex., has been incorporated with \$1,100,000 capital stock, to establish a Portland cement plant. Plans are now being prepared and the plant is expected to have a monthly capacity of 1,400 barrels. C. Leonard, Los Angeles, Cal., president; Charles Boyetcher, Denver, Colo., vice-president; A. Courchesne, vice-president and general manager; Felix Martinez, vice-president; J. E. Williams, treasurer; all of El Paso, Tex.; O. J. Binford, Los Angeles, Cal., secretary.

Stone & Webster Engineering Corporation, Boston, Mass., has recently placed contract for new equipment for the Pawtucket Electric Company, including four 520-horsepower Babcock & Wilcox boilers, equipped with Foster superheaters for 150 degrees superheat. This boiler room equipment is practically a duplicate of that recently ordered by the Texas Traction Company, of which the Fred A. Jones Company of Houston is consulting engineer, for operating the Curtis turbines in the new power station at McKinney, Tex.

Allis-Chalmers Company, Milwaukee, Wis., advises that its business continues to show a steady gain. During the month of May this company shipped from its works 552 cars of machinery, which was a gain of 20 cars over the record established for April. In April the aggregate weight of shipments was 21,680,847 pounds, while for the month of May the figure had risen to 23,772,242 pounds, making a total weight for the two months of 45,463,089 pounds. Cars bearing this enormous quantity of machinery, if coupled in one train, would have covered a distance of about eight miles.

Allis-Chalmers Company, Milwaukee, during the past two years has equipped six complete electric traction systems, aggregating a total of 218 miles of trackage, of which 150 miles are already completed and in daily operation. These include the Toledo Port Clinton & Lakeside, Cincinnati Milford & Loveland, Winona Interurban, Indianapolis Newcastle & Toledo, Indianapolis Crawfordsville & Western, and the Milwaukee Northern. The equipment for the latter road will constitute the installation of the largest gas engine driven electrical units for traction purposes in America.

Cutler-Hammer Manufacturing Company, Milwaukee, Wis., manufacturer of electric motor controlling devices, announces the purchase of the Wirt Electric Company of Philadelphia, Pa. The manufacture of the Wirt apparatus will be continued, and pending the inclusion in the Cutler-Hammer catalogue of the Wirt apparatus, the current Wirt catalogue will be used, which may be obtained from either the Wirt Electric Company, Philadelphia, or the Cutler-Hammer Manufacturing Company, or any of its district offices. The purchase of the Wirt company will enable the Cutler-Hammer company to meet more fully than ever before the requirements of the trade. For many years certain types of Wirt apparatus have enjoyed an enviable reputation. Particular attention is called to the very complete line of Wirt battery charging rheostats and field rheostats, which in 1902 were awarded the John Scott medal on recommendation of the Franklin Institute of Pennsylvania. Bulletins covering these and other lines of Wirt apparatus will be furnished on application.

ADVERTISING LITERATURE.

American Engineering Company, Traction Building, Indianapolis, Ind.—A novel piece of advertising literature is the pamphlet just issued by this company on the subject of the "Evolution of Transportation" from the steam locomotive to the electric locomotive. The pamphlet contains pithy paragraphs, emphasizing the advisability of the use of an expert and scientific agency in the construction of traction properties. The company makes examinations, reports, valuations and surveys and designs and supervises the construction of railroads, bridges, grain elevators and

industrial and manufacturing plants, and acts as consulting engineer. Contracts for construction are made only on the basis of cost-plus-a-fixed-sum.

General Electric Company, Schenectady, N. Y.—The electrification of the West Jersey & Seashore Railroad is covered at full length in this company's pamphlet just received.

Lunkenheimer Company, Cincinnati, O.—"Generator Valves" is the title of a new booklet issued by this company, which contains detailed information regarding the various types of Lunkenheimer generator valves and accessories, and is replete with splendid illustrations.

Lumen Bearing Company, Buffalo, N. Y.—The June issue of The Lumenary, the monthly publication devoted to the interests of this company, contains as usual several pages of readable prose and poetry. The metal report for May, as well as information regarding the metal situation and data regarding babbit metals, are also fully mentioned.

General Fireproofing Company, Youngstown, O.—A handsome 32-page work, covering this company's system of reinforced concrete construction, is a valuable addition to literature on this subject. The entire matter is covered most exhaustively, supplemented by excellent illustrations from photographs of construction work at various stages by the reinforced concrete system of this company.

Electric Service Supplies Company, Philadelphia, Pa.—A folder with return postal card attached is being sent to the trade regarding the National trolley guard, for which this company is the selling agent. The folder mentions the merits of the National trolley guard and describes briefly the method of construction. This guard is now being used by many of the largest and most prominent railways in the country.

Buda Foundry & Manufacturing Company, Chicago.—Bulletin No. 111 describes in detail the various railroad track, coal mine, depot and warehouse, wagon, elevator, portable and other scales manufactured by this company, as also its recording beams and quick weighing devices. The pamphlet is amply illustrated and contains full price lists of both scales and repair parts. There is also mention of the large line of other track appliances manufactured by the company.

American Spiral Pipe Works, Chicago.—The company's 1907 catalogue, comprising 100 pages, is the most complete work of this character published regarding all kinds of forged and rolled steel pipe flanges. It is of great interest to the engineering profession, as it contains general and detailed information covering flanges for power work. The catalogue is replete with splendid illustrations from photographs and drawings and contains full prices. The company also manufactures hydraulic supplies.

The J. G. Brill Company, Philadelphia, Pa.—The June issue of Brill's Magazine describes the additional equipment furnished by The J. G. Brill Company to the Inland Empire System at Spokane, Wash., also additional grooveless post semi-convertible cars for the United Railways & Electric Company of Baltimore, and a second lot of semi-convertibles for the San Antonio (Tex.) Traction Company, accompanied by splendid illustrations of the Brill types of cars furnished. An interesting article describing the manufacture of Brill truck frames is also contained therein.

General Electric Company, Schenectady, N. Y.—Bulletins Nos. 4493, 4498, 4502 and 4511, issued by the supply department of this company, describe respectively the parts of R controllers, Thomson single-phase high-torque induction wattmeters, G. E. knife-blade lever switches, type L form D-12, and lightning arresters, 1907 types. Bulletin No. 4503, issued by the lighting department, describes CQ generators and balancer sets, and Bulletin No. 4508, issued by the railway department, describes commutating pole railway motors. All of the bulletins contain excellent half-tone engravings from photographs.

Standard Varnish Works, 29 Broadway, New York.—A new catalogue has just been issued by this company in which the various insulating specialties manufactured by it are described. A novel and convenient improvement in catalogue work introduced by the Standard Varnish Works is the insulator's index, by reference to which it will be found that the varnish or compound best suited for various classes of work is indicated under the particular part of electrical apparatus it is designed to insulate. There are also several pages devoted to the latest method of insulation, viz., by means of drying and impregnating in vacuum. The vacuum system is being rapidly introduced into the shops of the large electrical manufacturers and operators of electric street railways in this company and its success has been so pronounced that indications are that the majority of the large electric railways throughout the country will adopt the method. The company will be pleased to forward a copy of this catalogue to anyone interested upon receipt of application.

American Sheet & Tin Plate Company, Frick Building, Pittsburgh, Pa.—"From Underfoot to Overhead" is the title of the beautifully illustrated brochure regarding tin for roofing purposes manufactured by this company. The booklet describes the experience of a piece of iron ore from its home in mother earth to its place on the home of man and is designed to give the architect, the builder, the roofer and the property owner an idea of the many processes through which a piece of ore must pass before it becomes the base of this company's MF Terne plate. Statistics have been carefully omitted from the book, because of the desire of the company to make its reading a pastime and not a study. However, the terms used and the descriptions given are accurate to the letter and beautiful half-tone engravings are shown, so that a clearer understanding of every process can be had. Suggestions

regarding the construction of a tin roof are made, accompanied by interesting tables for flat seam tin roofing, standing seam tin roofing, wind pressures on roofs, approximate weight of materials for roofs, snow and wind load and safe bearing loads. Tables are also shown of standard gauge and weights for all uncoated sheets and plates of iron. The company's other products are Terne plates, galvanized sheets, formed roofing materials, metal siding, metal lath and black sheets. The reading of the pamphlet will prove of educational value to anyone interested in the roofing subject.

Garden City Sand Company, Security Building, Chicago.—The subject of fire brick is treated exhaustively in this company's pamphlet, which contains illustrations and data regarding the standard shapes and sizes manufactured by it, as also valuable suggestions on furnace construction and general fire brick requirements and specifications for water tube and return tubular boilers. The company is a large manufacturer of special shapes of fire brick and its high perfection in this regard has merited the recommendations of the prominent manufacturers of smokeless furnace and chain grate stokers of the middle west. It is now filling a 40-car order of special shapes for one furnace manufacturer alone, and its locomotive arch business has been constantly on the increase. Suggestions are also made regarding the care of fire brick. The company's Rosedale fire clay meets the demand of the trade for a selected, high-class refractory clay. It also handles furnace sand, mined from the well-known Utica banks, and gannister, being a material made from silica rock, to which a sufficient quantity of plastic clay is added, together with a little water, to bond it. When a furnace wall or roof burns out in spots, by applying gannister to the burned-out portion, the lining is renewed and will last indefinitely. The company also carries in stock as nearly as possible all special tile used in baffling the numerous boilers which are on the market. This company is an extensive manufacturer of and dealer in building material and foundry supplies, and carries a very complete line of tile and cupola blocks; and also handles the famous Toch Brothers cement filler and floor paint, which is oil and water proof, and when applied to cement floors in power houses it prevents dusting and disintegration.

INSULATING MATERIAL.

From the time Faraday built his first coil the use of insulating material has steadily increased and it is natural that the conditions to be fulfilled by insulating materials vary so widely that no one material can be expected to serve the requirements of all classes of service. Faraday's first coils were constructed of bare copper wire coated with shellac. This served his purposes quite well, as the voltages he employed were low. The wires were next coated with silk or cotton thread in one or more layers and the coils made of this wire proved to have ample insulation for fairly high voltages, as long as the temperature was not allowed to rise too high and it was not subjected to undue mechanical strains, such as are inevitable in motor and generator work, and especially in the armatures and field coils of modern railway motors.

With the introduction of induction coils, in which very high voltages were generated, Ruhmkorff experienced considerable difficulty with his coils and it was not until Poggendorff suggested dipping the coils in melted paraffine that coils were obtained which would resist high voltages without a breakdown. These coils were probably the first to be insulated by the dipping process, which is now considered the most satisfactory method of insulating armature, field, transformer coils, etc., since it fills all the interstices of the coil, not only insulating the individual turns from each other, but mechanically separating them, holding them in a fixed position and thus protecting them from injury. Shellac, though it proved itself to be an efficient insulator for the conditions existing in the pioneer work in electrical engineering, is now superseded by insulating compounds having a superior dielectric strength, more elastic and more suitable in many ways for the conditions of service to be fulfilled in modern electrical machinery.

The Standard Varnish Works, 29 Broadway, New York City, manufactures insulating compounds of superior quality in such a wide variety that a material exactly suited for any set of conditions can be obtained. The advantage of having such a large variety of insulating materials available is that the engineer and master mechanic can select a compound which exactly meets their requirements, rather than select one of three or four insulating compounds intended to meet the full range of conditions covered by the 25 different insulating materials manufactured and regularly carried in stock by this company.

In addition to the 25 stock insulating materials, this company is prepared to manufacture special insulating materials to meet conditions which may not be covered by its regular products. It would be difficult to conceive of any condition which could not be met perfectly by one or more of them. Besides a line of clear insulating varnishes which can either be air dried or baked, the company manufactures standard oil and waterproof varnish for core plate insulation, a flexible mica sticking varnish, coil sticking varnish, light and black finishing varnishes and a splicing and filling-in compound. This company also manufactures a complete line of impregnating compounds which can be used for insulating armature and field coils, transfer coils, and for the impregnation of wood.

The Standard Varnish Works advocates the vacuum drying system of impregnating coils. With this process it is unnecessary to subject the coils to very high temperatures. By removing the moisture from the cotton at a low temperature and also removing the air from the interstices of the coils, it is possible to completely fill the latter and thus secure the high insulating qualities and mechanical strength desired. For small companies not having sufficient work of this class to do, the Standard Varnish Works will dip the coils for them, having at its plant the latest and most improved type of Passburg vacuum drying, impregnating and insulating apparatus.

THE GILCHRIST IMPROVED RAIL CHAIR.

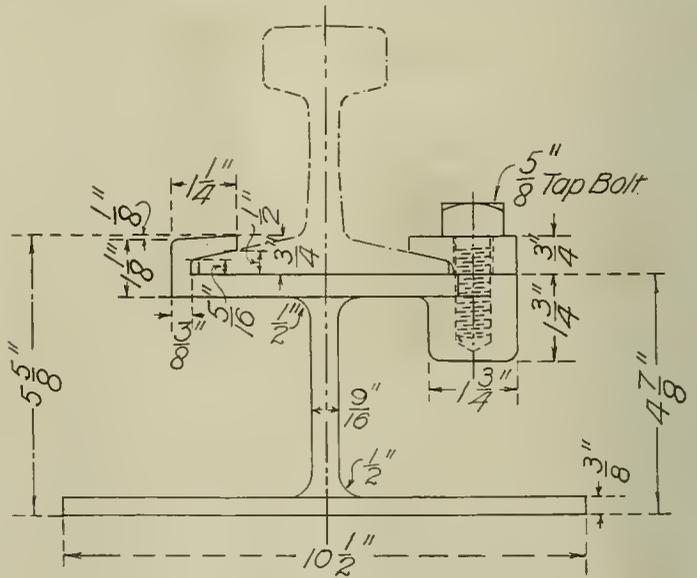

The steadily increasing traffic in cities has shown that the old forms of track construction are not adequate to stand up properly under the traffic of the present time. More substantial forms of track construction have therefore been introduced, many of which substitute concrete girders under the rails for the cross ties formerly used. In most cases where concrete track construction has been properly installed it has proved itself far superior to the

Gilchrist Rail Chair—Showing Method of Holding Rail.

old cross tie construction, but in many cases difficulty has been experienced in attaching the rails to the concrete in such a manner that they might easily be removed and new ones inserted without also removing the concrete from around the rails.

The need for an efficient, simple and economical method of attaching the rails to the supporting concrete girder is therefore evident, and to meet this Edward A. Gilchrist, McKeesport, Pa.,

Gilchrist Rail Chair—Detail Dimension of Parts.

has invented the rail chair illustrated herewith. These rail chairs are now being manufactured by the T. H. Symington Company, Baltimore, Md., and it is stated that they have been examined by a large number of prominent railway engineers, who have reported favorably upon them. A number of engineers have recently prepared track specifications in which they have recommended the use of Gilchrist rail chairs. An examination of the illustrations will show that the rail chair consists of an I-shaped casting, having a base 10 1/2 inches wide and 5 inches long. The upper head of the I has a hook-shaped projection on one side and a lug on its other side. One side of the rail base is held down by the hook-shaped projection, and a cast-iron clamping block screwed down by a

5/8-inch tap bolt, which screws into the lug previously mentioned, holds the other side of the base of the rail securely in position. These rail chairs are embedded permanently in the concrete and it is only necessary to loosen the tap bolts in order to remove or replace rails.

OHIO BRASS COMPANY'S NEW CATALOGUE.

The seventh edition of the Ohio Brass Company's catalogue of electric railway and mine haulage material and supplies has just made its appearance. The catalogue is 9 1/4 by 6 1/2 inches in size, is bound in cloth, and comprises 582 pages. It is profusely illustrated and covers all of the products handled by this company, showing also complete price lists. The volume is divided into 10 sections, as follows: Section 1, rigid and flexible pole brackets; Section 2, catenary construction; Section 3, trolley wire hangers, pull-overs, guard-wire insulators, etc.; Section 4, trolley ears, clamps, splicers, section insulators, cross-overs, etc.; Section 5, rail bonds, bonding tools, bonding caps and sleeves, channel pins, etc.; Section 6, materials for third-rail installations; Section 7, car equipment specialties and supplies; Section 8, construction material and supplies; Section 9, construction, track and line men's tools; and Section 10 contains some very useful tables, giving the comparison of aluminum and copper conductors, weights of stranded copper and aluminum cables, weights of solid copper and aluminum wires, properties of bare and insulated stranded copper cable and solid copper wire, tensile strength of copper wire, properties of galvanized wire strand, power required for electric traction, tables regarding structural steel tubing, standard iron pipe, standard and extra heavy pipe, copper equivalent of steel rails, sag in spans, following which are indices to trade numbers, code words and materials listed. The Ohio Brass Company is designer, dealer in and manufacturer of a complete and perfected line of appliances used in the construction and operation of electric railways, mine haulage systems, lighting and power plants. The main office and works are located at Mansfield, O.

GASOLINE MOTOR CARS FOR PASSENGER SERVICE.

BY A. L. ABBOTT.

The first gasoline motor car to be put into practical service by the railroads was a small velocipede type of car for inspection work. This was brought out a number of years ago by Fairbanks, Morse & Co., Chicago, Ill. It was so successful that the company continued experiments with new types of cars for various other purposes. A few years later this company had perfected and put into successful operation a number of types of cars to be used

Gasoline Motor Car.

for section gang work, replacing the hand car, for signal service, bridge inspection, track inspection, transferring switchmen in the yard, trolley repair work, and for moving light construction material. The latest product is the present light passenger car.

The engine used in all of this company's cars is of the highest grade, with individual cylinder, liberal crank case, nickel-steel crankshaft and special nickel-steel valves. They are of the high-compression type, four-cycle and are water jacketed. The cooler is made up of fine copper pipes with sufficient radiating surface to cool the engines under all conditions. In fact, the entire power equipment of these cars has been especially designed for the hard service it is to meet and is as near "fool proof" as can be built.

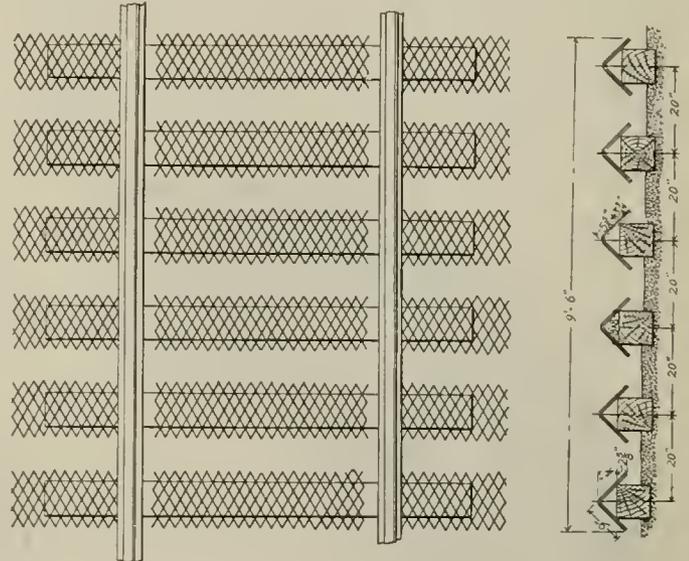

At Houston, Tex., between the terminals of the Houston electric lines and with a suburban extension, laid out by Brook Smith, a prominent banker at Houston, we find being used for passenger service a Fairbanks-Morse standard No. 16 motor car. This car is designed to be operated at any speed up to 35 or 40 miles per hour. The frame is of steel and securely riveted. The power is supplied by a two-cylinder 12-horsepower gasoline engine. Recent records tend to show that service derived at this point from this car is very satisfactory.

Another location where a similar car is being used is at Walnut Ridge, Ark. This car runs between Hoxie and Walnut Ridge, a distance of about two miles. The track over which this car is run was originally operated with one bob-tail street car drawn by a mule. The present owner of the road purchased a No. 16 motor car to operate over the lines of the Cache Valley Railroad, for carrying mail, and incidentally handling any passengers that might be picked up. This is a logging road, built through the swamps, and high water caused a suspension of operation. Since that time, to keep the line in operation, the motor car has been used. It is stated that the motor car, while in service in March, on the line between Hoxie and Walnut Ridge, has carried 600 passengers in one day, and that the average has been 300 passengers per day since the car was put in service on that road. The line over which this car operates parallels the St. Louis Iron Mountain & Southern Railroad.

Another point where a motor car is doing good service is at Mineral Wells, Tex. Here they are using a No. 16 Fairbanks-Morse special type C motor car between Mineral Wells and Lake-Wood Park. The company is known as Mineral Wells & Lake Wood Park Street Railway Company. The track is laid with 40-pound steel; the grades are light and the expense of construction was low. A few days ago the secretary of the road stated that one day they collected \$78.80 in cash fares at a rate of 15 cents a round trip. This company has since ordered a third car. The length of the track is 1.5 miles, but it is the intention to build a scenic railway around an artificial lake to which the road runs.

EXPANDED METAL CATTLE GUARDS.

A light and durable stock guard, which, it is stated, is practically impassable by stock has recently been patented by F. W. Stewart of the Climax Stock Guard Company. The new guard, as illustrated herewith, is made of expanded metal sheets, 18 inches wide and 2 feet long. These sheets are bent lengthwise into a

New Type of Expanded Metal Cattle Guard.

trough-shaped form, thus making each side 9 inches wide and 24 inches long.

These metal strips are set over the ties and extend 4 inches above and 2 3/4 inches below the tops. The ballast between the ties is removed to a depth of about 6 inches, which, with the triangle over the ties, makes the guard practically impassable. The ties may be set any distance apart that is desired, though a spacing of 20 inches center to center is recommended.

Should cattle try to cross these guards, their legs would go into the pit between the ties and upon trying to remove them the downward projecting portion of the guard would strike the animal's legs in a tender part, which would make it too painful for the animal to proceed. There is, however, no chance of an animal getting caught, as there is nothing to prevent it from withdrawing its foot. Small stock would certainly have serious trouble crossing over this form of guard, as the mesh may be made any size desired in order to prevent their hoofs from going through and still not give them any place for a foothold.

The expanded metal sections, each two feet long, are attached to the ties by means of from 8 to 15 staples, which hold them securely in position. It will be evident that little labor is required to install these guards. They leave the track free for inspection and repair without necessitating their removal. They also have the advantage that should a heavy object hanging under a train strike them they would only be bent and can easily be straightened and replaced. They are not easily torn out, as the mesh would tear before a sufficient force could be applied to pull out such a large number of staples. Another good point in their favor is that they can be packed in a relatively small space and consequently occupy little floor space in the storeroom and are easy to ship. If made of galvanized metal or if they are given a good coat of asphaltum paint these guards will last indefinitely and make one of the cheapest metal guards yet devised.

ENGINE-TYPE GENERATORS FOR DIRECT CURRENT.

In spite of the increasing use of turbo-generators for electric railway work, there are still so many engineers who believe only in "the steam turbine with a connecting rod on it" that the Allis-Chalmers Company has been steadily improving its well-known and efficient direct-current engine-type generators, illustrations of which are presented herewith.

Field Frames and Poles.

The pole frames of these (type "I") generators are made of a soft gray cast iron of ample cross-sectional area for rigidity and for the magnetic requirements. In those types of generators having round field coils the pole pieces are made of cast steel bolted to the inner periphery of the field frame. As a rule, however, the pole pieces are formed of steel punchings riveted together and bolted to the frame. The shunt field coils are form-wound on spools slipped on the pole pieces and held in position by small screw bolts passing through the end of the field-magnet spools.

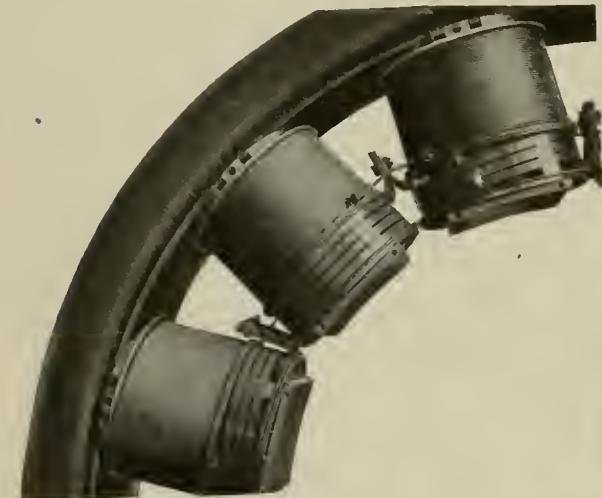

A unique improvement in the series-field winding has been introduced in the design of these generators. As will be seen from examining one of the detailed illustrations presented herewith the series-field winding is composed of laminated copper strips wound in the form of a continuous open spiral separated by insulating blocks. This permits a free circulation of air through the winding, thus keeping its temperature down and reducing its resistance.

Armatures.

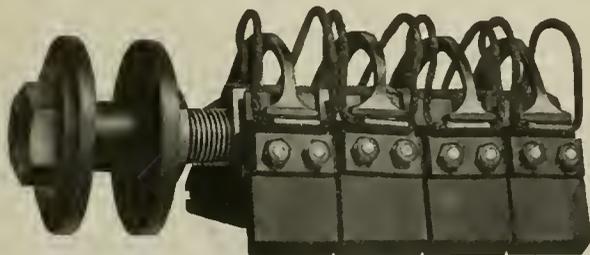

The armatures of these generators, 34 inches or less in outside diameter, are made of one-piece punchings of mild steel, while those of larger diameter are built up of punched mild steel segments dovetailed to fit on the spider with alternately overlapping joints. The inside of the armature is of open construction and a large number of radial ventilating ducts are provided through the laminations to afford ample ventilation and circulation of air through the armature and around the field coils. The armature coils are made of rolled copper strips, bent into shape in such a manner that all the armature coils of a given machine are interchangeable and readily renewable.

The individual conductors are insulated with linen tape and the several conductors that are to be placed in the same slot are grouped together and the slot insulation wrapped around them. The group of conductors with the slot insulation surrounding it is then placed in a steam-heated screw press, in which the insula-

tion is pressed into the shape necessary to fit the armature slot. As the coils are cooled before being taken from the press the insulation retains its shape. The coils are placed in the armature slots, where they are held in position by hard wood wedges fitted into grooves at the tops of the slots. No band wires are used on the armature under the poles, but steel wire bands serve to keep the ends of the coils in place.

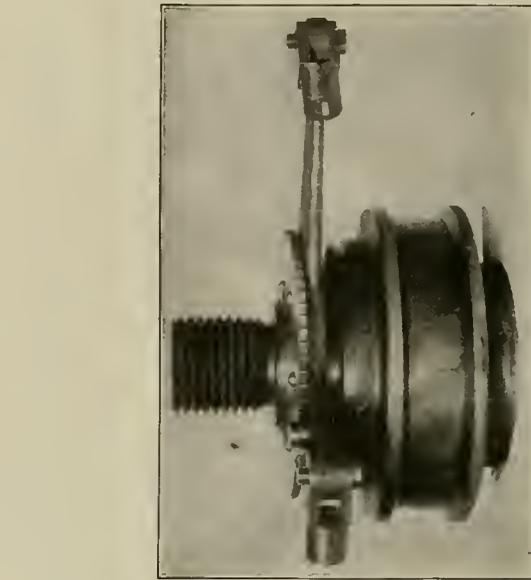

Type K Generators—Field Magnets, Showing Construction of Series Field Coils.

Type K Generators—Brush Holders and Supporting Arm.

The commutator segments are made of hard-drawn copper strip drawn to the proper taper to actually fit a commutator of

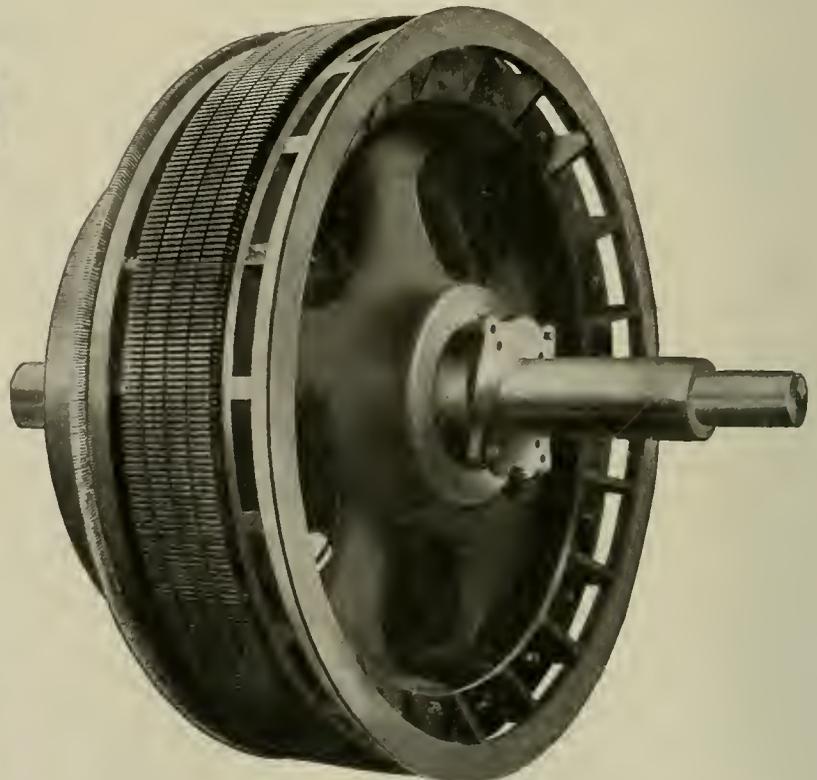

Type K Generators—Showing Details of Brush Oscillator.

to permit free circulation of air about them. The inside of the commutator is open and permits free circulation of air around it and insures cool running with a minimum possibility of warping.

Brush Holders and Brush-Holder Rigging.

The brush holders used on the type "I" generators are of the standard Allis-Chalmers reaction type, carried on substantial brush-

Type K Generators—Armature Core, Showing Strong and Well Ventilated Construction.

holder arms, supported on an adjustable brush-holder ring. The latter can be turned to adjust the position of the brushes by means of a hand wheel. The standard Allis-Chalmers brush oscillator is fitted on these machines. This device gives a transverse movement to the brushes and prevents the commutator from being worn in ridges.

The Sioux City Traction Company, Sioux City., Ia., is equipping about 20 of its cars with air brakes.

The purpose of the enormous investments of the New York New Haven & Hartford Railroad in electric railways is discussed in a letter of Charles S. Mellen, the president, which is quoted in the Philadelphia News Bureau. An abstract of this letter follows: "The thought of the company in acquiring Massachusetts trolley lines was not to suppress competition, for we do not believe there is serious competition between electric and steam systems of traction. It is our idea that all systems will develop ultimately into the electric, and that street railways will supplement the trunk lines. The solution of the problem of rapid transit will be the use of trunk lines between the cities and of street railways for collection and distribution within the cities." This expresses the common view as to the final effect of the changes which the use of electricity as a motive power is helping to bring about. The statement, however, explains the far-seeing motive of the extensive purchases of electric roads by the New York New Haven & Hartford Railroad. It is estimated now that this company controls 1,400 miles of electric road in various New England states.

It is regrettable that experience demands the use of wrecking cars by interurban railways. But, since no road can afford to have its tracks blocked for more than short spaces of time, it becomes desirable and in most cases financially practicable to make a considerable investment in suitable equipment for quickly clearing wrecks. The car of the San Francisco Oakland & San Jose Railway described in this issue is probably typical of the latest development in tool-car practice. It is provided with materials and supplies for every emergency, and many practical ideas based on the experience of steam railways and other electric railways have been incorporated in its construction and equipment. Attention is called to the

very complete list of materials as presented in the description. The car body is novel in design, extending as it does only three-fourths of the length of the sills. The remaining open platform carries a truck with an adjustable bolster that can be adapted to any height of car body used in and about Oakland. This very complete equipment, properly called a "wrecking tool car," is not provided with a crane for lifting trucks or car bodies. It is thought more desirable to have the crane on separate trucks and haul it as a trailer when necessary. A crane for such service necessarily must be of such large capacity as to be able to handle with facility the heaviest trucks and motors; and, in fact, the management of one interurban road is now considering the purchase of a derrick car that will be powerful enough to lift an entire car body on or off the track as desired. When wrecks occur the question of any reasonable expense for quickly clearing the line is hardly to be considered, and therefore an original investment for a complete ever-ready wrecking outfit should be considered good policy.

There are engineers who believe that boilers can be more safely operated by the use of gauge cocks than gauge glasses.

Gauge Glasses or Gauge Cocks?

There are a number of good reasons for this opinion: With gauge glasses the water tenders will depend entirely upon them, seldom operating the gauge cocks to make sure that the apparent water level indicated by the glass is the actual level in the boiler. No doubt many boiler explosions caused by low water, and wrecked engines caused by high water, have resulted directly from a faulty indication of the water level. Gauge glasses often become so dirty that it is extremely difficult to ascertain the water level, especially if they are not properly illuminated. The only way to impress upon the minds of careless employes the necessity for checking the gauge glass readings by the use of the gauge cocks is to remove the gauge glasses. If there are no gauge glasses the men responsible

will not only give more of their attention to the water level, but will make sure that the water column is clear at both top and bottom. This should be done at least once a day where the feedwater is good, and three or four times a day if the water is bad. The engineer in charge should personally test the water columns at least once a day. A further reason for abandoning the ordinary style of gauge glass is that they frequently break—especially if not cut the proper length and properly put in place. A large number of men have been severely scalded by the breaking of gauge glasses, and, where the gauge glasses are on a level with a man's eye, it has not infrequently happened that an employe has had an eye put out by the flying glass. If gauge glasses are to be retained, a good kind to be used is that with a flat, internally ribbed glass, held in a substantial metal frame. The optical properties of these glasses make the portion under water appear black, while the portion above water reflects light like a crystal, clearly defining the water line, which is easily distinguished even in poor light. Further, a thin coating of oil or dirt does not in the least affect the observation of the water level.

Twenty years ago the Master Car Builders' Association, in convention at Minneapolis, first adopted a standard type of automatic coupler. The report of the committee which considered the subject contained the following conclusion: "Your committee feels that the status of the (automatic coupler) problem at the present

**Repair Parts
and Coupler
Standardization.**

time warrants it in making the recommendation that this association adopt as a form of coupling the Janney type of coupler; that the association procure one of the present make of Janney coupler, and that all other forms of couplers that will automatically couple to and with this coupler under all conditions of service are to be considered as * * * conforming to the standard of this association." In accordance with the method by which the Master Car Builders' Association votes upon all changes in standards, this committee recommendation was referred to a letter-ballot and the M. C. B. automatic car coupler was adopted as standard for the railroads in the United States and Canada. This year, at the annual meeting, the president of the Master Car Builders' Association called attention to the increasing varieties of couplers, all of which conform to M. C. B. standards. This large number of designs entails the tying up of an enormous sum in repair parts which must be carried in stock by railroad companies. The president suggested that some restriction be placed on the introduction of new couplers and that a limit be given the number of couplers for which railroads must carry repair parts. Inasmuch as committees representing the electric railway associations are actively engaged in formulating standards, it should be well to consider this experience of the Master Car Builders' Association and adjust the limiting conditions of any standards adopted for electric railway use, so that the storekeeping departments may realize their share of the many values to be expected from standardization.

In the annual report for 1906 of the Cincinnati Lebanon & Northern Railway, a steam road which is controlled by the Pennsylvania Company, it is stated that

**Competition
with
Steam Roads.**

its commutation business should show an increase during 1907 because the inter-urban railway which parallels the steam railway made "an increase in its rates on December 1, 1906, which has already diverted some business to this company." Competition between steam roads and inter-urban electric railways is inevitable and the problem of the interurban manager is to regulate his service so that the company shall prosper in spite of lines which are parallel or which connect the same terminal points. Circumstances

may render some cases peculiar in themselves, but under ordinary conditions it is not advisable to lower fares or rates if it can be foreseen that they will have to be raised later. Public sanction to an increase is usually difficult to secure. Time will settle many problems of this character. While competition is certain, the electric railway manager is favored by certain physical advantages which are of constant, definite assistance in his efforts to secure business. On account of the inroads made upon its traffic by an electric line the Chicago & Alton Railroad tried the experiment two years ago of operating trains more frequently between certain places, and advertised that these trains would "stop on signal to engineer and on application to conductor at all public road crossings at which it is safe to take and discharge passengers." From the fact that they were soon discontinued, it is naturally inferred that the trains were not profitable. As contrasted with the steam road, the inter-urban electric line can offer frequent and usually more reliable service and it can point to greater convenience and advantage in terminal facilities, as well as to the absence during the ride of annoying smoke and cinders. These arguments are vital.

TAXES IN ANNUAL REPORTS.

Although the practice of deducting taxes from "gross income less operating expenses" is generally followed in annual reports of electric railways, as the recommended form of report of the American Street and Interurban Railway Accountants' Association, some companies, for purposes of their own, still consider taxes purely an operating expense.

In the "Question Box," which was a valuable supplement to the recent proceedings of the Southwestern Electrical and Gas Association at the San Antonio, Tex., meeting, there was published the query, with answers, whether traction company taxes should be included in fixed charges or in operating expenses. Out of four answers which were published, three responded "operating expenses" and the fourth favored the inclusion of taxes in fixed charges.

In its early days the Street Railway Accountants' Association considered this subject in its various aspects, and the division of opinion and practice which prevailed in those years is indicated by the changes which were made. The first draft of a standard report, which was presented to the association in 1897, provided that taxes be classified as a deduction from "gross income from all sources." When the association held its next annual meeting the committee reported that its members were "unanimously of the opinion that taxes, being incident to the ownership of property and the operation of the road, are an operating expense." The committee then found "no logical reason why taxes should not be treated as an operating expense."

The 1899 report of the committee recommended, in view of the interstate commerce commission classification of accounts, the steam railway standard, and in view of the position of the various state railway commissioners throughout the country, considering taxes as a deduction from income and not an operating expense account, that for the sake of uniformity and co-operation with the state railway commissioners and the Association of American Railway Accounting Officers the street railway classification be altered to correspond.

The standard classification of accounts in annual reports as now recommended provides that the deduction of taxes from income shall include all taxes on real estate and personal property, track taxes, franchise taxes, taxes upon capital stock, taxes upon gross earnings, car licenses, and other vehicle licenses; excepting, however, taxes on property such as real estate purchased or conducted as an outside investment, the net income from which is credited to "miscellaneous income." The classification which embodies this provision has been followed generally. It has been adopted officially

by the National Association of Railway Commissioners and it was used by the United States government census bureau in preparation of the street railway statistics which were gathered in connection with the 1900 census.

The operating accounts which, beginning July 1, are to be kept by steam roads under the jurisdiction of the interstate commerce commission provide that the aggregate of revenues from operations will produce total operating revenue, which, reduced by operating expenses, will leave net operating revenue. This phrase is substituted for the phrase income from operation as used heretofore in the form for annual reports. From net operating revenue taxes are to be deducted and the balance will be called operating income and carried to the income account.

Taxes are not governed by the efficiency or the inefficiency of the management, nor are they affected by the relative bond and stock capitalization of a road. A strike may reduce the operation of a road to a minimum and a receivership may eliminate the necessity of meeting fixed charges, but so long as the property is not abandoned some taxes are necessary.

Taxes are not under the control of the management, and to class the item as an operating expense renders the statement liable to misinterpretation. While it is essential to deduct the cost of taxation before arriving at the amount available for returns upon the capital investment, taxes should properly be shown as a separate item of outgo. The policy of showing taxes definitely aids in forming a better idea as to the state of the business.

SOME CHARACTERISTICS OF STEEL WHEELS.

A remarkably thorough series of wheel tests has been carried on during the past two years by George L. Fowler. This experimental work was performed with a view to establishing the value of the metal occurring in solid steel wheels as used for passenger cars. The very interesting results were presented to the Master Car Builders' Association by the experimenter in a topical discussion entitled "Solid Steel Wheels for Passenger Cars."

There are two factors upon which the use of a wheel depends: safety and economy. Many records have been published which show the economy to be obtained by the use of steel wheels or tires. Since the economy factor depends in a direct way on the safety afforded—a long-lived wheel having a larger factor of safety—the experiments mentioned were conducted with the determination of the relative safety of solid steel wheels as their object.

From the railroads there were obtained samples of each make of steel tires or wheels that had failed by what is known as "shelling out." To obtain the comparative value of the metal of the wheels, tensile test pieces were cut from three points in the tread, and these were tested in the ordinary way for maximum strength, elongation, elasticity, contraction of area and hardness.

Little difference was found in the tensile strength of the metal cut from the different tires. This quality increased with the quantity of carbon in the steel mixture. The lowest carbon of any tire was found to be about 0.57 per cent, the highest was 0.716 per cent and the tensile strength varied from 113,000 to 124,000 pounds per square inch. The limit of elasticity, however, could not be considered as varying directly with the tensile strength of the material. The elongation varied almost in direct proportion to the carbon; it ran from 6.87 per cent to 29.5 per cent, the latter figure, of course, being found with the lowest percentage of carbon.

Inasmuch as relative elasticity is a quality upon which is put much credence when preparing designs for any metal structure it is interesting to learn that solid steel wheels have the highest percentage of elasticity in relation to their ulti-

mate strength. The solid wheel was found to have the maximum degree of hardness, although to the credit of the others it is stated that the total range of hardness was slight, since all had been made of steel, the narrow carbon limits of which have been stated.

As a result of these determinations the statement is made that as far as laboratory tests can show the solid forged wheels can be depended on as far as safety is concerned.

Careful microscopical examinations of all the shelled-out wheels that were collected for these tests showed that slag was in each instance the cause of the shelling out. The presence of slag exists from the time a blank is cast. But with a careful inspection of the metal at this early stage of the wheel-forging process and a proper trimming of the ingot there should be obtained a mass of metal practically free from the damaging slag which might be carried from the surface of the mold to the tire of the wheel. There is a determinable difference in the finished product, depending upon whether the blank is cast to the form of a wheel and then given a surface rolling or is cut as a slice from an ingot and then so rolled that the entire shape is changed.

The experimental work showed that the removal of metal by grinding, under similar operating conditions, is four times as fast with cast-iron as with steel wheels. This ratio was determined by counting the number of revolutions of an abrasive wheel required to shorten by a definite length "pencils" of the two metals. The determination—this four-to-one ratio—was checked by skidding a loaded axle that had at one end a steel wheel and at the other a cast-iron wheel and was loaded with 24,000 pounds. When moved along the track at from 2½ to 3 miles per hour it was found that the metal removed, as accounted for by the flat spots, was about four times as much for the cast-iron wheel as for the steel wheel. But, remarkable as it may seem at first thought, when the speed was increased to about seventeen miles an hour, the wearing conditions were exactly reversed. This may be accounted for by the fact that the heat developed at the higher speed reversed the wearing qualities. However, the latter conditions are hardly normal, since heavy braking only occurs at the slow speeds.

As regards flange breakages tests have shown that the strength of a cast-iron wheel flange is about 90,000 pounds, while in these experiments the pressure required to break off, forward the back, the flange of a solid steel wheel was 556,000 pounds. In some parts of the country scrap steel has little or no sale value; therefore, since careful experiments seem to have shown the solid steel wheel to be a strong competitor, physically and chemically, of the steel-tired wheel, the first cost and the value of scrap probably will be the determining factors in any purchase.

LONDON FARES TO BE INCREASED.

London papers report that an agreement has been reached to raise the fares on the various London electric railway systems from July 1. This decision is the outcome of a conference held between representatives of the Metropolitan, the Central London and the Underground Electric Railways Company of London. The Central London Company agrees to abolish the uniform twopenny fare and to charge 3d. as a maximum. The Metropolitan will increase the fare between Aldgate and Hammersmith from 2d. to 3d., and other fares proportionately. Some months ago the District Railway raised certain fares. There is a suggestion that the motor-bus companies may also increase their fares.

The committee on local transportation of the Chicago council inspected on June 27 the section of the city traversed by the Calumet Electric Street Railway and the South Chicago City Railway. Extensions of the lines and improvements in the service have been requested by residents.

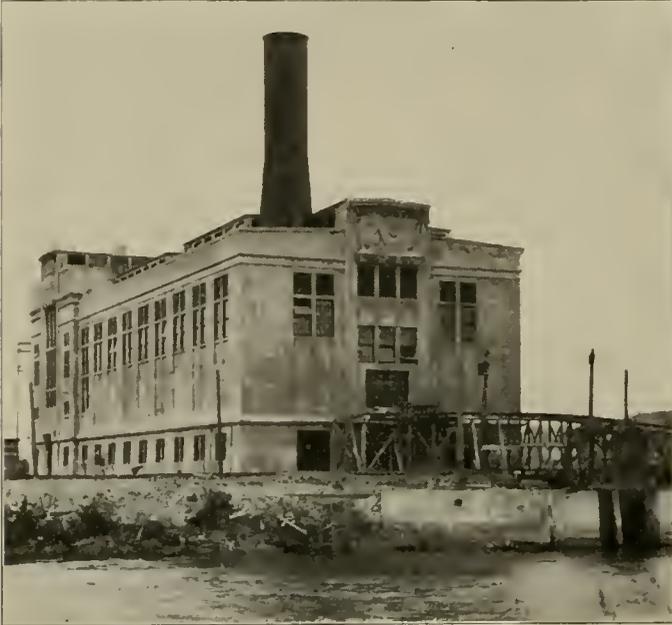

GEORGETOWN POWER STATION OF THE SEATTLE ELECTRIC COMPANY.

One of the largest electric generating stations in the state of Washington will soon be in operation. The new plant is that of the Seattle Electric Company, which is located on the Dwarmish river at Georgetown, a suburb of Seattle. The new power house, which was designed and built by the Stone &

concrete which was used throughout the construction of the foundations and superstructure consisted of a 1-2-4 mixture of Portland cement, sand and gravel. This was mixed in Ransome concrete mixers and was well tamped when in position.

Superstructure.

The concrete in the entire superstructure is reinforced by

Seattle Electric Power Station—Exterior of Power Station.

Seattle Electric Power Station—Ash Hoppers Under Boiler Room.

Webster Engineering Corporation, Boston, Mass., is situated on a large plot of ground owned by the electric company, on which there have also been constructed car barns and shops.

Owing to the character of the soil upon which the foundations were constructed it was necessary to drive piles to sup-

port round mild-steel bars. Several of the illustrations presented herewith show the method of constructing the forms and of carrying out the work.

The exterior view of the building gives an excellent idea of the artistic effects which can easily be obtained by the use

Seattle Electric Power Station—View of Engine Foundation During Construction.

port the turbines and boilers. These were set on 24-inch centers. The piles for the boiler room and wall foundations were driven in four rows, as shown in the sectional view of the boiler house. After being driven solid, they were cut off level with the high-water mark and the earth excavated from around the tops to the depth of one foot below high water. The whole surface over and around the piles was then covered with reinforced Portland cement concrete. The

of reinforced concrete; besides which a considerable saving in cost of construction also results.

The present building is only a portion of the proposed future power plant. As will be noted by reference to the ground plan the plant comprises two rows of boilers supplying two steam turbines, and their accompanying auxiliaries. Future extensions will be made up of additional bays similar to the one constructed at present. The advantage of this

design will be evident, as it confines the boilers practically in separate buildings, thus localizing any accidents which might occur to the steam piping or boilers themselves.

General Arrangement of Plant.

The general arrangement of the boiler and engine rooms is similar to that adopted for many of the recent installations of large size, namely, the boiler room is at right angles to the turbine room. The boiler room end of the building faces the water front. In the engine room there are two turbines, each with its independent auxiliary apparatus, and there are also installed static and rotary transformers.

Boiler Room.

The boilers are arranged in two batteries of six each, with one central firing aisle. There are installed 12 Stirling vertical water tube boilers of 470 horsepower each. The steam from these boilers is taken out of the rear upper drum and they are fed through the center upper drum. The blow-off is taken out of the bottom front drum. These arrangements will be recognized as rather unusual for Stirling boilers.

The boilers are fitted with plain grates and oil burners. Double ashpits are provided under each furnace. A novel improvement has been introduced in the design of these ashpits, in that the grate is divided longitudinally into two parts by a wall extending down to the mouth of the ashpit. This divides the ashpit into two parts and thus reduces by half the amount of cold air which enters the furnace when the ashes are being removed. An opening from the ashpit is provided to the rear of the boiler back of the bridge wall, which facilitates cleaning out the back connections. Ample space has been allowed back of the boilers to permit free access to the blow-off valves for operating, packing and repairing them. Bridges with hand rails extend the entire length

motor-driven fan delivering the products of combustion into a self-supporting steel stack of 11 feet internal diameter.

Fuel Supply.

Though it is intended to use only oil for fuel at present, provision has been made to change quickly to coal should that

Seattle Electric Power Station—Roof During Construction, Showing Reinforcement and Cable Way for Handling Concrete.

at any time become necessary or desirable. Ample coal storage bins have been provided above the main firing aisle and coal is delivered directly on the boiler room floor through chutes. Coal is delivered into the hoppers by an automatic

over both rows of boilers and greatly facilitate the manipulating and repairing of the various valves above the boilers and also facilitate getting at the main steam line for repairing or replacing blown-out gaskets.

The boilers are operated with induced draft, one large

Seattle Electric Power Station—Interior of Engine Room, Showing Switchboard Galleries, Engineer's Office and Wash Room.

self-tipping belt conveyor, fed by the coal elevator. The ashes are removed from the pits by cars on an industrial railway. Oil is stored in one 30,000-gallon storage tank situated about 500 feet from the main power house and in three auxiliary storage tanks each 8 feet in diameter by 34 feet

long. The latter are located outside the power house at the rear of the boiler room.

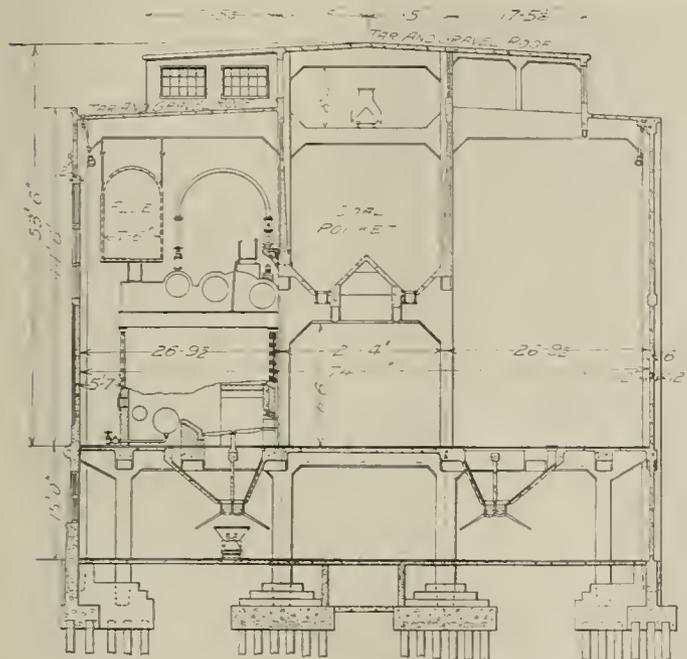

Piping.

The main steam line to the turbines consists of a 12-inch header extending along the front of each battery of boilers. The two 12-inch headers in each boiler room are connected by equalizer pipes, which thus greatly increase the amount of steam available in case of a break at any point of the steam lines. The steam auxiliaries are furnished with steam from two independent 6-inch steam lines which draw steam from the first four boilers of each battery. These auxiliary headers are connected by equalizers, thus reducing the likelihood of serious interruption of service. Two 8-inch boiler feed mains extend the length of the boiler room and branches from the feed mains deliver the water into the central upper drum of the boilers. The feed mains can be connected to either of two feed pumps. As an additional precaution against interruption of the feedwater service, each of the

is heated by the auxiliary exhaust in two 3,000-horsepower open Cochrane heaters.

Electric Installation.

The current is generated at 2,300 volts and transformed in step-up transformers to a potential of 13,200 volts. The generator leads pass through a conduit under the engine room floor to a wire trench extending along the north side of the building. From here they are carried up along the north wall to 13,800-volt type H oil switches through disconnecting switches to the oil insulated current transformers. After passing through the current transformers the current passes through 13,800-volt type H oil switches and out of the station. Each of the outgoing 13,200-volt transmission lines is connected to a 13,800-volt lightning arrester bank. The current for the motor generators is taken from the high-tension transformers and passed through step-down transformers, which reduce the potential for the motors. The direct current is generated at 600 volts, and in addition there is also a 2,300-volt service furnished by the plant. In addition to the type H oil switches there are also the usual high-tension and low-tension switchboards, potential transformers, Tirrell regulators, etc.

Seattle Electric Power Station—Cross Section Through Boiler Room, Showing Boilers, Ash Pits and Coal Pockets.

two 6-inch blow-off mains, extending the length of the boiler room, is interchangeably connected with the feed pumps and has valves at its discharge end, which thus permits using the blow-off connections as auxiliary boiler feed lines.

Main Generating Units.

The main generating units consist of one 3,000-kilowatt and one 8,000-kilowatt General Electric, Curtis, revolving field turbo-alternator. Each of these units is served by a Weiss jet condenser and is also fitted with an atmospheric exhaust. In addition to the main generating units there is installed one 75-kilowatt direct-connected engine-driven exciter and one 40-kilowatt motor-generator exciter. The local direct-current service for the trolley system is furnished by two 500-kilowatt motor generators, taking current through air blast transformers.

Pumps and Heaters.

One 12-inch centrifugal injection pump driven by a high-speed Porter-Allen engine, a rotative dry-vacuum pump and a step-bearing pressure pump are provided for each of the main generating units. In addition to these there are installed two duplex, outside-packed plunger Blake feed pumps, a house pump and fire pump. A motor-driven centrifugal pump has also been installed and is piped so that it can be connected on the fire lines in case of emergency. The feedwater

INFORMATION FOR ACCOUNTANT'S ASSOCIATION.

The American Street and Interurban Railway Accountants' Association has issued a circular asking for the following information:

- Does your company operate both street railway and electric light?
- Does your company indirectly, through lease or stock ownership, control and operate both street railway and electric light?
- Does your company, through a common ownership and operation, control and operate both street railway and electric light?
- Does your company operate, either directly or indirectly, any other public utilities than street railway and electric light? If so, what?

Accompanying this request is a letter from President C. L. S. Tingley, in which he says that at the recent convention of the National Electric Light Association at Washington, the question of a standard classification of accounts for electric lighting companies was discussed, and the matter was re-referred to the committee for further consideration. Mr. Tingley adds:

It seems to me that it would be unfortunate for the lighting companies to adopt a standard classification which would differ in its fundamental principles from that adopted by our association; particularly as many companies, members of our association, are also members of the National Electric Light Association, and a classification divergent in principle would be apt to create confusion, particularly among the smaller companies where the same officers would be obliged to deal with both classifications.

In order that he may have the necessary data to intelligently consider this matter, and bring it to the attention of the Accountants' association at the next convention, Mr. Tingley asks that the desired information be sent promptly.

In this connection Elmer M. White, secretary of the association, writes as follows:

The demand for blanks from companies that operate both railway and electric lighting (and in many cases gas lighting) properties is so frequent that I will ask all companies that operate these various properties to send me with as little delay as possible a duplicate collection of all blanks used by them. Our present collection is not up to date and is not arranged so as to give the best results to the members. These collections I will arrange by companies in suitable binding, one set to be used at the convention and the other to loan to members.

This appeal is made especially to the small companies, whether they have worked out a satisfactory set of blanks for themselves or not.

As you will note from the letter from President Tingley, the subject of electric light classification will receive considerable attention this year. It seems a very suitable time to take up this matter of forms as used by the public service corporations.

NEW YORK STREET RAILWAY ASSOCIATION.

The twenty-fifth annual convention of the Street Railway Association of the State of New York was opened at the Hotel Champlain, Lake Champlain, N. Y., on Tuesday, June 25, 1907. President J. N. Shannahan of the Washington Baltimore & Annapolis Electric Railway, called the convention to order at 10:30 on Monday morning, and following the roll-call delivered the annual address, as follows:

President's Address.

The selection of a meeting place for the twenty-fifth annual convention of this association being left with your executive committee, it was decided after a careful study that the Hotel Champlain at Bluff Point was admirably adapted for the purpose, and the committee trust their selection will meet with the approval of the gentlemen present.

The year just past has been one containing many events of interest and great concern to the electric railways of this state. Among these are the inauguration of electric service on the New York Central railroad in what is termed the Electric Zone, the electrification and inauguration of service on the West Shore Railroad between Syracuse and Utica and on the Erie Railroad from Rochester south, and last, but not least, the important change in policy on the part of the state of New York involved in the passage of the public utilities bill.

The operation of the electrified steam railroads is being closely watched, not only by the men interested in electric traction but also by steam railroad men. An interesting feature of the two instances of steam electrification spoken of above is that two entirely different types of construction have been used—in one direct current fed to the motors through a third rail and in the other alternating current through an overhead trolley. In the latter, an additional factor which will be watched with the keenest interest is the high voltage—13,200 volts being used.

The passage by the legislature of the public utilities act has been watched by the electric railways with the greatest concern. The changes made in the existing law by this act are of a radical nature, and it is a grave question whether the claim made by those favoring the bill, that the "good railroads" have nothing to fear from its operation, will be borne out in fact. It was stated by several gentlemen who appeared in opposition to the bill at the public hearing that one effect would be to stop the building of interurban lines through sparsely settled territory. This statement was not controverted, and should it prove true would cause a condition which would not be too quickly remedied, as even at present this state is far behind in the development of the rural districts by the interurban trolley systems.

That the general prosperity enjoyed by the business interests of this state has been participated in by the electric railways is clearly evidenced by the reports to the state board of railroad commissioners, which show the total gross earnings of street railways for the year ending June 30, 1906, to have been \$78,819,304.09, as against \$70,730,085.66 for the preceding year. The earnings per mile of road were \$36,526.82 for year ending June 30, 1906, as against \$20,579.95 for steam railroads for the same period, and \$33,684.20 for the electric lines for the year previous. A gratifying feature of the reports of the electric lines is the constant decrease in the percentage of operating expenses to gross earnings. In 1897 it was 60.57,

but it has steadily been cut year by year until in 1906 it was 55.19—a decrease of 5.38 per cent. This showing is the more striking when compared with the results shown by the steam railroads during the same period; in 1897 the operating cost of these lines formed 68.12 per cent of the gross earnings of these companies, and in 1906 it was 69.27 per cent, or an increase of 1.15 per cent in the 10 years. These figures undoubtedly give the management of the steam railroads food for thought, and furnish a strong argument for the electrification, at least of such branch lines as may be most readily changed.

The change in policy on the part of this association adopted a year ago, in admitting associate and allied members, has proved most successful. It has proved wise to put on a definite footing the representatives of railway and power companies outside of this state and the representatives of the various supply companies.

Your executive committee has tried to devise a system of dues which would effect a reduction in the dues now charged and provide sufficient funds to meet the running expenses of the association. They have been unsuccessful in this, and in their report recommend the continuance of the present system.

The minutes of the last annual meeting were approved.

William L. Patisson (secretary and counsel Plattsburg Traction Company) extended the courtesies of that line to those in attendance at the convention.

The reports of the executive committee and of the secretary were read, the latter showing 26 member companies who are active members—a gain of three during the last year—nine associate members, 68 allied members.

President Shannahan—At the quarterly meeting held at Albany in September, the association authorized the president to appoint a committee on "Brakes and Braking." The committee was composed of Messrs. Stanley, Fassett, Hanf, Mellen and Harvey. As you doubtless all know, Mr. Stanley went to London the first of March to assume charge of the London Underground. That leaves Mr. Fassett as the ranking member of this committee. I would like to have the report from the committee.

The report was to the effect that the committee found it impossible to recommend a standard system of brakes or rules for braking.

The report of the committee was accepted as read.

President Shannahan—We will take up the paper by J. C. Collins, secretary of the Rochester Railway Company, on "Some Phases of Electric Railway Accounting." (The paper appears elsewhere.)

President Shannahan called on Mr. Fassett to present the report of the standing committee on "Rules."

Mr. Fassett—It seems to me that it is rather superfluous for the committee, which has prepared a standard set of rules which are very generally adopted by the members of the association in the different cities, to have to come here every year and say the same thing. The rules have been printed, adopted and are in use. There are, however, some interurban and suburban rules which some of the companies rather objected to, and the companies up through the Mohawk Valley, Albany, Utica, Syracuse and Rochester are getting up a set of new rules for interurban service which they will

T. W. Wilson, President-Elect.

put in practice. Whether the association wants those rules to be distributed among the member companies for their consideration at the next meeting is something that the association itself will have to decide; but so far as the regular rules are concerned there is nothing to add to them that I am aware of.

Mr. Allen—As I understand the matter, the subject of rules has heretofore been referred to one committee, and their efforts have been expended in compiling, first, a book of rules for city operation, and a supplementary book for interurban operation. I think perhaps a majority of the city roads in the state are operating under what is known as the standard system of rules for city operation, but I think about every interurban road in the state is operating under its own rules; and if it meets with the pleasure of the chairman of the committee, as well as the pleasure of the association, I would suggest that the committee be divided, that a purely interurban committee be appointed to formulate the rules for interurban operation, and also have the present committee, or a like committee, continued, who shall review and report from time to time any changes that may be necessary in the city rules. I move that the question of rules be left to two committees, consisting of a city committee and an interurban committee,

more satisfactory, to work on. If it is agreeable to the lines that are formulating this new code of interurban rules I would suggest that Mr. Allen see that a sufficient number of copies are provided the secretary so that he can send them to the member companies.

I would now like to have a discussion of Mr. Collins' paper on the order system, as he outlined it, in effect on the Rochester railway, and I will call on Mr. Wilson to open the discussion.

Job Order System.

T. W. Wilson—In the Buffalo system we have a scheme in which we use, not a card, but a sheet 12 by 18 inches, on which the estimate is made. In the right-hand upper corner there is a place for the job number, and in the left-hand upper corner for the approval of the manager and president. About four inches of the bottom is left for the records of the auditor of the amount of supplies and cost of labor, and that is posted from time to time. When the job is completed we have a very accurate tabulation of the total cost, both of labor and all kinds of material. That is worked out in price per foot of single track, say, for track work, or per foot of special work. I did not understand whether that card that was spoken of was a card.

Members and Guests of New York Association at Bluff Point.

to be appointed by the president—committees of three each. (Carried.)

The committee on "Interurban Rules" was requested to report at the first quarterly meeting.

President Shannahan—Apropos of Mr. Fassett's remarks to the effect that he has grown tired of reporting year after year that there are no changes in the city rules, I would like to say that for a great many years the American Railway Association, composed of the steam railroads, maintained a similar committee, and from time to time it was found necessary, as the practice changed, to change the rules. I presume that that was the reason why that committee, or why this committee, was maintained year after year.

It would seem wise, in order to provide a basis for discussion, that the code of rules adopted by the lines through the Mohawk Valley should be sent to each member company in order that they may write the chairman of the committee on "Interurban Rules" discussing that particular code and suggesting changes which would seem to them wise and advisable. That will give your committee something to work on; they will know in advance and try, if possible, to meet the conditions on the various properties. It will facilitate the procedure, and when you come to the quarterly meeting you will have something very much more definite, very much

Mr. Collins—A card about five inches long by three inches in width. The estimate made on this is simply, when approved by the president, a minor job system.

Mr. Wilson—It occurred to me that it would not be large enough for all the various items.

Mr. Collins—We have something similar to yours that we call "authorizing."

Mr. Wilson—We have had our plan in force for about six years. It works very well. We always have an accurate cost for everything. We pay especial attention to the price per foot and can make a good comparison of the different jobs in that way.

Mr. Allen—I would like to ask Mr. Collins how far he carries the job order system in his maintenance work. For instance, shop practice, when you pull a car in for general overhauling, say, jacking it, stripping it, taking the motors apart and all that, is it part of the job order system?

Mr. Collins—No, it is not. Outside of the job order system there is certain work that has to be done regularly, that we group under that head, for instance, like cleaning cars, trucks, and so on. That must be done as they are pulled in, and the job order system is not applied to that.

Mr. Allen—Do you use the job order system on anything but reconstruction or renewals?

Mr. Collins—Everything.

Mr. Allen—It would seem to me that a job order system that would take into account work that is done in repairing or maintaining the different units of our electric railway systems would be quite cumbersome and entail the employment of considerable clerk hire; but it does seem that large items, such as renewals of track or rebuilding of a car house, renewal of ties or anything that might be charged to capital account, or anything that might be called extraordinary—that in such cases the job order system would result in furnishing to the proper officials a detail of cost of that work. But I cannot see how the adoption of the job order system for purely maintenance work would be anything but cumbersome. That is the point that is in my mind. I would like to hear from some of the other railroad members upon that.

H. M. Beardsley—We use the same system, or one similar—it does not work out exactly the same—and I do not find it cumbersome, because it is just as easy for the storekeeper, for instance, if he gets a requisition for some material, to charge that material to a job order or a working order, as we call it, "No. 201," as to charge it to "Account 6." He has a column on his monthly report sheet, and it simply means that he must put that amount of money into one column instead of another; and if material is bought outside it can be charged directly to the working order just as well as to Account 1, or 2 or 6, or any other number. The total, when the working order is completed, is simply transferred from Working Order 201 to Account 6, or from Working Order 203 to Account 7, and so on. I want to say that those who have not used this will find it very beneficial, as Mr. Collins says, in checking up storekeepers and so on. I have had several instances of that sort, where material might perhaps have gotten away if it had not been that we were looking after the working order pretty closely.

E. T. Peck—The Schenectady Railway Company has practically adopted the Rochester system. On our jobs, or construction work, or extraordinary maintenance charges, the head of the department from which it originates makes, first, a detailed estimate, and that is submitted to the general manager, and if the job is approved, instructions are then given to apply for a working order, which the department head does, giving his estimate on this working order. That is sent to the auditing department and the working order issued, which is again returned to the general manager for his signature. That gives authority to go ahead with the work. On all maintenance charges we use the regular job system similar to the Rochester system, and it works out very well indeed.

J. H. Pardee—J. G. White & Co. have a system of authorizations and cost analysis that is a little bit different from any that I have seen before. The principle, of course, is the same. It would not be applicable to small jobs or jobs lasting only a very short time, less than a month; but in reconstruction and new construction, or power house work, construction of car barns, work that would last for a period of several months or through a season, with their operating companies, the first of each year there is made up a detailed statement of the construction or reconstruction for the year. That is divided, if there are subsidiary companies, under the head of the different companies, or any convenient division of the work, and the authorization is prepared for that and passed by the board of directors, or approved by the proper officers. Then on the first of each month we get what is called a cost analysis sheet which shows, for instance, on property, the different authorizations, No. 1, 2, 3, 4, as the case may be. The first column is the amount authorized to be spent; the next column, the money actually expended from the start of the job up to the first day of the month; the next column, amount of obligations. The money has not been expended yet but contracts have been made for the material. The next column is balance available; the next column is the estimate of the cost to complete the job; the

next column, either the gain or the loss. If it is a gain it is entered in black ink, and if it is a loss in the estimated—that is, an estimated loss, of course, it is entered in red ink; so that the proper officers can see at a glance how that particular job is going, whether there is going to be an over-run on it or whether they are going to save money on it. The last column shows, also, the percent completed. That works out very well, and at once shows, graphically almost, a complete tab on the whole job and on each individual job.

The next order of business was a paper, "Some Notes on Electric Railway Shops and Shop Practice in Central New York," by Mr. W. H. Collins, of the F., J. & G.

It appears elsewhere.

(Vice-president T. W. Wilson in the chair.)

Vice-President Wilson—In order to start the discussion on this interesting question, I would ask Mr. Benedict, of Albany, to make a few remarks.

New York Shop Practice.

Mr. Benedict—I do not believe I have very much to say on this question, further than that I agree with Mr. Collins in the statement in his paper that it is results we are after. Each man in charge of the maintenance of properties has to study the conditions under which he has to operate. What would do in one case would not do in another. One property is interurban, another city; one has to do with heavy equipment similar to that used in steam railroad practice; another equipment is for city work exclusively where it is considerably lighter, and the tools used in operation should be adapted for the style of equipment. We have to consider also the question of cost. In the development of most roads they have passed through various stages from that of the horse car to that of the present up-to-date interurban lines. The man that has to deal with those conditions cannot obtain the same results as the man who takes hold of a new development, studies his conditions from the beginning and develops his maintenance of equipment along up-to-date lines. On the other hand, the man who has charge of the older systems has to study the conditions and find out what class of equipment it does not pay to maintain, what class of equipment he can afford to throw out or recommend having thrown out, and using in its place modern equipment; and when he has decided as to the style of equipment, then he studies his conditions as to shop practice, and when he has finally decided that he has to adopt what in his opinion is the best method and what I mean by the best method of maintaining equipment is the method that is the least expensive for all concerned.

Mr. Neil—Unfortunately and very regrettably we do not operate any interurban cars. The only thing we find in our practice is that elaborate shop records are top-heavy and ineffective. We make no attempt to keep elaborate and detailed records of every little thing that is done about a car. When a car is overhauled—I look after that myself, and I have loose sheets, and every time a car is overhauled I write out a new sheet for that car with the principal repairs on the car and tear up the old sheet. We found that worked out very well and resulted in considerable economies. I don't know what you other gentlemen do, but we have learned in our small way that the only sensible and reasonable way to keep shop records is to make them just as simple as possible, just as direct as possible, and to keep records only of things that we need. In that way we keep the records of wheels and gears, controller bearings, axle bearings, armature bearings and all that sort of thing. We don't care to know what a car did two or three or four or five years ago, but we do want to know when the last elaborate repairs were made on a car; and since we have adopted that system our shop repairs have been very much reduced, because we proceed intelligibly.

Jos. D. Evans (J. G. White & Co.)—I am very pleased

to be called upon to speak on this subject of shop practices and very much interested in Mr. Collins' paper. I am particularly interested in the feature of the master mechanics visiting the different shops, providing that when they visit the shops they tell the different master mechanics where improvements can be made. Too frequently our visitors come in and say, "Why, everything is very nice." They do not tell us the things that are wrong. That is the principal point, to have some one come in and tell us what is wrong. Then we can make the corrections. I rather think, Mr. President, it is a very good idea for the master mechanics to visit one another, and in my experience I have found that it is quite as frequently as not that we get our best suggestions from the master mechanic who is among those most poorly equipped, who has found it necessary to devise some scheme to meet requirements which the other man did not find necessary.

I think, as has been suggested, that the matter of records can be carried to an extreme, and you get a lot of records filed away up stairs in some dusty loft that are finally sold for so much waste paper; but it does occur to me that it is of vital importance that the actual records of the work as it progresses should be taken care of and filed and brought into shape for ready reference and comparison. I am rather more in favor of a tabulated record showing a comparison with the previous period than the idea of having a number of different sheets, as it frequently occurs that you lose track of the sheets. A tabulated record rather brings the thing before you in more condensed and exact form.

In connection with what has been said, I think a very good suggestion is to arrange the different equipments at different car stations or divisional points, with relation to the character of the equipment and the style of the cars. It very much simplifies the matter of repairs. Very frequently I have found, in my experience, that equipment had been distributed rather promiscuously, and that each car station would have two or three of one kind of equipment and possibly as many as five or six different kinds, whereas one kind could be distributed at one barn, and another at another barn, and in that way the repairs could be very much simplified. That, of course, depends largely on the requirements of the transportation department.

I am not willing to agree with the gentleman who says that the conditions vary in different locations. We are rapidly approaching a condition which I think very urgently requires the standardization of equipment, and I believe that outside of localities where they have excessively steep grades or something of that kind which requires emergency brakes and so on, that the conditions to be met in different localities are very similar; and with that in view I think it behooves nearly all the roads to prepare for the heavier equipment that has been spoken of.

Mr. Cole—I have had a number of properties that I have been out to examine during the last two years, in regard to the design and location of car barns and repair shops, and I have found, as Mr. Collins stated, that one of the great problems has been with relation to the class of machinery that they have in those shops. It has been of a nondescript character, a great deal of it being installed in the earlier days of lighter motors, lighter trucks and smaller cars. With the growth that has taken place in the last ten years in interurban extensions, they have done very little in the way of equipping the shops to meet that growth, and the consequence is that it has become difficult to make the repairs on the urban and the interurban cars in the same shop. I do not think there is any question but that a shop design can be made today so as to handle both the urban and the interurban equipment at the least cost, in the same shop, and machinery can be put in that will do that at the least cost, instead of making two repair shops and necessitating the

master mechanic losing time in traveling from one to the other to look those shops over.

Another condition which is found in repair shops is that there is generally too much handling of material. It is like the old style manufacturers that used to start the manufactured product and before it got to the assembling room they frequently took the material back to the same shop three times. In the shops of the new design the manufactured article starts from one shop and keeps going from shop to shop with absolutely no rehandling, until it goes to the assembling room. The same conditions can be brought about in the design of a car barn or a repair shop, so that your cars come in over the working pits where the general repairs are done. The machine shop should be located alongside, and the material should go direct from the repair pit to the machine shop. Then should come the blacksmith shop, and back of the blacksmith shop should be the carpenter shop, so that the body of the car as it is taken from the track goes through the machine and the blacksmith shop and is pushed to the carpenter shop, and so on. In that way the car undergoes absolutely no return movement. I think that in all accounting of the repairs of cars, material and labor and the time factor during the time a car is in the shop should be carefully considered, and I do not believe that the labor factors are given quite enough consideration in shops. For instance, most roads give their cars a general overhauling twice a year, as they change from the open to the closed or vice versa; and by adopting some method for observing closely the labor factor it gives you a comparison from year to year. About the same amount of labor is done on each car, and that should be given fuller consideration than it has received in the shops.

Mr. G. M. Harvey—In regard to Mr. Collins' paper, I think he has hit the conditions in New York very closely. It appears to me that one reason why this nondescript condition exists, of which he speaks, is the fact that most men in charge of equipment have to deal with the immediate present. They are, as a rule, so busy with the conditions before them that they do not have time to consider the conditions that may exist perhaps six months or a year hence, and frequently in installing new apparatus we find that the last takes the place of something that was furnished just immediately before. I think such things as that are being gradually overcome, and I think the reason for it is largely the result of the meetings which have been had at the different shops throughout the state. I think it has given a lot of the master mechanics a chance to consider the future layout of their individual plants.

Mr. Mays—As I was one of the master mechanics that attended some of these meetings, I followed Mr. Collins pretty closely, and I think he covered most every point that we had to present. I think the meetings are a very good thing. The master mechanics got together and discussed things, saw how the other men did the work and picked up a lot of points. I know I picked up a lot of points that I had not worked out and that had to be worked out. They were brought up in these meetings, and instead of one man having to do the work, I had the benefit of the work of all the rest of them. In regard to the shops, in central New York we all know the roads are growing very rapidly, and every effort is made to get cars to carry the people, and in the meantime the shops have been neglected. Most all of the shops that I have visited have just been overeroded with work, and consequently every one has done the best he could. A number of roads are now starting to build larger shops, and I think in the course of another year the conditions will be better on many of the roads in central New York.

Vice-President Wilson—There is one thing I am very much interested in, and that is as to whether or not the body of a car should be taken off the trucks and work in the shop

done simultaneously in both the paint shop and the truck shop. On a number of different roads, particularly the large ones, they have a different practice in that regard. I think Chicago jacks the car off the trucks and sends the body in on a small pair of pony trucks to the paint shop, the trucks meanwhile going into the truck shop. Has anybody here had any experience in that particular? If so, I would like to hear from those who can give the information.

Mr. Allen—I have no ideas on the particular question you ask, but it strikes me that the whole question of shop practice upon electric railways is one that has not had proper attention. I can cite an instance of a road in New York state that 12 years ago had a shop that was sufficient for the proper maintenance and care of its equipment. In the past 12 years that equipment has become obsolete, though it is still in use; but the 100 cars which had been operated and have been replaced by another 100 cars are still maintained by the same shop facilities. Our cars are our wares; they are what we have to offer the public, what we are selling. The condition of the car is one of the things by which the public judges of our service, whether a car is dirty and unkempt and noisy or out of repair, whether its condition is not one that is presentable to the eye, and the public passes on those questions, and passes on them very quickly. As I said before, I do not believe enough attention has been devoted to the question of proper shop facilities to care for the equipment; and that has been made more emphatic to me in the past year by these visits of the master mechanics of the different roads going over the different properties. The question comes to me, given a system of 100 cars, of which we will say two-thirds are for city service and one-third for suburban interurban service, is it possible to build a shop capable of extension in the same ratio that we add to the number of cars, and can our master mechanics at the present day agree upon a standard plan of shop and a standard method and system of putting those cars through the shop? This is a day of standards. We are all trying to put our equipment, our practice and the whole electric railway business upon a standard basis, and while of course I can draw a deduction, I would like to hear discussed by those who are responsible for the care and maintenance of our equipment the problem as to whether it is possible to pursue standard methods and to design and construct standard shops. It seems to me that until we do that we will have as varied costs, as varied conditions of equipment as ever. In one city you will see it up-to-date, clean and bright, and in the next city you will see an equipment that will make you ashamed of your profession. I would like to hear from some of our master mechanics along that direction.

Mr. Evans—I think the question Mr. Allen has asked is one that is open to a solution that is possible, but under present conditions is not very probable, as at the present time, to my mind, we are just changing from the older to the heavier equipment, and we would have to make provisions for a few years in advance, and it is rather difficult to tell what the requirements would be. It is rather a risky thing to assume, with motors of 200-horsepower capacity each, what other equipment you are going to need to take care of that, and everybody's track is going to suffer very severely when we get those heavier equipments.

With regard to taking care of the equipment, I think it is very possible, and it is a very good plan, to so standardize the trucks, particularly on double-truck cars, that the body can be run in and changed over to another pair of trucks kept ready, and in the meantime have the defective trucks repaired and had ready for the next body. In that way considerable time would be saved that the car would be out of service. It would be possible to arrange facilities whereby you could jack up the body, put it on other trucks and run it through the paint shop or the wood shop if necessary, and in

the meantime the trucks and motors could be entirely overhauled and put in first-class shape. That appears to me, Mr. President, to be the logical and more up-to-date manner of handling the modern equipment.

I just want to say, though, in connection with what has been said that very many of these very heavy cars are still operating on very narrow tread wheels with very small flanges, which of necessity is very severe on the equipment, very severe on the trucks, affects the motor frames and at the same time is hard on the track in general. It seems to me we ought to have a wider flange to carry these heavy loads and wider treads.

Mr. Allen—I just want to pursue this question a little bit further. Suppose a manager has a good bunch of money to spend, and one of the things he wants to spend it for is a new shop. He is going to rely to a very large extent upon his master mechanic for the plan of that shop. The shop is built. Is it capable of extension, is it capable of caring for the equipment at the present day or five years from today? It seems to me that at different times this association has appointed committees; some of them have been productive of good results; I think our Committee on Standard Rules have produced excellent rules. Last year after a heart-to-heart discussion on braking a committee was appointed upon that subject, and you have heard the report today. They have reported that it was not possible to design and adopt a standard system of braking. Now I would like to see how our master mechanics and some of our managers look upon this question as to whether it is possible to design a standard form of shop, that is elastic, capable of being developed as the needs of the transportation system develop and demand. If it is possible, I am sure that there is no way in which the electric railway system can be more greatly benefited than by having a committee of this kind appointed, if it can produce the results.

Mr. Evans—If I understand Mr. Allen's question correctly, it is directed to such a designing of shops as to admit of their being expanded in keeping with the requirements of the roads. That, it seems to me, would be difficult to arrive at, as difficult as it would be to say how many cars we shall require in five or ten or twenty years from now on a system with which we may be connected. To adapt a shop to expansion, the general plan, according to my idea, would require a transfer table through the center and wings leading off from it, with sufficient land to expand each of those wings as the business required. There is considerable objection from the operating point of view to a transfer table. I think the answer to Mr. Allen's question would depend very largely on how much land the company would be willing to appropriate. If they simply got a square and wanted to cover that with shops, that would settle it for all time to come; and if they were willing to buy 25 or 30 acres of land and locate where there was plenty of chance for expansion, it doesn't seem to me that it would be difficult to lay out a shop that would take care of almost anything you might want.

Mr. Benedict—It seems to me in considering the question of design of a shop you must first consider what you have to repair. Now, until you adopt a standard equipment I do not see how you can adopt a standard shop or standard tools for repairs. It is a question of adopting a standard equipment on a system and then designing your shop to take care of that equipment. If one road has an equipment of 100 h. p. motors, its style of shop would be somewhat different than that of another system which was operating short lines with single truck cars and 50 h. p. motors. But the standardization of equipment, it seems to me, should be considered in advance of the standardization of shop. We look back five years and see the changes that have taken place in our equipment. It seems to me that there is no one here that can say what the changes will be in the next five years in the

form of equipment, and therefore that it is impossible to design a shop today to take care of the equipment that will be used five years from today.

Mr. Allen—I just want to say that six years ago I built a shop sufficient to care for the needs of a given number of cars. Now I hear, and have heard for years, that that shop is not large enough and is not capable of expansion. We have not changed the type of our equipment in any way. We have an opportunity to build a shop. We thought at first we were going to build a shop, we will say, in Utica, and would design a shop to take care of the conditions as they look today, and, as we believed, capable of expansion. We changed our mind, decided we would not build in Utica but in Syracuse. We took the same plan and simply put it on a piece of property in Syracuse, and the conditions have not changed at all. Personally I cannot see why a shop cannot be designed for a given number of cars, I will say a 100-car shop, a 200-car shop, a 300-car shop, that will in one plant care for a given number of cars, and construct a shop on that plan. Now we have something to learn every day from our steam railroad brethren, particularly on the question of maintenance, and if I am a correct observer I think you will find the master mechanics of the steam roads have a standard plan of shop that they construct. They certainly do have standard designs for round houses for housing locomotives and making minor repairs, and tearing down shops and erecting shops, machine shops, in most of these large railroad centers—they are all pretty nearly on the same plan. I have no motion to make.

Model Repair Shop.

Mr. Peck—I would like to make a motion that a committee of three, composed of master mechanics, be asked to report as to the design of a model repair shop and report at our next meeting. I am rather surprised at our master mechanics taking this stand, because I am in the same predicament Mr. Allen is in. We have very poor repair shops and our company is ready to provide good ones, but what shall they be, and where are they to be located? If our master mechanics cannot help us out I do not know what we are going to do. It seems to me a general plan of a shop can be made up. It may be that in some cities the land is too valuable, and that has something to do with it, of course. I am satisfied that some plan could be outlined for shop work, however.

Mr. Benedict—I think it would be rather an easy matter to design a model repair shop, but the point under discussion, as I understand it, was whether this model repair shop would be adapted to various roads throughout the country. It would be a model shop and it would cost money. What you have to figure on is what you have to do with, how much your company is willing to spend. If it is simply a question of designing a model car shop and putting model tools into it, that is an easy matter; but to design, as I said, a shop that is adaptable to all the country, that is an entirely different matter.

Mr. Peck's motion was carried.

During the afternoon the members of the association visited Au Sable Chasm and the usual banquet was held in the evening.

Wednesday's Session.

Wednesday's session was fully occupied by the reading of papers in accordance with the programme. There was no discussion. The election of officers:

Officers.

President, T. W. Wilson, International Railway Company, Buffalo; first vice-president, E. S. Fassett, United Traction Company, Albany; second vice-president, E. F. Peck, Schenectady Railway Company, Schenectady; treasurer, H. M. Beardsley, Elmira Water, Light and Railroad Company, Elmira; secretary, J. H. Pardee, J. G. White & Co., New York. Executive committee: C. Loomis Allen, Utica & Mo-

hawk Valley; C. Gordon Reel, Kingston Consolidated Railroad, Kingston, N. Y.; W. S. Darbee, Albany & Hudson; J. C. Calisch, Buffalo & Lake Erie.

Members Present.

Albany—United Traction Company: H. A. Benedict, electrical and mechanical engineer; E. S. Fassett, general manager; C. H. Armatage, traffic manager; T. B. Dixey, director Albany & Hudson; R. P. Leavitt, general mechanical and electrical superintendent.

Buffalo—International Railway: T. W. Wilson, general manager; R. J. Garwood, superintendent of buildings; Thomas Pumfrey, civil engineer; C. W. Clark, engineer of way; W. H. Evans, master mechanic; M. D. Lloyd, purchasing agent.

Canandaigua—Rochester & Eastern Rapid Railway: W. R. W. Griffin, superintendent; J. E. Holmes, roadmaster.

Elmira—Elmira Water, Light & Railroad Company: W. W. Cole, vice-president and general manager; H. M. Beardsley, secretary and treasurer.

Fredonia—Buffalo & Lake Erie Traction Company: E. H. Stichel, general auditor.

Glens Falls—Hudson Valley Railroad Company: A. J. Gies, auditor; J. G. Phillips, assistant general manager; C. C. Dietz, secretary to general manager.

Gloversville—Fonda Johnstown & Gloversville: W. Stewart, assistant purchasing agent; George A. Harris, auditor; W. H. Collins, master mechanic; J. N. Shannahan, general superintendent.

Kingston—Kingston Consolidated Railroad Company: C. Gordon Reel, vice-president and general manager; G. B. te Bow, superintendent; A. M. Day, vice-president.

Peekskill—Peekskill Lighting & Railroad Company: Stuart Wilder, vice-president and general manager.

Plattsburg—Plattsburg Traction Company: E. N. Sanderson, president; W. L. Pattison, secretary and attorney; A. E. Reynolds, manager; E. E. Larkin, M. D., surgeon.

Rochester—Rochester Railway Company: E. J. Wilcoxon, general superintendent; J. C. Collins, secretary and auditor; W. F. Feeney, chief clerk; B. E. Wilson, general passenger and freight agent; B. C. Amesbury, division superintendent; I. E. Matthews, chief engineer; F. P. Maize, master mechanic; W. C. Callaghan, division superintendent.

Schenectady—Schenectady Railway Company: E. F. Peck, general manager; Axel Ekstrom, director; B. Pennoyer, engineer maintenance of way; Frank Walsh, manager freight department; Frank J. Doyle, master mechanic; E. J. Ryon, superintendent.

Syracuse—Syracuse Rapid Transit Railway Company: John E. Duffy, superintendent; J. M. Joel, auditor; F. M. DuBois, master mechanic; W. P. Gannon, attorney.

Utica—Utica & Mohawk Valley Railway Company: H. S. Williams, assistant electrical engineer; B. A. Frankel, chief treasury department; F. C. Dengate, assistant engineer maintenance of way; W. J. Harvie, electrical engineer; C. Loomis Allen, vice-president.

Montreal—Montreal Street Railway Company: Nelson Graburn.

Guests.

J. M. Wakeman, Henry W. Blake, Street Railway Journal; C. B. Fairchild, Jr., Electric Traction Weekly; B. V. Swenson, secretary American Street and Interurban Railway Association; Francis W. Lane, Electric Railway Review; C. H. B. Chapin, B. B. Nostrand, Jr., Empire State Gas and Electric Association; O. M. Diall, Thomas B. Jones, H. D. Hendee, Burlington, Vt.; W. W. Freeman, Brooklyn; J. H. Pardee, J. G. White & Co.; Howard McSherry, Public Service Corporation.

Supply Houses Represented.

Aluminum Company of America, H. K. Spalding, B. M. Polley, Allison, Giles S., G. S. Allison.
American Brake Shoe & Foundry Company, H. S. Bradfield.
American Electrical Works, Francis E. Donohoe.
American Locomotive Company, William Wampler.
American Steel & Wire Company, F. A. Keyes, M. W. Floto.
Altha Steel Casting Company, C. W. Owston, Jr.
Barbour-Stockwell Company, William W. Field.
Brill Company, The, J. G., G. M. Haskell.
Carnegie Steel Company, F. C. Deming, T. Guilford Smith, E. C. Brunke.
Consolidated Car Heating Company, Cornell S. Hawley.
Curtain Supply Company, A. L. Whipple.
Dixon, Joseph, Crucible Company, John A. Coudit.
Edwards, O. M., Company, Edward P. Chaffee.
Electric Cable Company, F. H. Cowles.
Electric Railway Review, John B. Bennett.
Electric Service Supplies Company, Mayer & England Department, Henry R. Swarthy, Jr.

Electric Service Supplies Company, W. V. Sweeten.
 Electric Storage Battery Company, A. H. Ackerman.
 General Electric Company, G. H. Hill, Albert V. Shump, H. N. Ransom, J. J. Regan, H. P. Karnochan, H. G. Grier.
 Goldschmidt-Thermit Company, E. Stutz.
 Gould Storage Battery Company, H. N. Powers.
 Hale & Kilburn Manufacturing Company, Sheridan A. Walker.
 Heywood Bros. & Wakefield Company, Bertram Berry.
 Hildreth Varnish Company, C. C. Castle.
 Johns-Manville, H. W., Company, E. E. Schmid.
 Kalamazoo Railway Supply Company, Fred N. Root.
 Lorain Steel Company, H. C. Evans.
 Marshall, R. W., & Co., R. W. Marshall.
 Midvale Steel Company, Thomas King, Cyrus L. King.
 National Car Wheel Company, E. H. Chapin.
 National Carbon Company, Arthur E. Carrier.
 National Lock Washer Company, F. B. Archibald.
 Niagara Lockport & Ontario Power Company, S. B. Storer.
 Ohio Brass Company, N. M. Garland, Nathan Shute.
 Pennsylvania Steel Company, John C. Jay, J. B. Smiley.
 Pratt & Lambert, Jos. Maycock.
 Pressed Steel Car Company, W. H. Wilkinson.
 Rail Joint Company, Wm. A. Chapman, B. M. Barr.
 Railway Audit & Inspection Company, H. N. Brown.
 Roebblings' Sons, John A., Company, G. W. Swan, H. L. Shippy.
 Sherwin-Williams Company, F. A. Elmquist, A. D. Collins.
 Standard Steel Works, E. Sidney Lewis, Harry W. Sheldon.
 Standard Underground Cable Company, H. P. Kimball.
 Sterling Varnish Company, W. V. Whitfield, A. S. King.
 Taylor Electric Truck Company, John Taylor.
 Westinghouse, Church, Kerr & Co., C. G. Wilson.
 Westinghouse Electric & Manufacturing Company, Clarence Renshaw, J. N. DuBarry, Jr., F. B. Erwin.
 Westinghouse Traction Brake Company, J. R. Ellicott, C. R. Ellicott, F. V. Green, E. H. Dewson.
 Wendell & McDuffie, Jacob Wendell, Jr.
 Wharton, Jr., William, & Co., R. C. McClay.

Exhibits.

The Taylor Electric Truck Company, of Troy, had on exhibition one of its new steel-tired wheels, the company being represented by Mr. John Taylor.

The Westinghouse Traction Brake Company, of Pittsburgh, showed an automatic car and air coupler designed to couple and uncouple both car and air connections simultaneously. It is claimed to be equally successful on cars of varying heights and for operation on sharp curves as well as on straight track. This coupler eliminates all slack between the coupler heads, thus permitting the handling of a train of several cars as a single unit. This device is being adopted by some of the prominent roads of the country. The company was represented by Col. J. R. Ellicott, manager of the New York office, E. H. Dewson and F. V. Green.

The Ohio Brass Company, of Mansfield, O., had an exhibition showing the workings of the Levitern car signal system. This system, by means of an ingenious but simple method of wiring and an auxiliary battery of dry cells, supplies current for one or more rear-end signal lights, one or more classification lights, or both, and does away with the only objection to using current from the trolley circuit for car signal lights. The company was represented by Mr. N. M. Garland and Mr. N. Shute, of the New York office.

Extensive European Electric Railway Project.

It is reported that American interests are planning the construction of a high-speed electric railway between Budapest and Vienna, at a cost of about \$25,000,000. A third-rail system controlled by the Detroit Construction Company is to be used. Starting from an underground station under the Rokus hospital, in Budapest, the line will cross the Danube between Kaposztasmegyer and Bekasmegyer, and then proceed along the right bank of the Danube, crossing that river again in a direct line from Komaron, and entering Austrian territory at Deveny. After leaving Deveny the railway will cross the Danube once more, between Grosz Entersdorf and Frenndenau, and will terminate at the Karlsplatz, Vienna. The road will be 160 miles long, and some of the trains will make the run in two hours, or in half the time consumed by the Hungarian state steam road now operating between the Hungarian and Austrian capitals.

FALSE CLAIM AGAINST UNITED RAILWAYS OF BALTIMORE RESULTS IN CONVICTION.

On account of the case of John D. Robinson, who has been sentenced to the Maryland penitentiary for perjury in connection with a suit for damages against the United Railways & Electric Company, Baltimore, has been received from James R. Pratt, assistant general manager of the company. The account of this interesting case follows:

Basis of the Claim.

Robinson claimed that on July 5, 1905, he was injured while a passenger on a car of the Fairmount avenue line of the United Railways & Electric Company. He stated that the conductor called out for the passengers to change cars, and as he arose to leave the car it was started suddenly and he was thrown across the seat in front. He claimed that a hernia followed as a direct result of the accident. The company had no report of such an accident; in fact, when Robinson first made his claim he stated that he was injured in a collision between two cars, and the declaration in the suit which he afterward filed alleged that the accident happened in this manner. The claim was not made for this accident until some time after it was alleged to have occurred.

Robinson carried an accident insurance policy with the Travelers' Insurance Company of Hartford, Conn. He made a claim and subsequently collected \$2,300 from this company upon the ground that he received a hernia while a passenger on a car of the United Railways Company. The railway company's first knowledge of this case was gained through its chief surgeon, who is also surgeon for the insurance company. It was his opinion that Robinson's hernia was an old one, which was later shown to be true.

Robinson employed an attorney and his claim was refused. He would have been arrested promptly for attempting to get money under false pretenses, but the attorney, instead of asking for settlement, simply filed the claim. As no crime is committed unless a demand is made, the railway company could do nothing but await the result of the suit, which was filed promptly. The case was tried in November, 1906, and resulted in a verdict for the defendant.

Contradictory Evidence.

Robinson testified on the witness stand that on the night of July 9, 1905, he was so ill that his family was assembled around him expecting his death. He said he was in bed from July 9 to July 19. He was confronted with a letter which he had written the railway company complaining that a conductor on the Carey street line had refused to accept from him four transfers on the night of July 9, which was the night, he testified, that he was lying at the point of death. It was also brought out in the testimony that on July 17, when, according to his statement, he was still in bed as a result of the injury sustained on July 5, he called at the office of the company in relation to a transfer dispute.

The trial of this case occupied some days, but the jury quickly brought in a verdict for the defendant. Robinson was immediately indicted by the grand jury on the charge of perjury, and on the additional charge of obtaining \$2,300 from the Travelers' Insurance Company under false pretenses; and, further, for attempting to obtain money from the United Railways & Electric Company under false pretenses. He was arrested on the same day, but was released under \$5,000 bail for trial in the criminal court. On May 29, 1907, he pleaded guilty to the indictment for perjury, and on June 4, 1907, he was sentenced to one year in the Maryland penitentiary.

It was brought out at the trial of Robinson's suit against the United Railways, that he had collected \$215 from the Employers' Liability Assurance Company of London, England, for injuries alleged to have been sustained in Cincinnati on August 8, 1904, in falling down a stairway. At this time he alleged the same injury which he claimed to have sustained in the accident in 1905.

Co-operation Needful.

This case clearly demonstrates what may be accomplished by the hearty co-operation of steam railroads, street railways and casualty insurance companies.

The company and the authorities were enabled to convict Robinson by the assistance of The Alliance Against Accident Frauds, an organization formed to prosecute persons who attempt by fraudulent methods to procure money from the members.

SOME NOTES ON ELECTRIC RAILWAY SHOPS AND SHOP PRACTICE IN CENTRAL NEW YORK.*

BY W. H. COLLINS, GENERAL SUPERINTENDENT FONDA JOHNSTOWN & GLOVERSVILLE RAILROAD COMPANY.

The topic for this paper was suggested by the recent inspection of shops by master mechanics of companies in central New York state. The plan followed was for the several master mechanics to visit each shop in turn, in a body, and submit a report in writing to the general manager.

This inspection demonstrated very forcibly that electric railway practice is rapidly changing. The buildings, tools and methods which have been sufficient in the past are inadequate today. It was also evident from the arrangement of these shops that they were not built with a view toward the rapid and economical handling of work. They are rather a series of additions, and the rest of the property has outgrown them.

Machine Shops.

The machine shops, whether in a separate building or located in a portion of one of the car houses, are so cramped for room that it is impossible to locate the tools to the best advantage. In some cases the tools are good, but in many cases they are inadequate, being nearly worn out. Even where there are good tools they are not, and, in a good many cases cannot be, arranged for the most economical working. As instances of this kind, the following might be cited: A wheel press between the pit and the wall of the building with no room behind it, and so close to the pit that wheels have to be handled across it; a fire-turning lathe at one end of the shop with the wheel press at the other end.

The blacksmith shop, as a rule, is near the machine shop, but instances were found where it is several hundred feet distant. This shop usually has a rather meager outfit, consisting only of tools for light work. Occasionally a power hammer, and in one shop a punch and shears, as well as a spring-tempering furnace, are among the tools.

Paint and Carpenter Shops.

The paint and carpenter shops are sometimes located in separate buildings at some distance apart. In one place they are on opposite sides of the city. In others, they are combined, much to the detriment of the paint shop, as good painting and varnishing cannot be accomplished in a dusty carpenter shop. As an instance of an extremely poor arrangement, one road has its paint, carpenter and overhauling shops all combined in one room. A desirable feature which appeared to be lacking in nearly all of the paint shops is a separate fireproof room for paint stock.

Electrical Work.

In the electrical shops is where the greatest divergence in practice prevails. The practice ranges all the way from making repairs to fields and armatures only to producing many of the most used electrical parts. The outfit for this class of work ranges from a banding machine and a baking oven, situated in a corner of the car house called the armature room, to a shop fully equipped with the tools and apparatus for making electrical parts. It is noticeable, however, that some of the shops have discontinued the practice of making their own coils.

The storeroom is usually well stocked, and bears evidence of being well looked after; but it is, as a rule, inconveniently located with reference to the shops. One road has its storeroom ideally located in the center of its shops, with windows all around, thus giving easy access to the different departments.

Inspection and Cleaning.

There is apparently a lack of uniformity in the methods of inspection, but this is largely due to local conditions. At some places it is possible to arrange for doing nearly all of the inspection in the daytime, but at other places the conditions are reversed, and it is necessary to inspect cars at night. The tendency, however, is toward a closer and more rigid inspection. The writer believes that inspection pays, and that the closer it is the better it pays.

In the matter of car cleaning there is quite a difference in practice. Some roads continue the old method of washing the exterior of cars with soap and water. Others use no water on the outside of the cars at all, but use instead a prepared oil cleaner, which is applied in liquid form. Both methods are effective so far as cleaning the cars is concerned, but there appears to be considerable difference of opinion as to which is the better method with reference to the cost of cleaning, preservation of varnish, etc. It is also the

practice on some roads to give the interiors of cars a general cleaning, such as mopping floors, cleaning windows and wiping the woodwork each day, while on others it is done but once or twice each week. At one place there was a vacuum cleaning device for taking care of plush seats, which did very effective work.

There is no uniform method of keeping service records. Some roads keep few, if any, accurate mileage records. Others keep only the more important records, the mileage of wheels and axles, the oil report, etc., while still others keep the mileage of each part. This can be carried so far that it is cumbersome, besides being an item of considerable expense. It seems to be a good practice to keep records of the more important parts, and occasionally to follow up some particular part the performance of which is not satisfactory. Anything beyond that appears to be in the nature of a luxury.

Summary.

To summarize, these repair shops are very inadequate. On account of the lack of suitable tools and sufficient room they are not in a condition to handle work with the greatest economy.

In the rapid development of these electric railway properties, proper provision does not appear to have been made for the upkeep of the equipment. It now seems that we have reached a point where it is economically practicable to reconstruct our shops. While it is true that electric railway practice is changing, and will continue to change, yet it is sufficiently stable so that plans can be made for providing suitable buildings and tools to handle work with the minimum loss of time.

The harmonious arrangement which prevails in large manufacturing plants, when the process is continuous and where there is so little waste effort, is what we should endeavor to approximate in our repair shops. The buildings should be so arranged that the work can be moved along continuously through the different shops, with the minimum amount of handling.

The organization at these shops seemed to be the redeeming feature. There is a sufficient number of foremen, and the distribution of forces is the result of careful planning. But while each foreman is capable in his own line, it is seldom that one is found who is versatile enough to take the position of head of the department. This is the element of weakness general to the organizations.

With the advent of the large interurban cars, a new element was projected into electric railway shop practice. These cars are usually equipped with steel or steel-tired wheels, solid gears, etc., and range in weight from 25 tons to 50 tons. This class of equipment cannot be compared with the ordinary electric railway equipment, but would seem to approximate more closely with steam locomotive practice. The writer believes that the methods and shop practices which will most successfully cope with this new problem in the traction field must be worked out along the lines which have proved so advantageous in the operation of steam railroads.

Electrification of Terminal and Suburban Lines.

A representative of a large electric company says: "The question has often been asked: Why are the railroads not more aggressive in respect to the electrification of their terminal and suburban lines? The principal reason is that the capacity of the manufacturing establishments is not large enough for the railroads to generally adopt electricity as a motive power.

"It is generally known that the electric companies are taxed as it is to the utmost of their respective capacities, and could not contract to electrify even a small percentage of the country's railroad mileage without being forced to shut off regular sources of consumption to a large extent. This, naturally, would result in disturbing regular channels of business.

"Many railroads have the question of electrification under consideration, and they are watching the experiments of the Vanderbilt lines very closely. There is every indication of the practical success of electric motive power on these lines, which will mark the beginning of a new era in electricity."—Wall Street Journal.

Population and Traffic in New York.

Since 1898 the population of Greater New York has increased 23 per cent. In the same time the street railroad passenger traffic in New York county has increased 73 per cent. Since 1900 the population of Manhattan has increased 17 per cent, while the street railroad passenger traffic has expanded 55 per cent. In these figures are to be found the secret of the street railroad congestion.

*Paper presented at the annual meeting of the Street Railway Association of the State of New York, June 25, 1907.

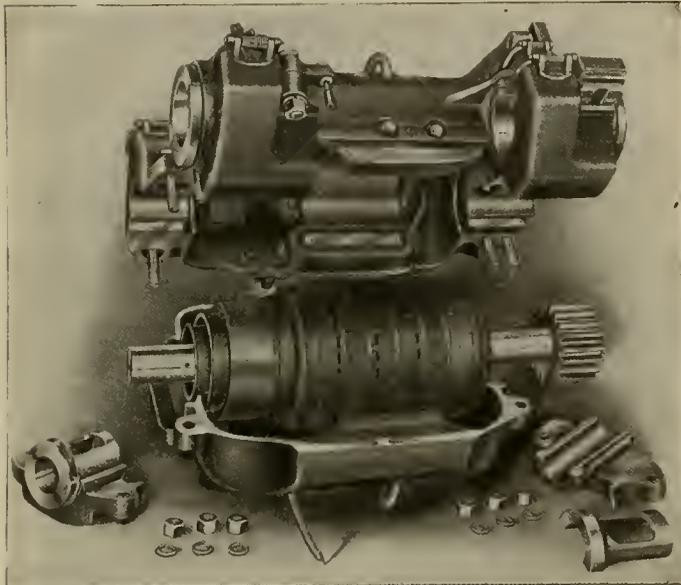

RECENT IMPROVEMENTS IN MOTORS AND CONTROL.*

BY G. H. HILL, RAILWAY ENGINEER GENERAL ELECTRIC COMPANY.

A review of the development of the electric railway during its 20 years of history is particularly impressive on account of its marvelous growth. While recognizing as a prime factor in this growth the universal demand for transportation facilities, a generous measure of the success can well be credited to the sound and sensible engineering that has dominated the art from its inception. From the diverse and various methods proposed a uniform system was early settled upon, which time and experience have proved to be good and adaptable to a development far greater than could have been anticipated. The progression of application from purely urban service to interurban has marked the most recent era of development, and it is toward this phase of railway work that a review of recent progress is chiefly directed. Interurban service primarily has required increased speed, larger cars, and consequently greater capacity in equipments; attendant on this are a higher voltage, greater mechanical and electrical strain and necessity for increased reliability. The improvements made to meet interurban requirements have naturally influenced the existing apparatus to a considerable extent. A review of each portion of the car equipment will, perhaps, serve best to illustrate what the recent improvements are and to indicate their relative value.

Motor Design.

Probably no similar problem has presented more difficulties than railway motor design. Subject to exceptional and sudden electrical strains, extreme ruggedness is essential. Ex-

Motor and Control Improvements—GE-204 Motor with Commutating Poles.

posed to heat and cold, mud and dust, water and grease, its surroundings could hardly be worse, and unusual protection to its winding is required. Placed in a service where great refinement of attention is impossible, it must nevertheless be reliable and withal efficient.

Although improvements are mostly detailed in character, they are the results of painstaking study and are of much practical value. As an example of modern construction and one of the most popular of recent designs, may be selected the G. E. 80 motor of 40-horsepower rating, which is of the split frame design found most suitable up to 75-horsepower size. Above this the box type is usual, and of this form the G. E. 73 may be taken as typical.

The improvements in motor construction which may be considered as recent may be classed as follows: Field coil insulation, lubrication of bearings, shaft and gear strength, gear case design, commutation.

Field Coil Insulation.

The modern coil is of the "mummy" type, heavily wrapped and made complete without any outside retaining spool. The insulation as now applied, instead of forming only an exterior coat, penetrates to the very heart of the coil. This effect is

attained by the vacuum process, which exhausts all moisture and air entrained in the coil and replaces it with an insulating compound. The treatment is not only at a higher temperature than formerly, but for a longer time. A cross section of a modern G. E. coil illustrates how thoroughly this insulating compound impregnates the winding. In consequence, unless the coils are "roasted" by a too severe load, they are able for many years to resist the action of the water and oil to which they are bound to be exposed. The "mummy" coil is more compact than a spool wound coil, is less affected by a gradual shrinking of the covering, and can be held more effectively against vibration and chafing. Incidentally, the field coil terminal has been improved in strength and insulation and is provided with a shroud or guard to protect the lead from breaking by vibration.

Lubrication of Bearings.

The change from grease to oil lubrication has proved a most practical advance. The use of oil, particularly in the armature bearings, has greatly reduced the cost of inspection and maintenance, and has probably doubled the life of the bearings, with a corresponding reduction of damage due to the armatures getting down on the poles. Conservative experience indicates a life of 50,000 car-miles for a bearing with oil lubrication. The amount of oil required will vary somewhat with local conditions, but with systematic attention, one gill of oil for the commutator end bearing and one and one-half gills for the pinion end bearing have been found ample quantity for 1,000 car-miles. The axle bearings may be treated the same as the car journals, and three gills for each 10,000 car-miles should ordinarily be sufficient.

Shaft and Gear Strength.

Improvement here is largely a matter of quality, which has been steadily raised, and now the tensile strength is from 70,000 to 75,000 pounds per square inch. The strength of shaft at the pinion end has been further increased by increasing the diameter of the taper to as near that of the shaft as possible.

Pinion material is now readily procurable with a tensile strength of 85,000 to 100,000 pounds per square inch. The strength of cast gears is, of course, somewhat below this, but for the larger motors a solid gear or a gear composed of a forged rim shrunk on a cast-steel center permits the use of a high quality steel in the teeth and has given excellent results. The split gear is almost exclusively used on the smaller equipments on account of its convenience. The four-bolt design, which has practically superseded the eight-bolt design, permits a more sturdy structure and a stronger bolt. Experience indicates that the bolts in the eight-bolt design were frequently weakened by too strenuous efforts in tightening them.

The adoption of a gear case with three points of suspension instead of two produced a most gratifying relief from breakage. Up to the present, malleable iron has been found the most satisfactory material for cases, but on account of the possible saving in weight some experiments have been conducted with the use of sheet steel riveted. The ordinary riveted case, of which there are several on the market, cannot be considered entirely successful, since with a very few exceptions on roads with unusually smooth track the vibration loosens the rivets and the case rattles itself to pieces. Appreciating the advantages and demand for a lighter case than is possible with malleable iron, careful study has been given the problem, and it is expected that a construction now being tried, in which the rivets and seams are welded by a special process, will prove satisfactory.

Commutation.

The commutator and brushes have usually required more care and attention than all other parts of the motor. The importance of brush quality as affecting commutator blackening, flashing and wear is frequently overlooked. Unfortunately the quality of American-made brushes has not been as high as it should be, and a better understanding of what is desirable would undoubtedly create the necessary demand for improvements, particularly in the direction of uniformity of product.

The chief ingredients of carbon brushes are hard gas coke and graphitic carbon, with a suitable binder of pitch or similar material. The coke supplies an abrasive action which grinds down the mica and keeps the copper surface clean. The soft graphitic carbon is lubricating in nature and of lower electrical resistance than the coke.

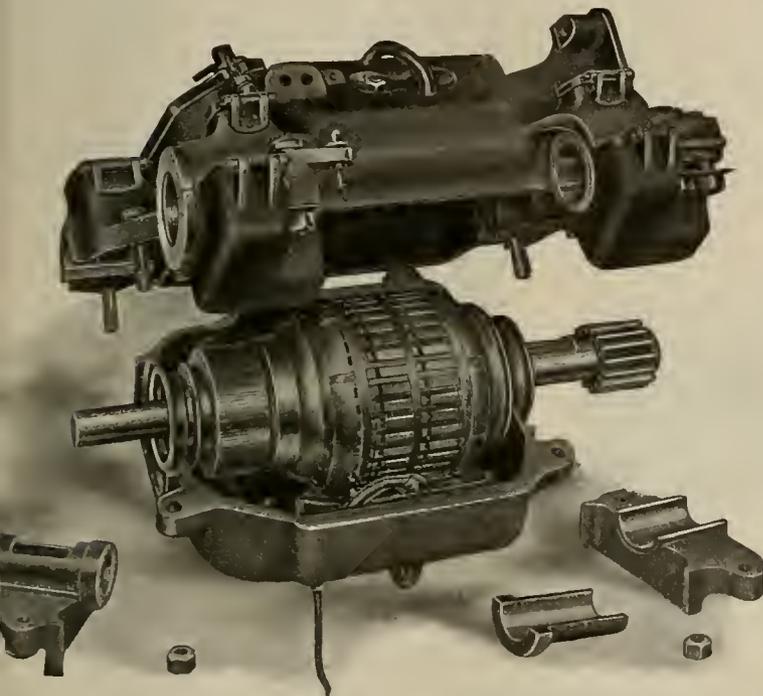

The proper proportions of these two elements will vary for different motors, depending upon the proportional amount and quality of mica in the commutator, whether the commutator is grooved or not, the speed of the commutator, the thickness of brush, and, to a certain degree, upon the service conditions. The fineness to which the ingredients are ground, the thoroughness with which they are mixed and the compactness to which they are compressed, that is, the amount of cellular space existing, all have a most practical bearing on

*Abstract of paper presented at the annual convention of the Street Railway Association of the State of New York, Lake Champlain, June 25-26, 1907.

the quality and service results. The most frequent cause of chipping and breaking is the stratification of the brush, which is hard to avoid in the extruded or "squirted" type of product. The reduction of expense of motor upkeep would in most cases handsomely repay the attention necessary to procure brushes that conform uniformly to rigid specifications, as to hardness, specific gravity, absence of stratification and fineness of texture.

Commutating Poles.

There is one recent departure in motor construction that merits particular mention. This is the addition to the motor of commutating poles. Motors so constructed are superior in commutation to the ordinary motor, and the limit of motor capacity for any service is no longer a matter of commutation possibilities, but of heating alone. Perfect commutation with extreme overloads, both as to current and voltage, is easily obtained. The commutating poles are small in size and are placed between the exciting fields, as may be seen in the illustration. They permit a reduction in weight of the exciting fields and a greater freedom of electrical design without sensibly increasing the weight of the motor. Briefly, the function of the commutating poles is to counteract

Motor and Control Improvements—GE-80 Motor.

the armature reaction and consequent field distortion and produce a commutating field of constant strength and position with relation to the brushes, unaffected by load or speed of the motor. Many incidental but valuable improvements attend this new departure, which will undoubtedly become a standard construction. Among these are absence of flashing and burning of commutator and brush holders, less brush and commutator wear, absence of sparking, lighter and more easily handled field coils.

A complete line of motors of this type has been designed and several hundred have already been sold. A more complete discussion of the theory of this interesting development will shortly appear through appropriate technical channels.

Control.

The recent improvements in control and equipment devices may be classed as follows: Cylinder controller details, contactor attachment, rheostat construction, car wiring, train or type M control, circuit-breakers and main switches, fuses, trolleys.

Cylinder Controller.

As with the motors, the improvements of the cylinder controller have been more a matter of construction details than methods. The higher voltage usual in interurban lines and the general increase in station and feeder capacity, making it possible to sustain very heavy short-circuit arcs, have made it necessary to remodel the controller to provide greater strength of blowout, more complete isolation of arcs and insulation of circuits, and a more rigid fireproof construction.

The K-35 controller may be taken as representative of the

most recent construction. The blowout magnet, instead of being a single coil placed at some distance from the arc points, is composed of individual coils, each placed close to the arc which it controls. The magnetic lines cross the arc so as to blow it outward from the contact tip into a chamber formed between the arc deflectors and the cover, instead of blowing it sidewise off the edge of the finger and against the arc deflector, as in the older forms of controllers, such as K-6 and K-2S. The effectiveness of the new arrangement is many times greater than the old, and as the arc is ruptured much more quickly the burning and blistering of the contacts are much reduced.

The construction and shape of the arc deflectors are such as to separate the fingers and contacts more effectively than in previous designs, and the insulation of the frame and cover is very thoroughly carried out with fireproof and non-hydroscopic material.

The cylinder is made up of cast segments clamped upon an insulated hexagonal shaft by means of flat keys and set screws. This construction is quite a departure from the molded type of insulation for cylinder castings which has been in use for a long time. A distinct advantage is that the cylinder may be more easily repaired in case of damage to one of the contact segments. At the same time, the drive of the segments is more positive and a loosening of the castings less likely to occur from careless or vicious handling. If they should loosen, they may easily be tightened by the set screws.

Motor Connections.

The connections of the motors have also undergone some changes of importance. Some of the new type of controllers are arranged with the bridge form of transfer from series to parallel connection, which avoids the opening of the circuit of either motor during the transition and thereby continues the full torque of both motors throughout acceleration. For very small cars this refinement may not be entirely necessary, but for the larger equipments, particularly those geared for high speed and intended for drawing trail cars, the bridge form of control is very desirable in order to avoid the unpleasant jerk when passing from series to parallel. In accomplishing this arrangement several extra control fingers are required and a division of the rheostats into two blanks is necessary. The slight complication is more than warranted.

Another change is that of reversing the motors by reversing the field connections instead of the armature connections. In doing this the fields are kept on the ground side of the motor as is quite necessary. The advantage lies in the fact that the reversing cylinder is not subject to the full voltage, but has across its contacts only the drop of the field, which is not over 20 volts. This eliminates the burning of the reverser contacts, which is apt to occur on hand controls for four motors when the reversing switch is used in an emergency.

Contactors with Controllers.

The attention of operators has been drawn to the controller difficulties very strongly on account of the burnouts, with the attendant flashing and frightening of passengers, which seem to occur more frequently than some years ago. The difficulty has arisen on those controllers which were constructed for a 500-volt circuit and which are now made to operate on a 600 or 650 volt circuit, in order to make these controllers thoroughly safe on the higher voltages, an arrangement has been perfected for operating two contactors, of similar form to those used on train control, in connection with the cylinder, so that the contactors will make and break the motor circuits and thus take all of the arcing. The attachment for doing this is placed at the bottom of the cylinder and consists of a small contact which controls the circuit to the coils of the contactors, the contactors being placed under the car. The arrangement has been installed on several roads and has given such satisfaction that provision has been made so that all of the old cylinder controllers can be fitted with this attachment. The separate, magnetically operated contactor is able to handle high-voltage and heavy-current arcs without difficulty, and, in addition to the duty above described, may also be used as an overload circuit-breaker. In this way no motor current is broken on the platform of the car, a point which will be appreciated by all operators. The overload device consists of a tripping coil on the contactor, which is controlled by a small switch placed in the vestibule convenient to the motorman. This small switch opens only the circuit to the coil of the contactor, which, of course, carries only a small amount of current, but is tripped in case of overload by a coil carrying the motor current. It is closed by the motorman in the same way as the ordinary circuit-breaker.

The use of cast grid rheostats is so universal that no comment upon them is necessary. The advantages of the cast grid type over the wire or ribbon-wound type are better insulation, better protection from moisture, more rugged con-

struction, ability to withstand more severe overloads of current without damage, and greater ease of repair.

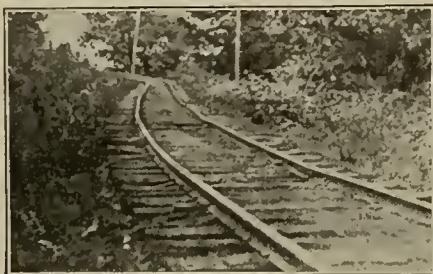

Trolleys.

For city service the standard US-6 trolley, with 4½-inch wheel, has given splendid results, the average life being about 10,000 miles. For greater capacity of equipment and higher speeds, however, a trolley base which will swivel more readily is desirable and a different construction of wheel is necessary to secure a reasonable life.

The US-13 roller-bearing trolley base has been designed to meet this demand. The base swivels on a roller bearing designed with ample margin for the strain of the pole. The height of the base when the pole is retracted is five inches, and its weight is approximately 100 pounds. Four sets of bearings are provided. Operating under tension with a 14-foot pole, a pressure of 35 pounds at an angle of 45 degrees can be given the trolley wheel, which, it is expected, will take care of the higher speed service.

The wheel used for high speeds is known as the form 21. It is 5¾ inches in diameter and has a bearing 3 inches long with a ½-inch pin. The diameter of the pin is made shorter than on the form 6, to reduce the speed of the rubbing contact, and this, with the increased length of bearing, has made the new wheel very serviceable on equipments as large as 500 horsepower. When operating at a maximum of 60 miles per hour under these conditions, it has an average life of 5,000 miles.

It should be borne in mind in operating these high-speed trolleys that the side spring for conducting the current from the wheel to the pole is absolutely essential to satisfactory life of the wheel, and these springs must be provided with proper tension against the wheel. If this is not done the current carried through the bearing will soon destroy it. The

Track and Equipment—Views of Poor Track.

shape of the fork is such as to, prevent its being caught in frogs and switches.

The pantagraph form of trolley has many commendable features for catenary overhead construction, which will undoubtedly come into general use on interurban roads. The results so far obtained in the use of this form of trolley will not justify us in making a complete recommendation for its adoption until further developed. Under special conditions where an ordinary trolley is extremely inconvenient its use is warranted, but it is believed that substantial improvements can be made in the pantagraph type which will make it very satisfactory, and tests and experiments are now being carried on.

Single Phase and High Tension.

In this review no reference has been made to the more radical departures from standard practice which are being given much attention, i. e., the use of single-phase and high-tension direct-current motors. The reasons for using either single-phase or direct-current motors do not arise from consideration of the equipments, but from the desirability of reducing the cost of transmission and distribution of current over long distances. Of the two, the single-phase is the more radical departure, and the problems in the design of the single-phase motor are occupying the earnest attention of able designers. The 1,200-volt, direct-current motor is more directly in line with standard practice, and the use of commutating poles has made such a motor thoroughly practicable. In fact, with such a system the problem of greatest importance is the method of distributing and collecting the current. The discussion of these broader subjects, however, would lead beyond the scope of the present review.

Petitions bearing over 5,000 signatures are reported to have been forwarded to the officials of the Georgia Railway & Electric Company of Atlanta, Ga., asking that smoking be permitted on the street cars. It is stated that the signatures include those of many prominent citizens of the city. Copies of the petition were placed in nearly every tobacco store in the city.

RELATION OF TRACK TO MAINTENANCE OF EQUIPMENT.*

BY W. R. W. GRIFFIN, SUPERINTENDENT ROCHESTER & EASTERN RAPID RAILWAY.

In traveling over different interurban lines, noting track and shop conditions, the writer has come to the conclusion that track condition enters largely into the cost of equipment maintenance. Rough track, with low joints, bad surface and line, racks car bodies and trucks, and is hard on car wheels as well as dangerous. It is also hard on motor armatures and is continually tearing off motor cables.

On one road requiring about 13 cars of heavy equipment to fill a schedule of 28 miles an hour, a visit to the shop showed seven busy men in the armature room and other parts of the shop similarly engaged.

On a visit to another road, the superintendent was seeking advice on maintenance of equipment and ways and means of keeping up repairs sufficient to keep his cars on the road. An inspection of his track showed low joints and track badly out of surface and line.

An analysis of two years' maintenance of track and equipment of the Rochester & Eastern Rapid Railway makes a very interesting study. In 1905, the second year of operating the road, there was spent on maintenance of track \$175 per mile of road, or \$11.20 per 1,000 car-miles, and track was kept in none too good condition.

On maintenance of cars (Acct. No. 6) there was spent \$14.52 per 1,000 car-miles.

On maintenance of electric equipment of car, \$5.20 per 1,000 car-miles.

In 1906, the third year, there was spent on maintenance

of track \$245 per mile of road, or \$15 per 1,000 car-miles; maintenance of cars (Acct. No. 6), \$10.77 per 1,000 car-miles; and maintenance of electric equipment, \$5.42 per 1,000 car-miles.

Records for 1906 show a large falling off of general repairs to car bodies, trucks, wheels, brake gear and brake-shoes, during the year 1906 over 1905, all of which is directly due to smoother track.

The figures regarding motor equipment do not show as decided improvement except in the item of motor cables. At the same time considering the fact that the average schedule speed was increased 12 per cent in the year 1906 over 1905, and also that the electrical equipment was a year older, it is evident that the improved track must have had a great deal to do with keeping the electrical repairs as low as they were.

In summing up: Eliminating painting and damaged cars, in body repairs, since these two items have no relation to track, the figures were:

	Acct. 6.	Acct. 7.	Track.	Total.
Per 1,000 car-miles, 1905.....	\$13.59	\$5.20	\$11.20	\$29.99
Per 1,000 car-miles, 1906.....	8.53	5.42	15.00	28.98

Making a total saving of \$1.01 per 1,000 car-miles.

From the above figures, it seems that it is good policy still further to increase the ratio of total expenditure on track since the track is the real permanent part of the railroad, and in so doing not only is a far better permanent way built up, but the time of renewal of cars and electrical equipment is greatly extended.

The enormous development of 20 years in electric railroads, from eight miles of track in 1886 to nearly 33,000 miles in 1906, consisting of 1,081 railroads operating approximately 77,000 motor and other cars, with capital stock aggregating nearly \$2,000,000,000 and a funded debt of over \$1,500,000,000, has been a very prominent factor in the expansion or evolution of certain lines of industrial manufacture.—Wall Street Journal.

*Abstract of paper presented at the annual convention of the Street Railway Association of the State of New York, Lake Champlain, June 25-26, 1907.

RECENT IMPROVEMENTS IN MOTORS AND CONTROL.*

BY CLARENCE RENSCHAW, RAILWAY ENGINEER WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY.

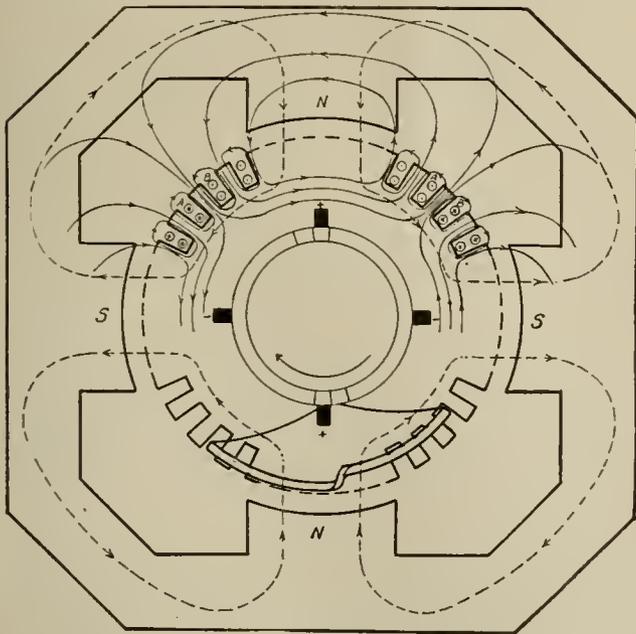

In dealing with the rather large subject of recent improvements in motors and control, I have not attempted to cover the matter broadly, but have devoted my time to three specific divisions with which I am most familiar, namely, interpole motors, unit-switch control and the single-phase system.

INTERPOLE MOTORS.

Probably the most promising improvement in direct-current railway motors for many years is the introduction of the interpole motor. The commutation of high-voltage current in railway motors has always been a most difficult problem for the designers of such machinery to solve, and the care of commutators and brushes forms no small part of the duties of the mechanical and electrical force of a railway company. Most commutator and brush troubles are due either directly or indirectly to sparking, and it is to correct them by correcting their cause that the interpole motor has been designed.

High Mica.

Sparking on a commutator bites away a small amount of copper and carbon at each spark, but does not affect the mica between segments. If the sparking is continued, the copper is soon eaten down, thus leaving the mica sticking up. This "high mica" in turn makes the sparking worse and causes a general roughening of the commutator, flattening of the bars, etc., with consequent rapid wear of the brushes, which fills the motor with carbon and copper dust, and sometimes causes it to flash, ground, etc. Milling down the

Improvements in Motors and Control—Figure 1—Magnetic Flux in Ordinary Motor.

mica below the copper prevents some of this trouble, but does not go to the root of the matter.

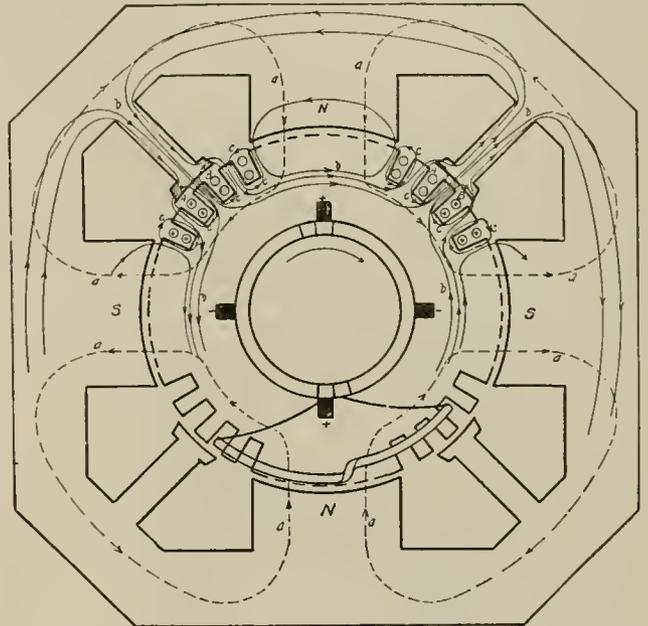

In service a railway motor does not run continuously with power on, but the time that it is operating under load is varied by a certain amount of coasting and stopping. During this no-load running the roughening which has been caused by the action of the current is partly corrected by the scouring and polishing effect of the brushes without load. In many cases the scouring action predominates so that the commutators remain bright and clean and take on a good polish.

Action of Interpole Motor.

The action of the interpole motor in preventing sparking and thus greatly reducing the wear on commutator and brushes can best be understood by the aid of a few simple diagrams. In these a multiple-wound armature has been shown for the sake of simplicity and clearness, although on

an actual motor a two-circuit winding would ordinarily be used.

In a motor without interpoles, as shown in Figure 1, there are three sets of magnetic fluxes produced: First, the lines "aa" due to the main field coils; second, the lines "bb" due to the current in the armature winding as a whole; and third, the leakage "cc" around each of the slots, due to the current in the conductors in that particular slot. The first set of lines may be regarded as the useful lines, and the second and third as incidental. It is to these last two that sparking is due. The coil "AA," which is just about to have the current reversed in it, lies in such a position that it is not cutting the lines "aa," and hence has no voltage generated in it from that source. It is, however, cutting the lines "bb," so that it has a voltage generated in it by them. When the coil is short-circuited by the brush, this voltage causes a local current to flow across the face of the brush in addition to the line current, which greatly increases the amount of

Improvements in Motors and Control—Figure 2—Effect of Interpoles Without Coils.

current that the brush must carry. As the coil passes under the brush, also, from position "A" to position "B," the current in the conductors in the slots "A" is stopped preparatory to being reversed, so that the leakage lines "cc" are also stopped preparatory to being reversed. This causes an inductive voltage to be created in the coil in addition to the voltage of rotation generated by the lines "bb," and these two voltages added together produce a spark between commutator bar and brush.

Construction.

In an interpole motor the interpoles consist of thin poles, each carrying a coil inserted into the frame between the main field poles and projecting down to the points on the armature at which the sides of the coils short-circuited by the brushes lie. If the interpoles alone were used without any coil, as shown in Figure 2, their effect would be to concentrate and increase the lines "bb," due to the armature magnetization, and also the lines "cc," due to the leakage around the slots, owing to the additional iron in the path of these two sets of lines, and thus raise the voltage in the short-circuited coil, and increase the sparking.

With coils on the interpole of a sufficient number of turns to just neutralize the armature magnetization, the effect of the lines "bb" will be eliminated, as shown in Figure 3, so that there will be no voltage generated in the short-circuited coil by its rotation, but the lines "cc," due to leakage around the slots, will still remain, and the increase in these, due to the presence of the interpole, would ordinarily give a sufficiently high inductive voltage to more than offset the advantage gained by the neutralization of the rotation voltage.

If, however, a greater number of turns be wound on the interpoles, so that their excitation overbalances the armature magnetization instead of merely neutralizing it and sets up a flux in the opposite direction, as shown in Figure 4, this flux can be made of such a strength that the leakage lines around the coil, which is being commutated, will also be elimi-

*Abstract of paper presented at the annual convention of the Street Railway Association of the State of New York, Lake Champlain, June 25-26, 1907.

nated, so that practically all of the voltage in the short-circuited coil is neutralized and sparkless commutation is obtained. Since the interpoles neutralize the active voltage in the short-circuited coils, they also eliminate the extra local current in the brushes and thus reduce the total current in the brushes to its minimum value, that is, to the line current. The elimination of sparking and of local currents in the brushes reduces the wear on the commutator and prolongs the life of the brushes to a remarkable extent.

The interpole winding is connected permanently in series with the armature winding, as shown in Figure 5, forming the "armature circuit," and in reversing the direction of rotation of the motor the armature windings and interpole windings are reversed together as a unit.

Advantages.

Aside from the general reduction in wear of commutator and brushes, the interpole motor has many incidental advantages. A properly designed motor of this type should run practically sparklessly from a load so light as to give treble the normal speed up to loads as heavy as double its ordinary one-hour rating. It should permit high voltages to be thrown on it, either at standstill or when running at high speeds, and its stability should be so great that it will commutate without appreciable sparking rushes of current which in the ordinary motor would invariably cause flashing. This great freedom from sparking and flashing makes the interpole motor especially well adapted for high-voltage service.

The use of the interpole increases the scope of the designer of railway motors in many cases where limitations of speed and weight determine the design, and in general it permits of a somewhat lighter motor. It gives less advantage in small motors than in large ones, as the commutating conditions in such motors are not so serious a problem. However, its general advantages will doubtless extend its use to sizes as small as 40 horsepower. Improving as it does those features of the railway motor which are universally acknowledged to be in greatest need of improve-

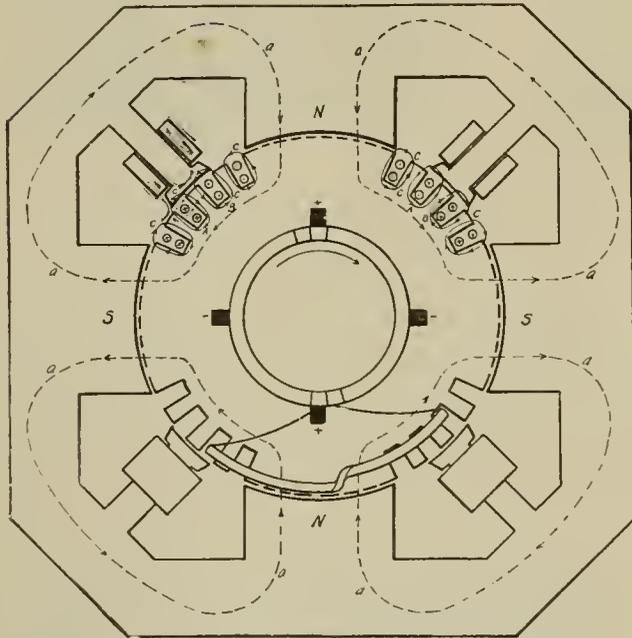

ment, the introduction of the interpole motor is an important step in electric railway development.

UNIT-SWITCH CONTROL.

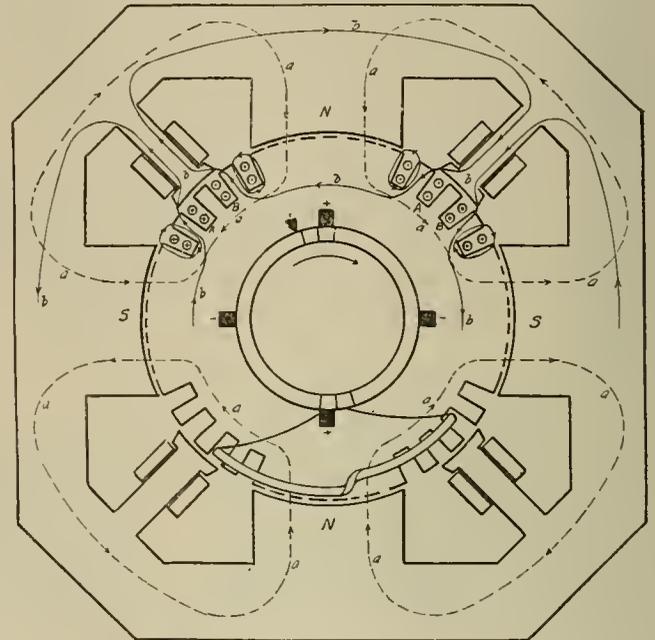

A most important development in control apparatus is the perfection and standardization of unit-switch control equipments for all sizes of motors. The ordinary drum type of controllers, while in general satisfactory for small equipments, leave much to be desired where it is necessary to handle large cars and powerful motors. Such controllers of large capacity must necessarily be heavy and bulky in order to contain sufficiently liberal contacts and blow-out coils to handle the large currents which pass through them. The weight of such controllers, moreover, must be mounted at the extreme end of an overhanging platform where it is least desirable and a large bunch of heavy cables must be led out there. On account of the size and pressure of the con-

tact fingers also, the drum requires considerable effort to turn it, especially should the contacts become slightly roughened and quick movements be impossible. Finally, it seems impracticable to design a blow-out which will enable such controllers to break the current with certainty under all circumstances, and in certain parts of the country it is not an unusual sight to see a motorman nursing an interurban car along the streets of a city by means of the overhead circuit-breaker and shooting out a stream of fire every time it is necessary to cut off power. The drum-type controller, however, is a rough-and-ready piece of apparatus, and when out of order its faults can be easily located and repaired by a comparatively cheap man if only a sufficient stock of spare parts is kept on hand.

The unit-switch control system was originally designed with special reference to the operation of two or more motor

Improvements in Motors and Control—Figure 3—Interpole Motor with Armature Magnetization Just Neutralized.

Improvements in Motors and Control—Figure 4—Magnetic Flux in Interpole Motor.

cars in a multiple-unit train, and it was at first adapted only for use in connection with the larger sizes of motors. Its other advantages, however, in providing a positive and reliable control, in placing all main circuit contacts and heavy cable out of the way beneath the car and in reducing to a minimum the amount of high voltage and heavy current wiring, are now rapidly extending its use to single-car operation and to smaller sizes of equipments.

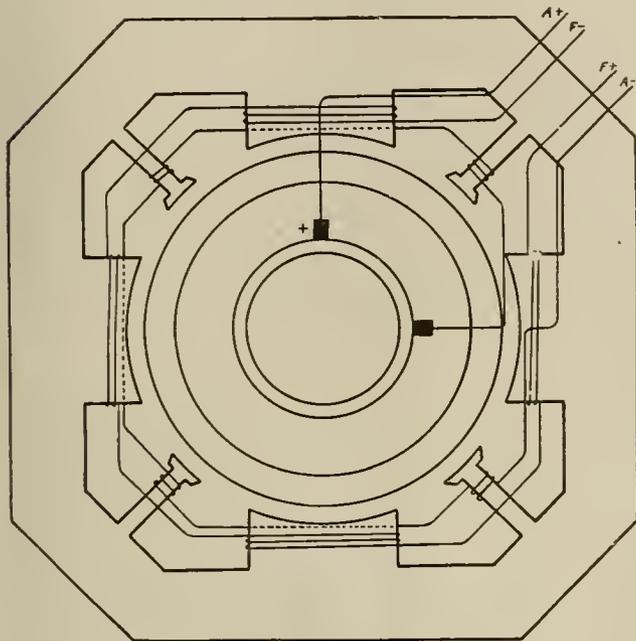

Essential Parts.

In the unit-switch control system the main or power drum of the hand control is replaced by a group of 10 or 12 (according to the size of the equipment) independent or "unit" switches, each provided with a strong magnetic blow-out and normally held open by a powerful spring. Each switch is closed when desired by a suitable pneumatic cylinder, using compressed air from the brake system. This combination of switches is called a "switch group." The reverse drum of the controller is replaced by a similar drum, except that it is more liberal in capacity, built in a separate case and moved to the forward or reverse position by one or the other of two cylinders having a common piston rod. This device is called a "reverser." The overhead circuit-breaker is replaced by a "line switch," which is essentially the same as one of the switches of the switch group, except that it is placed in a case by itself and is provided with an automatic trip, which causes it to open in case of an overload or short-circuit. These three pieces of apparatus effect the various necessary connections between motors, resistance and trolley.

Forming an essential part of the pneumatic cylinder for operating the switch group, line switch and reverser is a magnet valve which governs the admission or escape of air to or from that cylinder. These magnet valves are operated by means of a small 14-volt storage battery, and their opening or closing is regulated by means of a "master controller" to which their circuits are led. The switch group, reverser and line switch may thus be located in any convenient position, and nothing but the master controller need be located on the platform, and only the small low-voltage battery circuits need be carried to it.

For train operation the circuits from the battery and magnets are carried to "train line receptacles" at each end of the car, as well as to the master controllers, and when two cars are coupled together the corresponding receptacles on each car are then connected by a multi-point "jumper," so that the circuits are continued from car to car. When several cars are connected in this way the movement of a single master controller closes simultaneously the corresponding magnet circuits on all of the cars and thus operates also the corresponding main circuit switches.

Connected to the piston rods which move the various switches are a number of small contact switches which open or close auxiliary circuits between stationary fingers arranged to press on them. These auxiliary contacts are called "interlocks," and the circuits which operate the magnet valves of each of the various switches are carried through the interlocks

Improvements in Motors and Control—Figure 5—Method of Connecting Interpole Windings.

of other switches in such a way that the switches cannot be closed except in the proper order.

Acceleration.

The unit-switch control system, however, does not consist merely in replacing the ordinary controller with a set of pneumatically operated switches, which may be closed properly or improperly entirely at the discretion of the motorman, but the action of the switches is regulated so as to give a uniform current through the motors while operating on the resistance steps, and to thus secure a smooth and even acceleration of the car and protect the equipment from abuse. This is accomplished by means of a "limit switch." The limit switch consists of a coil, placed in series with the motor circuits, which lifts an armature whenever the current exceeds a predetermined amount. To the armature of this coil is attached a disc which closes a secondary circuit between two contacts when the armature is down, and opens this circuit when the armature is raised. The circuits for closing the various switches of the switch group are so arranged that it is not necessary to move the master controller step by step to cause the closing of the different switches, but so that by placing the master controller in a single definite position and holding it there the circuits to the first switches are closed, and the closing of these switches then automatically closes the next ones, etc., by means of the interlocks. The circuit from the battery which supplies power for this automatic operation is led through the secondary contacts of the limit switch, so that as long as the current through the motors does not exceed the desired value, the different switches will close one after the other almost instantaneously. Should the current through the motors at any time exceed the desired amount, however, the armature of the limit switch will instantly rise and thus prevent the closing of any more switches until the current has fallen to the desired value.

The regulation of the current during starting is thus taken entirely out of the hands of the motorman, who simply advances the handle of the master controller to the last notch and holds it there, and the closing of the switches is then

governed automatically by the limit switch. In order to provide for the handling of the car under special conditions, however, the apparatus is so arranged that the motorman may readily notch up more slowly than would be done by the limit switch, or may stop on any notch, and also so that by going to some extra trouble (enough to prevent his doing it unnecessarily) he can short-circuit the limit switch and notch up entirely independent of the current.

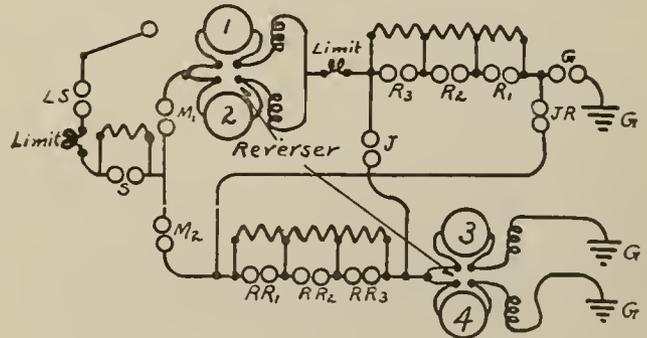

Master Controller.

As ordinarily built, the master controller for use with the unit-switch control system contains three notches for forward running and three for reverse. If the handle is moved to the first notch a slow-speed resistance point is obtained which is used principally in shifting cars. This first notch is hence called the "switching" position. If the handle is moved to the second notch, either with or without pausing on the first one, the switches close one after the other until the motors are connected in series. The second notch is therefore called the "series" position, and is, of course, a running point. If the handle is moved to the third notch, either at once or after pausing on one or both of the first two notches, additional switches will then close in sequence until the motors are

connected, in full multiple. The third notch is hence called the "parallel" position.

Transfer Resistance.

Figure 6 shows a schematic diagram of the switches and main circuit connections for an equipment of four 90-horsepower motors, and indicates the sequence in which the various switches close. In addition to stopping the handle on any one of the three notches, as already mentioned, and obtaining the switching, series or parallel connection, the motorman may so manipulate the master controller as to hold the switches in any one of the series and parallel positions indicated on the diagram. In connection with the above diagram it will be noted that instead of opening the circuit in changing from series to parallel, as is done in the large drum-type controllers, a special resistance connection is used for making the transfer without decreasing the current through the motors. The use of this connection avoids the jerk sometimes

obtained with drum-type controllers in passing from series to parallel, and helps in maintaining a smooth and uniform acceleration.

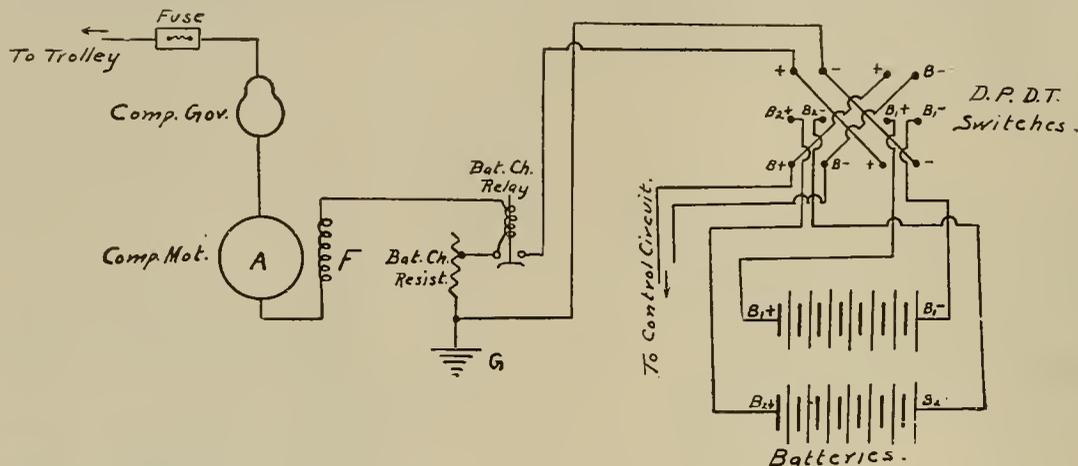

Storage Batteries.

An interesting detail in connection with this system of control is the method of charging the small storage batteries used for operating the magnet valves. Two batteries are carried on each car, and these are connected to the air-pump motor circuit, as shown in Figure 7. The two double-throw switches are always thrown either both up or both down, so

Many other details might be mentioned, but the above are sufficient to indicate the completeness with which every feature of the equipment has been worked out.

In providing for the control of the different sizes of motors most commonly used, two sizes of switch groups are employed. The construction of the smaller of these is shown by the cross sectional view in Figure 9. A similar view of the large switch group is shown in Figure 10. Figure 11 is a photograph of the reverser, with its cover removed.

This form of control possesses many advantages, not only over the drum-type controller, but also over any other type of

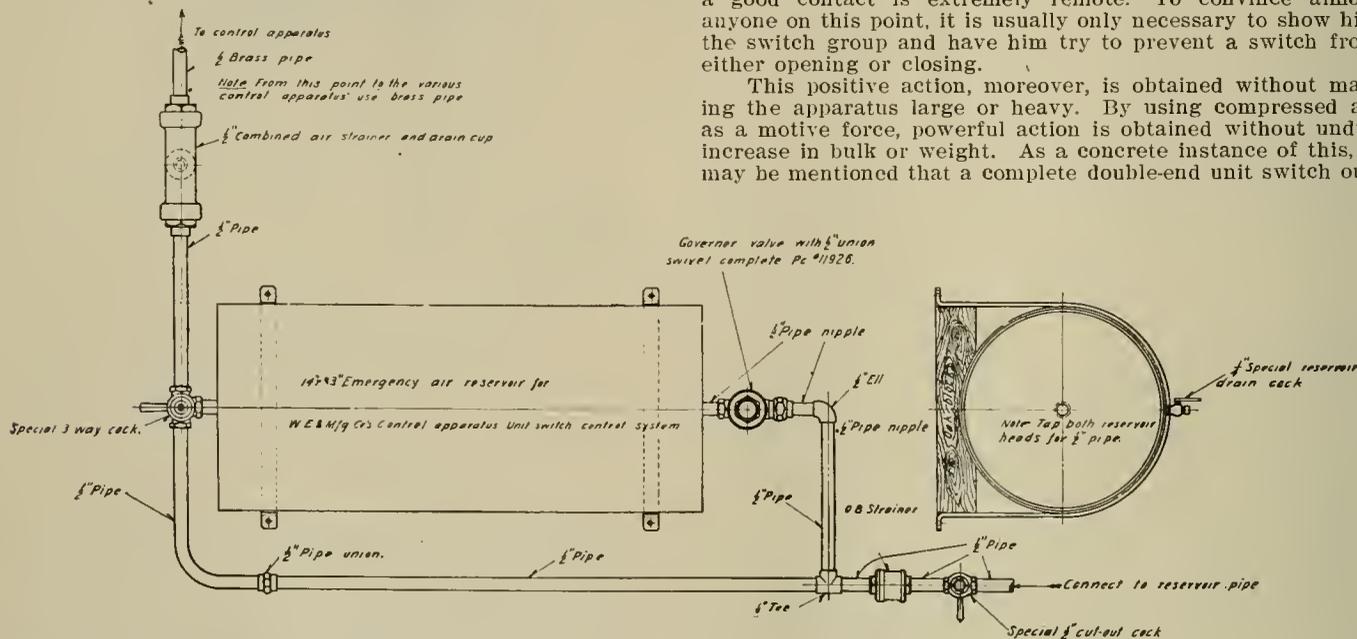

Improvements in Motors and Control—Figure 7—Connections for Charging Storage Batteries.

that one battery is connected to the control circuit while the other is being charged. Whenever the pump is running the battery which is being charged is connected by the "battery-charging relay" to the circuit of the pump motor. The resistance in series with the pump motor is so adjusted, in connection with the relative amount of time that the pump is running, and that the control circuits are closed, so that the battery will receive on the one hand sufficient current to charge it

multiple control now on the market. One of the most important of these advantages is the powerful force which is available both for opening and closing the switches, so that their action is most positive. In the smaller switch group, for instance, a force of approximately 75 pounds is available at the contacts for opening or closing them, and in the larger group this is increased to over 90 pounds, so that the chance of these switches failing either to open quickly or to make a good contact is extremely remote. To convince almost anyone on this point, it is usually only necessary to show him the switch group and have him try to prevent a switch from either opening or closing.

This positive action, moreover, is obtained without making the apparatus large or heavy. By using compressed air as a motive force, powerful action is obtained without undue increase in bulk or weight. As a concrete instance of this, it may be mentioned that a complete double-end unit switch out-

Improvements in Motors and Control—Figure 8—Control Reservoir and Air Piping.

properly without, on the other hand, receiving enough current to make it boil or gas. When this adjustment has once been made, the batteries will require little attention other than the reversal of the two switches once each day.

Another detail of the equipment is the air-storage system. A separate "control reservoir" is piped to the air-brake system, as shown in Figure 8, in connection with a "governor" or check valve and a three-way valve. Ordinarily the three-way valve is turned so that the air is drawn directly from the brake system, but in case of accident to the compressor or main reservoir the three-way valve may be turned 90 degrees and the reserve supply of air in the control reservoir is thus available to return the car to the car house.

fit for controlling a quadruple equipment of Westinghouse No. 121 motors (90 horsepower each) weighs only approximately 1,650 pounds, including the switch group, reverser, line switch, master controller, control reservoir and all details except wiring and resistance.

Another advantage of almost equal importance is the use of a low-voltage battery for operating the control circuits and the fact that the operation of the control is entirely independent of the line voltage. This point is of especial importance on interurban lines where wide fluctuations in voltage are frequently met with.

Although the elimination of bulky controllers and heavy cables from the platforms and the securing of control appara-

tus which will positively open the circuit under all conditions are in themselves sufficient reasons for the use of unit-switch control, the ability to operate two or more cars together with a single motorman, when required, is no mean advantage. There are many instances where trailers are now used, overloading the equipment and slowing down the schedule just at the time when rapid car movement is most needed, where multiple-unit operation would give superior service at less expense. This is becoming widely recognized even in the case of comparatively small equipments for city service, as may be seen from recent orders for 20 equipments of unit-switch control for operating double 60-horsepower motors in New Haven, Conn., and for 80 equipments for operating quadruple 55-horsepower motors in Baltimore, Md.

THE SINGLE-PHASE SYSTEM.

A consideration of recent improvements in railway motors and control would be very incomplete if no mention were made of the single-phase system, although the essential economies of single-phase operation are effected not by the change in motors or control, but in the other parts of the system. In order to obtain these economies, however, car equipments differing from direct-current equipments in certain particulars must be used, and it is proposed to mention briefly the essential features of these.

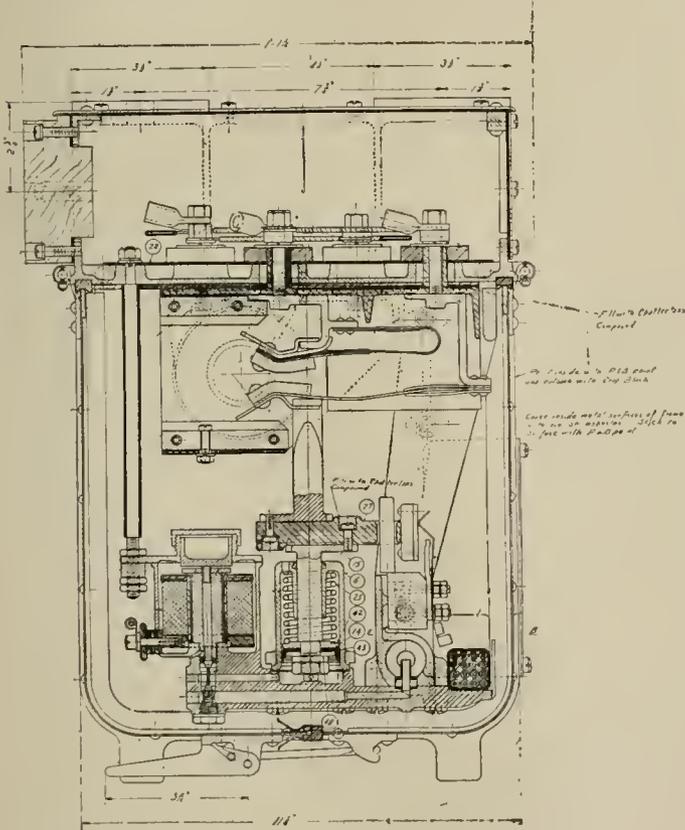

Advantages.

The single-phase railway system accomplishes the same results in car movement that have heretofore been secured by the use of direct-current equipments, but it does this in many cases with less first cost, less operating expense, increased flexibility and greater simplicity. These advantages are obtained principally by a simplification of the substations and the omission of substation attendants and by the elimina-

tion of a transformer on the car the voltage of the trolley and that of the motors may have any desired ratio. As it is entirely feasible to employ a voltage of 11,000 (which permits the distribution of a large amount of power with a very small current) on a properly insulated trolley wire, the single-phase system affords means of operating even the heaviest cars or trains from an ordinary trolley wire of moderate section with no additional feeders.

Single-Phase Motor.

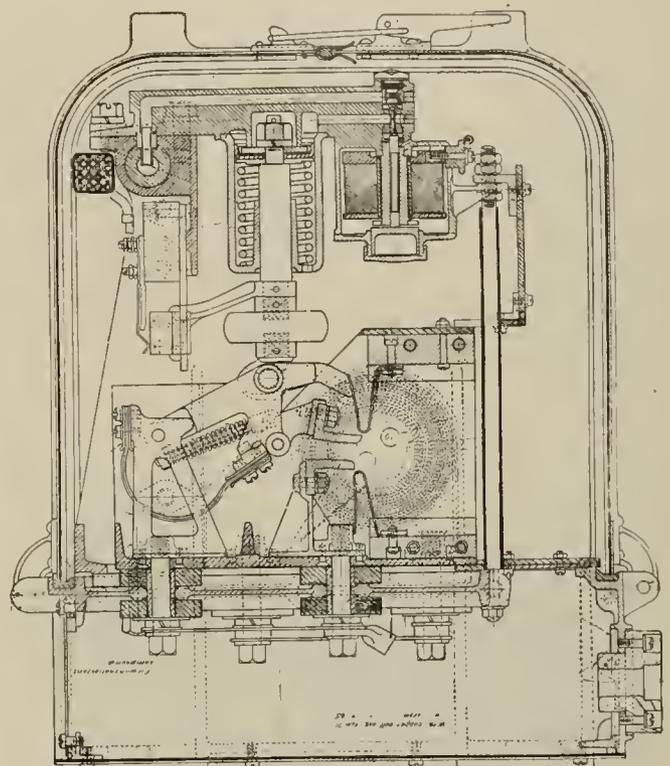

The one element upon which the entire single-phase system depends is the single-phase railway motor. This does not involve any particularly new or mysterious principle, but depends for its operation upon an extension of the well-known

Improvements in Motors and Control—Figure 9—Cross Section of Small Switch Group.

tion of practically all trolley feeders. At the substations the alternating-current power which is received from the generators is merely reduced in voltage by single-phase transformers and supplied at once to the cars, instead of being changed into direct current by polyphase transformers and rotary converters. The equipment of such a substation is so simple that, except for an occasional inspection, it may be left entirely without attendants.

One of the fundamental characteristics of alternating current is the readiness with which it can be transformed from one voltage to another. Where alternating-current motors are used, therefore, it is not necessary as with direct current to supply power to the cars at the voltage of the motors, but

Improvements in Motors and Control—Figure 10—Cross Section of Large Switch Group.

fact that reversing the current at the terminals of a series direct-current motor does not reverse the direction of rotation or interfere with the operation. This principle holds good no matter whether the current is reversed once every hour or once every minute. Since an alternating current gives merely the same general effect as a very rapid and continuous reversal of a direct current, it would be only natural to expect any ordinary direct-current railway motor to rotate if suitable alternating current were applied to it. Within certain limitations this is the case.

Windings.

The single-phase railway motor is essentially a series-wound motor very similar to the direct-current motor. On account of the rapidity of the reversal of the alternating current, however, a number of new phenomena are introduced, and in order to secure satisfactory commercial operation from the motor with this current certain changes in the design of the ordinary railway motor must be made. One of these is to make the entire magnetic circuit laminated instead of merely the pole pieces, to prevent excessive losses, due to the rapid reversals of the magnetic flux. Another essential feature is the "auxiliary" or neutralizing winding which is wound in the slots between the poles in order to neutralize the magnetizing action of the armature and hence its self-induction. This winding is connected in series with the armature in the same way as the interpole winding of the interpole motor. Instead of being located on definite poles, the auxiliary winding is distributed in slots in the faces of the main pole pieces so that the neutralization will be more complete and effective. Unlike the interpole winding, however, the auxiliary winding is not used to improve the commutation, but to improve the power factor of the motor.

Owing to limitations of design, the single-phase motor is

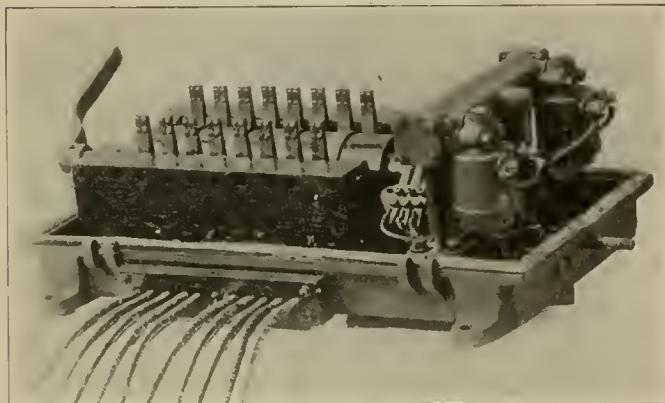

ordinarily wound for a voltage of from 200 to 250 instead of 500 or 550, as in the case of direct-current motors. The larger currents which must be handled on this account necessitate greater brush capacity than in direct-current motors, so that four brush arms are ordinarily required with a four-pole motor or six with a six-pole motor.

Performance.

The performance of the single-phase railway motor is very similar to that of a direct-current series motor, the principal difference being that the speed curve is steeper. The general effect of this is to cause a car equipped with such motors to run slower on heavy grades and faster on the level than a car equipped with direct-current motors geared for the same speed at an intermediate load.

The single-phase motor differs from the direct-current motor also in that on account of its self-induction it requires the application of a much greater percentage of normal voltage in order to send a given proportion of full-load current through it. On this account, it is not possible to allow as great a variation in the voltage at the car as is sometimes done with direct-current equipments, and to secure satisfactory operation the minimum voltage should never be less than about 80 per cent of the normal. Owing to the small currents used, however, this is a matter that is very easily taken care of. For the same general reason, the voltage on the motor may be varied in larger steps than with direct-current motors, so that fewer controller notches are necessary in order to secure a smooth acceleration, five notches, for instance, being ample for a quadruple 100-horsepower equipment. For the same reason, also, the motors are much less likely to be damaged by too rapid feeding of the controller, and hence automatic acceleration is usually not necessary.

The standard trolley voltage for single-phase operation is

Improvements in Motors and Control—Figure 11—Reverser, with Cover Removed.

6,600, although voltages of 3,300 and 11,000 are also employed in some cases. In order to collect current at this voltage from the trolley wire, a pneumatically operated pantagraph trolley has been devised which can be readily raised or lowered by the motorman without leaving his cab. In multiple-unit equipments, moreover, the trolleys on the entire train may be simultaneously controlled from any one point. This trolley is normally held against the wire by means of a spring, but is lowered and automatically locked down by the application of compressed air. Application of the air to another point will then unlock the trolley and allow it to rise.

To reduce the trolley voltage for use at the motors an oil-insulated, self-cooling auto-transformer is used. As this is ordinarily the heaviest single piece of apparatus on the car, it is commonly mounted in the center in order to simplify the matter of balancing.

As with direct-current motors, the speed of the single-phase motor varies with the voltage at its terminals, and the motor is controlled in this way. In order to get a variable voltage for this purpose, however, it is not necessary, as in direct-current practice, to change the grouping of the motors, or to introduce resistance into the circuit, but simply to connect the motors to different taps on the auto-transformer.

Control.

The various connections between motors and transformer may be made either by drum-type controllers or by unit switches, as with direct-current equipments. On account of the absence of any necessity for making series-parallel con-

nections, both drum-type controllers and unit-switch groups for single-phase equipments are simpler than those for direct-current operation. For instance, a switch group for handling four 100-horsepower direct-current motors weighs approximately 760 pounds, while one for handling four single-phase motors of the same capacity weighs only 400 pounds. An entire equipment of single-phase motors, however, is considerably heavier than an equipment of direct-current motors of the same capacity, so that a car equipped with the former and carrying the same passenger load will ordinarily weigh from 10 to 15 per cent more than one equipped with the latter. Switch groups for single-phase operation are controlled by small storage batteries in the same way as those for use with direct-current equipments, but in this case the batteries are taken off of the cars at intervals and charged from a suitable source of direct current at the car house.

Alternating-Direct Current Operation.

The qualities which make the single-phase motor suitable for operation on alternating current make it also an excellent direct-current machine, and such motors will operate beautifully on direct current of the proper voltage. It is often desirable to obtain the benefits of single-phase operation with cars which for a part of their route must run over the same tracks and use the same power as direct-current cars, and by connecting two or more single-phase motors in series for such operation they can readily be arranged to run from a 550-volt trolley wire, as well as from a 6,600 or other high-voltage one. Single-phase motors run somewhat faster with direct current of a given voltage than with alternating, while where operation on direct current is required of such motors, it is usually over city streets or in other places where only a moderate car speed is desired. On this account equipments for operation on both alternating and direct current are usually supplied with four motors, which are permanently connected in two pairs of two in series. These pairs are run in parallel on alternating current and in series (so that all four motors are in series) on direct current. This arrangement usually gives a speed on 550 volts direct current about two-thirds or three-fourths as great as that obtained when operating from normal voltage alternating current. When running on alternating current, the motors of such an equipment are controlled in the usual way by connecting them to different taps on the transformer. When running on direct current they are controlled by means of a resistance in series.

Change-Over Methods.

Equipments for operating on both alternating and direct currents are somewhat more complicated and expensive than those for operating on alternating current only, but they are equally satisfactory in operation, and the majority of single-phase equipments now in use are arranged in this way. In such equipments with drum-type controllers, the controllers are made with two drums, and in changing from alternating to direct current, for instance, the controller handle is moved from the shaft of the alternating-current drum to that of the direct-current drum. In multiple-control equipments, the circuits from the master controller to the various magnets are carried through a change-over switch. This is in the nature of a number of double-throw switches with the wires from the master controller connected to the middle points, so that with the change-over switch in one position a movement of the master controller operates one set of magnet circuits and closes the proper switches for alternating-current operation, while with the switch in the other position the same movement of the master controller operates a different set of circuits and closes the proper switches for direct-current operation. This change-over switch is governed by two relays, one connected to the transformer and arranged to operate on alternating current only, and the other connected to the direct-current trolley and arranged to operate on direct current only. With such an equipment, therefore, if alternating current is supplied to the car, the change-over switch will automatically set itself in the alternating-current position, or if direct current is applied to the car, it will set itself in the direct-current position. The movement of the same master controller in exactly the same way, therefore, closes an entirely different set of switches, according to the kind of current that is being used. Thus, in changing from alternating current to direct current, or vice versa, it is only necessary to see that the proper trolley is on the wire.

On a basis of the experience gained from 15 operating roads in America and several abroad, single-phase equipments have been standardized to a remarkable extent, considering the comparatively short time the system has been in use, and the advantages of the system have been so thoroughly recognized that at the present time no new railway line is laid out without carefully considering the advisability of using the single-phase system on it.

ELECTRIC RAILWAY ACCOUNTING.*

BY J. C. COLLINS, SECRETARY AND AUDITOR, ROCHESTER RAILWAY COMPANY.

According to the programme I am to discuss "Some Phases of Electric Railway Accounting," but in considering what I should talk about it seemed to me that you would be better pleased if I confine myself to one of the many topics that interest the operating man. And if I could bring you certain facts relative to the experience of the Rochester Railway Company, it would be not only more interesting for you but more valuable. I shall therefore speak to you this morning concerning the job-order system, which is, in my opinion, the best method to arrive at the detail of costs.

The standard system of accounting makes no provision for a subdivision of the 39 operating accounts that go to make up the operating expenses; consequently it is left to each road to devise some method that will give to the officials the details of cost in their respective departments, and at the same time give to the general manager or general superintendent the necessary detail to keep him in touch with what is going on. This is especially true of the track, line and mechanical departments.

In operating subsidiary accounts the tendency, in my opinion, is to go into so much detail that the system becomes cumbersome, in which event it becomes necessary to analyze the detail. It is not unnecessary complication that each road is looking for, but the shortest and simplest method that will place the facts in the possession of the various department heads. It seems to me that the job-order system of cost accounting affords the solution of the problem.

An Aid in Preparing Costs.

This system permits the separation of the details of cost of the various operations to any degree of fineness which may be thought necessary, and is a great aid in preparing costs. The idea of preparing unit costs is daily becoming more popular with our department heads, as it is of immense service in the making of new estimates. It is also of great benefit in making comparisons, for with this information the man in charge can quickly tell which of his foremen is the most competent.

For instance, in a case of track construction at two or more locations, it is very interesting to compare the cost per foot for track laying, cost per cubic yard for placing concrete, and so on. By this comparison the head of the department can base on facts his opinion as to the capabilities of his foremen, the facts being actual unit costs for work done under exactly similar conditions.

The day has passed when department heads are content to wait until the end of the month to know, in their respective departments, what it is costing to operate. For that reason the job-order system must be such that this information can be given daily. It is obtainable by the system used by the Rochester Railway Company, and as we have received a number of inquiries as to how we arrive at our detail of costs, I thought a description of our system might be of interest to the representatives of the different companies assembled here.

Estimate Card.

An estimate card, on which is noted the cost in detail of the proposed work and the account to be charged, is made out by the head of the department in which the estimate is prepared. When the head of any department makes an estimate of the cost of some particular work he desires to do, the knowledge that the actual cost will be compared with the estimated cost, and with work in other departments, serves to make him careful to reduce the cost to the lowest possible figure consistent with good work.

After the estimate card has been prepared it is transmitted by the department head to the general manager, whose signature carries with it the authority to proceed with the work, and the approval of the account to be charged. The general manager, through his approval of the estimate cards, is constantly in touch with the work being done, and the actual cost to date.

From the general manager the estimate card is forwarded to the auditor, who examines and verifies the charge, and then forwards the card to the job-order clerk. The cards are numbered consecutively beginning with No. 1, the first issued in the calendar year.

As soon as the job-order clerk receives the card, he numbers the job and places the card on file. The number is

(then telephoned to the department making the estimate, as well as to the storekeeper, and is confirmed as soon as possible by sending typewritten copies, on which are noted the number of the job, the account charged and a description of the work, to the heads of all departments. The foremen of the different departments, when necessary, are advised of the number, and instruct their men to use it on their time sheets, except in the track department. In that department, where we employ a number of Italian laborers, each track foreman makes one sheet covering the work of the men in his gang. These time sheets are then sent to the timekeeper, who posts the time and forwards the sheets to the job-order clerk. The latter, in figuring out the costs of the various jobs, also makes a complete distribution of the payroll on a distribution sheet, the footings of which are posted on the back of the estimate card.

Actual and Estimated Cost.

The job number is given on the requisition under which the material is drawn from the storeroom. These requisitions, when filled, are assembled daily by the storekeeper, and totals by accounts are posted on his distribution sheet. From this sheet at the end of the month the auditor gets his posting figure for materials charged to the different accounts. These requisitions are sent daily to the job-order clerk, who sorts them according to job numbers, figures the cost of each job to date, and posts the cost to date on the back of the estimate card. When the job is completed the actual cost in detail is compared with the estimated cost, and the head of the department that prepared the estimate is given a copy of the record for his information.

The working out of these estimate cards requires attention to figuring the cost of the work, and at the same time the fact that an estimate has been made out, and that the estimate will be compared with the actual cost, is an incentive to the different heads to keep more closely in touch with the progress and cost of work. This record is constantly referred to, and has proved by practice to be a feature of great value.

Check on Timekeeper and Storekeeper.

The job-order system also acts as a check on the timekeeper and storekeeper, as has been demonstrated several times within our experience. We have a system which we thought would not permit mistakes to be made by the timekeeper, but since adopting the job-order system we have discovered where the timekeeper has credited too much time to a man, or the wrong rate, and the mistake has passed unnoticed until the distribution of detail costs has been made up. The same is true of the storekeeper, so while our real object is to make a complete analysis of each account, we are also making a very careful audit of both the timekeeper and the storekeeper.

Another highly important advantage is that the miscellaneous charge is brought down to a minimum. This charge, under other methods that we have used, is often of such dimensions as to cause remark, but apparently it could not be lessened; but under the present system, with the various items admirably separated, the charge is always so small as to be passed over by the most exacting official without comment. The system also provides order in procedure. Before it was put into effect work was done and charged to its proper account before the exact amount involved was known. The bad effects of this plan are evident, and are avoided by the thorough method that is an essential part of the job-order system.

Summary of the Advantages.

A summary of the advantages of the system may be of interest. It provides for a fine subdivision of the operating accounts, and enables the general manager to keep constantly in touch with everything that is going on. It aids in preparing unit costs, and permits comparisons to determine the relative efficiency of foremen. It gives the detail of the cost of operation from day to day, and enables the general manager to see at a glance the variation from year to year in such cost. It tends to increase carefulness in the preparation of estimates, and, through comparison of the estimate with the actual cost, assists the official making the estimate to avoid errors that lead to estimates that are too low or too high. It affords an incentive to heads of departments to keep very closely in touch with the progress of work, and requires order in procedure, with the additional advantages of reduction of miscellaneous chargings and a thorough check upon the timekeeper and storekeeper.

It is reported from London that an agreement has been reached by the underground and other electric railways for an advance in fares to take effect on July 1.

*Paper presented at the annual meeting of the Street Railway Association of the State of New York, June 25-26, 1907.

NEW WRECKING TOOL CAR AT OAKLAND, CAL.

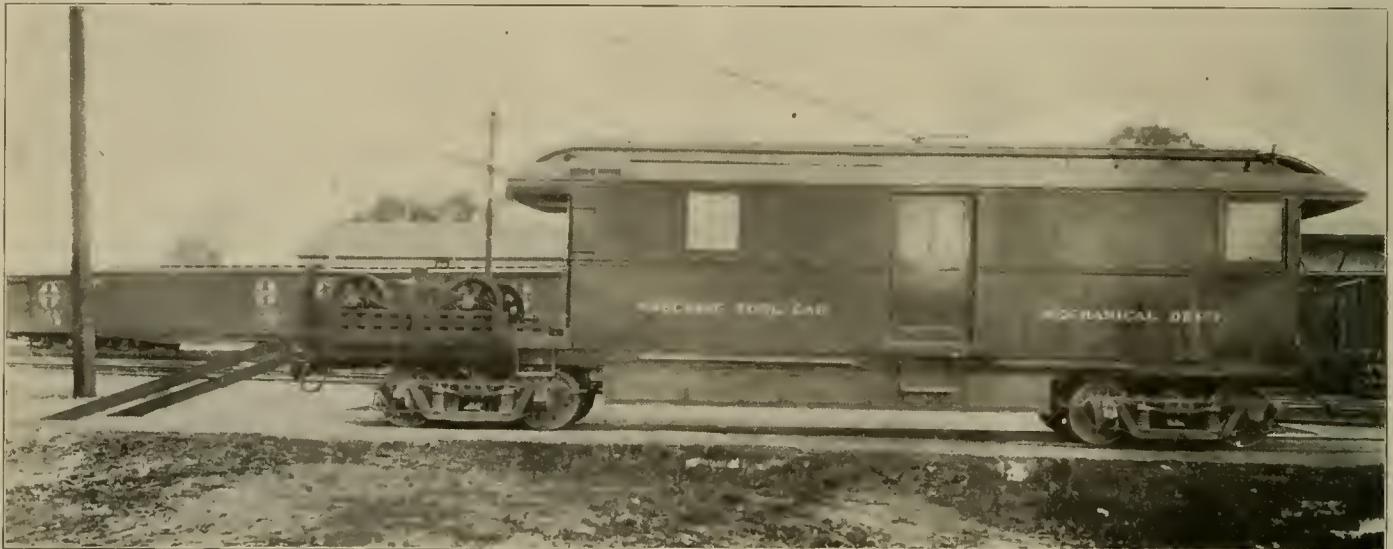

There recently has been completed in the Key Route shops at Oakland, Cal., a very complete wrecking tool car. This equipment is similar to the tool cars which were built by the Brooklyn Rapid Transit Company some two years ago for use on its elevated lines. The complement of tools which is carried on the new car is probably the most complete to be found outside of steam railroad practice. It is necessary to carry a sufficiently diversified equipment to provide for accident work on the city system of the Oakland Traction Company and the high-speed interurban system of the San Francisco Oakland & San Jose Railway Company (Key Route). This latter company has a double-tracked pier extending three miles into the bay to its ferry terminal, and therefore life preservers and tools for repairing the piers also are necessary in the car's equipment.

The new tool car comprises a 30-foot body, 8 feet wide and 8 feet high, mounted on a floor structure 46 feet long over buffers. The electrical equipment comprises two G.E.-66 motors with multiple-unit control. The car is mounted on

interior and exterior lights on the cars are wired with separate circuits. The classification lamps and tail lamps are so wired that they always show red behind and white in front and on the sides and front end. To provide additional storage capacity for tools, boxes, as shown in the engraving, are built under the floor of the car. There is a master key for these boxes which is fastened to a large brass tag and hung in a special place inside the car. Whenever the car is taken out in times of trouble it is the first duty of the motorman to unlock all these boxes and it also is his duty to see that they are locked again before the car starts on its return trip. The master mechanic carries duplicate keys for the car doors and lockers.

The tools and all the supplies carried in the car are painted green and red and are also marked with the number of the bin where they belong. A complete list of the material in each bin or box is posted on the box, and it is expected that these materials and the list shall agree at all times. Swinging brackets are mounted on the door frames, so that heavy tools, such as bridge jacks, can easily be lowered and raised between the car floor and the roadbed.

As earlier stated, the tools and equipment of this car are

Oakland Wrecking Car—View of Car, Showing Skids Placed for Lowering Emergency Trucks.

high-speed interurban trucks provided with a complete air brake equipment. Gould radial couplers and steel-tired wheels are used. From the illustrations it will be noted that the body of the car is shorter than the floor structure and that a platform at one end 3 feet 6 inches long is left for convenience in getting in and out of the car. The platform at the other end of the car is 12 feet long and provided with rails supporting a truck which may be lowered on portable skids to the track on which the wrecking car stands. An interesting detail is the provision made for varying the height of the rigid bolster of this spare truck to suit the several wheel sizes used on different cars of the system. The extra truck has no springs and the bolster is held in the truck frame by means of two iron pins. These pins pass through the plates of the truck frame and through the bolster. There are three sets of holes provided at varying heights in the plates, so that by moving the pins the truck and bolster may be adapted for use under cars having 30, 33 or 36 inch wheels. The total weight of the car and equipment is 70,000 pounds.

The interior of the car below the rails is painted a medium green and above the rails a lighter green similar to the shades used in locomotive cabs. The floor is oiled and the side sheathing inside is beaded and placed horizontally. The back platform is protected by a pipe railing with an opening opposite the door. All windows are provided with heavy gratings and shutters which can be bolted from within. The

especially complete, and it is thought that a list giving the number of pieces and their characteristics will be of interest:

Equipment on Wrecking Tool Car.

Rope and Tackle (Manilla).

No.	In.	D.	Feet.	Description

1	track gauge and combined level board.		

- 1 100-foot chalk line.
- 1 50-foot linen tape line.
- 2 spike mauls.
- 4 railroad picks.
- 4 D-handle shovels.
- 1 long handle shovel.
- 1 spade.
- 1 cant-hook.

- 1 14-pound sledge.
- 1 16-pound sledge.
- 2 12-pound sledges.
- 1 3-foot 4-inch pinch-bar.
- 1 4-foot pinch-bar.
- 1 4-foot 6-inch pinch-bar.
- 1 5-foot pinch-bar.
- 1 5-foot 6-inch pinch-bar.

- 4 rolls black tape.
- 12 2-way connectors.
- 1 sponge.
- 1 3-gallon sprinkling can filled with sand.

- 1 1-gallon pail, with lid, cup grease and paddle.
- 1 packing hook.
- 1 packing knife.

1 special truck with adjustable center and side bearings to fit every type of car body on S. F. O. & S. J. Ry. and O. T. Co. lines. Suitable means for loading and unloading same.

Assortment of following: Lag screws and boat spikes, machine bolts, screws, cotter keys, wire nails (60, 40, 20, 10, 8), brake pins, drift bolts.

Machinists' Tools.

- No. Coes steel-handled wrenches (8 for tool boxes)—
- 2 6-inch.
- 9 8-inch.
- 1 10-inch.
- 2 12-inch.
- 1 18-inch.
- 1 24-inch.
- 1 12-inch Trimo pipe wrench.
- 1 18-inch Trimo pipe wrench.
- 1 24-inch Trimo pipe wrench.
- 1 36-inch Trimo pipe wrench.
- 1 large alligator pipe wrench.
- 1 lot special motor wrenches.
- 1 socket wrench for lag bolts on pier.
- 6 2½-inch ball-peen hammers (4 for tool boxes).
- 1 4½-inch snips.
- 1 ⅝-inch capacity 36-inch bolt clipper.
- 4 8-inch pliers.

- No. 1 8-inch gas pliers.
- 1 10-inch gas pliers.
- 1 14-inch gas pliers.
- 1 5-inch screw driver.
- 1 6-inch screw driver.
- 1 8-inch screw driver.
- 1 10-inch screw driver.
- 1 extra large screw driver.
- 10 assorted cold chisels.
- 6 assorted drift pins.
- 8 assorted files, 14-inch.
- 1 ½ to 2 Trimo pipe cutter.
- 1 set ½ to 1 Little Giant stock and dies.
- 1 6-inch Prentiss machine vise.
- 4 10 by 14 inch maple hand tool boxes.
- 1 Post drill and drills, ¼, ⅜, ½, ⅝, ¾, ⅞ and 1 inch.
- 1 small forge.
- 1 small anvil and tools.

Overhead Tools and Supplies.

- No. 2 come-alongs.
- 1 ¾-inch block and tackle, 150-foot rope.
- 1 Clayton & Lambert blow pot.
- 1 soldering iron.
- 1 iron solder pot and ladle.
- 2 pounds solder.
- 2 pairs rubber gloves.
- 1 bottle Yeager's soldering salts.
- 1 portable telephone.
- 1 200-foot 4-0 trolley.
- 1 200-foot 2-0 round trolley.
- 1 200-foot 5-16-inch span wire.

- No. 1 200-foot 4-0 feeder copper cable.
- 4 4-0 splicing sleeves.
- 4 1-0 splicing sleeves.
- 4 2-0 splicing sleeves.
- 6 4-0 clamp ears, caps, cones and hangers.
- 6 1-0 ears.
- 1 500-foot No. 6 wire, insulated.
- 1 500-foot No. 14 wire, insulated.
- 1 30-foot extension ladder.
- 1 12-foot ladder.

Appliances—Miscellaneous.

- No. 2 6-inch iron roller dollies.
- 4 3¼ by 15 inch steel rollers.
- 4 1 by 18 inch iron pipe rollers.
- 4 1½ by 24 inch iron pipe rollers.
- 4 2 by 24 inch iron pipe rollers.
- 6 2 by 36 inch iron pipe rollers.
- 1 wheel gauge.
- 4 3-foot steel gads.
- 1 heavy switch iron, 5 feet long.
- 1 of each kind switch key with large tag.
- 4 3-gallon Stempel fire extinguishers.
- 2 fire axes.
- 3 galvanized iron pails, with rope attached to bail.
- 6 malleable iron torches.
- 6 torpedoes.
- 1 wall match box and matches.
- 6 white railway lanterns.
- 4 red railway lanterns.

- No. 2 green railway lanterns.
- 2 blue railway lanterns.
- 4 Dietz inspector's lanterns.
- 2 white lantern globes, extra.
- 2 red lantern globes, extra.
- 1 green lantern globe, extra.
- 4 red signal flags, with spike in stick.
- 2 green signal flags with spike in stick.
- 2 white signal flags with spike in stick.
- 4 light clusters, 32-candlepower, on poles, waterproof.
- 4 extension lamps with waterproof cord.
- 1 100-foot No. 1 R. C. wire, with pole, to carry current to de-railed car.
- 1 life ring buoy.
- 1 log book.

Parts and Supplies.

- No. 1 M. C. B. coupler, No. 65 knuckle.
- 2 pins for same.
- 1 air hose and cock (brake).
- 1 air hose and cock (signal).
- 1 lot king pins, assorted.
- 2 hanks trolley rope.
- 1 trolley wheel, spindle and washer.
- 1 16-foot trolley pole and wheel.
- 1 ball heavy twine.
- 1 lot marlin.
- 1 lot car fuses, assorted.
- 12 headlight carbons.
- 1 lot motor brushes, assorted.
- 6 incandescent lamps and adapters.
- 1 bar ½-inch round iron.
- 1 bar ⅝-inch round iron.
- 1 bar ¾-inch round iron.
- 1 bar 1-inch round iron.
- 1 bar ¼x4-inch 6-foot iron.
- 1 bar ½x3-inch 6-foot iron.
- 1 bar ⅞x3-inch 6-foot iron.
- 1 bar 1x2-inch 6-foot iron.
- 4 rolls acme tape.

- No. 1 each, spare journal brasses. Class I, M. C. B. 23, 23B, 20, Taylor.
- 2 large malleable iron squirt cans (machine oil).
- 2 tallow pots (car oil).
- 6 sheets sandpaper, coarse.
- 6 sheets sandpaper, fine.
- 6 sheets emery cloth, coarse.
- 6 sheets emery cloth, fine.
- 10 pounds cotton waste (in iron can with lid).
- 10 pounds wool waste (in iron can with lid).
- 10 pounds clean rags (in iron can with lid).
- 1 1-gallon can kerosene.
- 1 1-gallon can signal oil.
- 1 1-gallon can XX special oil.
- 1 1-gallon can Eldorado or other engine oil.
- 1 1-gallon can car oil.
- 1 1-gallon can gasoline.
- 1 1-gallon pail, with lid, track oil and brush.
- 1 1-gallon pail, with lid, gear grease and paddle.

Emergency Supplies.

- No. 2 canvas stretchers.
- 2 wool blankets (wrapped in stout paper).
- 1 rubber blanket (wrapped in stout paper).
- 2 small enamel bowls.
- 2 medicine glasses.
- 1 4-ounce graduate.
- 2 tablespoons.
- 2 dessertspoons.
- 2 teaspoons.
- 1 pair straight scissors.
- 1 pair curved scissors.
- 12 assorted ligatures.
- 2 packages safety pins.
- 1 package common pins.
- 1 pair dressing forceps.
- 2 rubber tourniquets.
- 6 small towels.
- 6 first aid packages.
- 1 roll iodoform gauze.
- 6 small rolls absorbent cotton.
- 2 large rolls absorbent cotton.
- ZO adhesive plaster—
- 1 roll ½-inch.
- 1 roll ¾-inch.
- 1 roll 1-inch.
- 1 roll 2-inch.
- Cotton gauze bandages—
- 12 rolls ¾ by 1 yard.
- 6 rolls 2¼ by 5 yards.

- No. 6 rolls 3-inch by 8 yards.
- 1 bottle colodion with brush.
- Directions on all bottles—
- 10 oz. tincture arnica.
- 4 oz. paregoric.
- 2 oz. chloroform.
- 8 oz. camphor.
- 4 oz. peppermint.
- 4 oz. aromatic spirits of ammonia.
- 8 oz. whisky.
- 10 oz. witch hazel.
- 2 oz. vaseline.
- 10 oz. liniment (½ aconite and ½ chloroform).
- 10 oz. liniment (¼ aconite, ¼ chloroform, ½ sweet oil).
- 10 oz. carron oil.
- 8 oz. castor oil.
- 8 oz. listerine.
- 4 oz. laudanum.
- 2 oz. hartshorne.
- 8 oz. salt.
- 8 oz. sugar.
- 1 oz. powdered alum.
- 1 oz. iodoform.
- 1 oz. bicarbonate sodium.
- 1 oz. chloride mercury tablets.
- 1 framed copy of "Emergency Instructions."

The car contains a very complete emergency cabinet. A list of the contents of this cabinet is given later. A large card of instructions, posted near by, explains the uses of the first aid packages contained in the cabinet. These instructions follow:

Emergency Instructions and Contents of First Aid Package.

(Original card, 16 by 13 inches.)

- For wounds on any part of the body:
- Gauze.**—For large wounds.
- Cotton.**—To cover over on top of gauze.
- Rubber Band (Tourniquet).**—To fasten around a limb or around the head to stop hemorrhage, particularly in case of crushed limb.
- Adhesive Plaster.**—To hold dressings, but never to be applied to an open wound.
- Cotton Bandages.**—To be used over first dressings where there is much bleeding.
- Gauze Bandages.**—To fasten splints in place and to support light dressings where there is no hemorrhage.
- Safety Pins.**—To fasten bandages, etc.
- First.**—Don't give a drink of whisky.
- Second.**—Don't pour ice or very cold water on wounds.
- Third.**—If the person is suffering from "shock," that is, pale, with pinched expression of face, drooping eyelids and cold surface of body, with feeble pulse, give spoonfuls of hot tea or coffee; if this cannot be had, teaspoonful of whisky or some other alcoholic stimulant, in a tablespoonful of hot water, every ten minutes, until five or six doses have been taken. Wrap in a warm blanket and put hot water bottles or heated bricks about the body.
- Fourth.**—The patient should be placed on his back, with head low, and this position should be continued in transporting.
- Fifth.**—Remove the clothing from the wounded part by cutting it away. Do not attempt to tear or draw clothing off, as this may further injure the wounded part. Always see the wound and know by your eye just what the nature of it is.
- Sixth.**—If a limb is crushed or torn, apply over the wound a thick pad gauze, then a large covering or pad of cotton, fastened with several turns of the bandages, handkerchief, or an elastic suspender.
- Seventh.**—Hemorrhage. This follows shock and is very rarely severe unless reaction takes place. Too much stimulation increases hemorrhage, and for this reason it is best to give only a little stimulant, well warmed, and repeat the dose if reaction is delayed. Bleeding is of two kinds: First, arterial, when the blood comes out bright and red in spurts; second, venous, when the blood is dark and flows in an even stream. Avoid trying to stop bleeding by twisting cords or handkerchiefs around limbs with sticks. When the wound is large and blood comes out in spurts, apply the rubber band tightly just above the wound, previously raising the wounded member or part, especially if it be a limb. Be careful to put the band on uninjured flesh (if the limb be crushed), and about three inches above the crushed tissues, else it will slip down and increase the hemorrhage. Be careful to see that the band be firmly hooked and fixed before leaving it. Small wounds, even though the hemorrhage be

arterial, require only a firm compress of the sublimated gauze, placed immediately over the wound and bandaged tightly in place with one of the muslin bandages. It is best after this to bandage firmly from the extremity of the hand or foot upward to beyond the wound with muslin bandages. Venous bleeding, which occurs when the wound is shallow (does not go deeper than the skin), as a rule, requires firm pressure over the wound and especially below it. If the wound be quite small, put a pad of styptic cotton into it and over it and bandage tightly in place and then apply a bandage from below upward. If only the scalp is involved, it may also be controlled by drawing a rubber band around the head, encircling it just above the eyebrows. This is very painful, however, and unless the bleeding is severe, it may be controlled by bringing the wounded or torn surface together and applying along the wound a thick layer of styptic cotton, and over this another layer of absorbent cotton and a tight muslin bandage. It is well to pass the bandage under the chin if the wound be on top of the head, as this holds it firmer and tighter.

Eighth.—After hemorrhage has been controlled apply gauze next to the open wound always, and never let an open wound remain uncovered longer than is absolutely necessary to control

injury. Injuries to the head require that the head be raised higher than the level of the body. In all cases, if practicable, lay the patient on his back, with the limbs stretched out in their natural positions; loosen the collar and waistbands, and, unless the head be injured, remember to have the head on the same level as the body; do not bolster it up with anything.

Thirteenth.—To place a person on a stretcher to carry him. Three persons are necessary to do this—two to act as bearers of the stretcher and one to attend to the injured part. Place the stretcher at the head of the patient on a line with the body, the foot of the stretcher being nearest the patient's head. One bearer kneels on each side of the patient and joins hands underneath his hips and shoulders with the bearer on the opposite side. The third man attends to the wounded limb, or looks after any bandages or splints that may have been applied. The bearers then rise to their feet, raising the patient in a horizontal position, and, by a series of side steps, bring the patient over the stretcher. He is then lowered gently on it and made as comfortable as possible. One bearer starts with the left foot and the other with his right; should they keep step the stretcher would roll badly.

In all cases of accident notify the claim department promptly, and also notify the head of the department in which the accident occurs.

SAN FRANCISCO OAKLAND & SAN JOSE RAILWAY and OAKLAND TRACTION COMPANY.

J. Q. Brown, Assistant General Manager and Engineer.

We acknowledge our indebtedness for the description of this car to its designer, J. Q. Brown, assistant general manager and engineer Oakland Traction Company and San Francisco Oakland & San Jose Railway.

EMPLOYES' BENEFIT ASSOCIATION IN MONTREAL.

The fourth annual report of the Montreal Street Railway Mutual Benefit Association has been issued. An abstract of the statement of Duncan McDonald, the president, follows:

The following is a summary of the relief work done during the year:

	1906-7.
Number of members disabled through sickness or injury..	728
Number of visits made by physicians to disabled members.	1,801
Number of consultations given by physicians to disabled members	7,578
Number of prescriptions issued.....	6,435
Amount paid for sickness and injury.....	\$9,737.00
Amount paid for medicine.....	1,894.73
Amount paid for pensions.....	30.50
Amount paid for death and burial insurance.....	6,016.69

The membership of the association now includes practically all the employes who are eligible for membership.

It will prove of interest to the members to know that the amount of \$53,911.75 has been paid out in benefits, since the organization of the association, divided as follows:

For sickness and injury	\$27,732.75
For medicine	4,483.32
For pensions	245.50
For deaths and burials	15,834.37
For medical attendance	5,615.81

Total

Owing to the long and very severe winter of the past year much sickness was prevalent among the members, and in consequence a very large amount was paid out in sick benefits: in fact, this item alone has taken up practically all the fees and dues paid in by the members during the year.

The third annual picnic, under the auspices of the association, was held at Dominion park in August, and lasted for a period of seven days, and your committee is pleased to report that the same proved successful. The picnic netted a profit of \$6,381.09.

Your "Committee of Management" gratefully acknowledges the special Christmas donation of \$3,000 received from the Montreal Street Railway Company, this being in addition to the contributions agreed to under Clauses 21 and 22 of our rules and by-laws, making the total contributions from the company \$13,397.30. This amount, together with the fees and dues received from the members, viz., \$10,891.50, and the proceeds of the picnic, and interest on investments and bank deposits amounting to \$7,679.79, makes a total revenue for the year of \$31,968.59, and the expenses being \$24,555.97, leaves a surplus of \$7,412.62.

The financial report of Patrick Dubé, secretary-treasurer, shows a total surplus at the end of the fiscal year of \$25,756.42. Of the total revenue for the year of \$31,968.59, there was paid out \$24,555.97, of which \$4,797.05 was for management expenses.

The report contains a copy of the blank used for giving notice of disablement and application for sickness or bodily injury benefit.

Oakland Wrecking Car—Interior, Showing Very Complete Equipment of Tools.

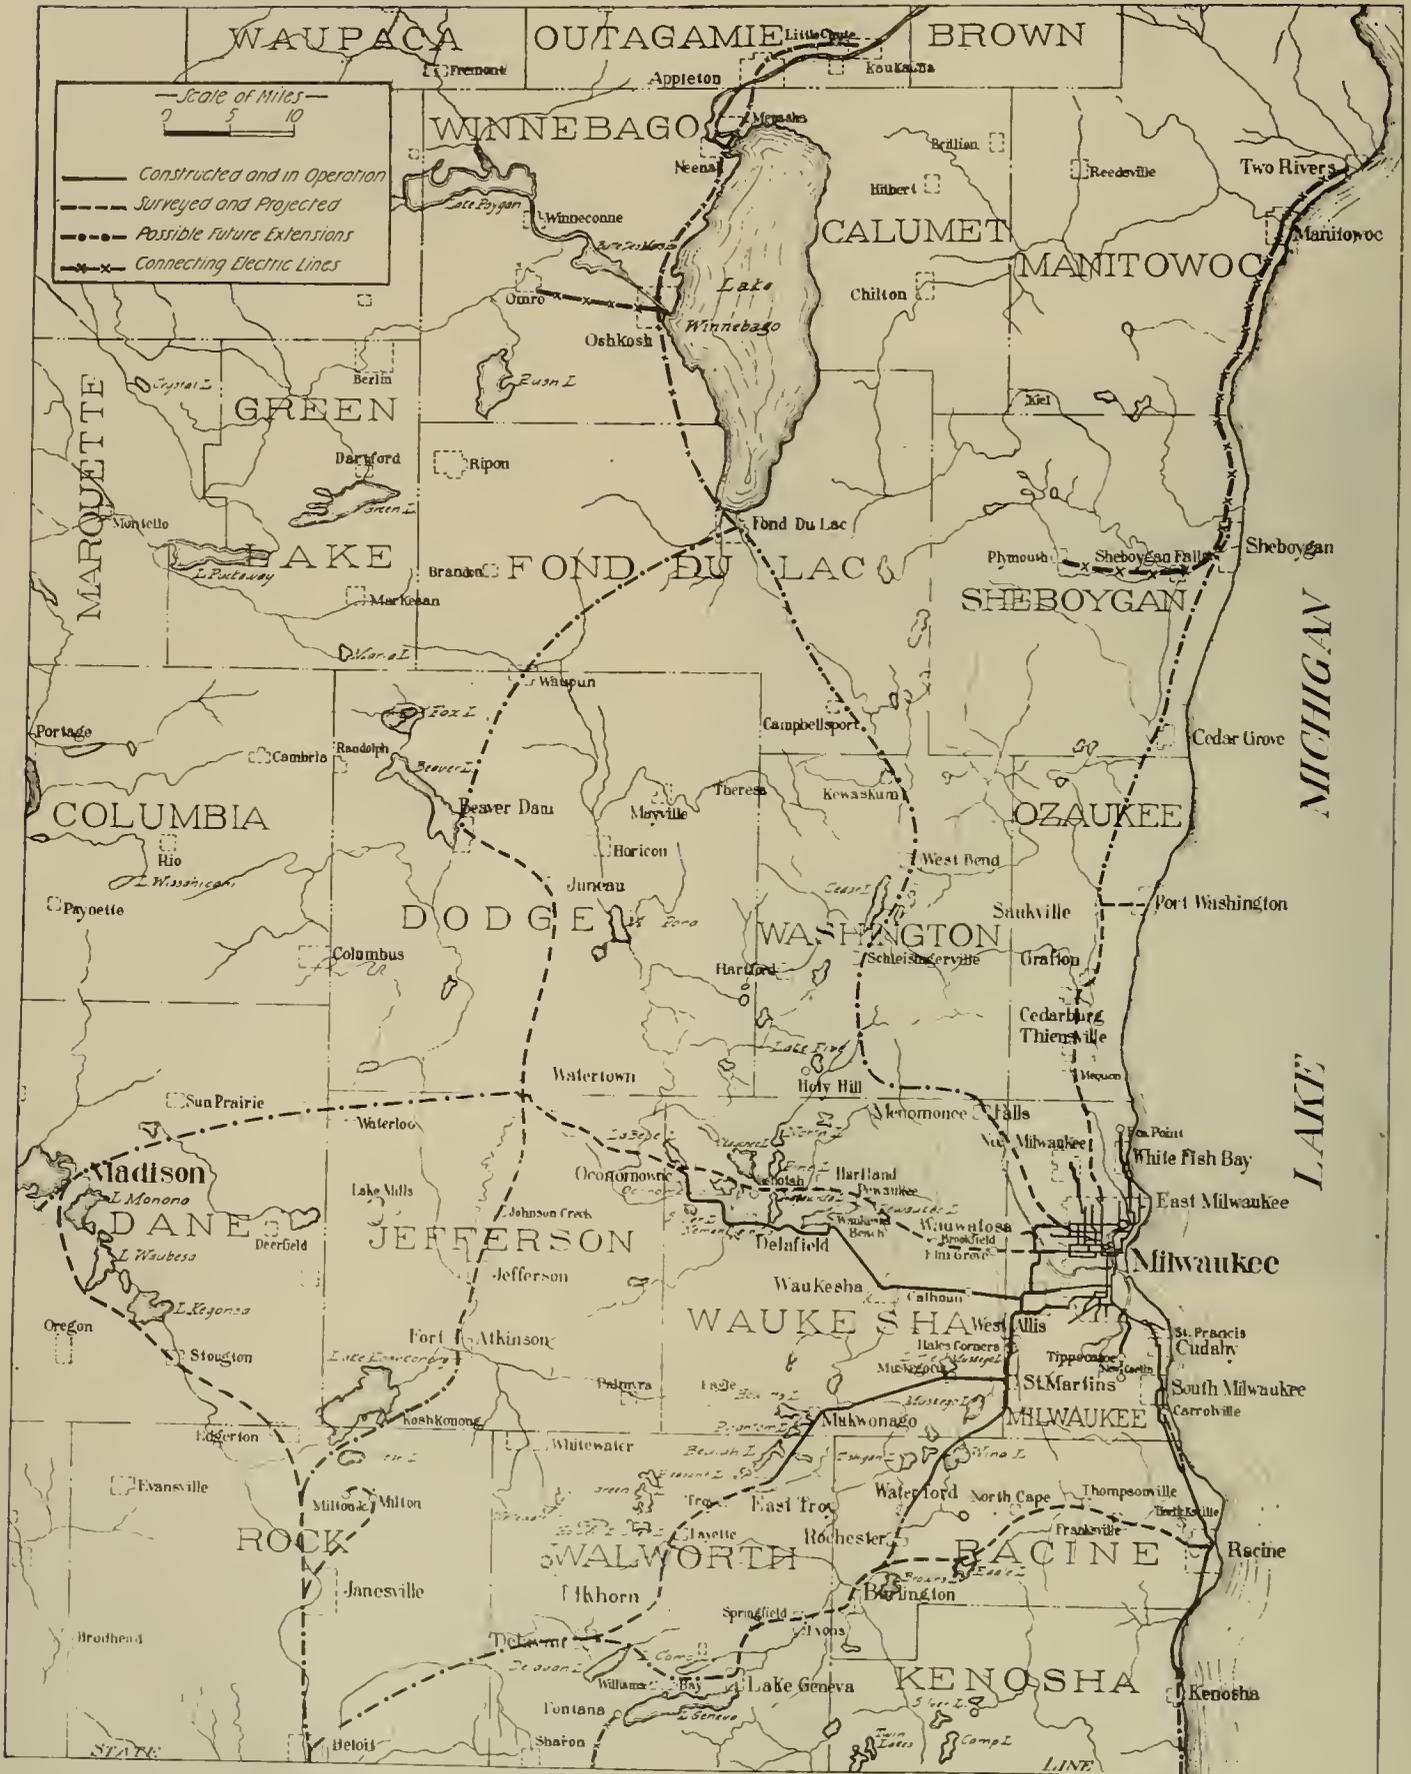

the hemorrhage; but, remember, a soiled or dirty covering is worse than none at all.

Ninth.—If a leg or arm is broken, straighten it gently and lay on a pillow, then tie the pillow up with several strips of muslin, bandage or splints found in the stretcher. Laths or barrel staves padded with some soft material may be used for this purpose. This should be done before the injured person is moved any distance.

Tenth.—Compound fractures are fractures accompanied by a wound of the soft tissues at the point of fracture, so that the bone is exposed to the air. In these cases treat hemorrhage and the wound according to the foregoing rules and then apply the splints. If the bones project beyond the skin, remember to bring them back into place by pulling the extremity in the direction of the displacement until the ends of the fragments are quite free from over-riding. Remember to always cover these wounds with the sublimate gauze and bandage.

Eleventh.—Burns. Carefully remove the clothing by cutting it off, if the part be clothed, and apply immediately three or four thicknesses of the sublimate gauze (dry or wet, in warm water in which one tablespoonful of bicarbonate of soda to the quart has been dissolved). As a rule never attempt to clean burns immediately after they occur. Cover the wounded part immediately, as directed above, and leave the cleansing to the surgeon afterward. Extensive burns are attended with great shock, as a rule, and require free stimulation. As burns are rarely followed by hemorrhage, stimulants may be and should be given in considerable quantities.

Twelfth.—Position in which a person should be placed after

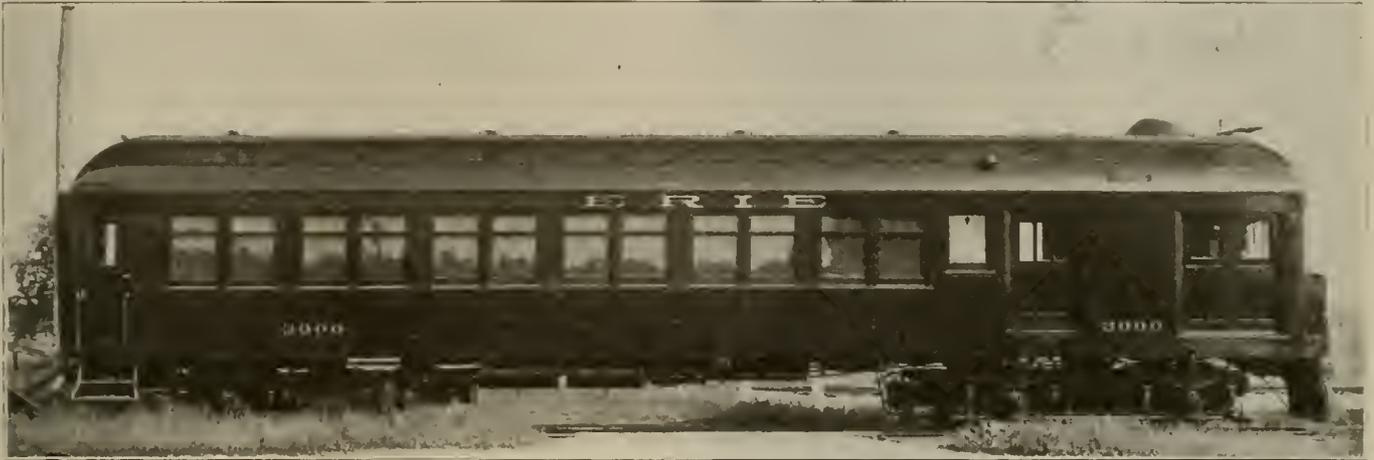

Map of Operating and Proposed Lines, Milwaukee Electric Railway & Light Company and Milwaukee Light Heat & Traction Company.

PROPOSED EXTENSIONS OF THE MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY.

In the Electric Railway Review of April 27, 1907, page 558, was presented a map of the city lines of the Milwaukee Electric Railway & Light Company, showing lines in operation and proposed extensions, as illustrating the ideas of John I. Beggs, president, of the new lines required to complete an ideal city system. Through the courtesy of Fred G. Simmons, superintendent of construction and maintenance

GANZ STEAM MOTOR CAR FOR THE ERIE.

The first Ganz steam motor car to be constructed and given its initial operating test in this country was delivered to the Erie Railroad at Dayton, O., on June 24 by the Railway Auto Car Company of New York. The car left Dayton for a leisurely trip to Jersey City over the Erie Railroad under its own steam. After reaching Jersey City the car was placed in regular service on one of the suburban lines of the Erie, and will be subjected to thorough tests. The

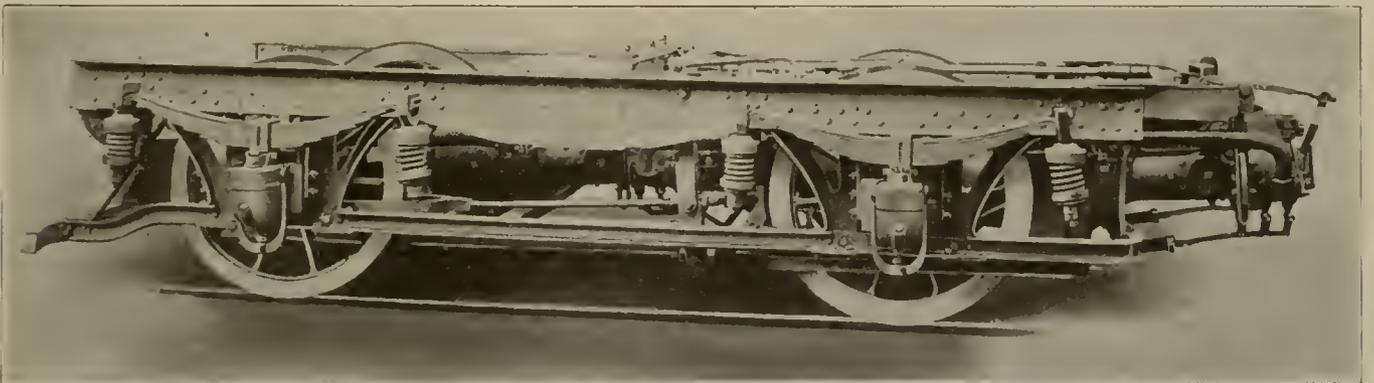

Ganz Steam Motor Car—General Appearance of Erie Car.

of way, we are now able to present an excellent map which has just been prepared of the entire system of the Milwaukee Electric Railway & Light Company and the Milwaukee Light Heat & Traction Company, which is controlled by the former and operates suburban and interurban lines in the vicinity of Milwaukee. This map shows the lines constructed and now in operation, the lines surveyed and projected, possible future extensions not yet surveyed and connecting lines operated by other companies.

The company has recently put into operation 13 miles of

only other Ganz car in actual service in this country is the one in use on the Florida East Coast Railway. This car was imported from Europe, where a great many of the cars are in use, giving satisfactory service.

The Erie car, as may be seen from the accompanying illustrations, is similar in appearance to the standard suburban passenger coach of the railroad company. The car is divided into four compartments. The motor compartment in the forward end occupies six feet. Immediately behind this is a similar space for baggage. Next is the smoking

Ganz Steam Motor Car—Truck Carrying Engine Cylinders.

new track between Waukesha Beach and Oconomowoc, and intends within the next few days to begin operating over about 11 miles of additional new track from Muskego Center to Mukwonago. This will be followed within a very short time by the opening of seven miles of new lines, still further extending this new line to East Troy. Work is now in progress on a line from St. Martin's to Waterford and Burlington, which will probably be opened this fall, and construction is being rapidly pushed on the line between Oconomowoc and Watertown, 14 miles, which is expected to be in operation next spring. Numerous other lines are being prospect, surveyed and laid out.

compartment with 12 seats. The rest of the car is the general passenger compartment. The car is 58 feet long over all and has seats for 50 passengers. The weight in working order is 45 tons, the use of a wooden body making the car heavier than the all-steel construction Ganz car, which is being built for the Chicago Rock Island & Pacific Railway, and is to weigh 36 tons.

The car is equipped with two compound inclosed steam motors of 60 horsepower each. These are mounted in the forward truck, each driving one axle through gears. The cylinders are 4.7 inches and 6.7 inches with a 5½-inch stroke. The maximum tractive effort is 3,700 pounds, and the motors

are arranged so that either may be operated independently of the other. All the working parts of the motors are inclosed in water and dust proof cases and run in oil. The steam generator, which is 42 inches in diameter and 5 feet high, is of 120-horsepower capacity, with a heating surface of 212 square feet and 6 square feet of grate area. The

Ganz Steam Motor Car—Interior of Cab, Showing Boiler.

steam pressure is 270 pounds, the steam being superheated. The boiler compartment also contains the control levers.

The fuel to be used is anthracite coal or coke, and this is carried, as shown in one of the accompanying engravings, in a bunker on the front end of the car which will hold enough coal for a continuous run of 50 miles. The fuel consumption is not expected to exceed 15 pounds per mile.

of 30 miles on level track or at 11 miles per hour on 2 per cent grades.

The Ganz principle for motor car operation has been described in detail at various times and was recently the subject of an interesting paper presented before the New York Railroad Club by Charles Ducas, secretary of the Railway Auto Car Company.

RECOVERY OF METALS FROM SCRAP.

A comparatively new industry has sprung up in the refining of non-ferrous scrap metal and the present high prices asked for all metals of this class has led to unusual activity in the scrap market.

Brass and other alloy scrap is recovered by remelting in crucibles with new metal. Fine particles of brass, such as occur in ashes, skimmings and sweepings, are recovered by a system of washing and jigging. Concentrates obtained from jigging processes are smelted in a reverberatory furnace or melted in crucible or oil-burning furnaces.

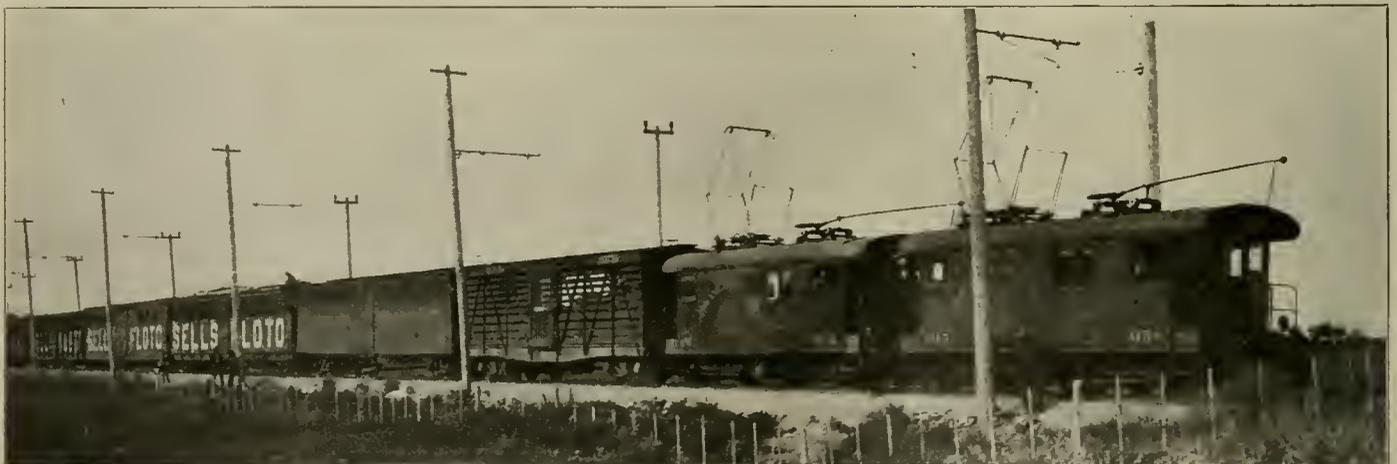

Copper scrap is treated differently according to the character of the material. The copper may be in the metallic state, as in trimmings from copper sheet, borings, grindings, punchings, etc., or it may exist in chemical combination with some other element, as in copper scale or blue vitriol.

Metallic scrap copper may be melted in reverberatory furnaces of similar design to those used in the copper mining districts. The slag skimmed off consists of impurities originally contained in the charge, and combinations of copper with oxygen and the fire brick lining of the furnace. The slag may contain from 30 to 70 per cent copper, which is recovered by smelting in a cupola or a small round water jacketed blast furnace.

Certain processes of manufacture yield some very dirty scrap mixed with grease and refuse, which appears almost worthless. If the metal is present in paying quantities, however, it can be recovered, no matter how polluted, by judiciously drying, sorting and smelting.—Copper and Brass.

HANDLING A CIRCUS TRAIN.

The accompanying illustration shows two of the powerful single-phase locomotives of the Spokane & Inland division of the Spokane & Inland Empire Railroad system, coupled to a circus train. This train comprised 23 cars, owned by the

Handling a Circus Train on the Inland Empire System.

The water tank, with a capacity of 600 gallons, is built into the underframe of the car. The air brakes are of the Westinghouse type, the air compressor being mounted on the trailer truck. The lighting is by Commercial acetylene gas and the car is heated by steam. The car is designed to make a speed of 40 miles an hour on level track and 15 miles an hour on 2 per cent grades, and will haul a trailer at a speed

Sells-Floto Circus Company, aggregating 2,300 tons, and including five 60-foot Pullman coaches, seven standard stock cars and eleven 60-foot flat cars. This train was hauled for a distance of 76 miles over the Spokane & Inland division of the Inland Empire system, from Palouse to Spokane, Wash., where the circus exhibited on the new grounds east of the city, owned by the electric railway company.

THE WORK OF THE CHICAGO SANITARY DISTRICT.

An extra meeting of the Western Society of Engineers was held in the Monadnock block, Chicago, Ill., on Wednesday, June 26, 1907. The speaker of the evening was Mr. Isham Randolph, chief engineer of the Sanitary District of Chicago. The title of his paper was "The Work of the Sanitary District of Chicago, Already Accomplished and Yet Contemplated, South of the Controlling Works at Lockport." It was read by the author and illustrated by numerous lantern slides.

The Sanitary District of Chicago now includes an area of about 350 square miles, and to dispose of the sewage from this district the flow of the Chicago river has been reversed, a grant having been obtained from the United States War Department to withdraw 10,000 cubic feet of water per second from Lake Michigan. A ship canal is being built which will connect Lake Michigan with the gulf of Mexico. About 14 years ago Mr. Randolph conceived the idea of utilizing the power available at Lockport, Ill., where there is an available fall of 34 feet, and at Lake Joliet, where there is another fall of 34 feet.

The construction of the drainage canal and power house at Joliet involved some extremely difficult engineering problems, one of the most extensive of which is an immense butterfly valve which is now in the course of construction at Lockport to prevent a serious flood in the Desplaines valley, should a break in the embankment of the drainage canal occur. This valve has a width of 184 feet and a height of 30 feet, and is supported at its center on a steel pivot 36 inches in diameter, and is designed to resist a total thrust of about 5,000,000 pounds when closed. The pivot is supported at its upper end by a steel bridge having a span of 210 feet, supported on two concrete piers in the center of the stream.

The method developed for operating this gate is an ingenious one, originated by Mr. Randolph. The butterfly valve is turned through a sufficient angle by means of an electric motor until its ends project into the stream. Near each end of the butterfly valve there are five gates which are operated electrically. By closing the gates in the upstream end of the butterfly valve and opening those in the downstream end the water itself causes the valve to close and shut off the water. The small gates which were open are then closed and the only water passing will be that which leaks under the main valve. To open the butterfly valve it is only necessary to open the small gates on the upstream end of the valve and leave those on the downstream end closed. The pressure on the downstream end of the valve then being greater than that on the upstream end will cause the gate to swing around to its original position.

The power house which has been constructed at one side of the locks is 368 feet long, 69 feet wide and 72 feet high from the tail-race to eaves. In it will eventually be installed eight 6,000-horsepower turbines direct connected to 4,000-kilowatt alternating-current generators and three exciter units of 600 horsepower each. The power house is constructed of hollow concrete blocks made in the shape of the letter T. The turbines are of the horizontal type, there being six turbines on each shaft. The runners, guides and gates of the turbines were built by J. W. Jolly, Holyoke, Mass., and the casings were constructed by Wellman-Seaver-Morgan Company, Cleveland, O. The shafts of these turbines, which are 12 inches in diameter and 75 feet long, are built up of three sections, the first being open-hearth steel, the second nickel steel and that nearest the generators nickel steel annealed.

A unique feature in the construction of the turbine casing is that the bearings, instead of being made of lignum vitae, water lubricated as usual, are lubricated by oil under pressure, and tubes lead from the floor above the wheel-pits down to each bearing, so that they can be examined and

watched while the wheel-pits are filled with water. The advantages of this unique construction are obvious. The speed of the turbines is controlled by Lombard mechanical governors, made by the Holyoke Machine Company.

Crocker-Wheeler revolving-field alternators are direct connected to the turbine shafts. These generators have 40 poles, and the revolving field, which is 29 feet in diameter, makes 162½ revolutions per minute. Current is generated at 6,600 volts.

The current generated by this station will be used for lighting and power. The Sanitary District owns about 9,000 acres of land in the immediate vicinity of the power house and it is proposed to sell or rent about 5,000 acres of this land for factories which will purchase power from the Sanitary District. With the completion of the second power house at Lake Joliet, making the total power available about 85,000 horsepower, there should be a rapid development of the country surrounding Joliet, which will have a marked influence on the electric traction business in that section. It is estimated that the sale of power from the power houses will be sufficient to pay the expense of building the canal and power houses.

INDIANA RAILWAY COMMISSION GATHERING DATA ON SAFETY APPLIANCES AND CROSSINGS.

The Indiana railroad commission is sending out to the railway companies in the state a set of information blanks inquiring in regard to interlocking devices, block signals and highway and street crossings, under authority granted the commission by the amended law of 1907. It is understood that the information gathered on these blanks will be used for reference in any proceedings in regard to the use of these safeguards.

Most important, perhaps, is the information concerning highway crossings. The blank asks for the number of grade street crossings on each line; number of grade highway crossings; number of overhead street and highway crossings; number of undergrade street and highway crossings; and the number of all the crossings named above protected by watchmen, gates, bell or otherwise, or not protected at all.

The interlocking blank asks for the number of such devices in which each road is concerned; the year constructed or rebuilt; whether mechanical or electrical; name of the company operating them; average daily train movement; the number of laborers employed; and the total number of their hours of labor; also the number of levers operated.

The block signal blank is divided into three sections: one concerns the lines now equipped; the second the lines to be equipped, and the third lines not to be equipped. With reference to the first two, the information asked concerns the date of construction of the system, existing or contemplated; the number of miles of automatic block; number of miles of manual telegraph block; miles of controlled manual block and the total number of miles of all kinds in the state, actual or contemplated. In addition there is space for the railroads to outline the expenses of construction, maintenance and operation; the questions asking for the average cost per mile for the construction of each kind; average cost a mile for the maintenance of each kind, and the average cost a mile for the operation of each kind.

The Detroit Jackson & Chicago Railway, which is controlled by the Detroit United Railway, has announced a reduction in passenger rates of about 15 per cent. The limited cars will hereafter make the run between Detroit and Jackson, Mich., in 2¾ hours, and there will be no excess fare charged on these cars. The fare reductions are material. For instance, the present fare from Jackson to Detroit is \$1.20; the new rate will be \$1.00. The new timetable will give 2-hour service between Jackson and Detroit for the present, which is a less frequent service. But as soon as the traffic demands it new cars will be installed.

ADJUSTING STREET GRADES IN SEATTLE.

Municipal engineering work of an especially interesting character is now being carried on in Seattle, Wash. This work comprises the readjustment of a large number of street grades and cutting down the elevation of some hills more than 60 feet. The accompanying halftone engraving shows the temporary trestle-work necessary on several streets to

We are indebted to him for the interesting information herewith given.

CHINESE AVERSE TO THE TROLLEY.

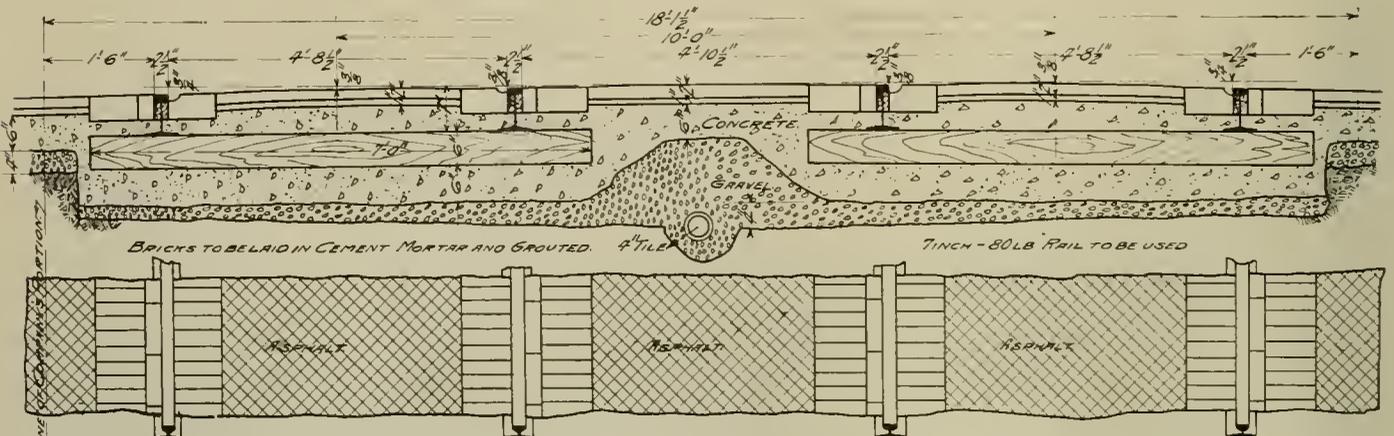

A feeling of apprehension exists among the foreign residents of Shanghai that serious disturbances may follow the opening of the new electric street railway system in July.

Adjusting Grades in Seattle—Blocking Up Track 17 Feet Prior to Raising Street Grade.

permit the continued operation of the cars of the Seattle Electric Railway. At the street intersection illustrated the grade of the pavement is being raised 17 feet. There are some streets on which cable lines are operated that are having jinrikisha men being thrown out of employment and em-

For some time the native press has been agitated over the installation of the electric car lines and frequent articles of a highly inflammatory character have appeared. A recent article points out the danger which will result from so many jinrikisha men being thrown out of employment and em-

Adjusting Grades in Seattle—Permanent T-Rail Track Construction of the Seattle Electric Railway.

more interesting problems in blocking up the track to permit of continued operation.

The accompanying line drawing shows the type of track structure being placed in the streets of Seattle that have been adjusted to their permanent grades. A 7-inch 80-pound T-rail with high web is used and the 7-foot ties are bedded in concrete. The concrete rests on gravel ballast drained with 4-inch tile. M. Lowd is chief engineer of the Seattle Electric Company, in charge of maintenance and reconstruction work.

phasizes the probable loss to commerce because of the inability of pedestrians to use the streets on which the tramway runs. After making the statement that from 5,000 to 6,000 persons have been killed by the electric railways in Tokyo, the writer says:

"During a storm of lightning or rain the electricity of the cars and that of the air will unite and passengers on the trams will be unable to leave them, whatever efforts they make."

News of the Week

Philadelphia Ordinance to be Reconsidered.

The Philadelphia Rapid Transit ordinance was passed by councils on June 20. Mayor Reyburn was waited upon by 20 members of councils on June 24, who urged him to have the ordinance recalled for further consideration and amendment, or else to veto it. It has been decided to consider the ordinance on July 1. The ordinance as passed embodies, with some changes, the provisions of the original bill, an abstract of which was published in the *Electric Railway Review* of May 11, 1907, page 615.

The right of the Broad Street Rapid Transit Company, Philadelphia, to lay tracks in Broad street was established by the Pennsylvania supreme court in a decision which dismissed an action brought by the Thirteenth and Fifteenth Streets Passenger Railway Company, seeking to enjoin the defendant from becoming a competitor.

Legislation Affecting Electric Railways.

Wisconsin.—The senate committee on transportation has reported a new street railway bill providing for indeterminate franchises in place of limited franchises. Municipalities are given the right to purchase at a valuation determined by the railroad commission. Every new franchise granted shall be indeterminate. A street railway operating under an existing license may surrender it and receive an indeterminate license. A company so doing shall be deemed to have consented to the future purchase of its property by the municipality at the commission's valuation and terms. The right of appeal to the courts from the determination of the commission is reserved. Any municipality may acquire by condemnation the property of a street railway company operating under a franchise existing when this act goes into effect.

Michigan.—The house has defeated the Tuttle bill, which removes many of the provisions restricting the acceptance of electric railway securities by state banks.

Object to Reducing Fares.

The Lincoln (Neb.) Traction Company, against which the city attorney recently filed a complaint with the state railroad commission to compel it to sell six tickets for 25 cents, has filed its answer with the commission. The company declares that to enforce such a demand would be confiscatory and that the Citizens' Street Railway, mentioned in the complaint as giving the lower rate, is operated at a loss and its officers have announced publicly that it does not intend to operate the system at a profit, but expects to sell its road to the city when completed. The company also states that it is selling tickets now cheaper than 90 per cent of the roads in the country covering a similar territory. The company has filed with the federal court a dismissal of the injunction suit against the city to restrain it from lowering fares, as the state commission now has the power to regulate the fares and the injunction against the city is to no purpose.

The Omaha Lincoln & Beatrice Railway, which was also included in the complaint to the commission, has filed an answer stating that it is a railroad and not a street railway and that its local business in Lincoln is only incidental to its interurban business.

Right to Build Transmission Lines.

The Indiana supreme court decided in favor of the Indianapolis & Cincinnati Traction Company on June 21 in the suit started by Leonidas H. Mull. The decision of the lower court was confirmed. The question involved is that of the right to condemn a right of way across private property for a transmission line from a power house to another line leased and operated by a traction company. The question arose by the condemnation of a right of way from the power house in Rushville of the Indianapolis & Cincinnati Traction Company, across the country to the road from Greensburg and Shelbyville to Indianapolis, which the company operates under lease. The farmers objected to having the high-voltage wires cross their fields and appealed to the court. A digest of the opinion follows: (1) The power conferred on interurban railroads by the acts of 1902, page 92, to condemn lands for uses appurtenant to all roads "acquired" by them includes power to condemn a right of way for a transmission line of poles and wires appurtenant to a leased line. (2) Said act is constitutional. (3) Said right of condemnation is not affected by the fact that the transmission line extends across country from a power house on the road leading east through Rushville to the road leading southeast to Greensburg. (4) This rule that a lawful business or structure is never a nuisance per se applies to a high-voltage electric line built across a farm by authority of law.

Chicago Arbitrators to Hold Hearing.

The first public hearing of Judge P. S. Grosscup and Prof. John C. Gray, the arbitrators who are to decide on the distribution of Chicago Railways Company stock in the reorganization of the Chicago Union Traction Company and its underlying roads, will be held on June 30. The attorneys representing the New York interests will present a plan for distribution and the protective committees representing the stockholders of underlying companies will offer such suggestions as they may desire. The decision of the arbitrators, which will be final, will probably be announced within three weeks. Judge Grosscup says that the rejection of the ordinance is no longer a possibility.

The Union Traction Company stocks will be deposited with the Chicago Title and Trust Company in accordance with the ordinance as soon as the majority stock of the underlying com-

panies, which is controlled by the committees, is ready for deposit. In their letter to shareholders the protective committees state that the underlying stocks will be deposited in escrow, the deposit to become absolute provided a certificate, signed by Judge Grosscup and Professor Gray, shall be filed in the following form:

"We hereby certify that a plan of reorganization formulated by the authority of the Chicago Railways Company has been filed with us and that in our judgment said plan makes full provision, all things considered, for the execution of whatever finding may be hereafter made by the arbitrators in the matter of the issuance and distribution of the securities of the Chicago Railways Company."

Proposed Monorail in New Jersey for New York "Commuters."

John H. Starin, Charles Stewart Smith and Woodbury Langdon, members of the New York rapid transit commission, which, under the public utilities law, goes out of existence on July 1, have become identified with a project to build a four-track monorail road between Jersey City and Newark, N. J. It is stated that a company will soon be formed and that a franchise will be applied for under the state franchise laws of New Jersey, which will do away with the delay of waiting for the sanction of the municipal authorities of Jersey City and Newark. It is proposed to run trains at intervals of not more than 10 minutes and at a speed of from 60 to 100 miles an hour, and to charge a 3-cent fare between Newark and Jersey City, eight miles, and a 5-cent fare between Newark and New York City. If arrangements cannot be made with the Hudson Companies' tunnel system to transfer passengers under the Hudson, it is proposed to establish a ferry service. It is stated that the type of monorail to be used is the one now being exhibited at Jamestown, and which is the invention of Howard H. Tunis, chief engineer of the American Monorail Company, Baltimore, Md. The American monorail, as it is called, is described as a system by which a car 47 feet long and 6 feet wide, and tapering at each end, is supported on two trucks of two wheels each, flanged on each side and running on a single rail. The car being light, and its weight principally at the bottom, it tends naturally to support itself in an upright position, but is held securely in that position by what is called the equilibrium device, arranged on top of the car, and running between light guide rails. The car is equipped with eight motors.

Use of Streets by Interurban Railways Constitutes No Basis for Damage Claim.

The Indiana supreme court on June 26 gave an important decision in regard to the use of city tracks by interurban railroads in the case of Lottie Armstrong against the Indiana Union Traction Company, in which the plaintiff asked for damages for the operation of cars on College avenue in Indianapolis. The court held that the use of the streets by interurban cars is no more an "additional servitude" than their use by city street cars, as long as they are operated within the city like street cars. But the court holds that whatever special damages they inflict on adjoining property by fast running or by the improper operation of their cars in other respects, must be paid. All of the judges express the opinion that interurban cars cannot be excluded from the streets by abutting owners, the owners having a right, at most, to recover damages.

The decision was by a majority only of the five judges, two of them contending that the mere use of the streets by interurban cars gives adjoining owners a right to damages as in the case of steam railroads. The fact that freight or express cars are run by the interurban railroads is discussed at length, but is held to make no difference in their right to use the streets.

The decision of the court is thus expressed: "The majority of the court hold that under the facts averred in the complaint and the law applicable thereto, appellee's railroad does not constitute an additional burden or servitude upon any of the public streets of the city of Indianapolis; that the complaint states a cause of action in favor of appellant only for the recovery of the special damages which she has sustained, as shown by the facts alleged, and for this reason only it is held by the majority that the lower court erred in sustaining the demurrer to her complaint."

Rapid Transit Affairs in New York.

It is reported that the Interborough Rapid Transit Company is planning to replace much of its rolling stock on the surface lines. It is stated that the type of car has not been adopted, but that the Montreal "pay-as-you-enter" car and the Minneapolis gate are being considered. The Montreal car, which was exhibited at the Columbus convention last fall, and which was described in the *Daily Electric Railway Review* at that time, has an exceptionally large platform, on which the conductor stands at all times and collects the fares as passengers enter the car. It is estimated that the company loses \$2,000,000 a year in fares which the conductors miss, a loss which would be eliminated by the use of this type of car. The Minneapolis cars are provided with a rear platform gate, which the motorman closes by a lever when he turns on the power.

The board of estimate on June 21 approved the application of the New York City Interborough Railway for several alterations in routes in the Bronx. The board also approved the application of the Hudson & Manhattan Railroad for permission to build a bridge connecting the third stories of its new terminal building across Dey street, between Church and Greenwich streets.

The Interborough Rapid Transit Company on June 22 began using a new system for separating the boarding and leaving passengers at its Grand Central subway station. The system consists of a line of railings about four feet back from the train, with openings opposite the ends and the middle of the cars. The openings opposite the middle are marked "entrance," and those opposite the ends are marked "exit." The former are kept closed by a long sliding bar until the alighting passengers have left the train. A "platform man" is in charge of each of these sliding bars. Considerable

confusion resulted at first because the passengers were not used to the plan, but it is expected that it will result in a relief from the congestion.

After 13 years of existence the rapid transit commission on Thursday of this week adjourned sine die and on Monday the board will cease to exist, being succeeded by the public utilities commission.

Engineering Association Issues Bulletin.

S. W. Mower, secretary of the American Street and Interurban Railway Engineering Association, under date of June 25, has sent out a circular letter to the members, containing information regarding the meetings of the association at the annual convention of the American Street and Interurban Railway Association and the affiliated associations, to be held at Atlantic City, N. J., during the week beginning October 14 next. The meeting of the Engineering association will convene at 2 o'clock p. m., on Monday, October 14, and will continue during Tuesday morning and afternoon. On Wednesday morning, October 16, at 10 o'clock, the joint meeting of all the associations will be held, with the closing session of the Engineering association at 2 o'clock the same afternoon. The headquarters of the association will be at the Hotel Dennis.

In the circular letter particular attention is called to the "question box," which is provided as a means of bringing miscellaneous matters before the convention. Although papers have been assigned on several subjects, it is thought likely that some matters of particular individual interest may not have been included. For this reason, therefore, a blank on which is printed a request that certain questions (to be named by the recipient) be discussed at the meeting, is inclosed with each letter, the blank to be filled out and returned to the secretary at London, Ont. During the first part of July these lists of questions will be printed and forwarded to the members for answers, the questions and answers to be printed later and sent out with the advance papers. It is hoped that the members to whom these blanks are sent will give the matter their early attention and thus facilitate the work of preparing these lists.

Applies for Freight Permit.—The Allentown & Reading Traction Company of Allentown, Pa., has applied to the city councils for a permit to carry freight, under the provisions of the Homsher law, passed by the last legislature.

Three-Cent Fare Bill in St. Louis.—A bill has been introduced in the St. Louis municipal assembly which provides that street railways in the city shall charge a fare of three cents for a continuous ride in one direction for persons over 12 years of age and two cents for children between the ages of 3 and 12.

Winona Interurban Will Handle Express.—A contract for the operation of the United States Express Company over the line of the Winona Interurban Railway from Warsaw to Goshen, Ind., effective on July 1, has been signed by both companies. Offices will be opened in the near future in the principal cities and towns along the route.

Electric Lines in Pennsylvania Must Report on Mileage.—Attorney-General Todd of Pennsylvania has given an opinion that the recently approved law requiring railroads to file with the department of internal affairs a statement of the length of their lines, the distance between termini, and the distance between stations, applies to electric as well as steam railways.

Aurora Elgin & Chicago Increases Wages.—The Aurora Elgin & Chicago Railway, Wheaton, Ill., has signed a new wage contract with the members of the Brotherhood of Interurban Trainmen employed on its lines, whereby the men will receive 23 cents an hour for the first year, 26 cents for the second year and 29 cents thereafter. The old scale was 22 cents for the first year, 25 cents for the second year and 27½ cents thereafter.

Ft. Wayne & Wabash Valley Benefit Association.—An employees' benefit association is being organized among the employees of the Ft. Wayne & Wabash Valley Traction Company of Ft. Wayne, Ind. The members will pay dues of 50 cents a month and will receive 50 cents a day in case of sickness or 75 cents in case of accident. Death benefits of \$100 will be paid. Officers are to be chosen by trustees elected by the members. Officers of the company have made donations to the benefit fund.

Trolley Trips in and About Montreal.—The Montreal Street Railway Company has issued a 16-page folder entitled "Trolley Trips in and About Montreal," which describes and illustrates with half-tones many of the numerous points of interest which may be reached over the company's lines. Montreal is fortunately situated in this respect, for in addition to many points of historical importance there are many picturesque suburban places to attract the summer traveler, including Mt. Royal Park, Lachine, Cartierville, Sault au Recolet, Bout de l'Isle. The Bout de l'Isle line passes through several quaint old French-Canadian villages. The folder is well arranged and gives concise information as to schedules, rates of fare, connections, etc., with an excellent map of the company's system.

To Test Validity of Half-Fare Law.—The first step to test the constitutionality of the law which provides that street railway companies shall sell to pupils of public and private schools transportation at half the regular rate was begun in Northampton, Mass., on June 18, when at the request of Chief Justice Aiken of the superior court a jury in that court, criminal session, rendered a verdict of guilty against the Connecticut Valley Street Railway Company of Greenfield, Mass. The case will be taken on appeal to the supreme judicial court. The case reached the jury on an agreed statement of facts presented by District Attorney Richard W. Irwin, representing the commonwealth, and Bentley Warren of Boston, representing the defendant corporation. The company had been indicted because of the refusal of the Northampton agent of the company to sell transportation at reduced rates to Fred W.

Chapin of Amherst, a student in the Northampton Commercial College. The defense is that the Northampton college is not a school of the kind contemplated by the makers of the law and that the section of the law entitling students of such schools to transportation at reduced rates is unconstitutional.

Accounting Committees Meet at Cleveland.—The committee on standard classification of accounts of the American Street and Interurban Railway Accountants' Association met at the Hollenden hotel in Cleveland on June 25, to confer on forms of accounting that will conform with rulings of the interstate commerce commission. Conferences will follow until suitable forms are recommended to the association for general adoption. Comptroller W. F. Ham of the Washington Railway & Electric Company, Comptroller C. N. Duffy of the Milwaukee Electric Railway & Light Company, Auditor F. R. Henry of the United Railways of St. Louis and Auditor W. G. McDole of the Cleveland Electric Railway were present. A sub-committee on interurban accounts, composed of A. B. Bierck, auditor of the Long Island Railroad; W. H. Forse, Jr., assistant treasurer of the Indiana Union Traction Company, and A. C. Henry, auditor of the Lake Shore Electric Railway, was also in session.

Geary Street Railway Seeks to Enjoin Acquirement by City.—The officers of the Geary Street Park & Ocean Railroad of San Francisco, Cal., on June 21 began an action in the superior court against the board of supervisors for the purpose of securing an injunction restraining that body from exceeding the dollar limit in its tax levy for the coming fiscal year for the purpose of acquiring and improving the Geary street system. It is held by the plaintiffs that the cost of acquiring the Geary Street Railway cannot be paid out of the general fund, and attention is called to the fact that the electors have twice refused, by their votes at elections, to authorize a bond issue for the purpose. The court is asked to grant an injunction immediately restraining the board of supervisors from making two separate tax levies for the general fund, or any additional or special tax levy; from making any tax levy in excess of \$1.00 on every \$100 of valuation; from levying any tax to pay for a municipal street railway, and from incurring any indebtedness for the purpose. The court is also asked to declare the appropriation of \$720,000 for the acquirement of the Geary street railway to be null and void.

Seattle Engineers Visit Spokane.—Nine members of the Seattle (Wash.) branch of the American Institute of Electrical Engineers visited Spokane on June 15 and 16, to inspect the power stations of the Washington Water Power Company and especially the Spokane & Inland Empire Railroad, which uses the single-phase system. On June 16 the party took a trip to Waverly over the Spokane & Inland line to visit the substation at that point. At a meeting on the evening of June 15 J. B. Ingersoll, general manager of the Spokane & Inland Empire Railroad, was to have read a paper on "Single-Phase Electric Railways," but was unable to be present. Mr. H. R. Stevens, consulting engineer for the A. S. Downey Company, said: "This territory has taken the lead in the matter of electric lines and transmission, being far ahead of the coast cities in the extensiveness of its electric lines and equipment. The single-phase system of operating electric lines, as used by the Inland Empire lines, has, we think, been shown to be a complete success." The party included: C. E. Magnusson, professor of electrical engineering in the University of Washington; W. S. Wheeler, franchise inspector for the city of Seattle and secretary of the Seattle branch of the American Institute of Electrical Engineers; G. W. Pielver, general manager for the Allis-Chalmers Company at Seattle; A. C. Babson, general manager for the General Electric Company at Seattle; C. Reuschell, salesman for the Allis-Chalmers Company; A. L. Snyder and C. A. Sears, of the Seattle Electric Company; Fred G. Simpson, of the Kilvern-Clarke Company; and H. R. Stevens, consulting engineer for the A. S. Downey Company of Seattle. The trip to Spokane was made at the close of the annual convention of the electrical engineers of the state, recently held at Seattle. Professor Magnusson was chosen delegate to the national convention of the institute, to be held this week at Niagara Falls.

Interstate Railways Company Plans to Carry Freight.—Unless present plans fail, the Interstate Railways Company of Philadelphia expects to begin hauling freight between Wilmington, Chester and Philadelphia in the fall. Much money is being expended upon track repairs, new sections of roadbed are being put in and in various ways the company is preparing for the extension of its business in the delivery of milk, fruit and general merchandise. One of the first items of traffic to be developed will be the milk trade. The southwestern division of the Chester Traction Company's system enters Philadelphia at Third and Jackson streets, and traffic arrangements will be made with all the lines of the Philadelphia Rapid Transit Company between Second and Thirtieth streets, which will make it possible to deliver milk to any point in the city at an early hour and before the passenger traffic of the day begins. It is the intention of the company, according to A. G. Jack, superintendent, to enter into active competition in another season for the fruit grown on the northern section of the Delaware peninsula. The Wilmington division of the company's system begins at the Christiana river, but a branch line extends to Delaware City, and it is the intention to make traffic arrangements with the Delaware lines, which would enable the company to land fruit in the wholesale district of Philadelphia in a run of not more than three hours. Only a package business, it is expected, will be done on the Chester and Darby division, the southwestern line to be used for all the through freight. It is not expected that a general freight business between Philadelphia and Chester will be developed, as the Chester boats give a rate that makes competition unprofitable for trolley cars, but the company expects to find a growing business in freight carrying between the suburban towns and between Philadelphia and the suburban sections through which the trolley lines pass.

Construction News

FRANCHISES.

Amityville, N. Y.—A 50-year franchise has been granted to the Huntington & Babylon Railroad to operate an electric line in this city.

Bisbee, Ariz.—The Warren Street Railway Company of this city has been granted a franchise to build and operate an electric line between Upper Tombstone canyon and Warren, Ariz. L. W. Powell, president, Bisbee, Ariz.

Bristol, Va.—A 30-year franchise has been granted to the Bristol Street Railway to build and operate an electric line in this city. Work is to begin at once.

Brooklyn, N. Y.—The Brooklyn Rapid Transit Company has filed with the borough authorities plans for a complete loop system at the Brooklyn Borough Hall, in anticipation of the early completion of the East river tunnel and the operation of trains direct from the Bronx to the Borough Hall station in Brooklyn. In this way it is proposed to relieve the congestion which undoubtedly would result by the landing of 30,000 extra passengers, which it is estimated will be handled during the morning and evening rush hours after the completion of the tunnel. It is stated that the borough authorities will insist on several modifications of the plans before filing their approval.

Buffalo, N. Y.—The Buffalo Genesee & Rochester Railway, recently incorporated with a capital of \$7,500,000, has been granted a certificate of necessity to construct a double-track electric line from Depew to Rochester, about 60 miles. As now planned the road will connect with the Buffalo & Depew Railway, where the Genesee street line of the International Railway enters Cheektowaga. The granting of this franchise is the culmination of a contest begun three years ago, caused by the refusal of the state railroad commission on two different occasions to allow the Buffalo & Rochester Railway the right to build its interurban line, on the ground that additional transportation facilities were not needed in the district. Much of the work of grading and extension, which already had been done, was stopped by the action of the commission; therefore the Buffalo Genesee & Rochester Railway was incorporated, as noted in our issue of June 1, with a slight change in the route as originally laid out by the Buffalo & Rochester. This overcame some of the objections formerly made by the commission and it now is believed that further proceedings against the building of the road will be discontinued. J. T. Mooney, general superintendent of the Buffalo & Depew Railway, will build the new line.

Chehalis, Wash.—The Centralia-Chehalis Electric Railway & Power Company again has applied for a franchise to build its line in Chehalis and from that city to Centralia. E. J. Weeks, Tacoma, Wash., representing the company, is quoted as saying that steel sufficient to lay one mile of track is on hand and that enough for six additional miles has been promised in the near future. If the franchise is granted actual construction work will be started within 60 days.

Davenport, Ia.—The city council at its meeting on June 19 passed an ordinance granting a franchise for an entrance into the city to the Eastern Iowa Traction Company, which proposes to build from Davenport to Maquoketa and Dubuque, Ia. Franchises over practically the same routes were also granted to C. G. Hipwell and to a company which proposes to build from Davenport to Manchester, Ia. Amendments were added to each ordinance providing that the company which first builds 20 miles of track outside of the city shall have the right to build the city tracks and the other two may make trackage agreements with the first.

Dunkirk, N. Y.—A franchise has been secured by the Buffalo & Lake Erie Traction Company to build its line into this city from Buffalo. This includes right of way from the eastern boundary line of Chautauqua county at Irving into and through the city of Dunkirk to its western city limits.

Evanston, Ill.—A franchise granted to the Chicago Consolidated Traction Company recently by the Evanston city council, giving the company the right to extend its tracks two blocks from Central street and Florence avenue to the city limits, to connect with a line to the Glen View golf links, was returned on June 24 by Mayor Joseph E. Paden with his veto, because it was passed by the council without advertising it for 10 days before passage.

Gainesville, Tex.—The city council has renewed the franchise granted some time ago for the building of the Gainesville Whitesboro & Sherman Interurban Railway. The renewal is for one year from July 1, 1907, at which time it is promised that the line will be in operation. A bonus of \$250,000 has been subscribed by local interests and will be paid over at the proper time.

Greenville, S. C.—Franchises to operate electric lines in this city have been granted to the following companies: South Carolina Public Service Corporation, Greenville-Anderson Interurban Railway and a proposed line from Greenville to Williamston.

Hot Springs, Ark.—H. McCafferty of this city has applied for a franchise to construct an electric line in Hot Springs, from the end of Spring street to a point two miles east of the city, where a hotel is located, and where it is proposed to build an artificial lake. It is announced that surveyors also are at work on a six-mile scenic railway, which it is planned to have in operation by October 1 next.

New Westminster, B. C.—The Burrard Westminster & Boundary Railway & Navigation Company, which proposes to build an electric railway from New Westminster to Seattle, has applied for a franchise.

Richmond, Ind.—The city council of Richmond at a recent meeting voted against the granting of a franchise to the Dayton & Western Traction Company, which is now without right to enter the city, unless it provides for universal transfers between its line and the city lines, and from the city lines to the interurban lines within the city limits. The same decision was reached with regard to the Terre Haute Indianapolis & Eastern Traction Company, which wishes to enter the city with its freight cars. The council also demanded the stoppage of cars at crossings upon the proper signal being displayed within the city limits.

Seattle, Wash.—The Seattle Electric Company has been granted a franchise for the extension of its line in East and North Fortyninth street, connecting the Green Lake and University lines.

Southport, N. Y.—The Elmira Corning & Waverly Railroad Company has secured a franchise to operate an electric line in this city.

Toledo, O.—The county commissioners have granted a 25-year franchise to the Toledo Railways & Light Company for the operation of its line on Phillips avenue, from Detroit avenue to the end of Phillips avenue. This will replace the franchise for the present single-track line, which has been operated for 16 years.

Toledo, O.—The Lima & Toledo Traction Company has been granted a franchise by the county commissioners to cross eight county roads on its route through Lucas county to Toledo. It is stated that a change in the location of a bridge over the canal where Glendale avenue crosses the railroad will probably be made, for which the company will pay the county \$400.

Vancouver, Wash.—The Washington Railway & Power Company of Portland, Ore., has been granted an additional franchise, through its attorney, Arthur Langguth, for several streets in Vancouver. The company is now pushing construction work as rapidly as possible and has purchased nearly all the material for construction.

Virginia, Minn.—The Mesaba Traction Company has secured a franchise to operate its line in this city, with 18 months in which to have the first mile of track completed and in operation. F. B. Myers, Biwabik, Minn., president.

Waycross, Ga.—Acceptance of the franchise recently granted by the city council to Burdette Loomis, Hartford, Conn.; George W. Deen of Waycross, and F. H. Ellmore, Jacksonville, Fla., has been filed, and it is expected that work on the surveys for the road will be started soon. The franchise also included the right to operate a gas plant.

RECENT INCORPORATIONS.

Chicago & Wisconsin Traction Company, Chicago, Ill.—Incorporated in Illinois to build an electric railway in a northerly and northwesterly direction from Chicago. Capital stock, \$10,000. Incorporators: H. R. Yaryan, Lewis E. Starr, Walter F. Wantke, Philip R. Lynch and George W. Miller, all of Chicago.

Danbury & New Milford Street Railway.—The bill for the incorporation of this 16-mile electric railroad has been passed by the Connecticut senate. The cost of construction is estimated at about \$30,000 per mile. Capital stock, \$200,000, which may be raised to \$900,000.

Douglas & Coos Electric Railroad, Marshfield, Ore.—Incorporated in Oregon to build an electric railroad from Roseburg to Marshfield. Capital stock, \$500,000. The following temporary officers have been elected: L. J. Simpson, North Bend, Ore., president; A. E. Marsters, Myrtle Point, first vice-president; L. H. Hazard, Coquille, second vice-president; Henry Sengstaken, secretary; J. H. Flanagan, Marshfield, treasurer.

Evansville (Ind.) Railways Company.—Incorporated in Indiana to take over the Evansville & Eastern Electric Railway and the Evansville & Mt. Vernon Electric Railway. Capital stock, \$1,000,000. Officers: W. L. Sonntag, president; C. H. Batlin, vice-president and general manager; M. S. Sonntag, treasurer; F. W. Reitz, secretary; and W. H. McCurdy, chairman of the board of directors; all of Evansville, Ind. It is stated that the Mt. Vernon line will be rock ballasted and the Rockport line extended to Grandview, Ind.

Norwich Colchester & Hartford Traction Company, Colchester, Conn.—The railroads committee of the Connecticut senate has reported favorably on the bill authorizing this company to operate its lines in Norwich, Bozrah, Lebanon, Colchester, Marlborough, Glastonbury and East Hartford and do a lighting and power business in Colchester. Capital stock may be from \$100,000 to \$1,000,000. The company may issue bonds and mortgage its franchise.

Phoenix & Western Development Company, Phoenix, Ariz.—Incorporated in Arizona to build and operate an electric line in Phoenix and an interurban railway from this city to outlying points. Application for franchises already has been made. Capital stock, \$1,000,000. Incorporators: S. S. Scull, S. S. Green, Lloyd B. Christy, Lysander Cassidy, Phoenix, Ariz., George W. Mische, Rochester, N. Y.

Southern Wisconsin Railway, Milwaukee, Wis.—Incorporated in Wisconsin to build and operate passenger and freight electric lines and to build or acquire electric light and power plants. Capital

stock, \$100,000. Incorporators: Charles F. Smith, William F. Adams and Albert R. Denu.

TRACK AND ROADWAY.

Abilene, Tex.—Work has commenced on the street railway line for this city and will be pushed rapidly to completion. The first work was begun at Park Heights, in southwest Abilene. The first shipment of ties is expected soon and the road will be put in operation about October 1. Three cars will at first be used and this number will be increased as the business demands it.

Alabama City Gadsden & Attalla Railway, Gadsden, Ala.—It is reported that this company will shortly begin the construction of its Alabama City loop, which will run south of the plant of the Southern Steel Company. The present Walnut street line will be used to get into the city.

Albia (Ia.) Interurban Railway.—It is reported that the right of way for the line from Albia to Hocking, Ia., has been acquired and contracts have been let for the construction of the line. The Engineering Construction & Securities Company of Chicago has the general contract, agreeing to have the work completed by November 1, and a subcontract for grading has been let to W. W. Cummings of Ottumwa, Ia. As soon as work on this line is under way surveys will be started for an extension north to Hiteman and Buxton. Calvin Manning of Albia is interested.

Alton Jacksonville & Peoria Railway, Jerseyville, Ill.—This company has begun the work of stringing the trolley wire on its line between Alton and Godfrey and it is stated that service between the two points will be inaugurated within the next few weeks. For the present power will be furnished by the Alton Granite & St. Louis Traction Company.

American Electric Railroad, Des Moines, Ia.—This company, which proposes to build an electric railway from Muscatine to Council Bluffs, Ia., is stated to have been quietly at work for several months and to have completed three surveys and secured half the right of way for the first section of the line, from Des Moines to Greenfield. It is also stated that construction will begin out of Des Moines in 60 or 90 days and that practically all of the construction material and equipment has been contracted for. The company was incorporated last October with \$20,000 capital stock and is said to represent a large Chicago bonding company. The incorporators were J. D. Pollard, C. F. Casselman and C. W. Baker, president, with offices in the Clapp building, Des Moines. The route from Muscatine to Council Bluffs as projected includes Muscatine, Sigourney, Oskaloosa, Knoxville, Des Moines, Indianola, Winterset, Greenfield, Fonatella, Griswold and Carson, Indianola is to be reached by a branch from Spring Hill, south of Des Moines.

Berkshire Street Railway, Pittsfield, Mass.—It is reported that this company will soon let contracts for an extension from Great Barrington to Canaan, Mass.

Birmingham (Ala.) Railway Light & Power Company.—The new street railway line to Mountain Terrace, the new residence district in the Highlands, southeast of Birmingham, was opened for traffic on Saturday, June 22.

Boise, Idaho.—It is announced that W. S. Kuhn of Pittsburgh, Pa., is financing an electric railroad, to be built from Twin Falls to Ely, Nev., and Boise, Idaho. Some of the preliminary work has been started and part of the material is on the way. Power to operate the line will be secured from Shoshone Falls.

Boston & Eastern Electric Railroad, Boston, Mass.—Another hearing before the Massachusetts railroad commission was held on June 19 in regard to the company's plans for the line from Boston to Lynn, Mass., and John H. Bickford, chief engineer, said it was planned to cross the Mystic river on a pile bridge with steel draw. Other bridges necessary were similarly planned. No traffic arrangements have been made with the Boston Elevated Company, but the plan was to approach the Sullivan square terminal by an elevated structure, to which the cars would rise by a 1 per cent grade from the company's Mystic river bridge, the new elevated being in or over Alford street, with station platforms parallel to that street and adjoining the present "L" terminal.

Boone Webster City & Ft. Dodge Interurban Railway, Boone, Ia.—At a recent meeting of the directors the following officers were elected: E. E. Hughes, Boone, president; F. A. Sackett, Webster City, first vice-president; John L. Goepfinger, Boone, second vice-president; J. H. Herman, Boone, treasurer; J. S. Crooks, Boone, secretary. The company discussed plans for financing the road from Boone to Webster City. The probability is that the line will be started this summer. Eastern capitalists are said to be interested.

Butler Saxonburg & Tarentum Street Railway, Butler, Pa.—It is announced that this company will apply on July 21 for a Pennsylvania charter to build an electric railway, 26 miles long, to connect the towns named in the title. It is stated that financial arrangements have been made and that the company will be in shape to begin construction as soon as the charter is obtained. Much of the right of way has been obtained. Those interested include William McDowell, E. C. and O. W. Rudert and James Cirigliano of Saxonburg.

Canton Youngstown & Akron Railway.—Active work will be begun on this new line within the next 30 days, according to the latest statement of John E. Monnot, promoter, who was in Youngstown last week, in the interests of the new trolley project. "I cannot say at what place the work will first be started," explained Mr. Monnot. "That will be determined upon later, probably this week. Everything is looking good for an early building of the line." The Collins Construction Company, Chicago, has secured the contract

for the work, which will be rushed along as rapidly as possible. The new road will require the building of 65 miles of track and roadbed, involving an expense of about \$2,000,000. The money to build the road is already available. There will be a direct line from Canton to Youngstown, a direct line from Youngstown to Akron, and a direct line from Akron to Canton.

Central Pennsylvania Traction Company, Harrisburg, Pa.—It is reported that this company has made arrangements to extend its line from Harrisburg to Dauphin, Pa., nine miles.

Chicago Lake Shore & South Bend Railway, South Bend, Ind.—J. B. Hanna, president, reports rapid progress on the line from South Bend, Ind., to Kensington, Ill. About 20 miles of track has been laid out of South Bend and work on the grading and on the power house at Michigan City is progressing satisfactorily. Mr. Hanna sets February 1 as the date of beginning operation.

Chicago & Milwaukee Electric Railroad, Greenwood, Ill.—The Columbia Construction Company of Milwaukee, Wis., has received a contract for laying this company's double track in the south side of Milwaukee and will begin work this week on Grove street. The company has until August 27 to lay two miles of track.

Cincinnati Dayton & Ft. Wayne Traction Company, Dayton, O.—The directors have decided to increase the capital stock from \$1,000,000 to \$3,000,000 and it is stated that construction will begin at once. Dr. George of Dayton is president.

Columbus (Ga.) Railroad.—This company proposes to build an extension of its street railway system on Twelfth avenue, from Eighteenth to Twenty-ninth streets, and has requested the city authorities to provide the necessary grades, etc.

Denver & Greeley Railroad, Denver, Colo.—J. D. Houseman writes that this company, recently incorporated to build a system of electric lines between Denver and Greeley, Colo., is now securing right of way and terminals. Surveys are not completed.

Denver & Interurban Railroad.—Construction is now in progress on the city lines in Ft. Collins, Colo. Grading was started last week on the Mountain avenue line. It is the intention to complete this line to Prospect Park and have the cars in operation in time for the stock show the last week in August.

Erie Cambridge Union & Corry Railway, Erie, Pa.—A meeting of the stockholders has been called for July 8 to consider an increase in the bonded indebtedness in order to complete the construction of the road, which was promoted by the late Senator Gibson. Considerable grading has been done, but the progress of the work was delayed by Mr. Gibson's death.

Franklin & Towamensing Electric Railway, Allentown, Pa.—Surveys for the route of this company's proposed nine-mile electric line between Slatington and Leighton, Pa., have been completed by Charles W. Grossart, Allentown, Pa.

Gainesville Whitesboro & Sherman Railway, Gainesville, Tex.—It is reported that financial arrangements have been made for completing this road from Gainesville to Sherman, Tex., on which nine miles of grading was done last year, provided the franchises can be renewed. John King of Gainesville, vice-president and general manager.

Galt Preston & Hespeler Street Railway, Galt, Ont.—This company is double-tracking its line between Galt and Preston, Ont.

Hanover & York Street Railway, York, Pa.—Rapid progress is being made on this extension of the York County Traction Company from York to Hanover, Pa., 20 miles. Grading is in progress at five places and many of the culverts and bridge abutments have been completed. One of the largest structures on the line will be the highway crossing at Eyster's Mill. Dodge & Day of Philadelphia are the contractors. Rails and ties have been delivered at several points.

Hornell Bath & Lake Keuka Railway.—This company has been authorized by the New York railroad commission to build its proposed road from Hornell to Bath, Hammondsport and Branchport, N. Y., 50 miles. The company has a capital stock of \$1,000,000. F. W. Hastings of Bath is interested.

Illinois Traction Company, Champaign, Ill.—A public hearing on the plans for the bridge across the Mississippi from Venice, Ill., to St. Louis, Mo., was held last week by Col. Clinton B. Sears of the United States army engineering corps. Representatives of different civic associations and of steam railroads whose tracks are to be crossed were present and no objection to the plans was offered. They will now be submitted to Secretary of War Taft for approval. The plans were prepared by Ralph Modjeski of Chicago.—Twenty carloads of steel rails have been delivered for use on the Lincoln-Mackinaw line. Graders are now at work just east of the Lincoln College grounds. The line is 27.9 miles long and enough grading has been completed so that it is predicted that tracklaying will begin in August. It is stated that grading is also to begin on the Springfield-Jacksonville line this year, between Jacksonville and New Berlin, where the line has been located.

Indiana County Railway.—This company, which is controlled by the Jefferson Traction Company of Punxsutawney, Pa., has laid about six miles of track, from Indiana to Ernest and Creekside, Pa. Fifteen miles, from Indiana to Clymer, has been graded and a line from Indiana to Blairsville, 16 miles, is to be graded this summer.

Indianapolis Crawfordsville & Western Traction Company, Crawfordsville, Ind.—E. P. Baker, vice-president, has announced that the tracklaying on this line from Indianapolis to Crawfordsville, Ind., 44 miles, has been completed and all of the ballasting except about eight miles. The power houses and substations are practically completed and cars are to be operating by July 4.

Indianapolis Huntington Columbia City & Northwestern Railway, Syracuse, Ind.—It is reported that Benjamin Raupfer and Thomas R. Marshall, with other stockholders, propose to reorganize this company, which is now in receiver's hands, and complete the road. It is stated that the indebtedness of the company is but \$18,000 and over \$100,000 has been expended on the road. It was proposed to build from Huntington to Goshen, 66 miles. About five miles of track has been laid and about 10 miles additional has been graded. Surveys had been completed. It was the intention to extend the line ultimately to Indianapolis. The receiver's sale will be held in August. Thomas A. Bell of St. Louis is president.

Indianapolis Newcastle & Toledo Electric Railway, Newcastle, Ind.—It is now announced that this line will be in operation from Indianapolis to Newcastle, Ind., by September 15. The company expects to have the line completed east to Muncie by the first of the year.

Kenosha (Wis.) Electric Railway.—This company has begun the extension of its lines within the city and during the next three months about three miles of new track will be laid.

Kentucky & Ohio River Interurban Railroad, Paducah, Ky.—The directors met in Paducah last week to consider plans for building the proposed line from Paducah, Ky., to Cairo, Ill. It is stated that the right of way has been secured and that construction contracts will be let in a few weeks.

Lafayette & Chicago Electric Railway, Lafayette, Ind.—It is announced that work on this proposed electric line will be started within two months. G. W. Infield, president, has announced that a Chicago bonding company is ready to furnish 75 per cent of the capital required.

Lehigh Valley Transit Company, Allentown, Pa.—The directors have decided to proceed with the building of the proposed bridge to connect Allentown and South Allentown, Pa., which will be 1,820 feet long and will cost \$350,000.

Little Rock & Hot Springs Electric Railway, Little Rock, Ark.—A mass meeting was held at Little Rock, Ark., last week in the interests of the proposed electric line to Hot Springs, and \$20,000 was subscribed. Committees were appointed to secure additional subscriptions. L. Garrett is vice-president and general manager.

Louisville New Albany & Southern Traction Company, New Albany, Ind.—It is announced that this company, which proposes to build an electric railway from New Albany to French Lick, Ind., will soon ask for bids for the construction of its line.

Macon Americus & Albany Electric Railway, Macon, Ga.—It is reported that the Interurban Construction Company is preparing to let contracts about July 1 for the construction of this proposed line from Macon to Americus and Albany and from Macon to Griffin and Atlanta, Ga. Several bids have been received. N. J. Cruger of Albany, Ga., president.

Madison & Fond du Lac Electric Railroad, Madison, Wis.—This company, incorporated last October to build an electric third-rail line from Madison to Fond du Lac, Wis., is making preparations to begin construction at an early date. The route includes Windsor, Columbus, Beaver Dam and Waupun, with a branch from Beaver Dam to Fox Lake and Watertown. A power house at Beaver Dam has been purchased. The company also proposes to furnish power for lighting, and several franchises have been secured for both lighting and railway privileges. Seventy-pound rails will be used. David Howard of Madison, president; F. A. Umsted, chairman of the board of directors.

Metaline, Wash.—S. H. Anschell of Metaline is reported to be interested in a project to build a railway from Colville to Metaline, 40 miles.

Milwaukee Northern Railway, Port Washington, Wis.—The Wisconsin supreme court has decided in favor of this company in suits brought by the Milwaukee Light Heat & Traction Company to determine the title to a right of way claimed by both companies, from North Milwaukee to the northern line of Milwaukee county and beyond. The traction company claimed that it had adopted the route in question. The Milwaukee Northern is now building over the right of way on its line from Milwaukee to Port Washington.

Mt. Desert Transit Company, Bar Harbor, Me.—It is stated that construction contracts probably will be let this fall for building the proposed line from Ellsworth to Bar Harbor and Southwest Harbor, Me., about 40 miles. Surveys are now in progress. John S. Kennedy of New York, N. Y., is president, and W. E. Baker & Co. of New York are the engineers.

Nashville (Tenn.) Railway & Light Company.—A force of 100 men is at work on the grading for the extension of this company's line on the Lebanon turnpike beyond Mt. Olivet, its present terminus. The work of laying the rails will be started in the near future.

Naugatuck Valley Electric Railway.—It is announced that this road, which has been under construction from Naugatuck south to Seymour, Conn., by way of Beacon Falls, will be in operation some time in July. The line is controlled by the Connecticut Railway & Lighting Company and when completed will afford through service from Waterbury to Ansonia, Derby and Bridgeport.

New York & Queens County Railway, Long Island City, N. Y.—This company has made application to the board of estimate and apportionment for permission to build a line in Franconia avenue, from Twenty-second to Thirty-first street, on Thirty-first to Broadway and on Broadway to Bell avenue, affording direct connection with the Belmont tunnels, now under construction.

Northern Electric Railway, Chico, Cal.—Construction has been started on the line from Chico to Hamilton City, Cal.

Northern Traction Company, Hibbing, Minn.—Grading is now in progress between Chisholm and Hibbing, Minn., for the line which is to connect Hibbing with Blwahik and a number of other towns on the Mesaba range. R. F. Berdie, president.

Oklahoma City El Reno & Southwestern Interurban Railway.—G. N. Martin of Chicago, promoter of this company, which proposes to build an electric railway from El Reno to Shawnee, via Oklahoma City, 90 miles, was in Shawnee last week making arrangements for terminal facilities. The line from Oklahoma City to Shawnee is to be built first, according to Mr. Martin, and surveys are now being made.

Olean (N. Y.) Street Railway.—This company has let to the Groton Bridge Company, Groton, N. Y., a contract for bridge work amounting to \$40,000.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—The new Twenty-fourth street line to South Omaha was formally opened for traffic on Saturday, June 22. Shortage of labor is seriously interfering with the construction work in Omaha. Work on the Fortieth street line has been stopped and all of the men available are now working on the extension of the Ames avenue line, from Thirty-sixth street to Fortieth and Grand avenue. As soon as this work is completed the men will be put to work on Fortieth street, north of Dodge, to complete the eight blocks of line to Cumming street.

Pacific Electric Railway, Los Angeles, Cal.—Workmen are now putting in a tower and interlocking switch at the intersection of the Short Line and the Southern Pacific tracks at Oneonta, Cal., and it is announced that interlocking plants will be installed at all crossings in the suburbs.

Pasco, Idaho.—Gustave Harris of Walla Walla, Wash., has applied for a franchise to build a street railway system in Pasco.

Port Arthur (Ont.) Electric Street Railway.—The city council has decided to double-track the municipal electric street railway system at a cost of approximately \$55,000. Following are some of the materials required: Six hundred and twenty tons of 56-pound rails, 18 tons of spikes, four tons of bolts, 18,450 ties, 14,868 pounds of No. 00 trolley wire, 280 trolley hangers, 300 double pull-overs, 1,500 pounds of seven-strand No. 12 wire. J. McTeigue is clerk.

Richmond & Chesapeake Bay Railway, Richmond, Va.—The tracklaying on this line from Richmond to Ashland, Va., 15 miles, has been completed and a party of officials made an inspection trip over the line on a construction train last week. Ballasting is now nearly completed and a large number of men are engaged in erecting poles and stringing wire.

Rochester Scottsville & Caledonia Electric Railroad.—It is stated that this company has applied for a certificate of necessity to extend its line from its present terminus to Le Roy, Stafford and Batavia, 16 miles. Isaac W. Salyerds, president; Morton E. Lewis, secretary.

Rockford (Ill.) & Interurban Railway.—This company is now double-tracking the Seventh street line, from Charles street to Second avenue, and will soon begin the construction of a loop on Seventh avenue, from Railroad avenue to Eighteenth street, thence to Kishwaukee street, south to Harrison avenue and east to Eleventh street.

San Diego (Cal.) Electric Railway.—The trolley wire has been strung and work on the laying of the ties and rails of this company's Adams street line was started on June 17. The line extends eastward from the pavilion on University Heights, through University Heights and Normal Heights, to the eastern boundary of the latter subdivision. W. Clayton, vice-president and manager, San Diego, Cal.

Spokane-Pend d'Oreille Rapid Transit Company, Limited, Spokane, Wash.—J. Grier Long, treasurer, has announced that construction is to begin at once on the line from Spokane to Lake Pend d'Oreille, Idaho, 42 miles, the litigation which has delayed the work having been settled. J. J. Browne, one of the promoters, has purchased for \$35,000 a terminal site on Squaw Bay.

Springfield Clear Lake & Rochester Interurban Railway, Springfield, Ill.—Arrangements are being made for financing the construction of the line from Springfield to Hillsboro, Ill. A franchise in the latter town has been secured and it is stated that construction will begin at once. J. E. Melick, president.

Susquehanna Railway & Light Company, Lancaster, Pa.—This company made an agreement with W. J. Hayes & Co. of Philadelphia to purchase the Philadelphia Coatesville & Lancaster line, the line between Coatesville and Parkersburg and the partially constructed line between Parkersburg and Christiana, Pa. The executive committee has directed the officers to improve the line between Parkersburg and Coatesville, and to rebuild and complete the line between Parkersburg and Christiana. The line between Christiana and Coatesville is to be operated by the Conestoga Traction Company, in connection with the Lancaster & Eastern Railway.

Tacoma (Wash.) Railway & Power Company.—Men are now engaged in building a large loop at the terminus of the new American Lake line. The 18-acre tract inside of the loop at the lake is to be used as an amusement park.

Tampa (Fla.) Electric Company.—This company is reported to be taking steps to extend its line to Gary, Fla.

Temple, Tex.—It is stated that surveying for the line from Temple to Marlin and Waco, Tex., is to start on July 1. J. B. Coffinberry is one of the promoters.

Tennessee & Georgia Interurban Railway, Chattanooga, Tenn.—Surveys and estimates for this proposed 9 $\frac{1}{2}$ -mile road from Chattanooga through Rossville Gap to Ft. Oglethorpe and Chickamauga park are now completed, part of the right of way secured and financial arrangements for its construction practically assured. S. W. Divine, Dodge, Ga., is promoting the project.

Texas Traction Company, Dallas, Tex.—It is stated that very satisfactory progress is being made on the line from Sherman to Dallas, Tex. Material is being received in large quantities and the second shipment of 2,000 tons of 80-pound rails is expected by July 1 from the Carnegie Steel Company. Machinery for the power house at McKinney is now being installed, and the power will be ready to be turned on some time before the track is ready for cars. As originally announced, President Strickland believes the road will be ready to bring Christmas shoppers to Dallas. F. A. Jones, chief engineer.

Thomaston, Conn.—Work on the roadbed of the new electric line, which is to be built from Waterbury to Thomaston, Conn., is progressing so satisfactorily that it will soon be ready for laying the 15 carloads of rails which have recently arrived.

Torreon, Mex.—It is reported that Dr. J. W. Lim and others of Torreon have secured from the government the right to build and operate an electric railway from Torreon to Matamoros, Coahuila, Mex., about 10 kilometers. Machinery has been ordered from the United States and work is to begin at an early date.

United Railways & Electric Company, Baltimore, Md.—Announcement has been made that this company will make the following extensions to its present system: Orangeville to Highlandtown, by way of Eighth street; Lakeside to Cockeysville, on its own right of way; Towson to Timonium, and an extension of the Wilkins avenue line to Halethorpe and Elkridge. It also has been decided to extend the St. Paul street line to Boland Park.

Utica & Mohawk Valley Railway, Utica, N. Y.—This company has filed notice in the county clerk's office of the following proposed extensions: A second track, beginning on Whitesboro street at the westerly line of the city of Utica, and extending westerly along Whitesboro street about 1,546 feet. A single-track line extending from Deerfield Corners westerly along, in and upon the Marey road to the so-called Seymour road. A single-track line from Deerfield Corners along, in and upon the Trenton road or North Genesee street to the reservoir. A second track extending from Deerfield Corners on North Genesee street southerly in, along and upon North Genesee street to the old channel of the Mohawk river.

Warren Street Railway, Bisbee, Ariz.—It is announced that the construction work on this company's line between Upper Tombstone canyon and Warren is to be pushed as rapidly as possible. The rails have been ordered and are expected within a month. The cars, which will be built by the McGuire-Cummings Manufacturing Company of Chicago, have been promised by August and it is expected that the line will be in operation by October next. L. W. Powell, Bisbee, is president.

Western New York & Pennsylvania Traction Company, Olean, N. Y.—W. R. Page, president, recently told the board of trade of Bradford, Pa., that this company will construct a trolley line from Eldred to State Line, Pa., which would connect with the Bradford-Olean line, now under construction. Mr. Page also stated that it was the intention of the company to construct a line from Bradford to Carrollton to connect with the Olean and Salamanca lines. It was proposed, he said, to rebuild the entire system in the city of Bradford on paved streets, as well as rebuild and extend the Lewis Run line.

POWER HOUSES AND SUBSTATIONS

Wagner Lake Shore & Armour Railway, Wagner, S. D.—It is announced that this company has made arrangements to acquire the electric light and power plant at Wagner, S. D., and to build a new power house at Armour, S. D. It is expected that about \$25,000 will be spent for new electrical machinery and accessories.

Los Angeles (Cal.) Interurban Railway.—This company has begun work on a substation for transforming high-tension current for use on its lines. The current is generated by the Pacific Light & Power Company at its plant at the mouth of San Gabriel canyon. The new transformer station, which is to be located at Azusa, will be a brick building, located on the company's property on West Ninth street.

Kansas City-Western Railway.—It is announced that at a meeting of the board of directors of this company it was practically decided to purchase current for the operation of the cars from the Metropolitan Street Railway Company, provided that a long-time contract could be made at a lower rate than that for which the Kansas City-Western can generate its own power. It is stated that the Metropolitan Street Railway Company has agreed to erect a converter station at a cost of about \$25,000, provided that the Kansas City-Western will sign a long-time contract.

Ogden (Utah) Rapid Transit Company.—This company is installing a motor-generator set, having a capacity of 350 amperes, to be used in furnishing power for the operation of its cars. It is expected that the motor-generator set will be ready for operation in about ten days. The current will be furnished by the Utah Light & Power Company. It is expected that the installation of this unit will materially improve the service, as it will avoid the frequent shutdowns experienced when the company operated its own power house, which will now be held in reserve for use only in emergency.

Personal Mention

Mr. William J. Ager has resigned as superintendent of construction of the Spokane Traction Company, Spokane, Wash.

Mr. W. P. Brenning has been appointed assistant master mechanic of the Alton Granite & St. Louis Traction Company.

Mr. O. P. Sells has resigned as general superintendent of the Mattoon (Ill.) City Railway, to accept another position at Bloomington, Ill., effective on July 1.

Mr. P. L. Downs and Mr. A. F. Bentley of Temple, Tex., have been elected first and second vice-president, respectively, of the Belton & Temple Traction Company of Temple.

Mr. W. A. Comstock of Alpena, Mich., has been elected president of the Milwaukee Northern Railway of Port Washington, Wis., succeeding Mr. J. M. Saemann, resigned.

Mr. A. S. Swank has resigned as superintendent of the Cincinnati Northern Traction Company of Hamilton, O., to accept a position with the Western New York Construction Company of Buffalo, N. Y.

Mr. Herman E. La Breeque has been appointed assistant superintendent of the Jersey Central Traction Company at Keyport, N. J. He formerly was with the Portland (Ore.) Railway Light & Power Company.

Mr. George Dorn has resigned as assistant superintendent of the Louisville & Southern Indiana Traction Company, New Albany, Ind., to accept a position with the Indianapolis & Louisville Traction Company.

Mr. G. E. Peck has been appointed auditor and cashier of the Mason City & Clear Lake Railway, Mason City, Ia., and the People's Gas & Electric Company. Mr. Peck heretofore has been connected with the Waterloo Cedar Falls & Northern Railway at Waterloo, Ia.

Mr. Frank W. Arnold has resigned as manager of the Oswego (N. Y.) Traction Company to become connected with the Ft. Dodge Des Moines & Southern Railway of Des Moines, Ia. The employees of the Oswego Traction Company tendered Mr. Arnold a farewell banquet. Mr. George Wright has been appointed to succeed him.

Mr. E. H. Richards, formerly superintendent of the Newport division of the Old Colony Street Railway, has resigned to accept a similar position at New Bedford, Mass. For several years he was division superintendent of the Brockton division of the Old Colony company and was, at one time, manager of the Taunton-Attleboro-Providence line.

Mr. L. C. Bradley, whose resignation as superintendent of the Scioto Valley Traction Company, to become associated with J. G. White & Co. of New York City, was noted in a previous issue, has been appointed superintendent of the Eastern Pennsylvania Railway, one of the properties controlled by the White interests. Mr. Bradley's headquarters will be in Pottsville, Pa.

Mr. H. C. Young, general passenger agent of the Lake Shore Electric Railway, has been granted a three months' leave of absence, effective on June 11, during which time all traffic matters will be looked after by Mr. A. C. Henry, auditor of the company. All communications, therefore, pertaining to matters in this department should be addressed to him at Norwalk, O. Mr. John Miller will act as traveling passenger agent, reporting to Mr. Henry.

We are officially advised that Mr. W. W. Street has been appointed superintendent of transportation of the St. Louis & Springfield Railway and the St. Louis & Northeastern Railway at Staunton, Ill., succeeding Mr. Thomas G. Wood, who has been appointed superintendent of the St. Louis Decatur & Champaign Railway, the new line which has just been opened between Decatur and Champaign. These lines are all divisions of the Illinois Traction System.

Mr. J. Jordan, heretofore superintendent of the Cleveland Painesville & Eastern and the Cleveland Painesville & Ashtabula railroads, Willoughby, O., has been appointed general manager of those roads, effective on June 1, as announced in last week's issue of the Electric Railway Review. Mr. Jordan entered railway service in 1885, at the age of 18, with the Grand Trunk Railway, in the locomotive department, remaining there until 1888. He was then for four years employed as conductor by the Saginaw Street Railway, Saginaw, Mich., and held a similar position with the Citizens' Street Railway of Detroit until 1895. When the Detroit Railway began operating in 1895 he was appointed division superintendent and two years later, on August 12, 1897, was made superintendent of the Cleveland Painesville & Eastern Railroad, which last year acquired the Cleveland Painesville & Ashtabula Railroad.

Mr. Samuel B. McLenagan, whose appointment as general manager of the Central California Traction Company was noted in our issue of June 15, was born on a farm in Wisconsin in 1861. In 1881 he obtained a position with the United States revenue cutter service, where he remained as assistant engineer for 11 years. From 1892 until the latter part of 1893, he was connected with the General Electric Company at San Francisco, resigning to become superintendent of the San Francisco-San Mateo Railway. After four years of service with this company he accepted a similar position with the Oakland San Leandro & Haywards Railway, where he remained until 1902, when he was appointed superintendent of the Los Angeles Inter-Urban Railway. This position he held until June of this year, when, as earlier noted, he resigned to become

general manager of the Central California Traction Company, which is now building a third-rail interurban line, to be operated at 1,200 volts direct current from Stockton north to Sacramento, and south to Modesto. His headquarters will be at Stockton.

We are officially advised that Mr. Harro Harrsen, general superintendent of the Mexico Electric Tramways Company, Limited, of Mexico City, Mex., has been appointed acting general manager of the company during the absence of Mr. R. C. Brown, general manager and managing director, who is visiting the United States. A new position has also been created, that of freight superintendent, and Mr. William J. Everett has been appointed to the office. More attention is to be paid to freight handling in the future and the department is to be put on a better working basis. Mr. Everett is an experienced street railway man and was formerly connected with the Mexico city lines when they were under the management of the Distrito Federal Company. He has been connected with the Indianapolis Street Railway, the Toledo Railways & Light Company, the Havana Electric Railway, and more recently with the Auburn & Syracuse Electric Railroad of Syracuse, N. Y.

Mr. Gus Muhlhausen, general manager of the Evansville Suburban & Newburg Railway, celebrated the eighteenth anniversary of his connection with this road on June 19, by inviting a party of about twenty personal friends to take a trolley ride to Newburg and Booneville, Ind. On the return trip in the evening a banquet was served to the guests in a large express car temporarily fitted up as a dining hall, followed by speech making and story telling. Mr. Muhlhausen was the recipient of hearty congratulations on his long and successful connection with the road and all expressed their appreciation of the enjoyable ride and the unique banquet on wheels. Among those present were: F. J. Scholz, W. B. McDonald, L. C. Shippard, C. A. Cunningham, Frank Schwegeman, A. J. Rutledge, C. P. White, Dr. W. A. Wheeler, Henry Cook, Capt. Lee Howell and others.

Obituary.

William Findlay Shunk, well known from his connection with the construction of the New York elevated roads, died at his home near Harrisburg, Pa., on June 22, aged 77 years. He was born near Harrisburg in 1830 and was a graduate of Dickinson College. His first engineering work was on the Pennsylvania Railroad in 1856, and from that time on he was engaged in engineering work on various roads. In 1874 he was appointed engineer in charge of the laying out and building of the elevated lines of New York and at the completion of this work was appointed chief engineer of the Manhattan Elevated Railway, the company formed to take over the elevated lines of the west side. He remained with this company until 1882, when he resigned to engage in various engineering enterprises, the best known of which is his successful work on the Guayaquil & Quito Railroad over the Andes, said to be the highest railroad in the world. Since the completion of this work in 1902 Mr. Shunk had retired from active business. In addition to the recognition attained by his successful engineering work, he was known to technical journalism as the author of a book on railroad curves and "The Field Engineer."

Financial News

Atlantic City & Shore Railroad, Atlantic City, N. J.—The report that control of this company is now owned by the West Jersey & Seashore Railroad is erroneous. In part consideration for a grant of trackage rights, the Atlantic City & Shore company has given the West Jersey company an option to purchase after 1913 a majority of the capital stock of the Atlantic City & Shore company, and to secure this option, 51 per cent of the capital stock of the Shore company has been deposited with a trustee.

Brooklyn Rapid Transit Company.—At the special meeting of stockholders of the Brooklyn Union Elevated Railroad on June 19 the creation of the proposed mortgage for \$20,000,000 was approved. Stockholders of the Nassau Electric Railroad approved on June 11 the proposed mortgage for \$5,000,000. The purpose of the creation of these mortgages was stated in the Electric Railway Review of May 23, 1907, page 696.

Chicago City Railway.—The \$3,000,000 of 5 per cent three-year notes, due in 1908, have been called for redemption on July 1 at 101 and interest.—The \$6,000,000 bonds which were purchased by the Harris Trust and Savings bank and the First Trust and Savings bank are offered for sale at 98 and interest.

Connecticut Railway & Lighting Company.—A block of 1 per cent guaranteed common stock is offered at \$75 a share by F. J. Lisman & Co. The property is leased for 999 years from December, 1906, to the New York New Haven & Hartford Railroad for a rental, which, with cash on deposit with a trustee, is sufficient to pay 4 per cent dividends on the common stock to 1914, and about 4 1/3 per cent thereafter.

Eastern Ohio Traction Company, Cleveland.—At the receivers' sale on June 25 the Chagrin Falls & Garrettsville line was bought by H. P. McIntosh at \$152,000, the upset price. There was no bidder for the property as a whole, or for the Cleveland & Chagrin Falls line, or the Cleveland & Eastern line, which extends to Chardon and Middlefield. The Cleveland & Chagrin Falls is subject to a first mortgage of \$200,000, and the Cleveland & Eastern

to a first mortgage of \$1,000,000. On the former the upset price had been fixed at \$106,000 and on the latter at \$50,000. The Chagrin Falls & Garrettsville division now passes from the control of the receiver. The other two portions of the line will remain under his supervision until a successful effort is made to dispose of them.

Evansville (Ind.) Railways Company.—This company has been incorporated with \$1,000,000 capital stock, to acquire the properties of the Evansville & Eastern Electric Railway and the Evansville & Mt. Vernon Electric Railway. The incorporators are: W. H. McCurdy, W. M. Ford, Fred W. Reitz, C. H. Battin, Edwin Walker, M. S. and W. L. Sonntag. The officers are: W. L. Sonntag, president; C. H. Battin, vice-president and general manager; M. S. Sonntag, treasurer; F. W. Reitz, secretary. William H. McCurdy is chairman of the board of directors, which is composed of the incorporators.

Hot Springs (Ark.) Street Railroad.—This company has changed its name to the Hot Springs Street Railway Company and the number of directors has been reduced to four, as follows: Samuel W. Fordyce, Charles H. McKee, William C. Fordyce and H. E. Martin.

Kansas City Railway & Light Company.—The preliminary income account for the fiscal year ended May 31, 1907, compares as follows:

Year ended May 31—	1907.	1906.	1905.
Gross earnings	\$5,715,339	\$5,153,168	\$4,449,174
Operating expenses	2,909,136	2,596,539	2,235,260
Net earnings	\$2,806,203	\$2,556,629	\$2,213,871
Other income	9,440	9,671	16,588
Total income	\$2,815,643	\$2,566,300	\$2,230,462
Interest charges, etc.	1,765,870	1,644,524	1,501,862
Surplus for dividends	\$1,049,773	\$ 921,776	\$ 728,600
Preferred dividends	476,105	476,105	476,105
Surplus	\$ 573,668	\$ 445,671	\$ 252,495

At the annual meeting of stockholders in Jersey City on June 24 H. O. Coughlin was elected a director to succeed S. R. Knott.

Northern Ohio Traction & Light Company, Akron, O.—Application has been made to the New York stock exchange to list \$7,938,000 capital stock.

Pawcatuck Valley Street Railway, Westerly, R. I.—Boston papers state that a reorganization has been effected by a committee of bondholders, which is composed of E. P. Shaw, Jr., of the Boston & Worcester Street Railway and others. The company defaulted in its bond interest on November 1, 1906. A majority of the bonds and stock was held by W. L. Mauran and by an arrangement with the committee the outstanding \$100,000 first mortgage and \$40,000 second mortgage bonds were canceled, and a new mortgage of \$50,000 has been placed upon the property and \$14,000 contributed by the bondholders.

Poughkeepsie City & Wappinger Falls Electric Railway, Poughkeepsie, N. Y.—The New York railroad commission has approved the issue by this company of \$250,000 bonds for the purchase of cars and other equipment.

Spokane & Inland Empire Railroad, Spokane, Wash.—At the annual meeting of stockholders on June 15 the directors were re-elected. The directors re-elected the officers, as follows: F. A. Blackwell, chairman of the board; Jay P. Graves, president; F. Lewis Clark, first vice-president; A. L. White, second vice-president; W. G. Davidson, secretary; H. B. Ferris, treasurer. The foregoing, together with Aaron Kuhn, W. G. Graves and Waldo G. Paine, constitute the board of directors.

Tri-City Railway & Light Company, Davenport, Ia.—The capital stock will be increased from \$1,500,000 to \$2,500,000, in order to provide for the acquisition of the Davenport & Suburban Railway.

United Railways Company, St. Louis.—An issue of \$1,200,000 of two-year 5 1/2 per cent notes will be made. The proceeds will be devoted toward the retirement of \$1,500,000 of 6 per cent first mortgage bonds of the Citizens' Railway, due on July 1. The additional funds needed will be supplied from the treasury.

Utica & Mohawk Valley Railway, Utica, N. Y.—The New York railroad commission has given approval to an increase in the stock of this company from \$6,250,000 to \$7,500,000.

Dividends Declared.

- Aurora Elgin & Chicago Railway, Chicago, preferred, quarterly, 1 1/4 per cent.
- Boston & Worcester Electric Companies, Boston, preferred, \$2.00.
- Capitol Traction Company, Washington, D. C., quarterly, 1 1/2 per cent.
- Holyoke (Mass.) Street Railway, 1 per cent
- Johnstown (Pa.) Passenger Railway, quarterly, three-fourths of 1 per cent.
- New Orleans Railway & Light Company, preferred, quarterly, 1 1/4 per cent.
- Rochester (N. Y.) Railway, preferred, quarterly, 1 1/4 per cent
- Syracuse (N. Y.) Rapid Transit Company, preferred, quarterly, 1 1/2 per cent.
- Tri-City Railway & Light Company, Davenport Ia., preferred quarterly, 1 1/2 per cent.
- Washington Water Power Company, Spokane, Wash., quarterly, 1 3/4 per cent.
- West End Street Railway, Boston, preferred, 1 per cent

Manufactures and Supplies

ROLLING STOCK.

United Railroads of San Francisco, San Francisco, Cal., it is reported, is in the market for 50 cars.

Tampa & Sulphur Springs Traction Company, Tampa, Fla., placed an order a few days ago for six cars.

Galveston-Houston Electric Railway, Houston, Tex., under construction, is in the market, it is reported, for 20 cars.

Cleveland Southwestern & Columbus Railway, Cleveland, O., it is reported, has purchased a few large interurban passenger cars.

Hays Brothers Company, Arkansas National Bank building, Hot Springs, Ark., will be in the market for six cars soon. W. E. Mitchell, manager.

New York City Railway, New York, N. Y., has ordered 154 cars from The J. G. Brill Company and is also asking figures on all-steel cars for surface use.

Canadian Development Company, El Reno, Okla., is in the market for a complete street railway equipment. Harry Schafer, El Reno, Okla., manager.

The J. G. Brill Company, Philadelphia, Pa., has recently shipped 25 cars to the Lisbon (Portugal) street railway. The Brill company has supplied this road with over 200 cars.

Penn & Franklin Street Railway, now under construction from Wilksburg, Pa., to Pittsburg, it is reported has placed an order with the St. Louis Car Company for 10 closed cars.

Willamette Construction Company, which is building the Oregon Electric Railway, Portland, Ore., has placed an order with the American Locomotive Company for two electric locomotives.

New Orleans Railway & Light Company, New Orleans, La., which was reported to be in the market for a number of new cars, officially advises us that it has not yet definitely decided on the matter.

Utah Light & Railway Company, Salt Lake City, Utah, which is in the market for 62 cars, as reported in the Electric Railway Review of June 15, will place the contract for these cars on June 27.

Washington Railway & Power Company, Portland, Ore., which is building a street railway in Vancouver, Wash., is in the market, we are officially advised, for four passenger cars for city service, equipped with standard-gauge double trucks and good motors.

Buffalo & Lake Erie Traction Company, Buffalo, N. Y., as reported in the Electric Railway Review of June 15, has placed an order with the Cincinnati Car Company for 25 combination passenger and baggage cars. The specifications call for the following details:

Weight	\$6,000 lb.	Height, over all.....	13 ft.
Length	56 ft. 7 in.	Body	Wood
Width	9 ft. 4 in.	Underframe	Steel

Special Equipment.

Brakes	Westinghouse	Journal boxes	Symington
Couplers	Tomlinson	Lighting system.....
Curtain material.....	Pantasote	Holophane globes
Curtain fixtures.....	Protected groove	Springs	Triple elliptic
Heating system.....	Hot water	Trucks	Baldwin
Draft rigging.....	Tomlinson		

Birmingham Railway Light & Power Company, Birmingham, Ala., as reported in the Electric Railway Review of June 8, has placed an order for four closed passenger cars with the St. Louis Car Company. Delivery is to be made about September 1. The specifications call for the following details:

Seating capacity.....	40 passengers	Width, inside	7 ft. 4 in.
Weight	45,000 lb.	Over all	8 ft. 6 in.
Wheel base.....	6 ft. 6 in.	Height, track to trolley base..
Length of body.....	29 ft. 7¼ in.	12 ft. 3 in.
Over vestibule	39 ft. 1¼ in.	Body	Wood and steel
Over all	40 ft. 7¼ in.	Underframe	Steel

Special Equipment.

Air brakes	National	Safety tread	Q & C
Brakeshoes	M. C. B. type	Sanders	St. Louis
Center bearings.....	Seats	Heywood Bros.
.....	Symington ball bearing	Side bearings	Baldwin
Couplers	St. Louis	Trucks	Baldwin
Curtain fixtures.....	Forsyth cable	Gongs	Brill Dedenda
Curtain materials	Pantasote	Hand brakes	Wheel
Destination signs	Hunter's	Heating system.....	Consolidated
Fenders	Emery	Headlights
Gears and pinions.....	Combination Frisco type
.....	E. W. Bliss & Co.	Interior finish.....	Mahogany
Journal boxes	M. C. B. type	Journal bearings.....	M. C. B. type
Markers	Lintern	Varnish	Hildreth
Motors.....	4 GE-57	Vestibule	Full
Paint.....	Olive green		

Scioto Valley Traction Company, Columbus, O., which was reported in the Electric Railway Review of June 22 to have ordered four express trail cars, officially advises us that these are second-hand 50,000-pound capacity railroad box cars. They are being over-

hauled, repainted and equipped with Standard rolled and forged steel wheels, Van Dorn automatic couplers and standard Westinghouse automatic air brakes.

Elkins Electric Railway, Elkins, W. Va., which was reported in the Electric Railway Review of June 22 to be in the market for a few electric motor passenger cars, officially advises us that it will also be in the market for regular passenger and freight equipment in the near future.

Chicago City Railway, Chicago, Ill., was reported in the Electric Railway Review of April 13 to have placed an order for 300 cars with The J. G. Brill Company. This order has been divided among the Brill plants, as follows: G. C. Kuhlman Car Company, 150; The J. G. Brill Company, 100, and the American Car Company, 50.

SHOPS AND BUILDINGS.

Augusta & Columbia Railway, Augusta, Ga.—This company has purchased a site on which it proposes to erect terminals to cost about \$250,000.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—It is reported that this company has purchased property at Wellington, O., on which to build car houses and a station. The station will consist of a ticket office and waiting, baggage and express rooms.

Consolidated Railway, New Haven, Conn.—This company will immediately start the erection of a station at Luna Park and Charter Oak Park. The plans call for a platform, with a granolithic surface, 25 feet wide by 125 feet long. Over it will be a roof supported by turned wood pillars. It will be built on the company's private property.

Fresno (Cal.) Traction Company.—This company received bids on June 25 for the construction of the car houses and machine shops that have been under consideration for some time, as reported in the Electric Railway Review of April 20.

Lima & Toledo Traction Company, Lima, O.—This company, it is reported, has made a proposition for property in Toledo, O., on which it will erect a large passenger and freight station and also a car house.

Nashville (Tenn.) Railway & Light Company.—This company has appropriated \$10,000 to remodel its transfer station building. Work has been under way for some time and will require four months.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—This company has decided not to erect a new car house on the site recently bought for that purpose, as reported in the Electric Railway Review of May 11. At a meeting of the directors it was decided to sell the property to the St. Joseph hospital, which was anxious to prevent the erection of the car house because of its proximity.

Paris (Ill.) Traction Company.—This company will build a car house, 50 by 120 feet, on a lot donated by the Commercial Club.

Pittsburg Harmony Butler & New Castle Street Railway, New Castle, Pa.—This company has closed a long-time lease on property in Butler, where it will erect a car house, 30 by 80 feet, to accommodate 10 cars. The second story of the building will be devoted to the offices of the company.

Rockford & Interurban Railway, Rockford, Ill.—It is reported that this company will erect a machine shop on First avenue, opposite its car houses.

Springfield (Ill.) Consolidated Street Railway.—This company has awarded the Culver Construction Company the contract for erecting a car house in Springfield.

Springfield (Mass.) Street Railway.—The construction of a modern electric car house will be started by this company this year, on its property at North Main and Hooker streets. The building will have a capacity of 100 cars and will cost from \$150,000 to \$200,000. It will be built of brick, one story high, and set well back on the property owned by the company. In connection with the storage part of the building there will be repair shops, equipped with the newest machinery. Outside there will be plenty of room for a yard, with track space for a large number of cars.

Utah Light & Railway Company, Salt Lake City, Utah.—Plans for this company's new car houses and repair shops have been practically completed and work on them will commence early in July.

TRADE NOTES.

Westinghouse Machine Company, Pittsburg, Pa., has declared its regular quarterly dividend of 2½ per cent, payable on July 10.

Manning, Maxwell & Moore, Incorporated, New York, has declared a regular quarterly dividend of 1½ per cent, payable on July 1.

Barrett Manufacturing Company, New York and Chicago, whose Chicago plant was burned recently, will rebuild at West Twenty-fifth and Fuller streets, Chicago.

United States Graphite Company, Saginaw, Mich., is successfully exploiting its lubricating graphited oil. It is based upon this principle: Amorphous graphite, when reduced to an impalpably fine powder, and when mixed with oil in the proportion of about one teaspoonful to the pint of oil, will remain in perfect suspension long enough to feed through lubricator tubes without clogging.

Thus every drop of oil carries its mite of graphite to the bearing surface.

Westinghouse Air Brake Company, Pittsburg, Pa., has declared a quarterly dividend of 2½ per cent, and an extra dividend of 2½ per cent, both payable on July 10.

E. D. Edmonston, recently chief engineer of the American Construction Company, New Orleans, La., has joined the engineering staff of W. S. Barstow & Co., New York and Portland, Ore.

Sturtevant Engineering Company, 147 Queen Victoria street, London, Eng., European representative of B. F. Sturtevant Company, Boston, Mass., has recently opened an office at 2 Rue Lebeau, Brussels.

F. W. Rowe has been made assistant purchasing agent of the General Electric Company, Schenectady, N. Y. Mr. Rowe has been purchasing agent of the Aultman & Taylor Machinery Company, Mansfield, O.

W. W. Adams has been appointed manager of the Pittsburg and Buffalo offices of the Browning Engineering Company, Cleveland, O. The Pittsburg office is in the House building and the Buffalo office in the Erie County Bank building.

The J. G. Brill Company, Philadelphia, Pa., is offering, through Edward B. Smith & Co., bankers, Philadelphia and New York, a \$5,000,000 issue of its 7 per cent cumulative preferred stock. This stock is offered at par and accrued dividends.

Ridgway Dynamo & Engine Company, Ridgway, Pa., manufacturer of engines and dynamos, has appointed Samuel W. Hays' Sons, 302 Farmers' Bank building, Pittsburg, Pa., as its sales agents in the Pittsburg district, northern West Virginia and southeastern Ohio.

Harrington Signal Company, New York, N. Y., has been organized with \$50,000 capital stock to manufacture railway materials and devices. Those interested are: George W. Sweeney, Victoria hotel; Edward M. Tierney, Marlborough hotel, and Samuel H. Harrington, 120 Liberty street, all of New York.

Wallace Supply Company, Chicago, on account of fire at its old address, 18 West Washington street, has recently removed its offices and works to 19 South Jefferson street, where it has installed increased facilities for handling its double-door fixtures and other railway specialties.

I. R. Nelson & Co., Newark, N. J., on account of increasing business, have leased a small factory, 43 Lawrence street, Newark, where they will handle their electrical repair work. They are specialists in street railway shop work and economical maintenance of rolling equipment.

Lewis Motor & Crane Company, Camden, Me., has been incorporated with a capital stock of \$10,000 for the purpose of manufacturing electric motors, cranes, etc. The officers of the company are: President, G. E. Allen; treasurer and clerk, R. Robinson, both of Camden, Me.

New York Air Brake Company, New York, re-elected all of its retiring directors at the annual meeting of stockholders. President Starbuck announced that the company's business established a new record for the month of March, and that enough business has been booked to keep its plants busy for six months.

Allis-Chalmers Company, Milwaukee, Wis., reports that during the month of May it shipped from its works 553 cars of machinery—a gain of 20 cars over the record established for April. In April the aggregate weight of shipments was 21,680,847 pounds, while in May the figure had risen to 23,772,242 pounds, making a total weight for the two months of 45,463,089 pounds.

Crocker-Wheeler Company, Amper, N. J., announces that in order to handle its mass of business in electric generators and motors in southern Ohio, the Cleveland office of the company has found it advisable to open a sub office in the Columbus Savings & Trust Company building, Columbus, O., which will be in charge of Charles W. Cross, formerly of the Cleveland office of the company.

National Railway Signal Manufacturing Company, Wheaton, Ill., announces the recent installation of its positive block signal on the Aurora division of the Aurora Elgin & Chicago Railway, and the company is also installing several of its highway crossing signals on the third-rail division of this road. The Chicago & Milwaukee Electric Railroad Company has recently placed an order with it for highway crossing signals.

Northern Engineering Works, Detroit, Mich., reports the following recent shipments of cranes for power station service: A 24-ton capacity 62-inch span crane for the Buffalo & Susquehanna Coal Mining Company, Sagamore, Pa.; a 6-ton capacity 36-inch span crane for the Winchester & Washington City Railway, and a 5-ton capacity 36-inch span crane for the Watertown Electric Light Company.

Rushmore Dynamo Works, Plainfield, N. J., has let contracts and is breaking ground for a new factory and power house. The main building, which is to be used exclusively for the manufacture of lighting apparatus and generators, will be 50 by 250 feet, and two stories high. The offices and lens grinding department will occupy the upper floor, while the lower floor will accommodate the stamping and drawing presses and other machine tool equipment.

Los Angeles Switch & Signal Company, Los Angeles, Cal., has been incorporated in California with a capital stock of \$500,000, to manufacture electro-fluid-hydraulic automatic switches, circuit-closers, crossing appliances, audible signal devices and other railway appliances. Its offices are at 315 Union Trust building,

Los Angeles, Cal. R. B. Sumner is secretary and general manager. The other incorporators are: Dr. W. J. Bell, Oliver C. Bryant, Roger S. Page and W. E. McVay. The company's factory is expected to be in operation in about thirty days.

Elastic Metallic Packing Company, Camden, N. J., has recently been incorporated in the state of New Jersey with a capital stock of \$30,000, to manufacture packing for engines, etc. The incorporators are: Charles E. Paul, 655 North Forty-fourth street, Philadelphia; Paul F. Quinlan, 91 South Wycombe avenue, Lansdowne, N. J.; James M. Meade, 5411 Haverford avenue, Lansdowne, N. J.

Cowling Engineering Company, Cleveland, O., is making rapid progress in the erection of its structural iron plant at Collinwood, O., which is near Cleveland. The plant will consist of three buildings, 100 by 450 feet, of brick and steel construction, and will have an annual capacity of 100,000 tons. One of the buildings and the template shop will be completed by the first of August. The office building, two stories high, has been completed, and the office force is now moving in. The Cowling Engineering Company is just finishing its work on a building for the Cleveland hippodrome, which contains 5,300 tons of structural steel.

Independent Pneumatic Tool Company, Chicago, states that its business since the first of January has shown a remarkable increase over the corresponding period last year. The company is operating its plant day and night in order to meet the demands for its products. Sufficient orders have been booked by the company to keep the plant running for several months, notwithstanding the fact that recently the manufacturing facilities of the plant were increased 50 per cent. Before the end of the present year the company expects to double the present capacity of the plant. While the domestic business has shown the greater increase, a large number of orders for export have also been received.

Blake Signal & Manufacturing Company, 246 Summer street, Boston, Mass., reports that its tube flux is finding ready sales among all classes of consumers. In addition to quantities of small orders from numerous telephone companies, some recent and large orders have been received from the following: Union Switch & Signal Company, Pennsylvania Steel Company, Long Island Railroad, Boston & Maine Railroad, Milford & Uxbridge Street Railway, Kny-Scheerer Company, Johns-Pratt Company, Electro-Dynamic Company and the Emerson Electric & Manufacturing Company. All of these orders materialized after a trial of samples.

Miller Anchor Company, Norwalk, O., has just received notice that the Washington Baltimore & Annapolis Electric Railway will use 2,800 of the Miller Safety anchors along its right of way between Baltimore and Washington. About two months ago the Roberts & Abbott Company, Cleveland, O., engineers in charge of the construction of this electric railway, made a very thorough test of four different makes of anchors in the sand and clay ground along this line, and after careful consideration of all the anchors tested, decided to use the Miller safety anchor. The Chicago & Milwaukee Electric Railroad has just placed orders for 2,000 of the Miller No. 3 anchors.

A. A. Lane, engineer, for some years past with the Taylor-Wilson Manufacturing Company, Pittsburg, Pa., has been engaged by the General Fireproofing Company as office manager in the reinforced concrete department, at Youngstown, O. Mr. Lane has enjoyed a wide experience in construction engineering, having been in charge of extensive operations with a number of companies, among them being the H. B. Camp Company, Akron, O., and the National Fire Proofing Company. During his connection with the Taylor-Wilson Company Mr. Lane was instrumental in the design and supervised the construction of its new plant at McKees Rocks, Pa., including its reinforced concrete machine shop.

Preston Player has opened an engineering office at 15 State street, Boston, Mass., with the object of electric railway, light and power examinations and reports. Mr. Player is a graduate of Harvard and the Massachusetts Institute of Technology, with a broad experience in the operating, executive and analytical features of public service corporation work. Several years ago he was associated with the Walker Company of Cleveland, and later he took a course at Cornell University. Mr. Player spent about four years with the Stone & Webster interests of Boston, including the superintendency of the Brockton Edison Company and the managership of the Blue Hill Street Railway. For about two years he was associated with Messrs. Jackson & Curtis, bankers, of New York and Boston.

Western Wire Sales Company, 324 Dearborn street, Chicago, announces that it has been made western sales agent for the Bay State Insulated Wire & Cable Company, Hyde Park, Mass. This company has recently been organized and has a promising future. Besides having a large capital and an up-to-date factory it has at its head Andrew J. Conlin, who for the past 17 years has been associated with the Simplex Electric Company as general superintendent. Mr. Conlin in these years developed the product of this company to its present high standard until the Simplex wires and cables are favorably known everywhere, and his knowledge and vast experience will doubtless put the products of this company on the highest basis. J. H. H. McNamee, the treasurer and general manager of the new company, who is well known throughout New England, is one of the prominent men of that section of the country. Among his other public offices he has been the mayor of Cambridge, Mass. Outside of the regular lines of rubber and lead covered insulated wires and cables, this company is making a specialty of railroad signal wire, to meet any specifications, 30 per cent pure para rubber insulated wires and cables, mining cables, flame-proof wires, telephone wires, etc.

ELECTRIC LOCOMOTIVES FOR INDUSTRIAL HAULAGE.

The advantages resulting from the use of electric locomotives for surface and industrial haulage are being generally recognized. This is evidenced by the increasing demand for this class of locomotive. The absence of smoke and cinders and of coaling and watering stations, together with the comparatively small amount of attention required by electric locomotives, are only a few reasons for the success of this class of motor in light industrial service.

The Baldwin Locomotive Works makes a specialty of building electric locomotives for all classes of surface haulage, the electrical equipment being furnished by the Westinghouse Electric & Manufacturing Company. These engines are frequently required to operate under special conditions, and designs must be modified

Electric Industrial Locomotive—Narrow Gauge.

accordingly. The electric locomotive can readily be adapted to operate on lines where the clearance limits are restricted, or where there are few facilities for maintaining the power.

The accompanying photographs illustrate two Baldwin-Westinghouse locomotives recently built for industrial haulage. The locomotive for the Carpenter Steel Company is of the single-end mining type, with a cab at the operating end. As the track gauge of this engine is only two feet, the frames are placed outside the wheels. The frames are supported directly on the journal boxes, through coiled springs. Four sand boxes are provided; they are cast in one piece with the frames and have spouts to all the wheels. The bumpers are of cast iron, with suitable draw pockets. Hand-brake equipment is provided, with brakeshoes on all the

Electric Industrial Locomotive—Standard Gauge.

wheels. The cab is substantial in construction. It has sliding doors and drop windows, and is so arranged that the motorman has an unobstructed view when running in either direction. The motor at the front or cab end of the locomotive is hung between the wheels, while the rear motor is outside-hung. The equipment includes a gong and two headlights, which are placed under the eaves of the cab.

General Dimensions.

Service	Surface haulage	Journals	3¼ by 5½ in.
Gauge	2 ft.	Width	3 ft. 8 in.
Motors ..	Two, No. 61, 250 volts	Height	6 ft.
Diameter of drivers.....	24 in.	Length	9 ft. 7 in.
Wheel base	3 ft. 2 in.	Weight	9,500 lb.

The locomotive built for the J. L. Mott Company differs materially in design from the one previously described. As this locomotive operates on standard-gauge track, the frames are conveniently placed inside the wheels. The bumpers are of cast iron,

equipped with M. C. B. automatic couplers. The wheels are of solid rolled steel, manufactured by the Standard Steel Works. Hand-brake equipment is provided, also four sand boxes, with spouts for all the wheels. The cab is of wood; it is centrally located, thus leaving a platform at each end of the locomotive. Convenient steps and handrails are provided. The motors are outside-hung, thus leaving space between the wheels for other equipment.

General Dimensions.

Service	Industrial	Journals	4 by 6 in.
Gauge	4 ft. 8½ in.	Width	6 ft. 4 in.
Motors ..	Two, No. 131, 220 volts	Height	9 ft. 6 in.
Diameter of drivers.....	30 in.	Length	11 ft. 4 in.
Wheel base	5 ft.	Weight	17,000 lb.

These are but two representatives of a large number of Baldwin-Westinghouse electric locomotives recently constructed for special service. Other designs have been built and are successfully operating under the various and difficult conditions so frequently encountered in mine or industrial haulage.

MALLEABLE IRON TIE PLATES.

As the weight and speed of interurban cars increase the desirability and necessity of maintaining the track in true surface and alignment are daily becoming of more importance. The volume of traffic handled by interurban railways depends to a great extent upon the safety and comfort of travel. From a financial standpoint the maintenance of track is important. Good track also reduces accident losses. A large proportion of the total operating expenses of a railway is spent in maintaining track and roadway, therefore any improvement in the track structure which can be made at moderate cost and will tend to lessen the expense of maintenance should well repay for the money invested in it.

The cost of ties is rapidly increasing as the supply of wood suitable for this purpose diminishes and any device that will increase the life of the ties and lessen the labor required to keep

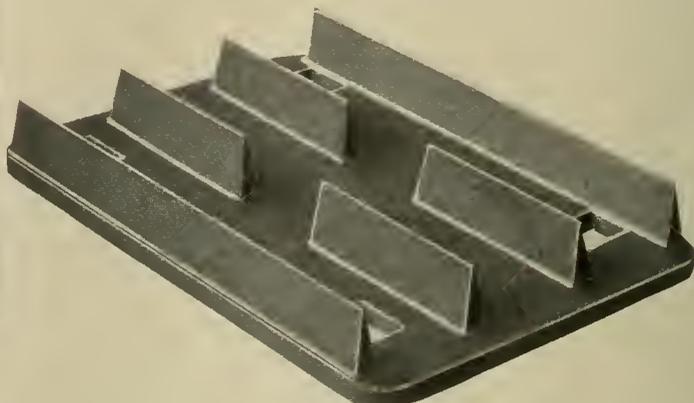

Malleable Iron Tie Plates—Top View of Plates for Tangents (Right) and for Curves (Left).

track in surface should not be overlooked. By adzing the surface of worn-out ties under the rails and inserting tie plates the cost of new ties frequently can be saved.

Several years' experience has demonstrated that the malleable iron tie plate affords the properties of an efficient track fastening. It is effective in preventing the rail flanges from cutting into soft wood ties, also oak ties and frog and switch timbers subjected to the severest traffic. It is an under-support holding the rails in a perpendicular position and prevents the rolling or canting, especially on curves.

Tie plates, properly settled in the tie and spiked, prevent the

Malleable Iron Tie Plates—Under View, Showing Ribs.

spreading of gauge by securing the help of the inside, as well as the outside spikes, because the outside spikes cannot be crowded without drawing the inside spikes with them.

By preventing the cutting-in of ties the undulations of the rails are reduced and the creeping of track thereby minimized. The plates provide a uniform support to the rail on every tie without reference to its age.

Because of the rapid destruction of steel tie plates, caused by the effect of corrosion from the action of the atmosphere, and also from the fact that in a steel plate it has been impossible to roll a shoulder and flange on the plate, a number of large railroads have experimented with malleable iron tie plates, with the result that a number of the larger systems have adopted the malleable iron plate as a standard. This is because the malleable iron plates

mit the commutator to wear down evenly and prevent sparking. The brush holders on these motors are two in number, having from two to four carbon brushes each, depending upon the size of the motor. The brushes slide in finished ways and are pressed against the commutator by independent fingers, which give a practically uniform pressure throughout the working range of the brushes. A pig tail shunt is provided between the fingers and the brush-holder body to prevent the current passing through the spring or pivoting pins. The brush holders are adjustable to allow for wear of the commutator, and are securely clamped in the proper position. They can be readily removed through the opening in the frame over the commutator.

Ventilation and Pinions.

Particular attention has been given to the ventilation of these motors. Free circulation of air between the interior and the exterior of the motor can be obtained. The armatures are so constructed that when running a large volume of air is drawn into the interior of the core and expelled through ducts opening along the exterior. Good ventilation with the small mechanical and electrical losses obtained in these motors keeps them cool. This greatly adds to their service capacity. The gears for these motors are made of cast steel of special quality, extra hammered to improve the quality of the metal. The gear teeth are accurately cut, and the width of face and pitch is such as to insure ample strength. The gear cases are made of malleable iron and are suspended at three points from the magnet frame to prevent vibration. Strengthening ribs radiate from the supporting points to prevent the case from cracking.

Suspension.

In the box frame type of motors, the front of the frame is provided with a lug which rests on a bracket secured to the truck transom. The motor is prevented from rising by a forged strap bolted over the top of the lug. When the truck is out from under the car, motors can be mounted on or taken off the truck from above, no pit being required. In the case of the split frame motors, lugs are cast on the upper half of the frame, to which a suspension bar is bolted. The lower half of the motor frame can be swung down for inspection and repairs without disturbing the rest of the motor.

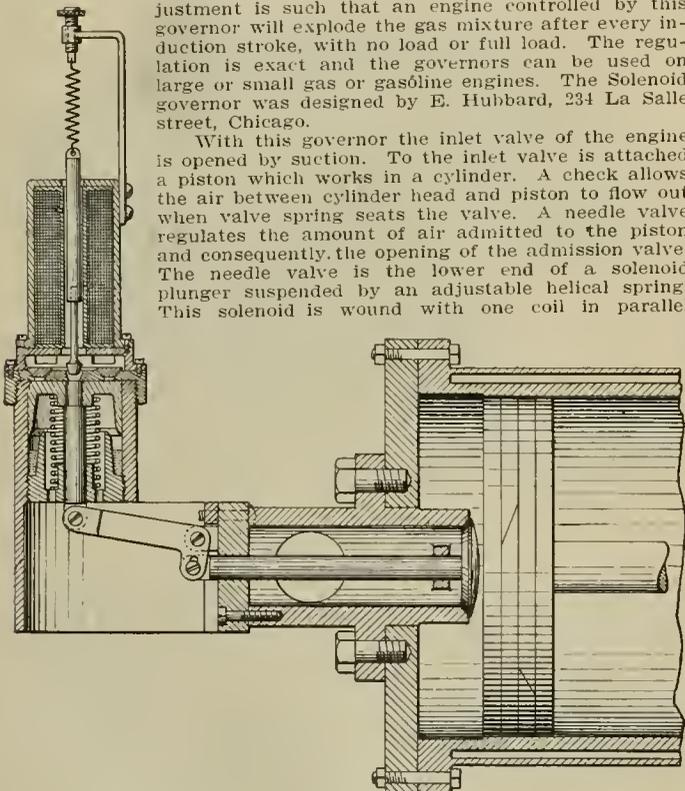

Rating.

The capacities of these motors for continuous service are high, owing to their good electrical efficiency and ventilation. The ratings of the motors are based on a temperature rise by thermometer of not more than 75 degrees C. above the surrounding air taken at 25 degrees C. after an hour's run at rated load and voltage. Motors are wound for operation at 600 volts as standard and have a liberal margin of safety at this voltage, as good commutation is a special characteristic of this type of motor.

THE SOLENOID GAS ENGINE GOVERNOR.

A new governor has been perfected that is said to absolutely control the regulation of a gas engine automatically, and keep the engine at the required and a steady speed. The "solenoid governor" is a development along new lines. Its adjustment is such that an engine controlled by this governor will explode the gas mixture after every induction stroke, with no load or full load. The regulation is exact and the governors can be used on large or small gas or gasoline engines. The Solenoid governor was designed by E. Hubbard, 234 La Salle street, Chicago.

With this governor the inlet valve of the engine is opened by suction. To the inlet valve is attached a piston which works in a cylinder. A check allows the air between cylinder head and piston to flow out when valve spring seats the valve. A needle valve regulates the amount of air admitted to the piston and consequently the opening of the admission valve. The needle valve is the lower end of a solenoid plunger suspended by an adjustable helical spring. This solenoid is wound with one coil in parallel

Application of Solenoid Gas Engine Governor.

with generator field and one in series. The relation of the series to the parallel coil can be varied to get a drop in speed when load goes off, to get the same speed with a change of load or to get a rise in speed when load goes off, or vice versa.

From the results of actual tests it appears that any regulation can be obtained, either slower with no load than with full load, or constant speed with or without load. The device is simple, not liable to get out of order and controls the speed of the engine within any predetermined limits.

Atlantic City Convention Bulletin.

George B. Keegan, secretary of the American Street and Interurban Railway Manufacturers' Association, has issued a bulletin in regard to the arrangements for exhibits at the Atlantic City convention, October 14-18. The steel pier, on which the exhibits are to be located, extends into the ocean about 1,600 feet. It has recently been widened and reinforced and under arrangements made by the Manufacturers' association, there will be available on the steel pier about \$3,000 square feet of exhibit space, exclusive of aisles, which is the largest area the association ever had. Nearly 60,000 square feet will be provided with the same plant of inside and outside booths installed for the M. M. and M. C. B. conventions in June. On account of having made very favorable arrangements, the Manufacturers' association announces that this space provided with booths can be had for the low rate of 20 cents per square foot, this charge being made for the erection and use of booths, with no charge for floor space.

The remaining space, on which no booths are erected, will be given free of cost, but, of course, it will be necessary for the exhibitors using this space to erect their own booths. There will also be track space for track exhibits in close proximity to the steel pier.

Electric current, both alternating and direct, will be available, as well as steam and compressed air.

Atlantic City is easily accessible for the shipment of materials and arrangements have been made whereby it can be guaranteed that there shall be no exorbitant charges for cartage or labor, skilled or unskilled, and that the regular rates prevailing in Atlantic City shall obtain.

The membership fee has again been fixed by the executive committee at \$35 for the current year, and each membership entitles the member, without charge, to four badges, each entitling holder and lady to all the privileges of the convention and to such entertainments as may be provided.

The Marlborough-Blenheim hotel will be the headquarters hotel for the Manufacturers' association.

The flattering reports from a large number of the members at Columbus last year as to results obtained through the convention prove conclusively the value of this association, and with the organization on its present businesslike basis and the favorable outlook for Atlantic City the next convention promises to surpass every street railway convention ever held.

Correspondence regarding exhibits and applications for space should be addressed to Mr. George Keegan, secretary, 13-21 Park Row building, New York City.

ADVERTISING LITERATURE.

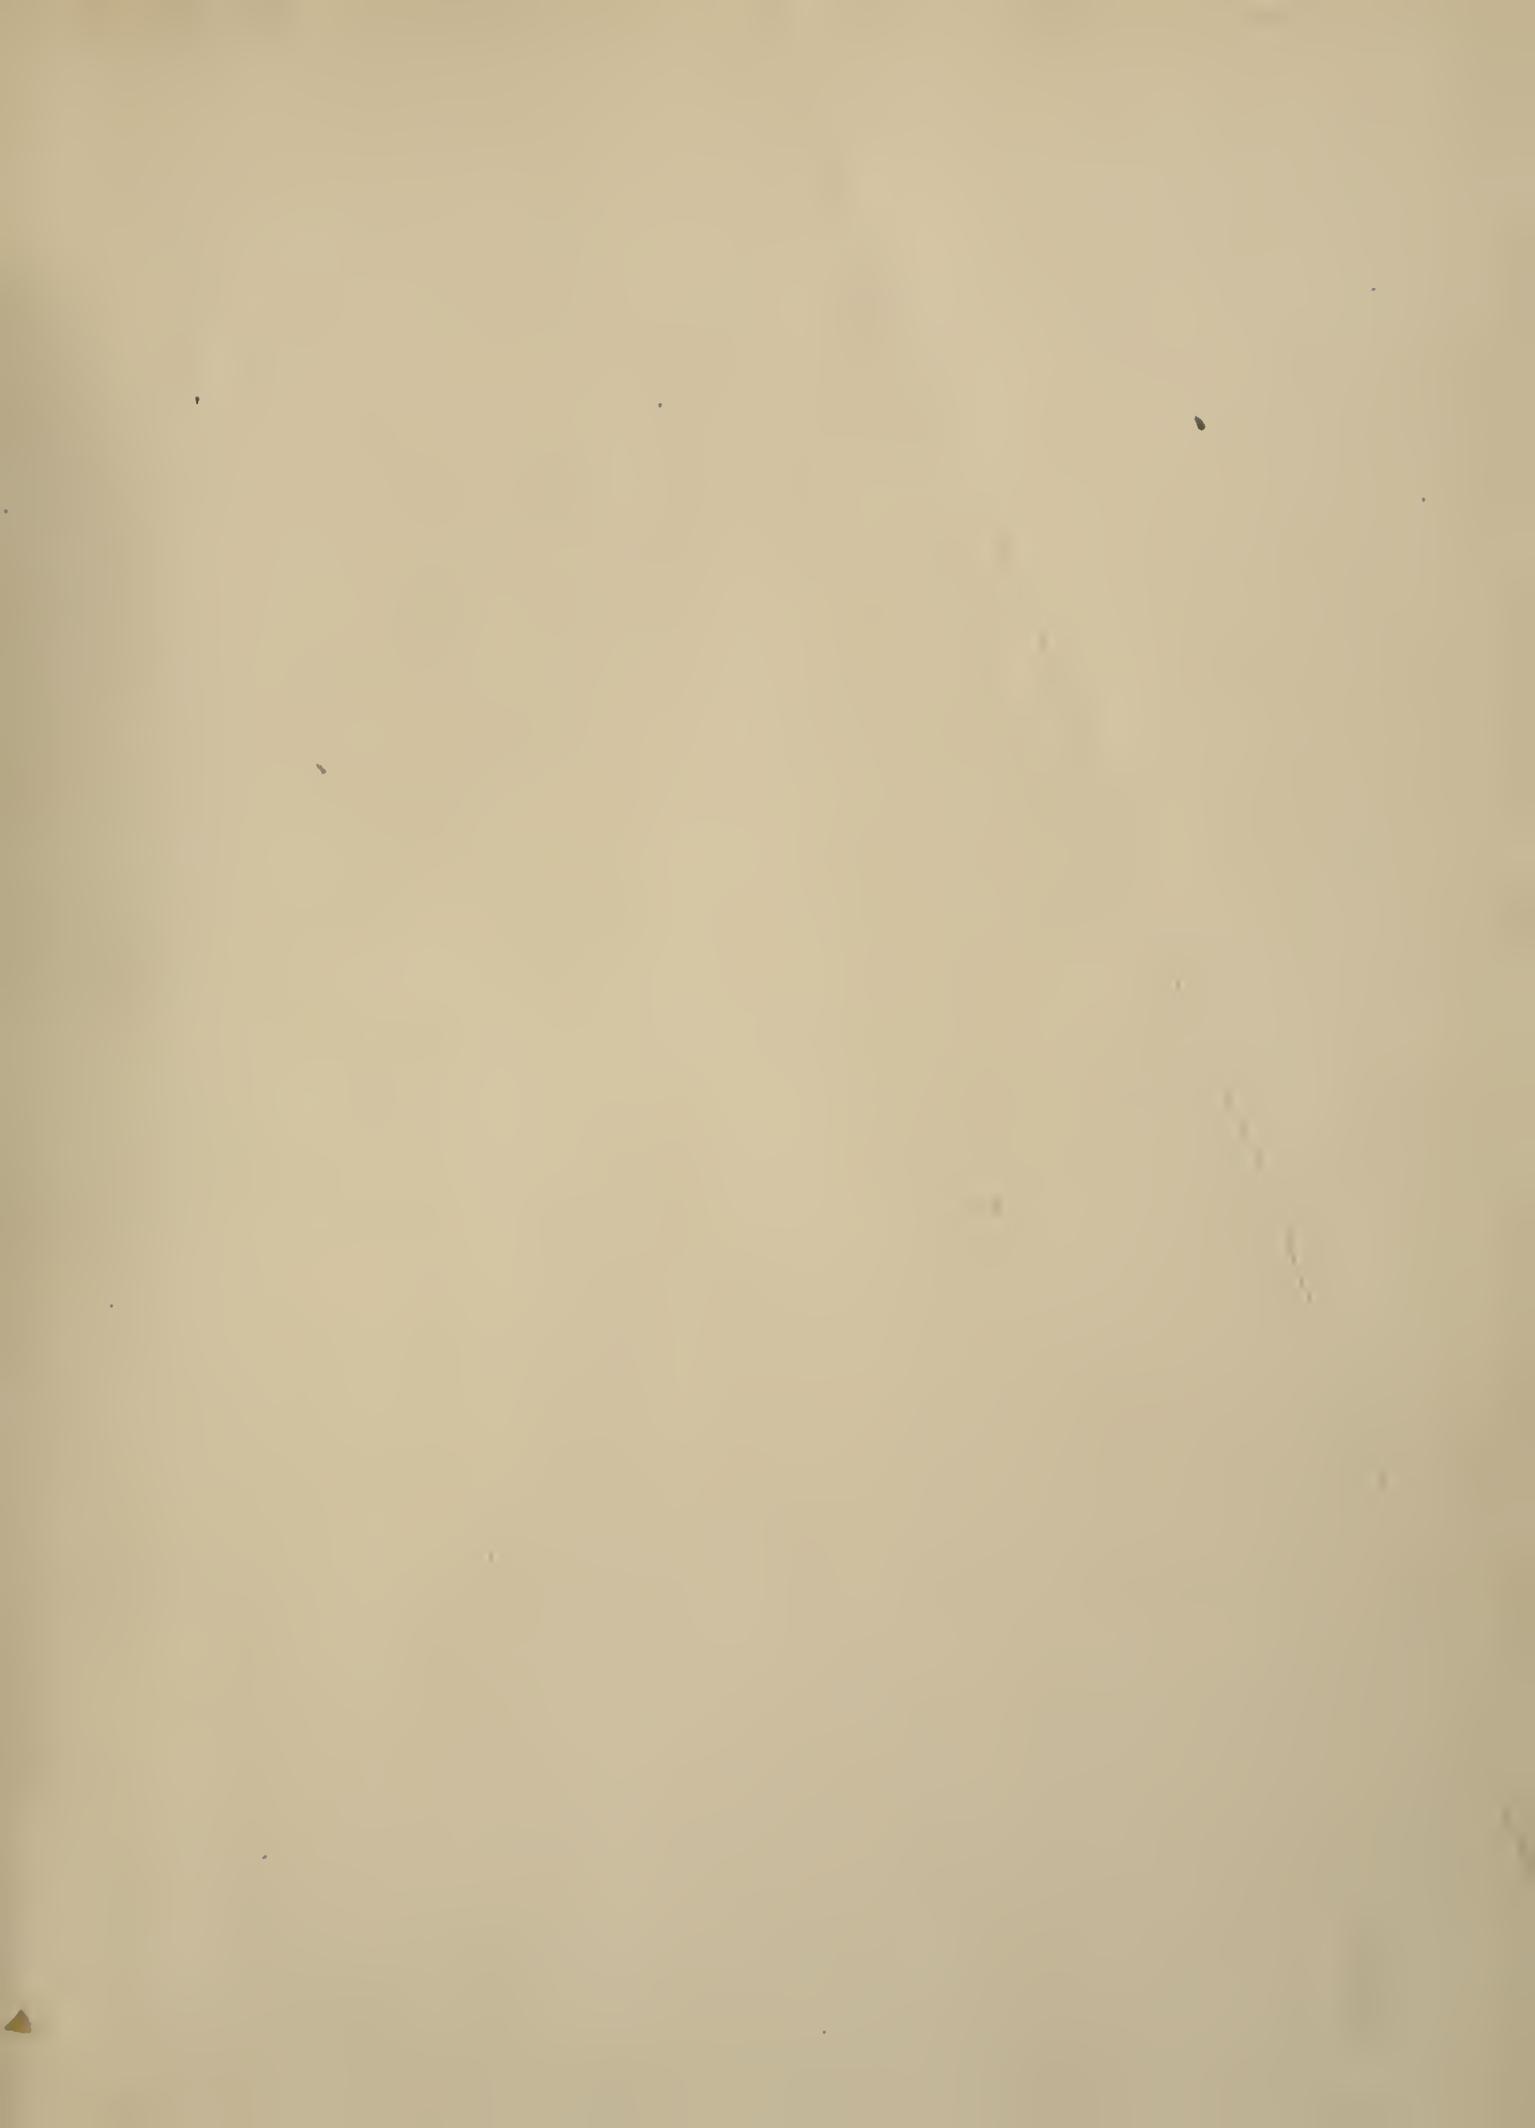

Allis-Chalmers Company, Milwaukee, Wis.—Leaflet No. 4006 describes the Allis-Chalmers belted generators, type AB alternator, which are especially adapted for lighting and power plants in small towns, factories, public and private institutions, office buildings, etc.

General Electric Company, Schenectady, N. Y.—Electrically operated ratchet driven rheostat switches have several advantages over other remote control means of operating rheostats. In Bulletin 4510 recently issued by the transformer department of this company, these advantages are pointed out, and a description is given of a simple, compact and efficient form of rheostat switch now being placed by it on the market.

Drummond's Detective Agency, 1 Ann Street, New York City.—A somewhat novel advertising idea is a couple of index cards of standard library size, which are being sent by the Drummond's Detective Agency to corporations throughout the country. The card, entitled "Strike-Breakers," contains on the face the address of this agency; on the back information regarding the plan pursued in strike breaking, and the cost and advantages thereof. The card entitled "Detective Work" also contains on the face the name and address of the agency and on the back a statement regarding the class of work handled by it.

Russell Car & Snow Plow Company, Ridgway, Pa.—The company's catalogue just issued illustrates and describes the Russell combination car and snow plow, as also the several other styles of Russell snow plows for use on electric railways. Inclosed with the catalogue is a set of four winter scenes showing snow conditions and the Russell railroad plow in action on the Sarles branch of the Great Northern Railroad in January, 1907. The scenes indicate the severity of the snow conditions and the efficiency of the Russell plow. The company's plows for use on electric railways are designed on the same general lines as its steam railway snow plows and it therefore feels justified in making the claim that it manufactures also the best snow-fighting equipment on the market for the use of electric railways.

London Underground Railway Completed.—The last link of the late Charles T. Yerkes' tube system of underground railroads for London was opened on June 22. The new line, which connects the northern suburbs with the heart of London, is eight miles long. It was begun in 1903, runs on an average 60 feet below the surface and cost \$25,000,000. A party of financiers and officials attended the opening ceremony, which was followed by a luncheon. The public were permitted to travel free during the afternoon and evening and were given souvenirs of the opening of the road.
